COVERING LATE 1947
TO EARLY 1948

CHASSIS REMOVAL (For Servicing)

Due to the type of chassis mounting used, removal of the entire tilt-out door assembly (with receiver chassis attached) simplifies removal of the receiver chassis. The receiver chassis can then be easily removed from its shock mountings. Removal is a little "tricky" but can be done most readily as described below:

Disconnect all cables and leads to the chassis.

Remove the screw and washer (#1 in figure 1) from both tilt-out spring studs (2), one on each side of the tilt-out assembly. Slip the tilt-out springs (3) off their respective studs. Unscrew the ends of the tie-bar (4). The tie-bar then hangs free on the copper braid used to bond it to the chassis.

Stand at the end of the cabinet (adjacent to the radio compartment) with left hand on the door handle at the front and with right hand in the radio compartment near the back of the chassis and grasping a long screwdriver as shown in Fig. 2.

With the left hand, pull the assembly out to **one half** of its full tilt-out position. With the screwdriver, pry both tilt-out arms (#5 in Fig. 2) off their studs (#6). **Using the screwdriver blade, push the tilt-out arms toward the front of the cabinet (against bracket #7.)** The assembly will move downward a slight amount from its original mounting position. The tilt-out assembly can now be removed from the front of the cabinet by tipping it forward and then pulling it straight out. CAUTION: In models having record storage compartments below the receiver, the record storage compartment door MUST be closed during the actual process of removing the radio tilt-out door assembly.

CHASSIS REPLACEMENT

Install chassis on the tilt-out assembly, making sure the chassis shock mounting is assembled exactly as shown in Fig. 3. Be sure that the grommets shown in Fig. 3 are in place on the chassis bracket and that the chassis bracket does not touch the tilt-out arm.

Make sure the rubber strips (#8) are in place.

To replace the assembly, grasp it with both hands and move it into place in the cabinet, in the tilted or open position.

Then continue to hold the assembly in place by grasping the door handle with the left hand. Now pull the assembly slowly toward its closed position. **At the same time** with the screwdriver in the right hand, spring the tilt-out arms (#5) inwardly until they clear the studs. The assembly will move downward and into the cabinet with the tilt-out arms in the position shown in Fig. 2.

Then lift the assembly by lifting the handle with the left hand and the tilt-out arms with the right hand. One at a time slip each tilt-out arm into place on its stud.

Replace the tie-bar (#4) and tilt-out springs (#3). Reconnect the leads and cables to the chassis.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube or some local condition is not responsible for faulty reception. The following is a list of the minimum equipment necessary to realign this receiver.

In the following alignment procedure the high side of the signal generator is connected to the terminal indicated in the "Signal Generator Coupling" column below. The ground side of the signal generator is connected directly to the chassis. The output meter should be connected across the voice coil of the speaker for all measurements.

1—AM signal generator covering 455 KC, 600 KC, 1550 KC and 10.7 MC

2—FM signal generator covering 10.7 MC, 92 MC and 106 MC

3—Output meter, rectifier type, approximately 0 to 2 volts RMS

4—Dummy antennas
100MMFD Mica Capacitor
300 Ohm Resistor
0.01 MFD Capacitor

In adjusting the radio frequency trimmers and padders it is advisable to "rock" the variable capacitor gang slightly across the signal being delivered by the signal generator until that particular signal has been accurately peaked.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment. A signal generator is required having the following frequencies: 455 KC and 1400 KC An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD. condenser. The ground lead from the generator may be connected to any spot on the metal chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the movable trimmers in the IF cans, until a maximum reading is noted on the output meter.

The volume control of the receiver should be turned to maximum during the IF and all subsequent alignment and the generator output as low as possible to prevent the AVC from working and giving false readings.

SECOND STEP: With the leads from the generator still connected as in IF alignment, adjust the generator to 400 KC. Set the dial pointer to 1400 KC on the dial scale. Adjust the oscillator trimmer until the signal is tuned in.

THIRD STEP: Remove the generator leads from the condenser. Connect the hot lead from the generator through a 200 MMFD. condenser to one of the leads which project from the back of the loop antenna. Connect the ground lead of the generator to the remaining lead. With the generator and the receiver still tuned to 1400 KC, adjust the antenna trimmer until a maximum reading is noted on the output meter.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment. A signal generator is r quired having the following frequencies: 455 KC and 1400 KC. An output met should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. s tion of the gang condenser, through a .1 MFD. condenser. The ground le from the generator may be connected to any spot on the metal chassis. Tu the gang condenser to complete minimum capacity. Set the generator to 4 KC. Adjust the movable iron cores in the IF cans. These IF adjustments a made in the top and in the bottom of the can under the chassis. Adjust t cores until a maximum reading is noted on the output meter.

The volume control of the receiver should be turned to maximum durin the IF and all subsequent alignment and the generator output as low as po sible to prevent the AVC from working and giving false readings.

SECOND STEP: With the leads from the generator still connected as in l alignment, adjust the generator to 1400 KC. Set the dial pointer to 1400 K on the dial scale. Adjust the oscillator trimmer until the signal is tuned in

THIRD STEP: Remove the generator leads from the gang condenser.

Replace the chassis in the cabinet. Loosely couple the generator to t receiver loop by making a complete turn over the outside of the cabinet. Wi the receiver and the generator still set at 1400 KC increase the generator ou put. Adjust the Antenna trimmer through the back of the chassis until maximum signal is noted on the output meter.

No further adjustment should be necessary as the coils and gang conde ser in this receiver have been specially handled at the factory to insure prop alignment at the lower frequencies.

NOTE: When the antenna trimmer is adjusted at 1400 KC., the chassis as we as the "A" and "B" batteries must be in normal position in the cabinet reflect the proper loop impedance.

DATE: 7-9-46 APPROVED:

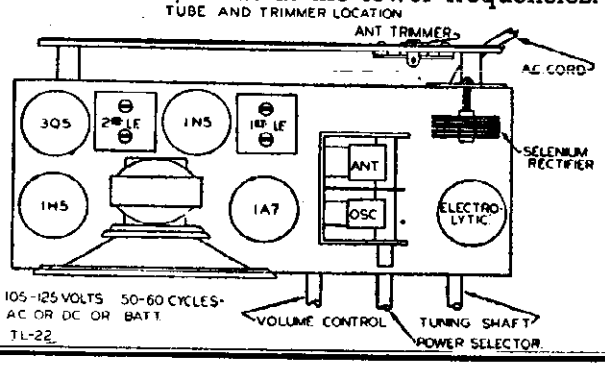
Remove chassis from cabinet for alignment.

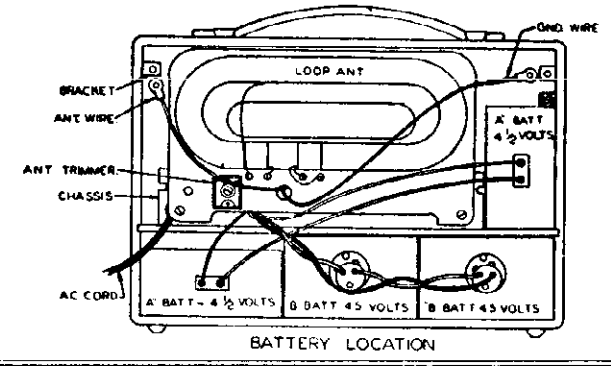
A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the top of the oscillator section of the gang condenser. Adjust this trimmer until the 1720 KC signal is tuned in.

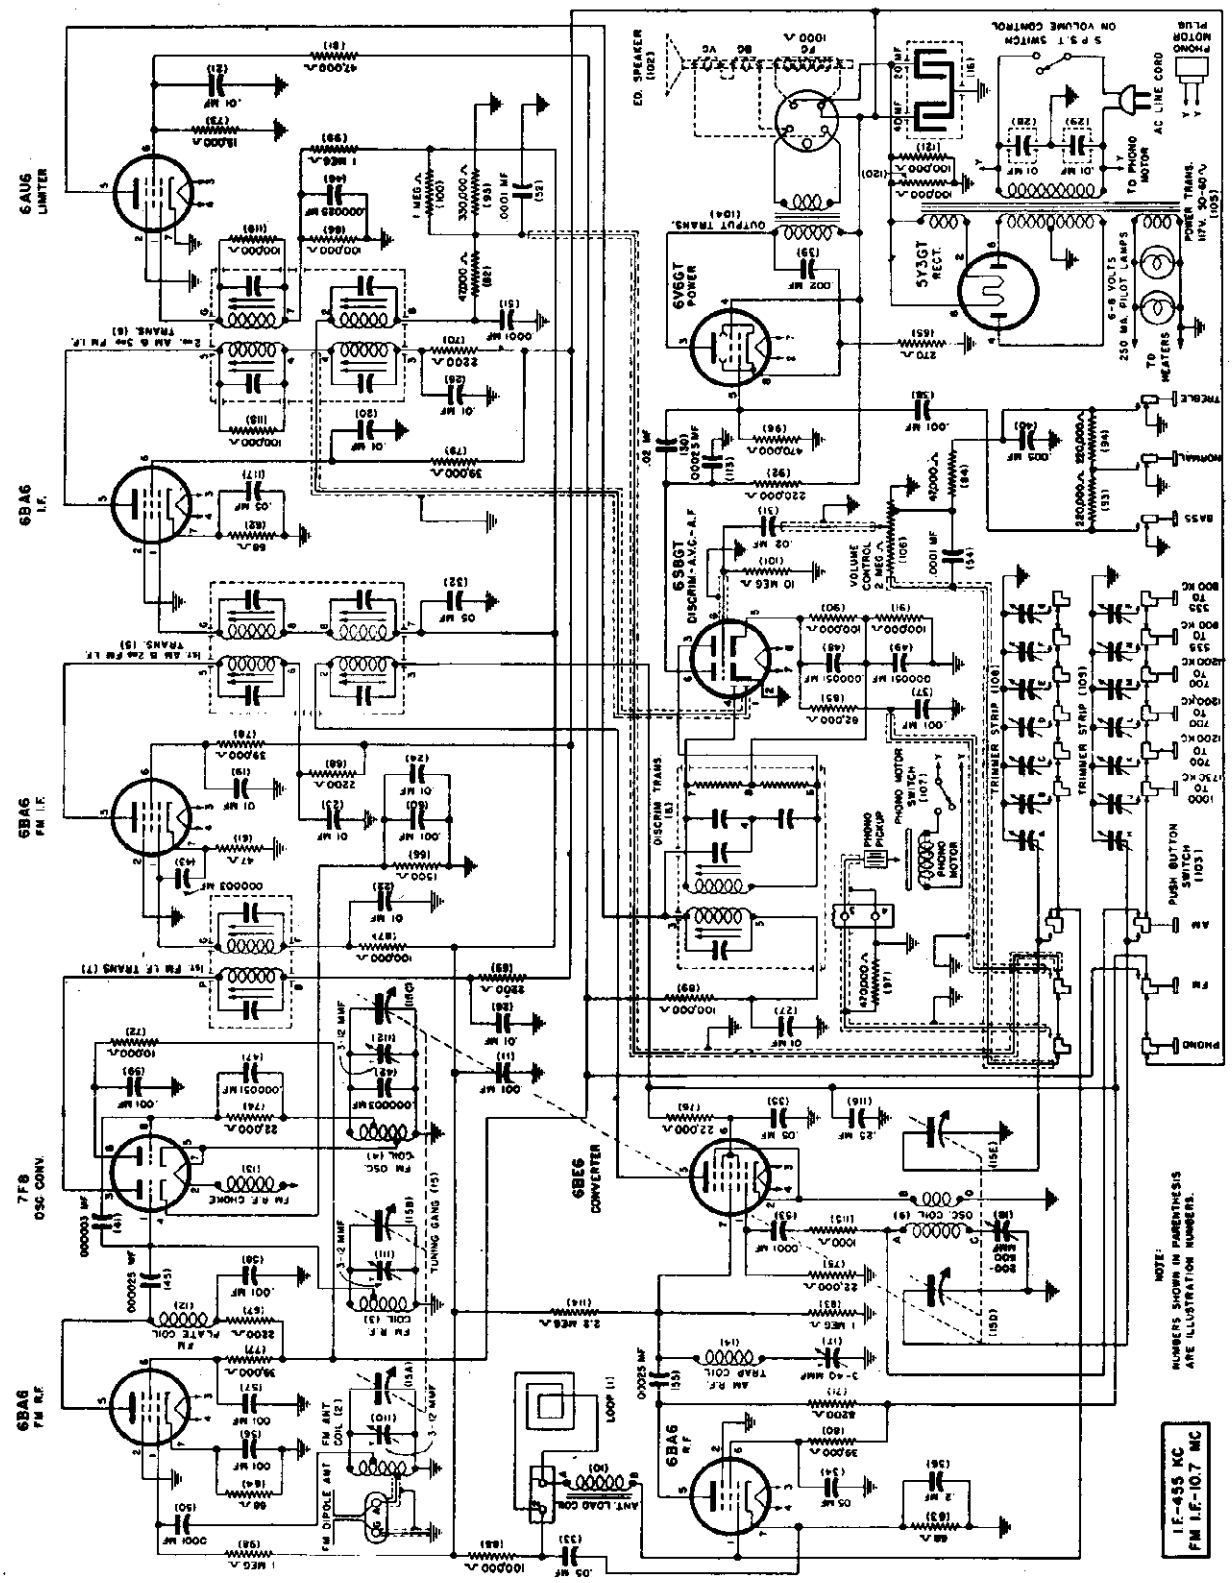
THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.





MODEL 10C-249

ALLIED RADIO CORP.



FM ALIGNMENT

Instructions for Alignment of the Frequency Modulation I. F. Transformers, Discriminator, Oscillator, R. F. and Antenna Circuits, with AM equipment generally available to the service man.

The equipment necessary for this procedure consists of the following:

D.C. Vacuum Tube Voltmeter of the Volt-Ohmyst Type. An AM Signal Generator that will supply:

(1) A 10.7 M.C. Signal for I F. alignment.

(2) A 105 M.C. and 109 M.C. Signal—a Signal Generator that only goes up to 30 M.C. but which has sufficient fourth harmonics present in the carrier could be used for this purpose.

THE GENERATOR USED NEED NOT BE FREQUENCY MODULATED.

IT IS ALWAYS DESIRABLE TO ALIGN THE "AM" I. F. TRANSFORMERS BEFORE MAKING ANY OF THE "FM" I. F. ADJUSTMENTS, and to RECHECK "AM" I. F. TRIMMERS AFTER COMPLETING "FM" I. F. ADJUSTMENTS.

BE SURE TO MAKE THE "FM" ADJUSTMENTS IN THE ORDER GIVEN BELOW.

(1) PROCEDURE FOR ALIGNMENT OF FM DISCRIMINATOR TRANSFORMER:

(A) Connect the Voltmeter from Pin No. 5 of the 6S8GT tube to chassis.

(B) With a .002 Mfd. Isolation Condenser in series with hot Signal Generator lead, connect generator from Pin No. 1 of the 6AU6 Limiter tube to chassis.

(C) Set Signal Generator to EXACTLY 10.7 M. C.

(D) Adjust 10.7 M. C. Discriminator Primary Trimmer for MAXIMUM reading on Voltmeter.

(E) Leave Signal Generator set at 10.7 M. C. and modulate with a 400 cycle note.

(F) Adjust 10.7 M. C. Secondary Discriminator Trimmer for MINIMUM 400 CYCLE RESPONSE IN THE SPEAKER. IMPORTANT: The reading on the Voltmeter should be ZERO. MINIMUM AUDIO RESPONSE WILL BE RATHER CRITICAL IN ADJUSTMENT.

(G) To check adjustment, swing Signal Generator to one side of 10.7 M. C. until MAXIMUM reading is obtained on Voltmeter and NOTE FREQUENCY and VOLTAGE READING. Then swing Signal Generator to the opposite side of 10.7 M. C. until MAXIMUM reading is obtained on Voltmeter and AGAIN NOTE VOLTAGE AND FREQUENCY READINGS. The two Voltmeter readings should be similar within 3 DB. and the two Signal Frequency readings should be a reasonably equal distance from 10.7 M. C. The difference in K.C. between the center frequency and one side should not exceed the difference between the center frequency and the other side by more than 50 K. C.

NOTE: If reliable FM Generator is available at 10.7 M.C., the procedure outlined in Paragraph (G) will be simplified by aligning to the proper pattern on an Oscilloscope. 100 K. C. deviation should be used.

CAUTION: Care should be taken to align the I. F. stages at the EXACT same center frequency as the Discriminator Coil. Switching from FM to AM on some generators may shift the carrier frequency somewhat.

(2) PROCEDURE FOR ALIGNMENT OF "FM" I. F. TRANSFORMERS:

(A) Connect the Voltmeter from the junction of the two 1 Megohm Resistors, (Illus. 99 and 100) to chassis.

(B) Connect Signal Generator to Input Grid (Pin No. 1) of 7F8 Converter tube.

(C) Set Signal Generator to EXACTLY 10.7 M. C.—if possible, mark the position where this occurs right on the Generator's calibrated dial because **this becomes a reference point** in checking for proper FM I. F. alignment.

(D) Adjust each of the 1st, 2nd and 3rd FM I. F. Transformers' 10.7 M. C. trimmers for MAXIMUM reading on Voltmeter. KEEP OUTPUT OF SIGNAL GENERATOR SO THAT A READING OF APPROXIMATELY 2 to 4 VOLTS IS OBTAINED ON THE VOLTMETER.

(E) After all the above FM I. F. Transformer Trimmer adjustments have been correctly completed, MAKE A NOTE OF THE READING ON THE VOLTMETER.

(F) Next, detune the signal generator to a slightly HIGHER frequency (higher than the 10.7 reference frequency), until the Voltmeter reads ONE-HALF of the figure noted in (E) above, and MAKE A NOTE OF THE GENERATOR FREQUENCY AT WHICH THIS OCCURS.

(G) Now, detune the signal generator to a LOWER frequency (lower than the 10.7 reference frequency), until the Voltmeter again reads ONE-HALF the original figure noted in (E), and AGAIN NOTE THE GENERATOR FREQUENCY AT WHICH THIS OCCURS.

The difference between the two above frequencies obtained in (F) and (G), the one lower than 10.7 M. C. reference point and the one higher, is the "Half-amplitude" Band width of the FM-I. F. system. These two frequencies (F) and (G), should be somewhat uniformly spaced on either side of the 10.7 M. C. (C) reference frequency. A SLIGHT DIFFERENCE IS NOT SERIOUS. Only when one is more than twice as far as the other from the 10.7 M. C. reference frequency, or when there is a double peak, is the discrepancy serious. Assuming the FM I. F. Transformers have been properly adjusted, a double peak, or extremely one-sided "half-amplitude" band width, is usually caused by regeneration or a defective FM I. F. Transformer.

(3) PROCEDURE FOR THE ALIGNMENT OF THE "FM" ANTENNA, R.F., AND OSCILLATOR CIRCUITS:

(A) Leave Voltmeter connected as it was for FM I. F. Alignment.

(B) Connect the hot Signal Generator lead through a 300 Ohm Resistor to the FM Antenna Post, marked "ANT" on back of chassis, and the other lead to the post marked "GND".

(C) Set Signal Generator so that it will deliver a modulated 108 M. C. signal. [illegible]

AM ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next.

Before starting alignment:

(A) Check tuning dial adjustment by turning gang condenser until plates reach maximum capacity stop (completely in mesh) at which point the dial pointer must be exactly even with the last line at the low frequency end of the AM dial calibration. If dial pointer does not point exactly to last line move to correct position.

(B) Use an accurately calibrated test oscillator with some type of output measuring device.

(C) WHEN ADJUSTING THE 1730 KC OSCILLATOR TRIMMER, THE 455 KC TRIMMER, remove chassis from cabinet and disconnect the loop connection wires from the set. Attach a 1 megohm resistor across these connections and feed output of test oscillator across the 1 megohm resistor.

(D) THE 1400 KC LOOP ANTENNA TRIMMER and 600 KC PADDER should be adjusted only after all other adjustments have been made and with the set mounted in the cabinet, and the loop in position. When aligning the 1400 KC Antenna Trimmer and 600 KC Padder, couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2″ or 3″ form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
			Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	AM Band position	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to AM-Osc. stator plates of tuning condenser (15D). Low side to frame of condenser through .01 Mfd. condenser.	Adjust each of the 2nd 455 K. C. AM I. F. transformer trimmers for maximum output, then adjust each of the 1st 455 K. C. I. F. transformer trimmers for maximum output.
2	AM Band position	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.00025 Condenser	See Paragraph (C) above.	Adjust 455 K. C. trap trimmer for **MINIMUM** 455 K. C. Signal.
		Exactly 1730 K. C.	Exactly 1730 K. C.			Adjust 1730 K. C. oscillator trimmer for maximum output.
		Approx. 1400 K. C.	Approx. 1400 K. C.	See Paragraph (D) above.		Adjust 1400 K. C. AM Ant. trimmer for maximum output.
		Approx. 600 K. C.	Approx. 600 K. C.			While rocking gang condenser, adjust 600 K. C. oscillator padder for maximum output.

signed to deliver a 108 M. C. signal, use a generator covering at least to 30 M. C. and set this generator frequency to 27 M. C.—the fourth harmonic of which will be 108 M. C.

(D) Set Receiver Dial Pointer to EXACTLY 108 M. C.

(E) Adjust 108 M. C. Oscillator Trimmer for MAXIMUM reading on Voltmeter or MAXIMUM signal heard in speaker.

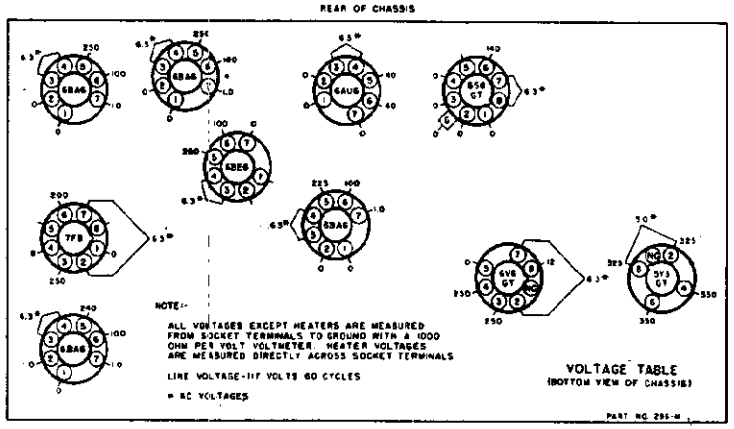
(F) Next, tune the receiver to 104 M. C.

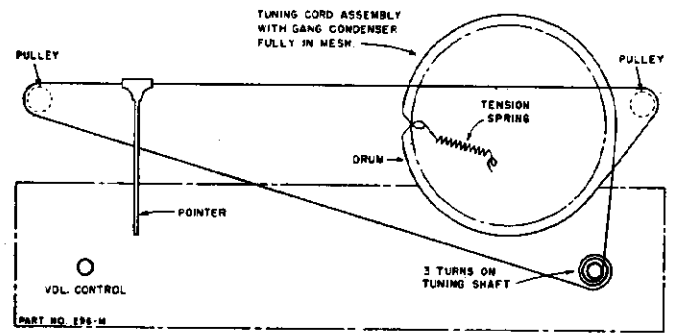
(G) Set Signal Generator to deliver a 104 M. C. modulated signal.

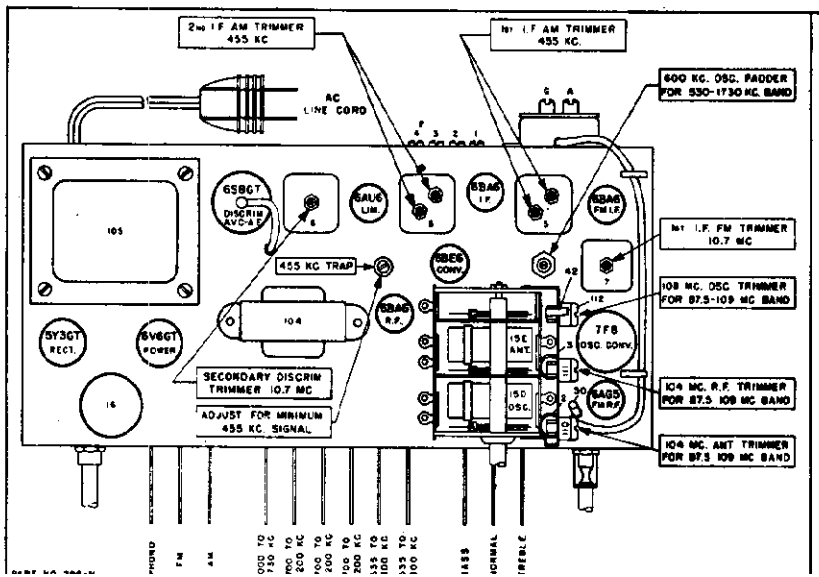
(H) Adjust 104 M. C. Antenna and R. F. Trimmers for MAXIMUM reading on Voltmeter or MAXIMUM signal heard in speaker.

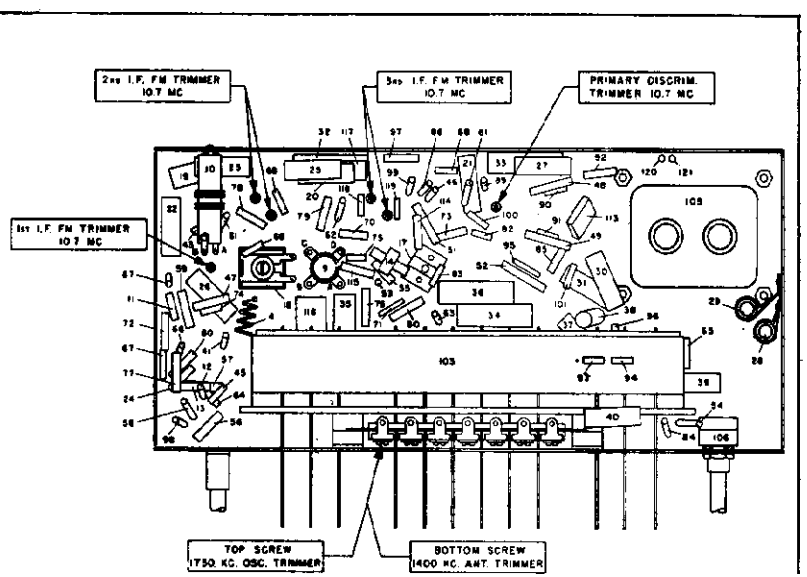
Because it is somewhat helpful to hear the signal, an AM modulation on the 108 M. C. and 104 M. C. signal frequencies may be used for alignment of the FM Oscillator, R. F. and Antenna circuits. With modulated or unmodulated signal, ALWAYS ADJUST FOR MAXIMUM READING ON VOLTMETER. (ADJUSTMENT OF "FM" GANG CONDENSER PLATES AT 98 M.C. AND 90 M. C. MAY BE NECESSARY TO INSURE PROPER TRACKING.)

A FREQUENCY MODULATED SIGNAL GENERATOR may be used instead of an AM signal generator. When a Frequency Modulated Signal Generator is used, it is recommended that an unmodulated carrier be used for all of the above adjustments EXCEPT alignment of the Discriminator Secondary Trimmer. Use a Frequency Modulated signal (100 K.C. deviation) and align Discriminator Secondary for proper pattern on an Oscilloscope.









PARTS LIST

Illus. No.	Part No.	Part Name	Description
1	20E235	Antenna	Loop
2	2E48	Coil	FM Antenna
3	2E49	Coil	FM R.F.

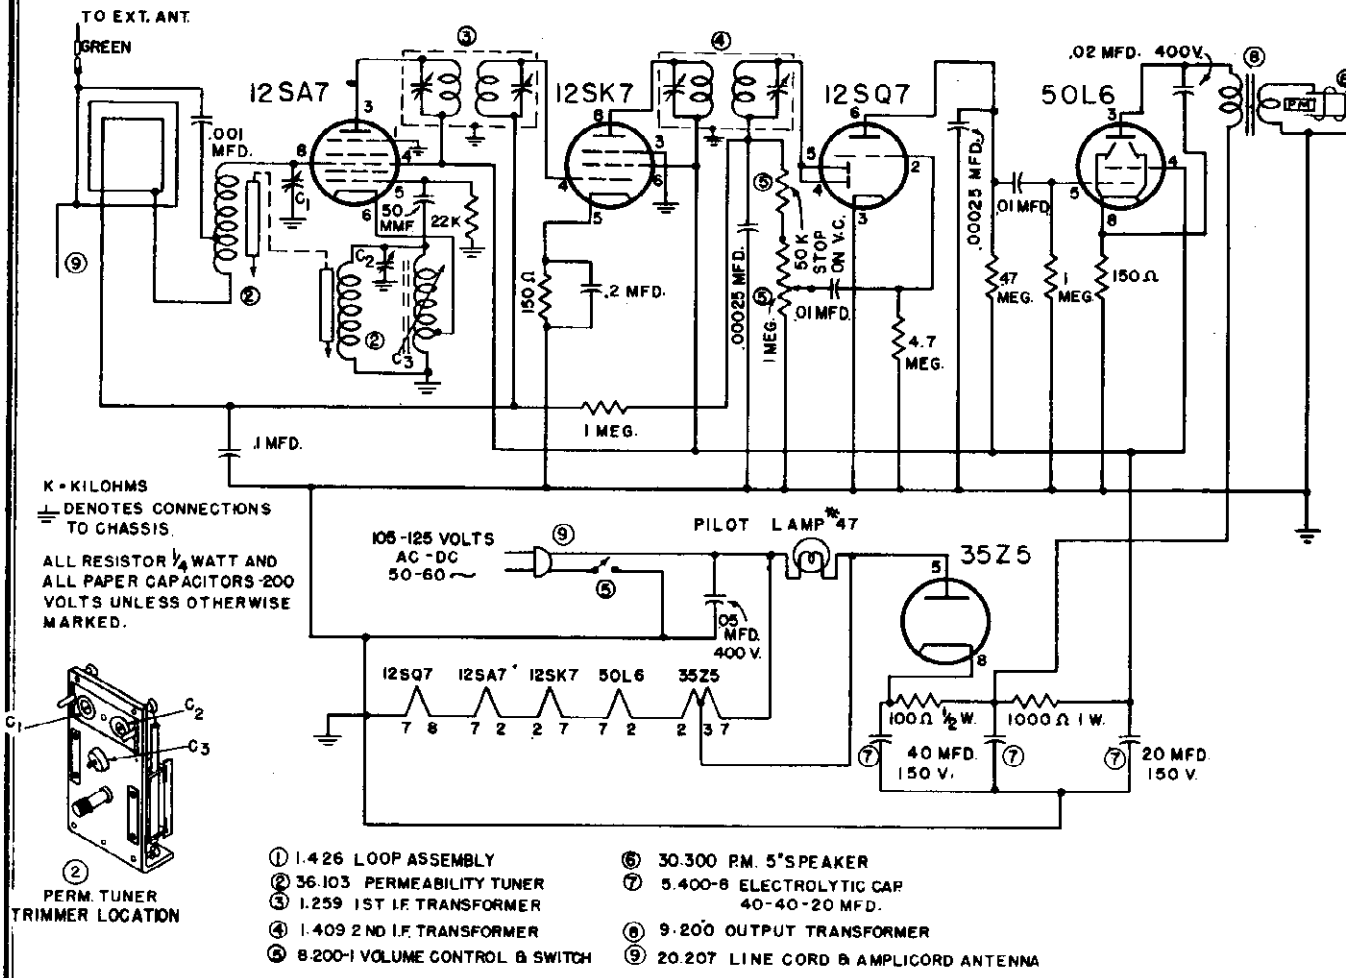
18E4-2	Post	4 Post Binding
18E4-3	Post	2 Post Binding
7E111	Slide Rail	For Record Changer
17E27	Socket	For Pilot Light
20E184	Socket	2 Contact, Female, for Phono Motor



MODEL 125-P SCHEMATIC DIAGRAM

LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC).

POWER CONSUMPTION 30 Watts.

TUNING RANGE: Broadcast: 545 to 1620 Kilocycles (185 to 550 meters).

DIAL: The Dial Scale is calibrated in Kilocycles times 10 to correspond with newspaper or periodical listings.

TUBES: The tubes used and their functions are as follows:

12SA7 Converter	12SQ7 Detector, Avc and Audio Amp.
12SK7 I. F. Amplifier	50L6GT Beam Power Amplifier
	35Z5GT Rectifier

CAUTION: If this receiver is operated on D. C. (Direct Current), and you cannot obtain reception although the tubes are lighted, reverse the line cord plug to obtain the correct polarity. Objectionable hum or noise may also be eliminated on A. C. operation by reversing the line cord plug.

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the Antenna Trimmer (C1) of the Permeability Tuner. Connect the Signal Generator ground lead to the chassis. Connect a suitable Output Meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Permeability Tuner to the extreme clockwise position (cores out of coils).

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

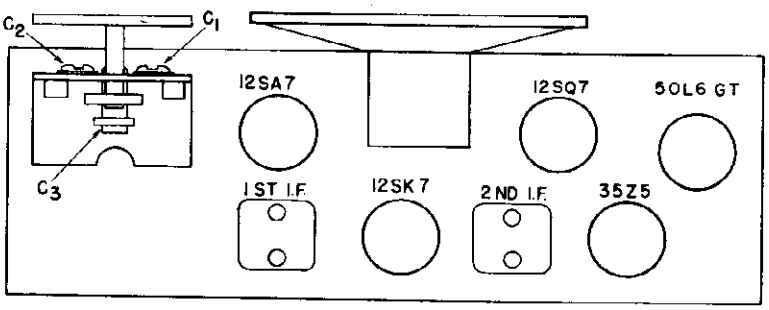
(3) Set the Signal Generator to 1620 KC and loosely couple through a 2 or 3 turn loop to the receiver loop.

(4) With the Permeability Tuner set at the extreme clockwise position (cores out of coils), tune in the 1620 KC signal by means of the Oscillator Trimmer (C2).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer (C1) on the Permeability Tuner for maximum output.

(6) Set the Signal Generator to 600 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Oscillator Shunt Coil (C3) for maximum response while "rocking" the Signal Generator. Recheck the High Frequency Oscillator Trimmer (C2) and re-peak the Antenna Trimmer (C1) for maximum response.

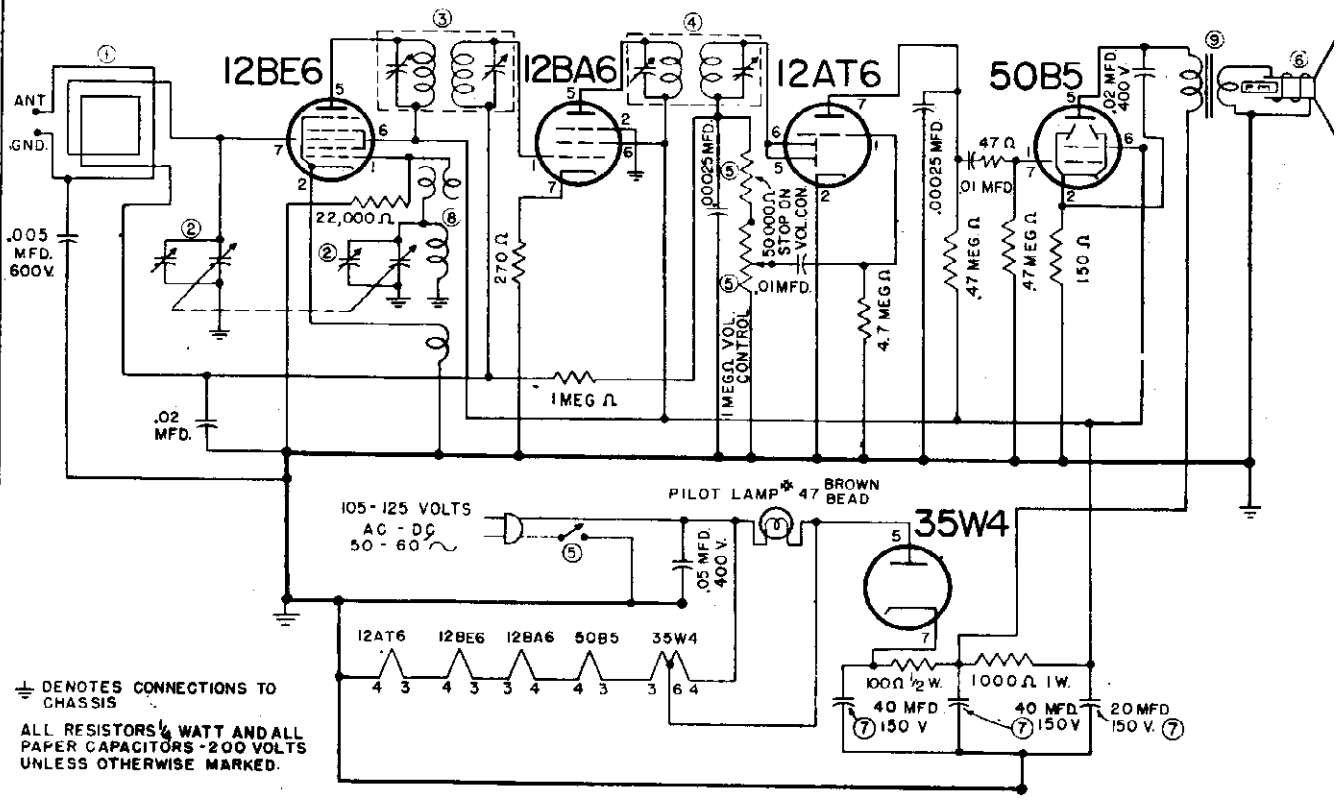
Note: Oscillator and Antenna Coil Saddles have been set and adjusted at the factory. Do not attempt to readjust the Oscillator or Antenna Coil Saddles during the above alignment procedure or serious mis-tracking will occur, resulting in loss of sensitivity at various points in the band.



TRIMMER AND TUBE LOCATION DIAGRAM

INSTALLATION: The Model 125-P is complete in every detail for efficient and immediate operation. A self-contained Loop Antenna is included, which will give excellent results in most locations. Due to the directional properties of the Loop, it may be advantageous to turn the receiver to the left or right in noisy locations for maximum signal and minimum noise. A best position for reception can always be found. The "Amplicord" Antenna which is part of the line cord should be fully extended for reception of weak stations. In unfavorable locations where distant reception is required, a well-constructed outside antenna may be used, and connected to the Green wire labeled "Ant." at the rear of the Loop.

ASSOCIATED MERCHANDISING CORP. MODEL 125



I.F. = 455 K.C.

① 1.403 LOOP ASSEMBLY
② 2.163 2GANG VARIABLE COND.
③ 1-259 1ST. I.F. TRANSFORMER
④ 1.409 2ND. I.F. TRANSFORMER
⑤ 8.200-1 VOLUME CONTROL & SWITCH
⑥ 30.300 P.M. 5" SPEAKER
⑦ 5.415 ELECTROLYTIC CAP. 40-40-20 MFD.
⑧ 1.402-1 OSCILLATOR COIL
⑨ 9-200 OUTPUT TRANSFORMER

LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC).

POWER CONSUMPTION: 30 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

DIAL: The Dial Scale is calibrated in Kilocycles times 10 to correspond with newspaper or periodical listings.

TUBES: The tubes used and their functions are as follows:

12BE6 Converter — 12AT6 Detector, Avc and Audio Amp.
12BA6 I. F. Amplifier — 50B5 Beam Power Amplifier
35W4 Rectifier

CAUTION: If this receiver is operated on D. C. (Direct Current), and you cannot obtain reception although the tubes are lighted, reverse the line cord plug to obtain the correct polarity. Objectionable hum or noise may also be eliminated on A. C. operation by reversing the line cord plug.

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

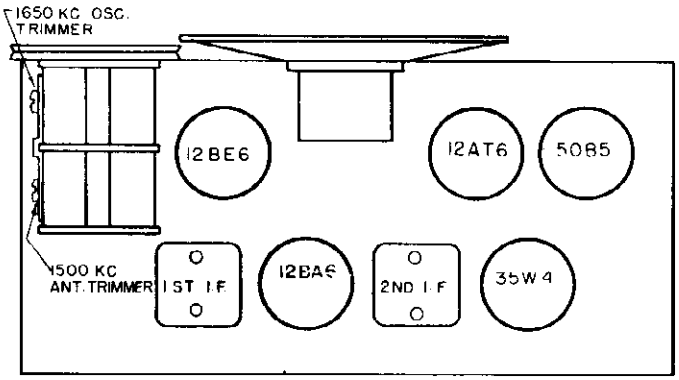
(1) Set the Signal Generator to 455 KC and connect to the Stator Lug on the rear section of the Variable Capacitor. Connect the Signal Generator ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the output meter.

(3) Loosely couple the Signal Generator Ground Lead to the loop and set to 1650 KC.

(4) With the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.



MODEL 125-Z

TRIMMER AND TUBE LOCATION DIAGRAM

INSTALLATION: The Model 125-Z is complete in every detail for efficient and immediate operation. A self-contained Loop Antenna is included, which will give excellent results in most locations. Due to the directional properties of the Loop, it may be advantageous to turn the receiver to the left or right in noisy locations for maximum signal and minimum noise. A best position for reception can always be found. In unfavorable locations where distant reception is required, a well-constructed outside antenna may be used, and connected to the *Green* wire labeled "Ant." at the rear of the Loop. A water or gas pipe may be used as a ground and connected to the *Black* wire labeled "Gnd." at the rear of the Loop.

MINOR REASONS FOR FAILURE TO FUNCTION: Defective tubes, defective Volume Control and On-Off Switch, line cord reversed on D.C., defective line cord plug.

MODEL RER-9 AUDAR INC.

SPECIFICATIONS

117 Volts 60 Cycle AC ONLY -- 130 watts.

8 Multi-Purpose Tubes Including Rectifier Giving 13 Tube Efficiency.

Built-in Antenna.

6 x 9 oval Alnico V speaker.

Broad Band Bass Boost with Treble Control.

TUBES USED

6SK7--R.F. Amplifier

6SA7--Mixer

6SF7--I.F.Amplifier, Diode Detector and Automatic Volume Control

6SQ7--Audio Amplifier and Volume Indicator Rectifier

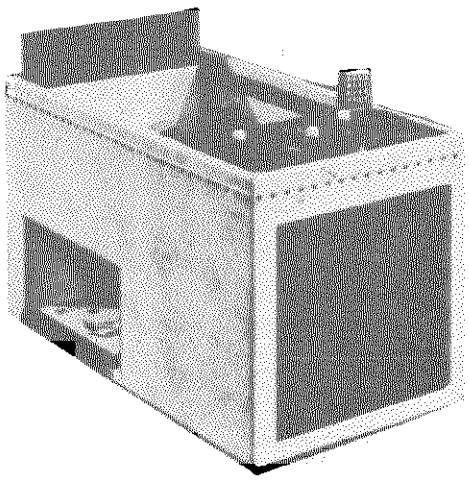
6SN7 GT -- Microphone Preamplifier and Audio Amplifier

6V6 GT -- Power Output Amplifier

5Y3 GT -- Power Rectifier

6U5/6G5 -- Tuning Eye and volume level Indicator

Changer Compartment light - 10 watt, 117 volt, double contact, candelabra, bayonet - Mazda No. 10C7-DC



TUNING EYE

The 6U5/6G5 magic eye tube located in the center of the dial is used as a tuning indicator when the selector switch is in the RADIO position. The tuning knob should be adjusted to cause the eye opening to be narrowest for perfect tuning. When the selector switch is in the RADIO RECORD or VOICE RECORD positions, this tube functions as a volume level indicator. It is not operative in the PHONO position.

Alignment Instructions

Step	Dummy Ant.	Signal Generator Coupling	Signal Generator Frequency	S3 Switch Pos.	Radio Dial Setting	Output Meter	Adjust	Remarks
1	.05mfd	High side to ant. jack low side to chassis	455 KC	Radio	Tuning Cap. fully open	Across voice coil	A1:A2	Adjust for maximum output.
2	.05mfd	"	"	"	"	"	A3:A4	"
3	See note	See note	540 KC	"	Tuning cap. fully closed	"	A5	"
4	"	"	1720 KC	"	Tuning cap. fully open	"	A6	Adjust for maximum output. Repeat steps 3 and 4 until desired range is secured.
5	"	"	1400 KC	"	Tune for maximum output	"	A7	Adjust for maximum output. Rock tuning capacitor while adjusting
6	"	"	1400 KC	"	"	"	A8	"

NOTE: Make all RF adjustments with a dummy antenna, which consists of a piece of wire approximately 8 feet long, connected to the antenna jack. Signal generator should be connected to a short length of wire placed several inches from the dummy antenna.

Voltage Table

No.	Tube	Pin 1	Pin 2	Pin 3	Pin 4	Pin 5	Pin 6	Pin 7	Pin 8
1	6SK7	0V	0V	0V	AVC	.75VDC	100VDC	6.3VAC	185VDC

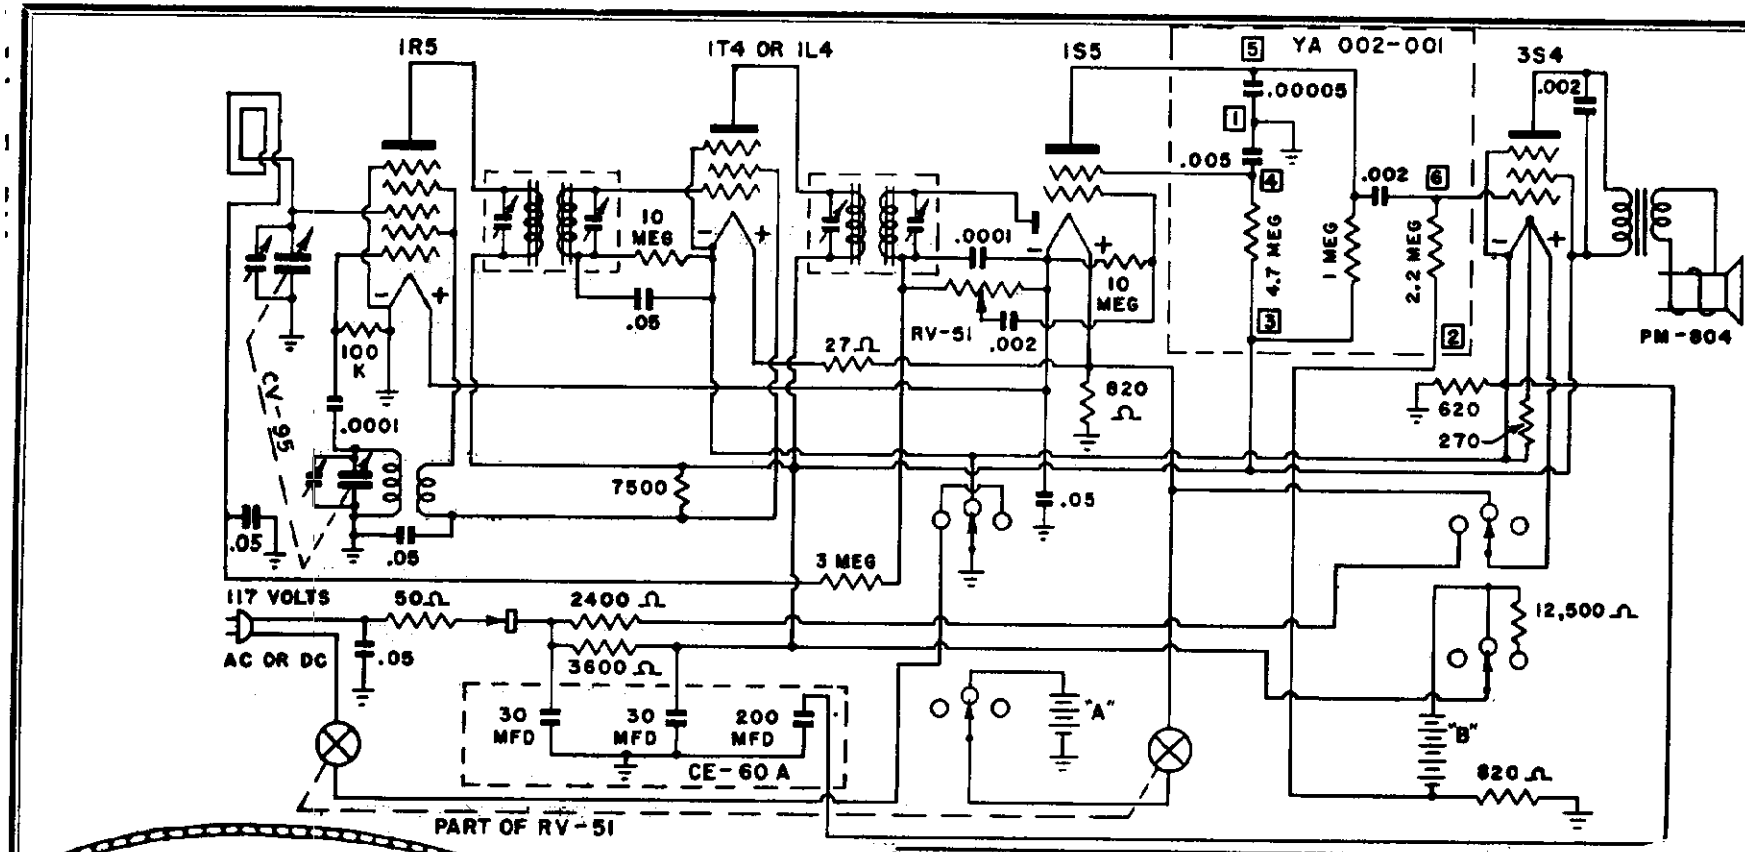
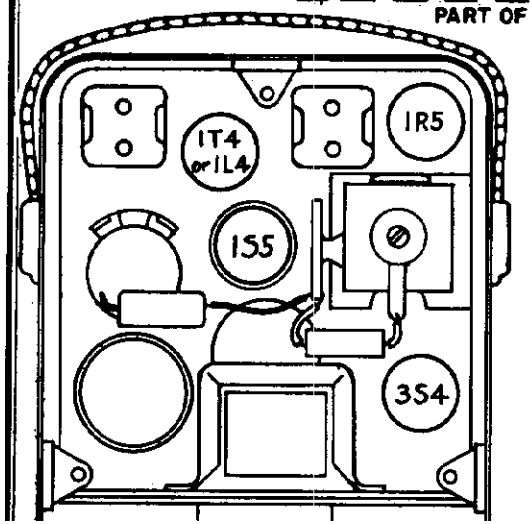
Conditions

1. SWITCH S3 in radio position, volume control at normal listening level, broadcast signal being received.
2. All DC voltage measurements except those marked with an asterisk are at 20,000 ohms per volt. Voltages marked with an asterisk obtained with a VTVM.
3. AVC voltage will vary with strength of received signal.
4. Voltage readings are from [illegible]





I. F. 455 KC
RANGE 540-1600 KC

Batteries Required

1 67½ Volt "B" Battery. Use one of the following types, or equivalent:
Eveready No. 467
Burgess No. XX45
Ray-O-Vac No. 4367
Winchester No. 1710

2 Flashlight Cells. Size D. Use two of the following types, or equivalent:
Eveready No. 950
Burgess No. 2
Ray-O-Vac No. 2LP

AUTOMATIC RADIO MFG. CO., INC. MODEL TOM THUMB BUDDY

MODEL TOM THUMB
BUDDY

AUTOMATIC RADIO MFG. CO., INC.

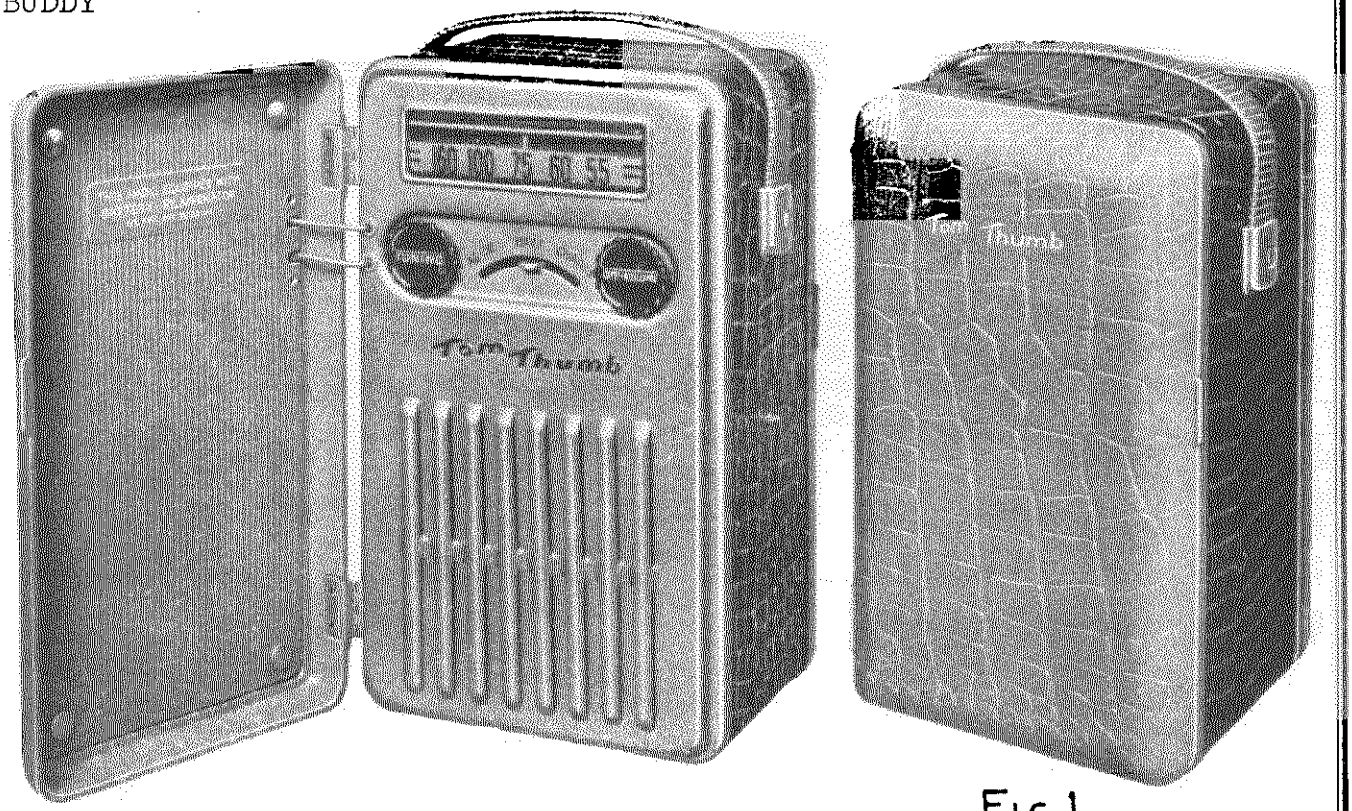


FIG. 1

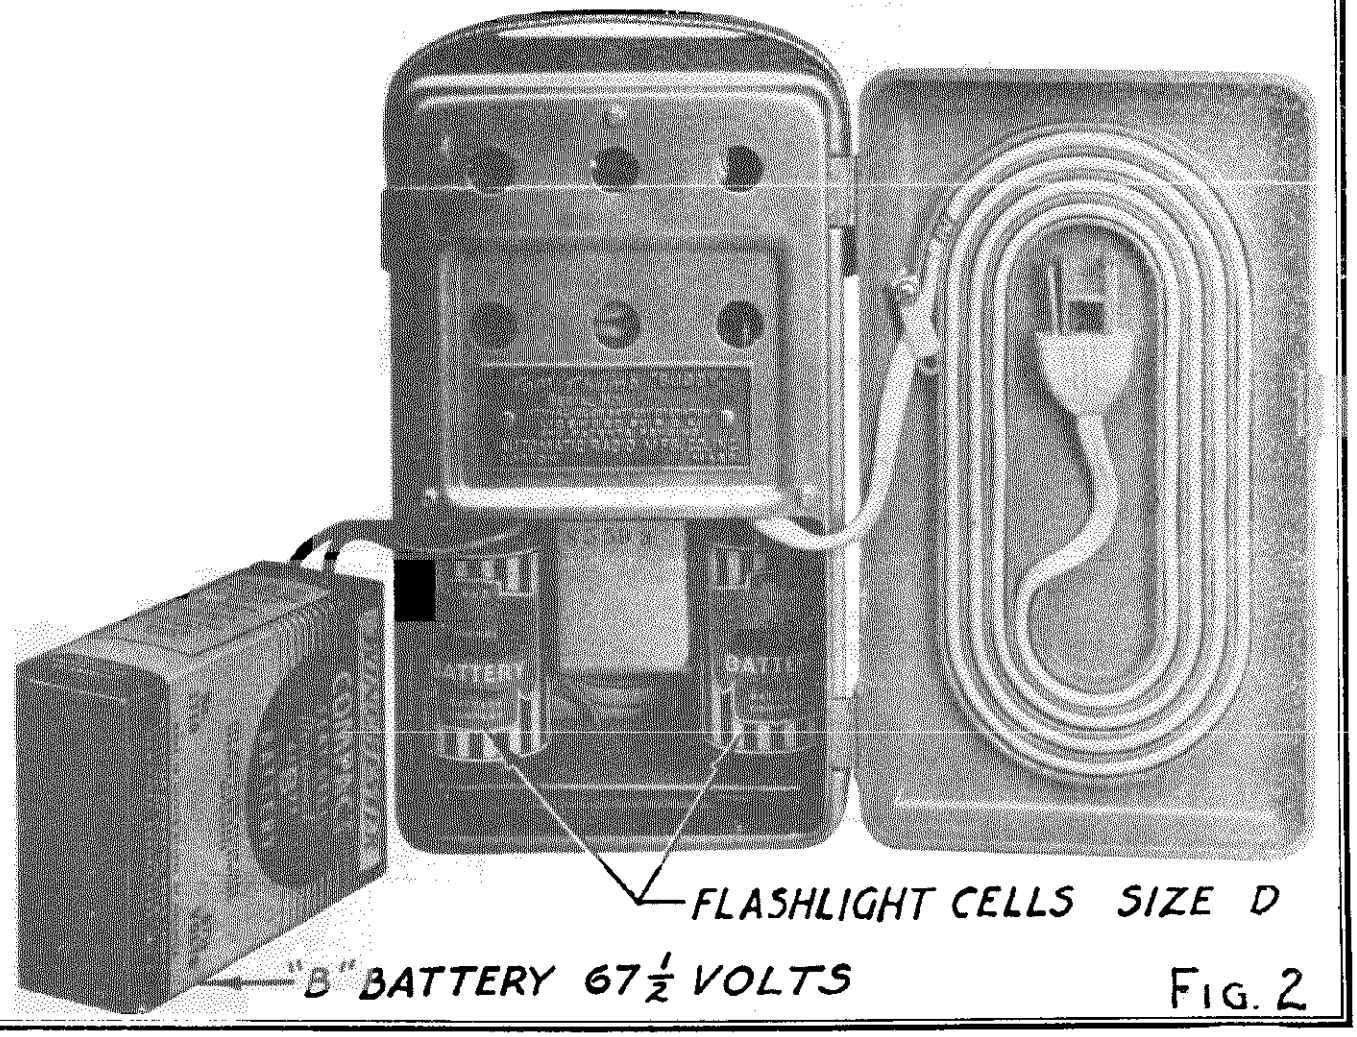

FIG. 2

BATTERY INSTALLATION INSTRUCTIONS

Flashlight Cell Installation

1.) Open Back door.
2.) Insert flashlight cells on each side of speaker frame as indicated in figure 2.

"B" Battery Installation

1.) Snap connector strip over "B" battery terminals.
2.) Insert bottom end of "B" battery to the extreme right under frame of back cover.
3.) Drop top of battery into position over flashlight cells.
4.) Slide battery slightly to the left to locate centrally under back door frame.

NOTE: "B" battery can be removed by lifting top of battery by the connector strip terminal leads a reversing the above procedure.
Batteries that have become badly swollen can be taken out by removing the back cover and dc assembly.

BATTERY CHARGING

The "Charge" feature contained in this model is only applied to the "B" battery. The inexpensi flashlight cells are not subjected to a charge.

Failure of the radio to operate on battery power will first be due to exhausted flashlight cells. T radio will operate again on battery power when these cells have been replaced.

The "B" battery under normal operating conditions without charge will last approximately three tim as long as the flashlight cells.

The normal operating life of the "B" battery can be extended from two to three times with charging outlined below.

The following procedure should be followed when a battery charge is required. (Refer to figure 1 switch detail.)

1. Plug power line cord into AC or DC 117 Volt power line.
2. Turn "Off-On" Volume knob to the right until a click is heard.
3. Slide 3-position Operation Selector Switch to "AC-DC" position. If radio operates, power outlet working satisfactorily.
4. Slide 3-position Operation Selector Switch to "Charge" position. The battery is now on charge

The best possible performance on battery operation can be realized if the battery is periodica charged for about as long a period as it has been in use, rather than wait until it has run down. F example, if the radio has been operated for four hours on battery, it should be on charge for at least fo hours afterwards. In this manner the quality and sensitivity of the radio will be at a maximum since tl fully charged "B" battery will insure "new battery" performance.

This charge can be repeated many times until finally the "B" battery is completely dissipated and w no longer respond to a charge.

DO NOT REPLACE "B" BATTERY UNTIL RADIO FAILS TO OPERATE ON BATTERY POWER WIT NEW FLASHLIGHT CELLS.

Power Line Cord

The Power line cord is contained in the spiral groove on the inside of the back cover. For "AC-DC" "Charge" operation, remove plug from post holder and unwind required length of cord necessary reach available outlet. Wind back in spiral groove when not in use. If entire length of cord has bee unwound, start rewinding from outside groove and work in towards the center. Put plug back into pc holder.

THE FOLLOWING PROCEDURE SHOULD BE FOLLOWED TO REMOVE CHASSIS FROM CABINET FOR REPAIRING

1.) Remove knobs.
2.) Remove tri-mount snap fasteners securing loop cover (contained in front door) and unsolder loc leads.
3.) Remove three screws holding back frame and cover assembly in position.
4.) Slip off back frame and cover assembly.
5.) Remove cabinet body.
6.) Remove the mounting screws that secure chassis to three mounting brackets.
7.) Slide chassis out carefully spreading mounting brackets slightly if necessary.

MODEL TOM THUMB CAMERA

AUTOMATIC RADIO MFG. CO., INC.

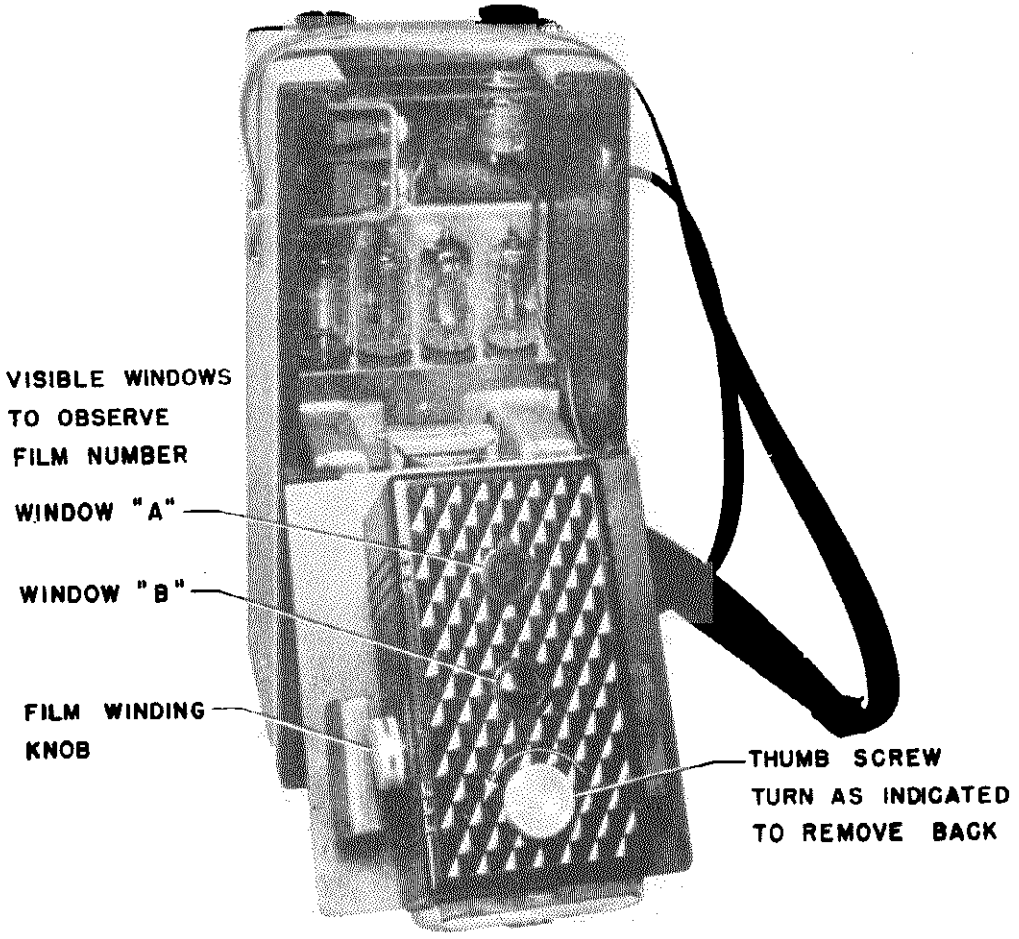

FIG. 3

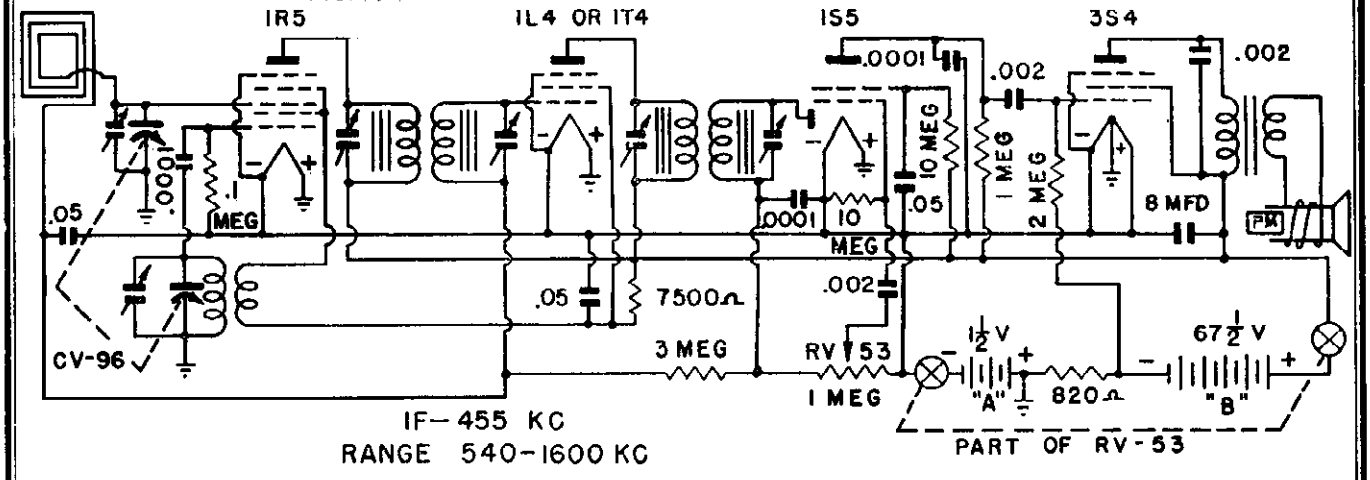

THE FOLLOWING PROCEDURE SHOULD BE FOLLOWED TO REMOVE CHASSIS FROM CABINET FOR REPAIRING.

1. Remove knobs.
2. Remove bottom screw on back located below tuning dial window.
3. Remove back by dropping down slightly and lifting out.
4. Remove license label.
5. Unsolder speaker and bottom battery terminal leads.
6. Swing camera down.
7. Remove screw located in center of terminal board.
8. Drop chassis carefully so that control shafts clear inside top of cabinet and swing out.

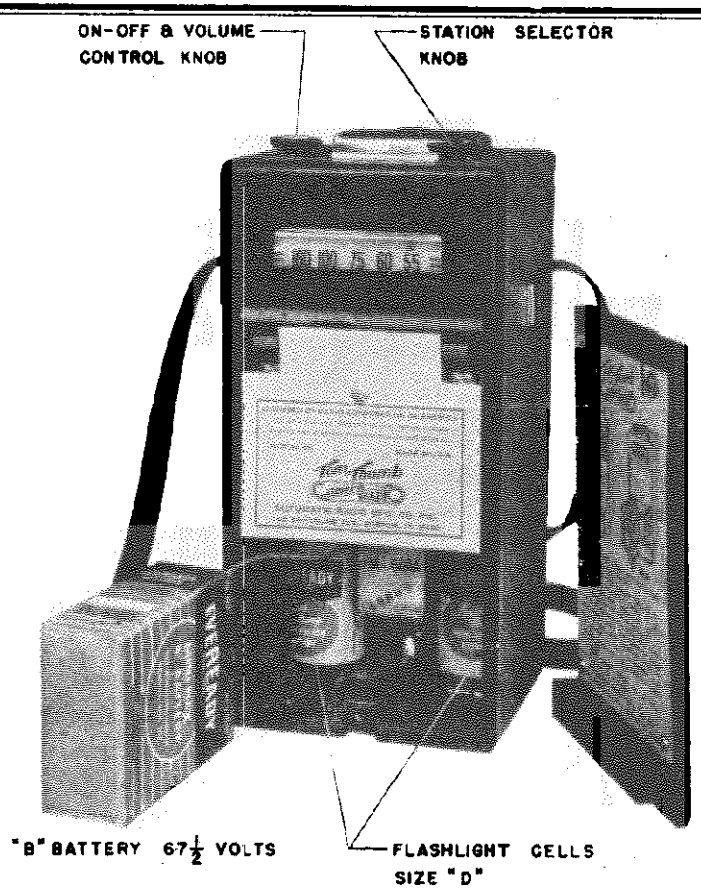

FIG. 2

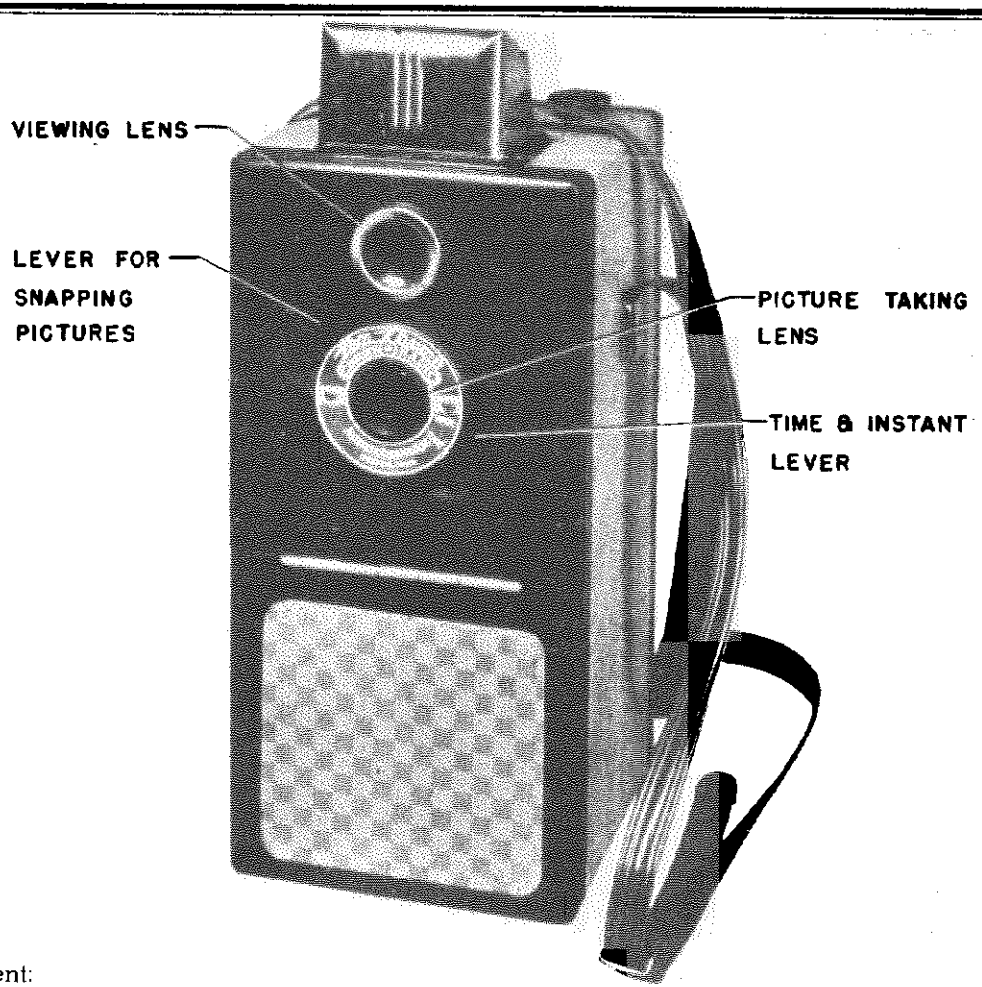

FIG. 1

Batteries Required

1 67½ Volt "B" Battery. Use one of the following types, or equivalent:
- Eveready No. 467
- Burgess No. XX45
- Ray-O-Vac No. 4367
- Winchester No. 1710

2 Flashlight Cells. Size D. Use two of the following types, or equivalent:
- Eveready No. 950
- Burgess No. 2
- Ray-O-Vac No. 2LP
- Winchester No. 1511

BATTERY INSTALLATION (See Figure 2)

1. Remove bottom screw on back located below tuning dial window.
2. Remove back by dropping down slightly and lifting out.
3. Insert flashlight cells on each side of speaker frame as indicated in Figure 2.
4. Snap connector strip over "B" Battery terminals.
5. Place "B" battery over flashlight cells (See Fig. 2).
6. Replace Back.

MODEL TOM THUMB CAMERA — AUTOMATIC RADIO MFG. CO., INC.

FILM REQUIRED FOR CAMERA:

AGFA A8 OR EASTMAN 127 OR EQUIVALENT.

TO LOAD AND UNLOAD CAMERA (See Figure 3)

Facing tuning dial, place thumb on camera top cover with other fingers on radio side and push camera away from knobs. An unlocking click will be heard as the camera hinges down and exposes all the necessary adjustments. Turn thumb screw to the left to remove back cover.

Always load and unload camera in shaded place, never in bright sunlight! Insert slotted end of spool into the winding knob at the top of camera. Then place film in empty receptacle at extreme opposite end. Fit ends of spool into the grooves (under film retainer spring). Push the roll down into the grooves which hold the roll. Then break seal on film and pull end towards empty spool. Thread end of film through widest side of slot in empty spool. Turn winding knob two or three times until paper rolls on empty spool. Replace back of camera. Be sure thumb screw is turned as far as it will go to be sure cover is on as tightly as possible.

TO WIND FILM

Suspend Camera-Radio in front of operator by means of adjustable shoulder strap so that camera lens faces subject to be photographed. Unlock camera by pushing camera top away from knobs as mentioned previously. The camera will hinge down and expose necessary controls.

Turn winding knob slowly and watch film pass red window "A". When the figure "1" appears in the center of Window "A", you are ready to take the first picture. Swing camera back into position again pressing the camera firmly towards the knobs until a slight click is heard. This indicates that the camera is properly locked in place. After taking this picture swing camera down again exposing control and wind knob slowly until figure "1" appears in red window "B". Then take second picture. After this picture is taken, turn knob until figure "2" appears in window "A". After snapping the picture, turn knob until figure "2" appears in window "B" In this manner 2 pictures are taken for each number appearing on the film roll — one in window "A", one in window "B". When number "8" appears in the center of window "B", you have taken 16 pictures. When you have taken all of the pictures, keep turning knob in same direction until the complete roll of film including the red paper is all wound on the top spool.

TO REMOVE FILM

Open back of camera as when loading Then press down on spring holding film roll and lift out spool of film. Now, seal roll with piece of gummed paper attached to end of roll so that it will not unroll.

HOW TO TAKE PICTURES

Open cover at top by placing thumb and forefinger on bottom of cover and lift upward. Look down into ground glass enclosed under cover. Point lens of camera at object you want to photograph. Object you see reflected there will appear on your finished picture. By moving camera closer or further from object, you can gauge the proportions and size desired in finished print. When ready to photograph, hold camera steady; then press lever firmly and picture has been taken. **NOTE:** Always have sun behind you with object being photographed facing sun!

SHUTTER

The shutter has been carefully adjusted to give you maximum excellent reults for all standard shots! It has also been regulated to enable you to take clear, clean photographs of landscapes, groups, portraits, and "action shots." To adjust shutter for instant or time exposure, merely move indicator at left of camera to either INST. or TIME.

FOR INSTANTANEOUS PICTURES

Move indicator to INST. Grasp Camera-Radio firmly. Sight object to be photographed in ground glass view finder. **HOLD CAMERA-RADIO STEADY.** Then press shutter lever down firmly, and the picture is taken.

TIME EXPOSURE

Move indicator to "TIME". Place Camera-Radio on a solid support (a table or bench) so that Camera-Radio will not move. (Never hold Camera-Radio in hands for time shot.) **Then press shutter lever and hold down until you have counted the required number of seconds** for exposure desired. (Five seconds usually being ample, depending upon lighting conditions.) Then picture is completed . . . If you wish to return to INST. daylight shots, push lever back to INST.

IMPORTANT: To obtain best results, subject to be photographed should be at least 8 feet away from camera.

"LARGER" CONTACT PRINTS

Most photo finishers throughout the country are equipped with contact enlargement printers that produce approximately 3¼"x4" prints from the negatives you get with this camera.

Retail prices for these enlarged prints vary in different sections of the United States. However, in most cases they cost only slightly more than ordinary quality prints. See your dealer for further information.

INSTRUCTIONS

- Be sure lenses are clean. Use soft, clean cloth.
- Keep interior of camera free from dust.
- Be sure cover is tightly closed before taking picture.
- Be sure film is wound as tightly as possible before opening camera to remove film.

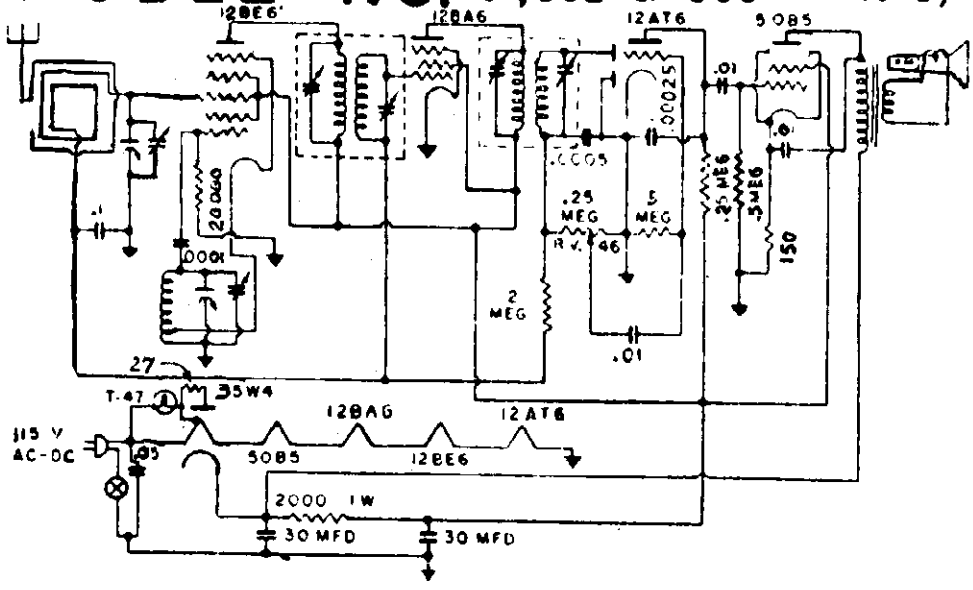
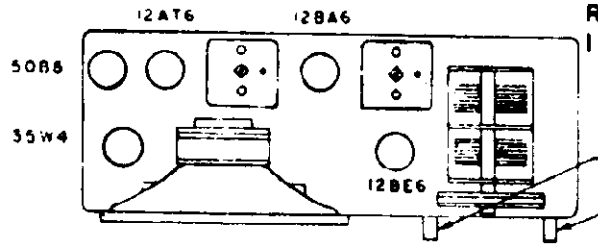
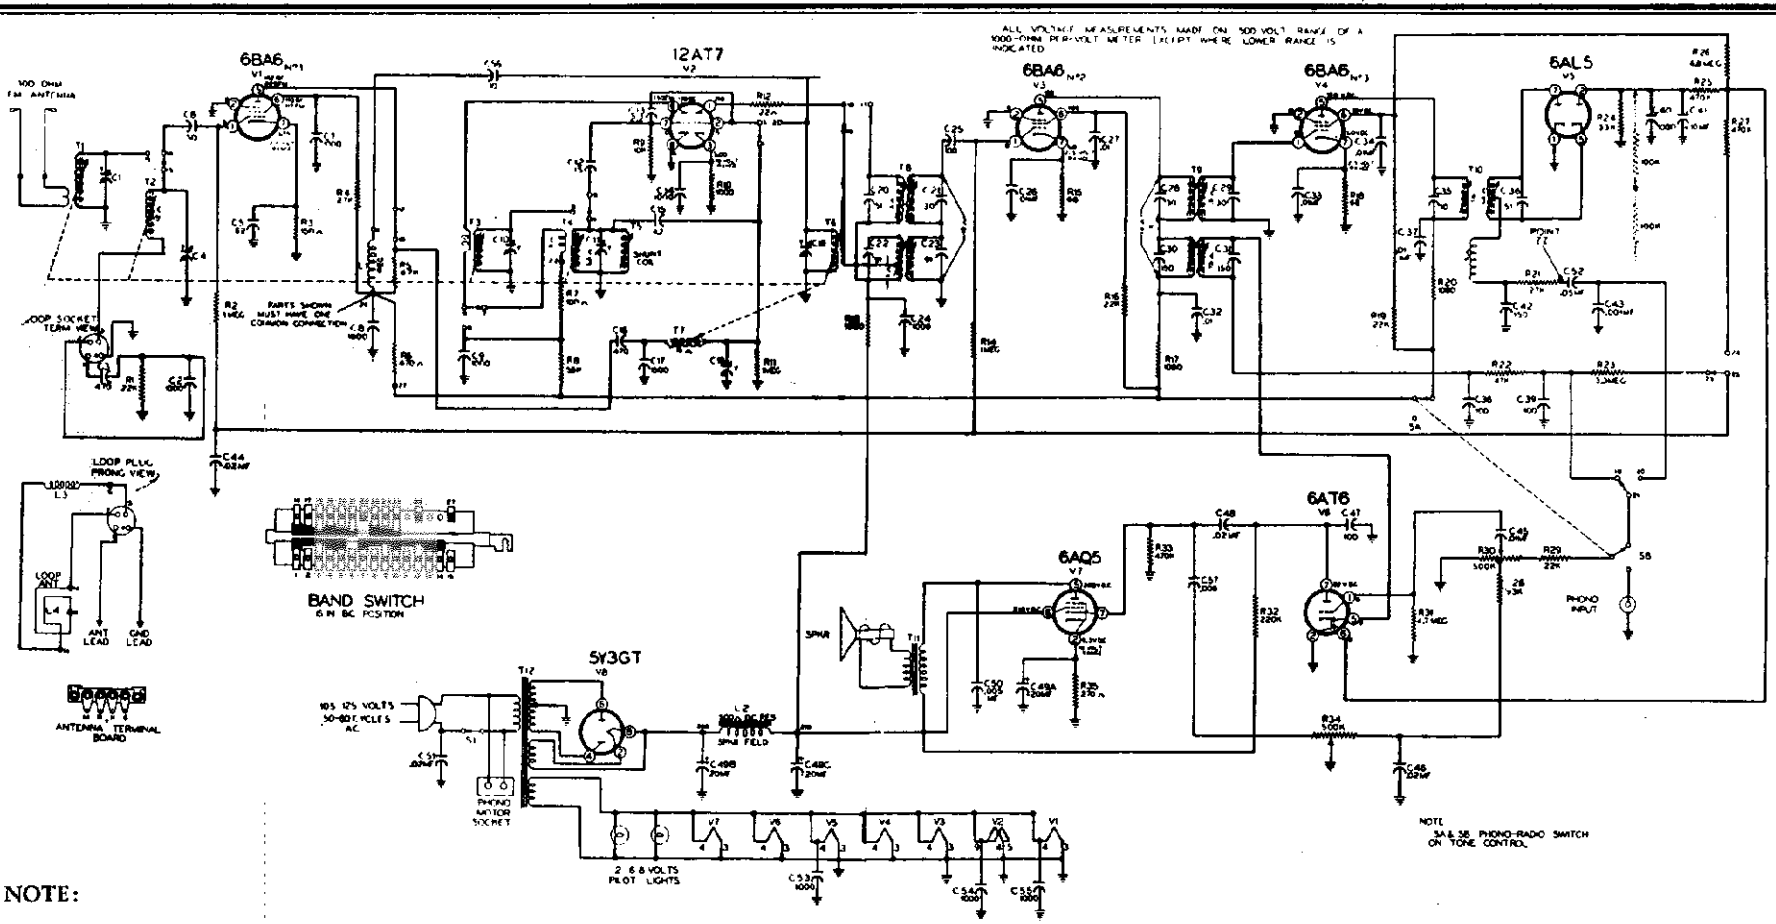
MODEL NO. 801, 802 & 803 (SERIES B)





RANGE 540-1650 KC
IF FREQ 455 KC



NOTE:

The two 100K ohm resistors in series from Pin No. 2 to ground are connected as shown only when aligning the FM - I.F. Refer to FM - I.F. alignment procedure.

On some sets R12, 22 ohms, C-9B1-42 is replaced with C-9B1-45, a 39 ohm resistor.

On some sets C24, 40, 53 Part No. C-8G-13016 (uninsulated type) is replaced with an insulated type, same value, Part No. C-8G-13201.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.

Frequency Ranges...Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.

Intermediate Freq...AM - 455 kc.; FM - 10.7 mc.

Selectivity.....AM - 42 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM - 200 kc. broad at 2 times down. I.F. FM - 400 kc. broad at 10 times down.

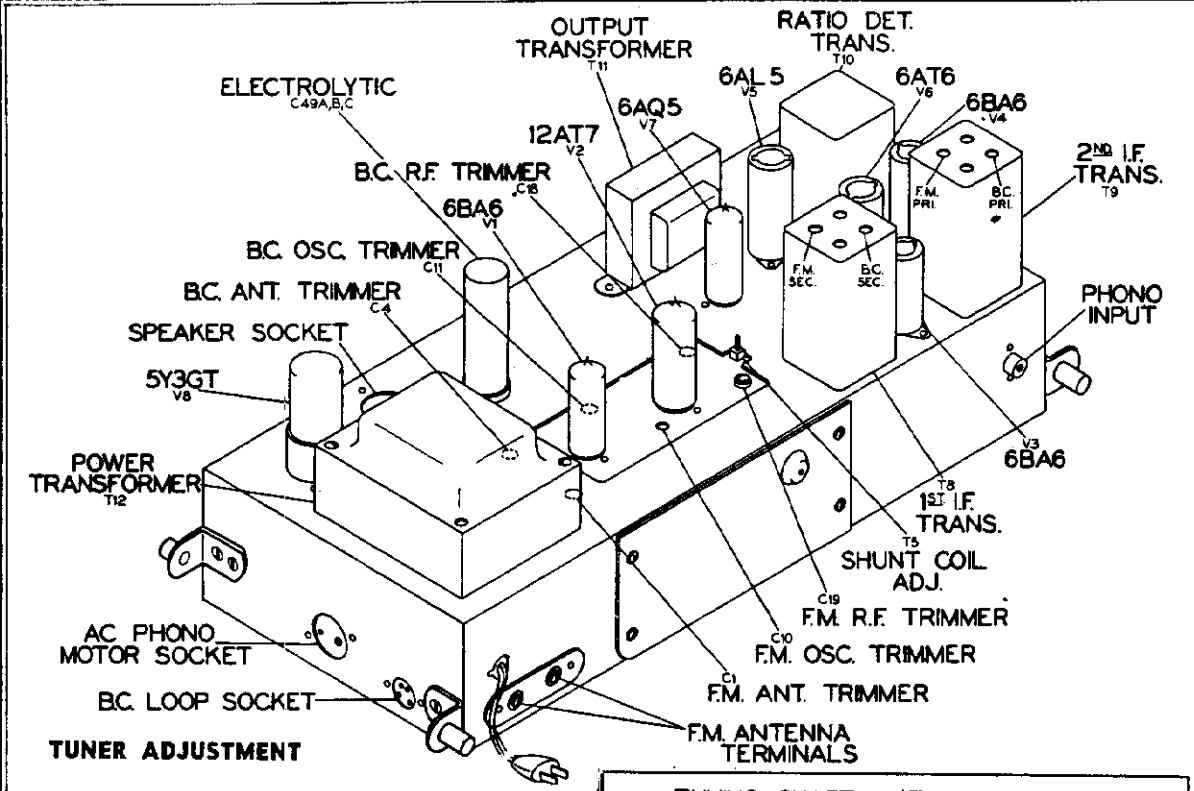
Power Output.....2 watts, 10% distortion. 4 watts maximum.

Loud Speaker.....10" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

AM Sensitivity.....(For .5 watt output with external antenna)—5 microvolts average.

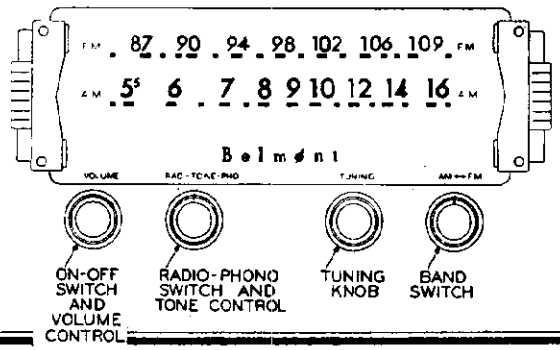
Tube and Lamp Complement

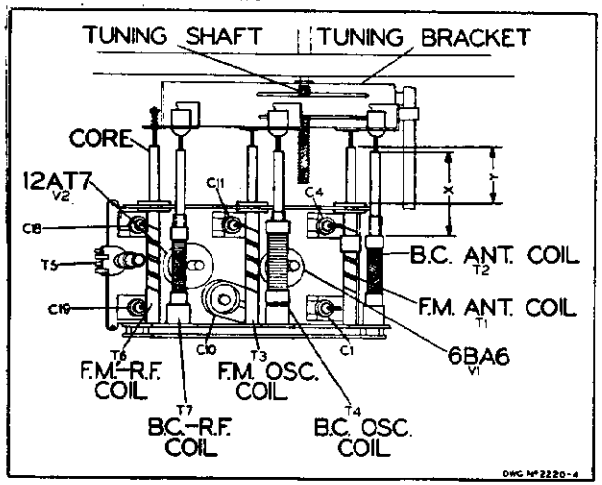
6BA6, FM—AM R.F. stage.
12AT7, FM—AM oscillator and mixer.
6BA6, FM—AM 1st I.F.
6BA6, FM—2nd I.F.
6AL5, FM ratio detector.
6AT6, AM detector. A.F. AMP. and A.V.C.
6AQ5, Audio output.
5Y3, rectifier.
T-44 dial lamp (2 used)



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.





FM Aerial — The noise-reducing capabilities of FM are noticeably greater when strong FM signals are obtained. Therefore, we recommend, wherever possible, the use of an outside "folded dipole" aerial with a 300-ohm line lead-in. The aerial must be installed according to the directions furnished with it. The radio is shipped from the factory with the built-in FM aerial connected to the two screws labeled "F.M. Antenna Terminals", (See Chassis View). To connect the lead-in from the outside FM aerial, remove the two wires from the built-in FM antenna and connect the twin lead-in wire to the two screws. Either wire of the twin lead-in can be connected to either screw. A ground connection is not required for the FM reception, but may occasionally be helpful. The ground wire should be connected to the black lead at the rear of the chassis.

It should be remembered in conjunction with the erection of an FM folded dipole aerial that the signal strength from an FM transmitting station is less and less at greater distances from the transmitter and that FM reception is hardly ever possible beyond "line of sight" distances between transmitting and receiving aerials. This maximum limit is usually about 45 miles but consistently satisfactory reception is frequently limited to 30 miles or less depending on the height of transmitting and receiving aerials and the intervening terrain.

Broadcast Aerial — In locations remote from broadcasting stations or where receiving conditions are poor, an outside antenna, 50 to 75 feet long including lead-in, will give best results.

Connect the antenna lead-in wire to the *tan* wire extending out of the rear of the radio chassis.

If an external antenna is used, an external ground should also be used. The ground wire (*black*) should be connected with a clamp to a well-cleaned water pipe or to a metal rod driven several feet into the earth.

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT — No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE — The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T10	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T10	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T9 10.7 m.c. windings See top and bottom views.	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T8 See top and bottom views.	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A." Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube volt-meter between the mid-point of the resistors and point zz.

NOTE "B." If T10 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check center of pointer so that it coincides with the marker to the extreme right on the calibration strip when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST
100 Mc. Use about 25 microvolts	FM Antenna Terminals See note	300 ohms	C10 Osc. C19 R. F. C1 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

MODEL B-8AF21 BELMONT RADIO CORP.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

AM-I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 2400 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T9 AM windings. See top and bottom views.	Maximum output. Should be ½ watt.
455 Kc. Use 70 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T8 AM windings. See top and bottom views.	Maximum output. Should be ½ watt.
400 cycles. Use 60 millivolts	Hot end of volume control and ground	None	Maximum output. Should be ½ watt.

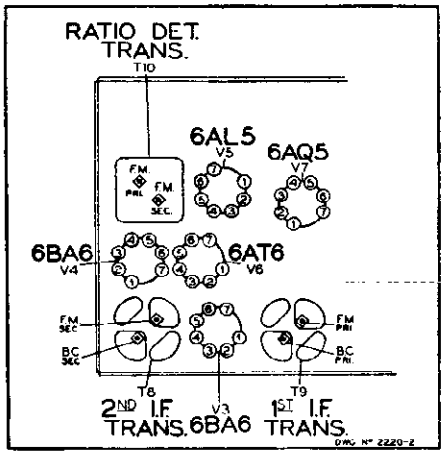
BROADCAST BAND-R. F. ALIGNMENT

Check center of pointer so that it coincides with the marker to the extreme right on the calibration strip when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C11 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T5 for maximum ½ watt
1620 Kc. Use 5 microvolts	AM Antenna and Ground	200 mmf.	C4 and C18 for max. ½ watt. See note

NOTE: Re-check first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism.



TO ALIGN POINTER—Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Re-adjust bracket to eliminate backlash.

NOTE: The two 100K ohm resistors in series from PIN No. 2 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: On some sets R46—22 ohm resistor is replaced with a 39 ohm resistor, Part No. C-9B1-45.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.

Frequency Range...Broadcast Band—535 to 1620 kc.
FM—Band 88 to 108 mc.

Intermediate Freq. AM-455 kc; FM-10.7 mc.

Selectivity.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc.
I.F. FM-180 kc. broad at 2 times down.
I.F. FM-320 kc. broad at 10 times down.

AM Sensitivity.....(For .5 watt output with external antenna)—3 microvolts average.

FM Sensitivity.....(For .5 watt output)—10 microvolts average.

Power Output.....8 watts, 10% distortion. 10 watts maximum.

Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

Tube and Lamp Complement.....6BA6, FM—AM R.F. stage.
12AT7, FM—AM oscillator and mixer.
6BA6, FM—AM—1st I.F.
6BA6, FM—2nd I.F.
6AL5, FM—ratio detector.
6AT6, AM detector.
A. F. AMP. and A.V.C.
6SN7, Push-Pull. Driver and phase-inverter.
5U4G, rectifier.
6V6, output.
6V6, output.
T-44 dial lamp (2 used).

Automatic changer..
Russell C-10 with P-93 Cartridge.

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE— The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mjd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Resonance should be about 3 volts
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4 10.7 m.c. windings See top and bottom views	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3 See top and bottom views	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a resonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out.

For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of suppling the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

AM-I.F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 *Kc. Dummy Antenna* .1 *Mfd.*

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings See top and bottom views	Maximum output Should be ½ watt
455Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

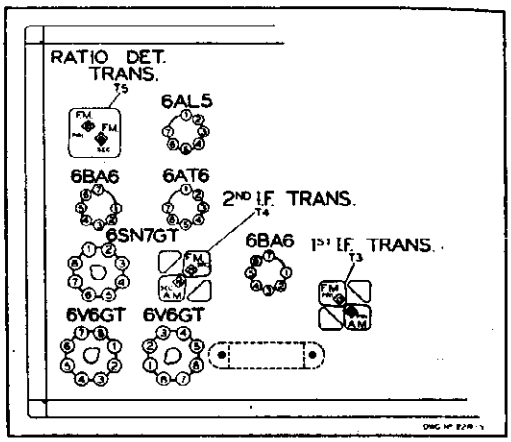
BROADCAST BAND-R.F. ALIGNMENT

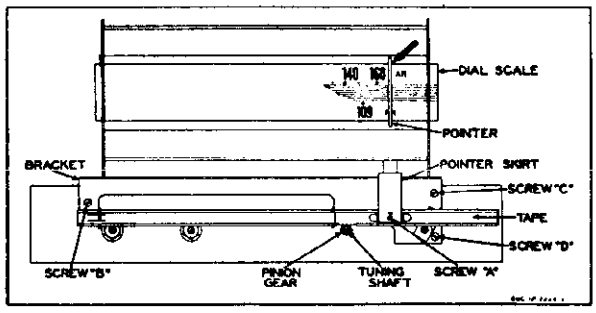
Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C59 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T12 for maximum ½ watt
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C57 and C61 for max. ½ watt. See note

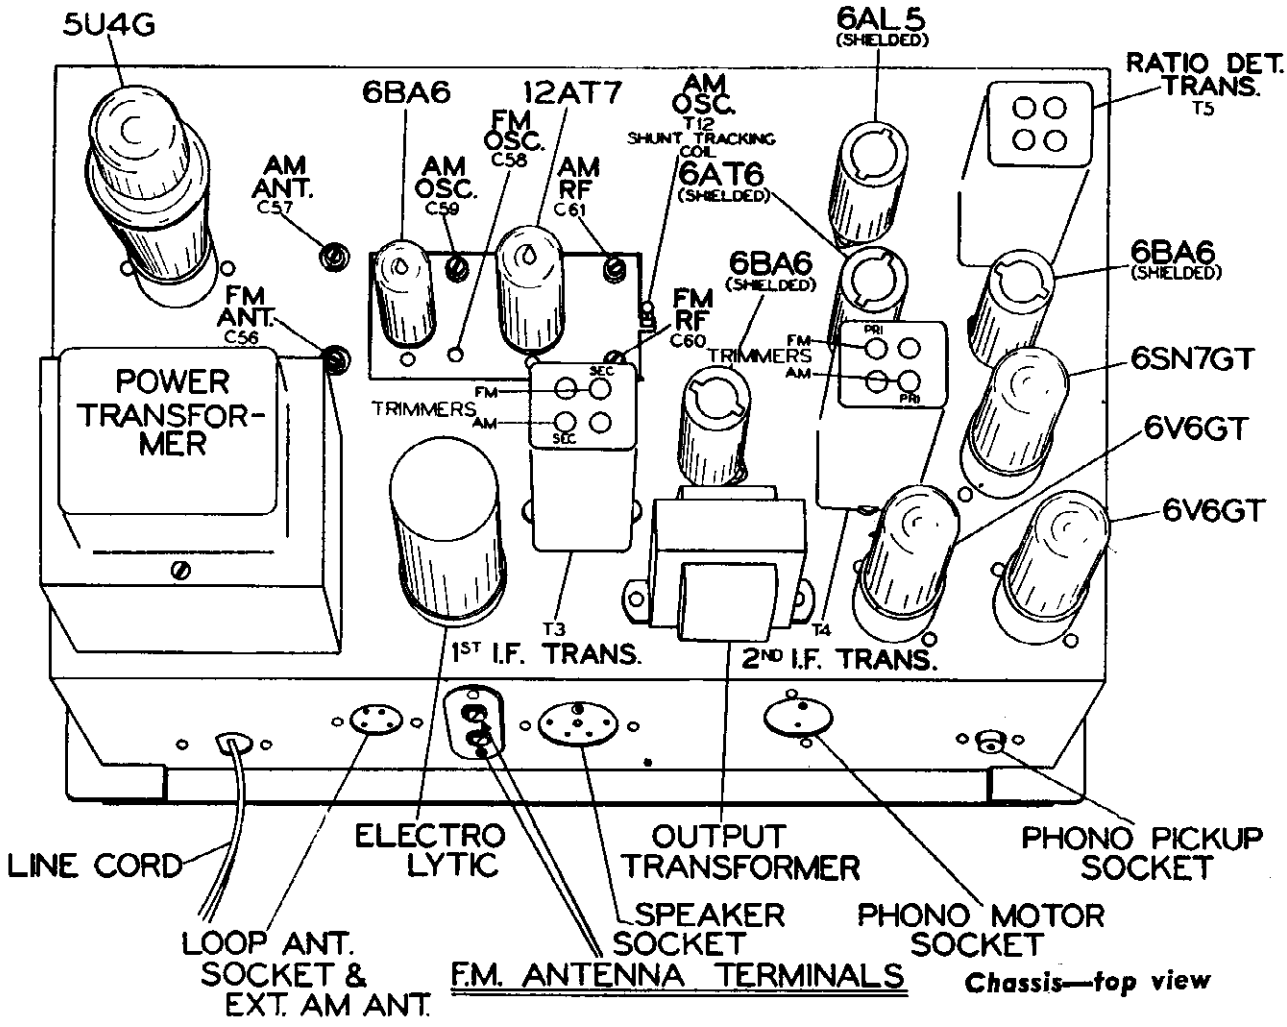
NOTE: Re-check first two adjustments after this adjustment because of inter-locking effects.

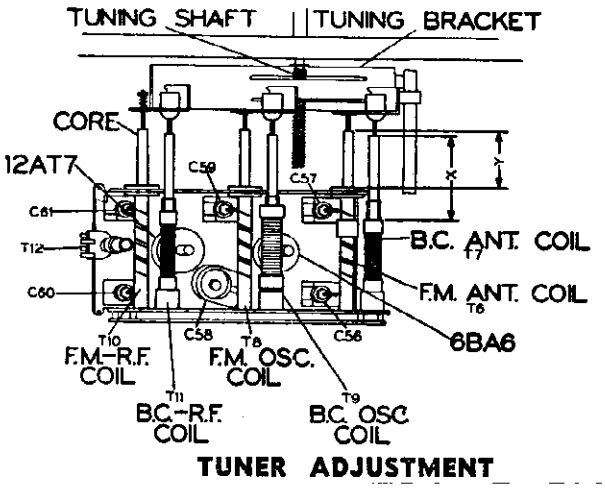
Procedure for disassembly and assembly of dial mechanism



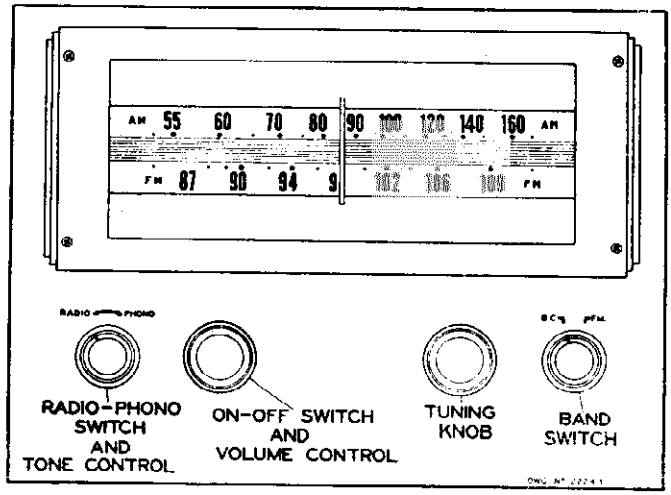


Loosen screws "C" and "D" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.





TUNER ADJUSTMENT



With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.

Power Supply	6 volts D.C.
Frequency Range	530 to 1600 kc.
Intermediate Freq.	455 kc.
Tuning	Two permeability-tuned circuits.
Antenna System	Adjustable to accommodate various car antennae capacities.
Speaker	5-inch; electro dynamic voice coil impedance 3.2 ohms.
Power Output	1 watt undistorted; 1.6 watts maximum.
Sensitivity	20 microvolts average for 500-milliwatt output.
Selectivity	50 kc broad at 1000 times signal at 1000 kc.

MODEL 5C12 BELMONT RADIO CORP.

ALIGNMENT PROCEDURE

(Refer to Chassis View)

- Output meter across 3.2-ohm output load.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Volume control at maximum for all adjustments.
- Connect ground post of signal generator to radio chassis.

BAND	SIGNAL GENERATOR				ADJUSTMENT

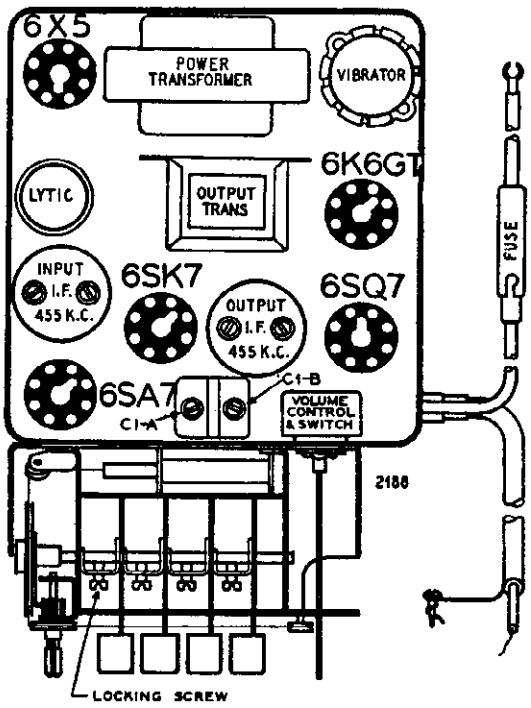
I.F.	455 kc	.1 mfd.	Pin #8 Grid 6SA7 Tube	Chassis	Adjust Trimmers of T2 input I.F.
Broadcast Band	1600 kc	30 mmfd.	Antenna Lead	Chassis	Adjust Trimmers C1-B Oscillator and C1-A Antenna.
Broadcast Band	1400 kc	30 mmfd.	Antenna Lead	Chassis	*Slide Antenna Coil lengthwise for max. output by means of a screw driver.
Broadcast Band	1600 kc	30 mmfd.	Antenna Lead	Chassis	**Adjust Antenna Trimmer C1-A to maximum output.

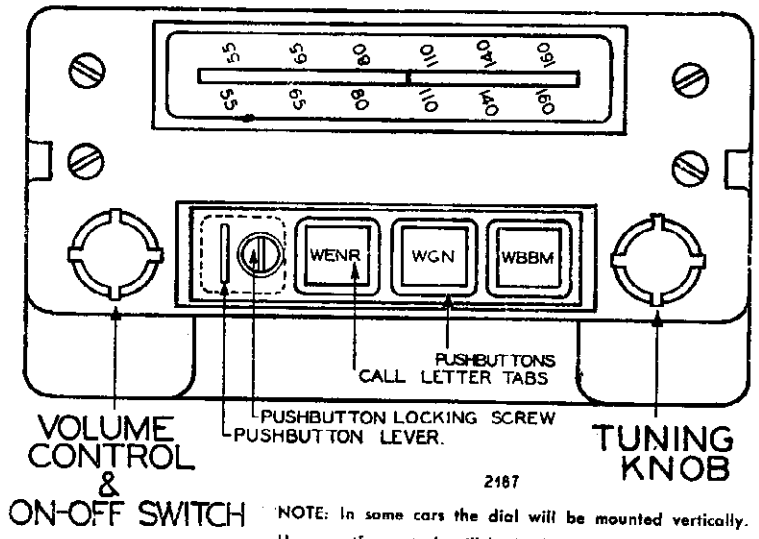
*This adjustment will seldom be necessary in service work as the Antenna Coil is adjusted and sealed in place at the factory. The necessity of this adjustment can be checked quickly by tuning set to a 1400 kc. signal and adjusting C1-A. If a large increase in output is noted the Antenna Coil should be adjusted.

**If Antenna Coil is adjusted, C1-A should be readjusted at 1600 kc.. These two adjustments (Antenna Trimmer C1-A and Antenna Coil) should be repeated until no further improvement is noted.

NOTE: At 1600 kc., the Oscillator Core should extend 31/32 inch from the edge of the Coil Form.



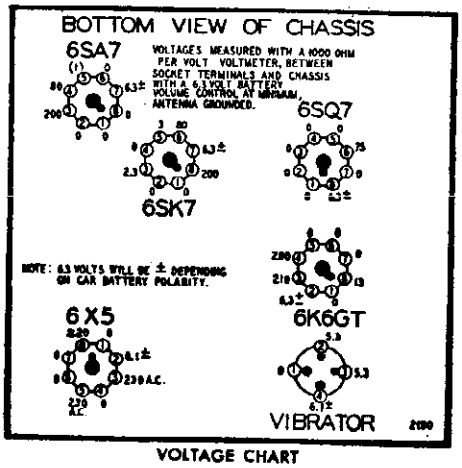
CHASSIS VIEW—Showing tube location, trimmers, and the pushbutton locking-screws.



NOTE: In some cars the dial will be mounted vertically. However the controls will be in the same relative position.

SETTING THE PUSHBUTTONS

Press the first pushbutton lever in firmly and the locking screw will show up in the hole. Unscrew the locking screw several turns to the left with a screw driver. Hold the pushbutton lever pressed in firmly and tune in the desired station. With the pushbutton lever still pressed in, tighten the pushbutton locking screw. Continue to set up the other three pushbuttons in the same manner. Replace the pushbuttons on the levers and insert the call letters. Stations may be changed whenever desired by pulling one or all of the pushbuttons off and re-setting to any desired station as outlined above.



VOLTAGE CHART

MOUNTING LOCATIONS

The chart below shows the mounting positions for cars back to 1939. Most cars previous to 1939 will require under-dash mounting.

To use the chart, note the position letters for the required car, then refer to the small drawing for the location of the letter or letters. The word dash indicates that the radio will fit the dash, similar to a custom installation. The following pages show the method of dash installation on cars requiring no dash panel kits.

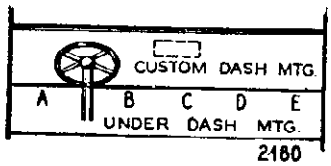
The 1941, 1942 and 1946 Ford; the 1941, 1942 and 1946 Pontiac; and the 1942 and 1946 Mercury will take a dash installation, but require panel kits for mounting and trim. Instructions for mounting the radio and panel kit are included with each panel kit, however, refer to this manual for connections and motor noise suppression.

Make of Car	1946	1942	1941	1940	1939
Buick	C	C	C	C - D	C
Cadillac			B - C		
Chevrolet	Dash - C	Dash - C	Dash - C	C - E	D - E
Chrysler	Dash	Dash	Dash	Dash	C
De Soto	Dash	Dash	Dash	Dash—B - D	C
Dodge	Dash A	Dash - A	Dash - B	Dash—B - D - E	C
Ford	*Dash	*Dash	*Dash - C	B - D	B
Hudson	D - E	C - D - E	C - D - E	C - E	B - C - D
Lincoln	B - C - D	B - C - D	None		
Mercury	*Dash	*Dash	*Dash	A - B - D	B
Nash	C	C	C	A - C	E
Oldsmobile	C - D - E	A - C - E	A - D - E -	***C - with Add. Brkt.	C
Packard	C - D	C - D	C - D	D - E	D - E
Plymouth	Dash	Dash	Dash	Dash—B - D	C
Pontiac	*Dash - D - E	*Dash - D - E	*Dash—D - E	C - D - E	C - D - E
Studebaker	C	C	C	C	C
Americar		**Dash - B - D - E	**Dash		

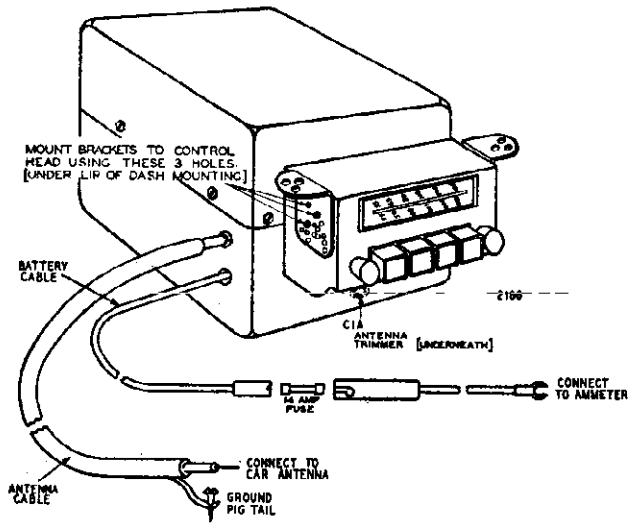
*Use special dash mounting plate.

**Cut dial opening as per dimensions shown on Willy's Americar drawing on page 4.

***Oldsmobile 1940. The radio can be mounted under the dash below the plastic portion, however, it must be supported by a metal strap. Another rear mounting strap, Part No. 115713 will be suitable. Bolt the radio to the metal strap and bolt the strap to the metal dash panel lip.



Universal Under Dash Mounting

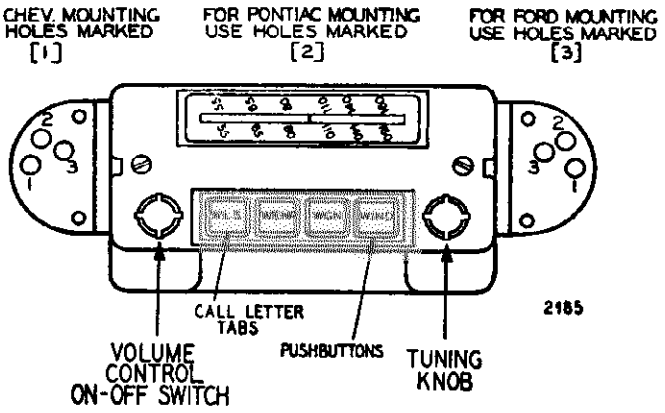


This view shows the battery cable, antenna and ground cable and the two mounting brackets at the side of the tuning dial which are used to mount the radio to the underlip of the dash. These brackets are packed with the kit of hardware and should be fastened to the chassis using the holes shown in solid black. They are then bolted to the underlip of the dash and the rear mounting strap used as shown in the Chevrolet installation. Under Dash Mounting must be used on cars not shown as Dash Mounting in the chart above.

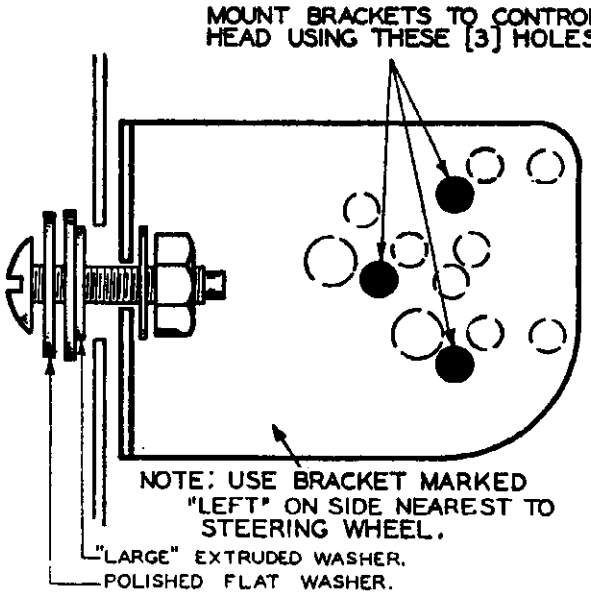
MODEL 5C12 BELMONT RADIO CORP.

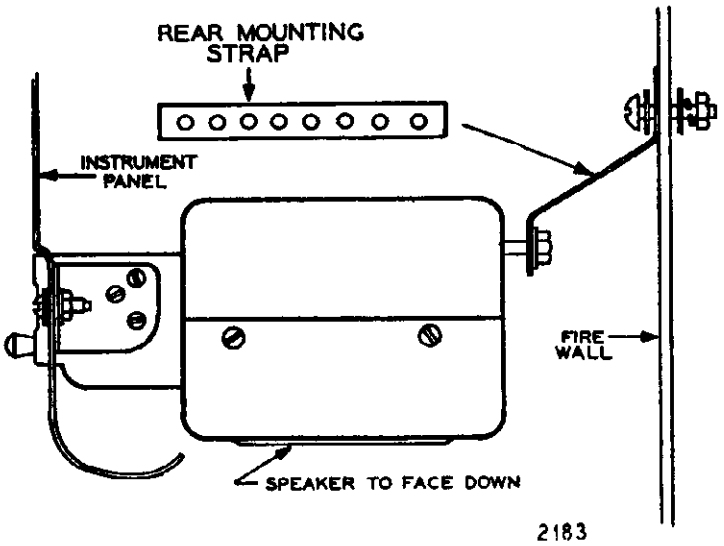
1941, 1942 and 1946 Chevrolet

This view shows how the chassis is mounted to the dash. The rear mounting strap (in the kit of hardware) should be bent as shown and used to support the chassis at the back. The two front mounting brackets should be fastened to the chassis using the solid black holes as shown. Lay the bracket on the left hand drawing and the black circles will show through the holes to be used. The two holes marked No. 1 in the front brackets, as shown in the Dial View Drawing, should be used to bolt the chassis to the dash.



DIAL VIEW WHEN MOUNTED

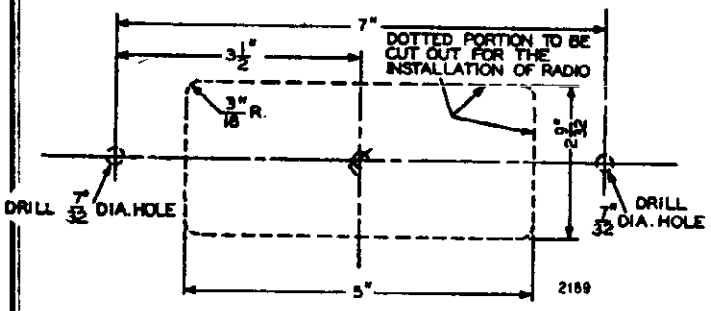




NOTE: Mount Chassis as shown with the speaker face down. Be sure to use rear mounting strap.

1941 and 1942 Americar Models (Willys)

Remove the panel from the left side of the dash and cut an opening, using the dimensions below. Mount the chassis the same as in the Chevrolet installation.



FINAL CONNECTIONS

The antenna cable should be connected and the shield grounded to the car body.

Connect the battery cable to the hot side of the ammeter behind the instrument panel and then insert the fuse in the cable receptor.

ANTENNA TRIMMER

(See Chassis View)

The input circuit has been especially designed to be used with a low capacity antenna of the fish pole or whip type.

Truetone antennas are especially designed to be used with this radio.

Tune in a station on the high frequency end of the dial and adjust the antenna trimmer for maximum volume. A weak station which does not fade is best for this adjustment.

IMPORTANT (ALL INSTALLATIONS)

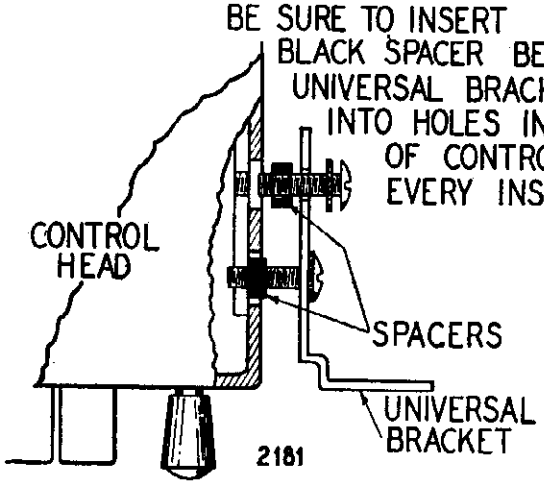
Two universal mounting brackets are supplied with the kit of hardware and are mounted in various positions on the chassis for installation in or under the dash of different cars.

In all installations it is very important that the black metal spacers be used between the front mounting brackets and the side of the chassis. The spacers must fit into the holes in the side of the chassis. They are packed in the kit of hardware.

Be sure to draw the rear mounting strap up tight so that it holds the chassis rigid.

In some installations it may be necessary to adjust the antenna trimmer before bolting the chassis to the dash.

Two pairs of extruded washers are supplied for use when bolting the chassis to the dash. Be sure the washers seat properly in the dash mounting holes and use the pair which fits the holes snugly.

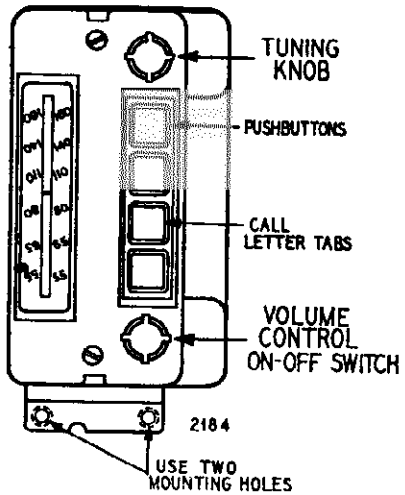


Dash Panel Mounting

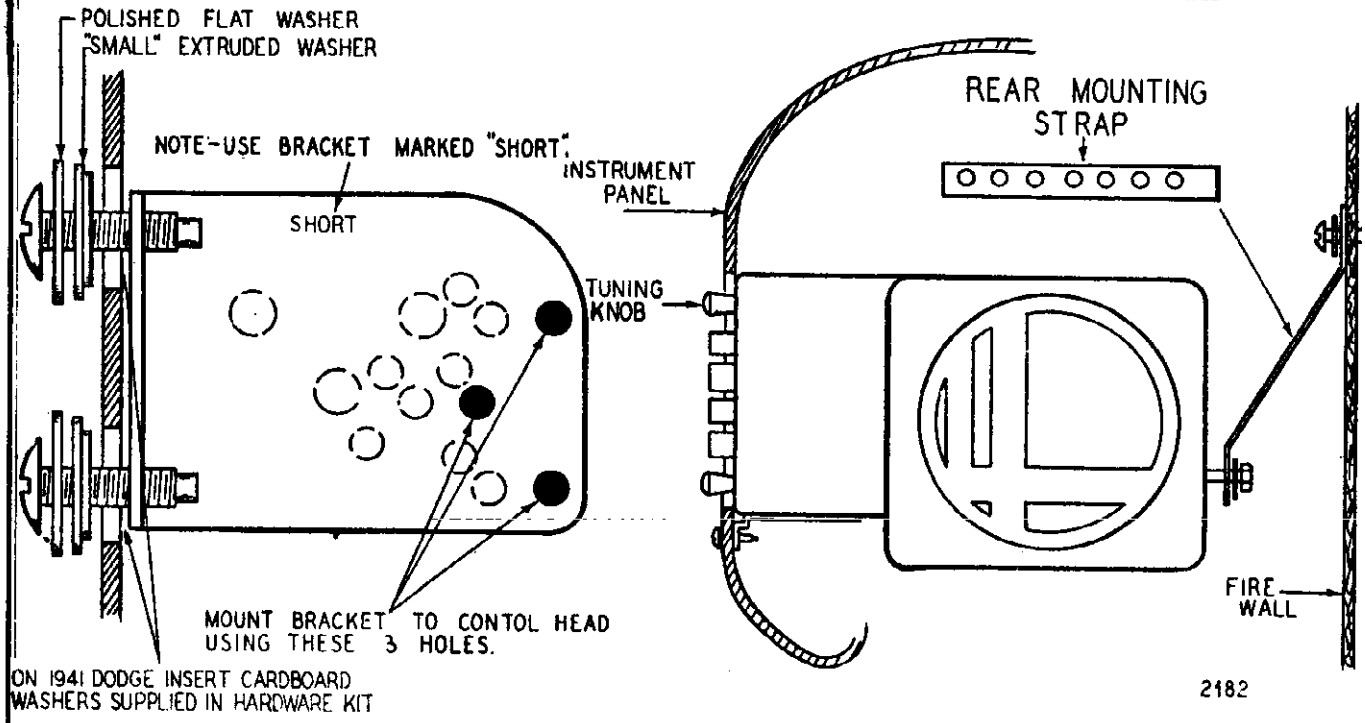
1940, 1941, 1942 and 1946 Models of Chrysler, De Soto, Dodge, Plymouth

Mount the chassis as shown with the dial vertical. A special bracket marked "short" is supplied with the kit of hardware. Mount this bracket to the chassis, using the solid black holes shown in the left hand drawing. Note that the chassis should be mounted with the tuning knob at the top. It may be necessary in some installations to reverse the bolt in the cowl lever to prevent it from hitting the speaker grill. On Plymouth cars remove Pal nut behind dash at top of dial opening so the dial will come up flush.

The call letters must be carefully trimmed to fit the push-buttons horizontally. Be sure to use the black spacers pictured above when mounting the front (short) bracket.



DIAL VIEW WHEN MOUNTED



NOTE: Lay the bracket on drawing above to identify holes. Bracket when mounted will of course be at bottom of tuner.

NOTE: Mount Chassis as shown — Be sure to use Rear Mounting Strap.

ELIMINATING MOTOR NOISE

GENERATOR CONDENSER

A Generator Condenser must be connected in all cases from the battery terminal of the generator to the Generator frame.

This condenser must not be connected across the field winding terminal on late cars which use Automatic Cutouts.

It is advisable that you find out from your local car dealers where the manufacturer recommends the condenser be connected for each make of car.

DISTRIBUTOR SUPPRESSOR

A Distributor Suppressor is required in practically all cases, except Ford V8's where none is used. The high tension lead must be removed from the distributor head and the suppressor inserted in its place. The high tension lead is then plugged into the suppressor.

AMMETER CONDENSER

A .5 Mfd. by pass condenser should be connected from one ammeter terminal to a good ground on the instrument panel. Usually this condenser plus the generator condenser and distributor suppressor will remove all objectionable ignition noise.

ELECTRICAL ACCESSORIES

If the above procedure has not reduced the noise sufficiently, it will be necessary to continue by passing sources of noise.

Accessories such as lighters, electric motor heaters, horns, light switches, automatic relays, electrical gauges such as oil, water and gas are often a source of interference. In these cases the procedure is to try a condenser from ground to various accessories until the interference is eliminated, then install the condensers in those places permanently. Spark intensifiers should not be used.

HIGH AND LOW TENSION LEADS

In many cars the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

Part No.	Schematic Diagram Reference	Description	No. Used in Set

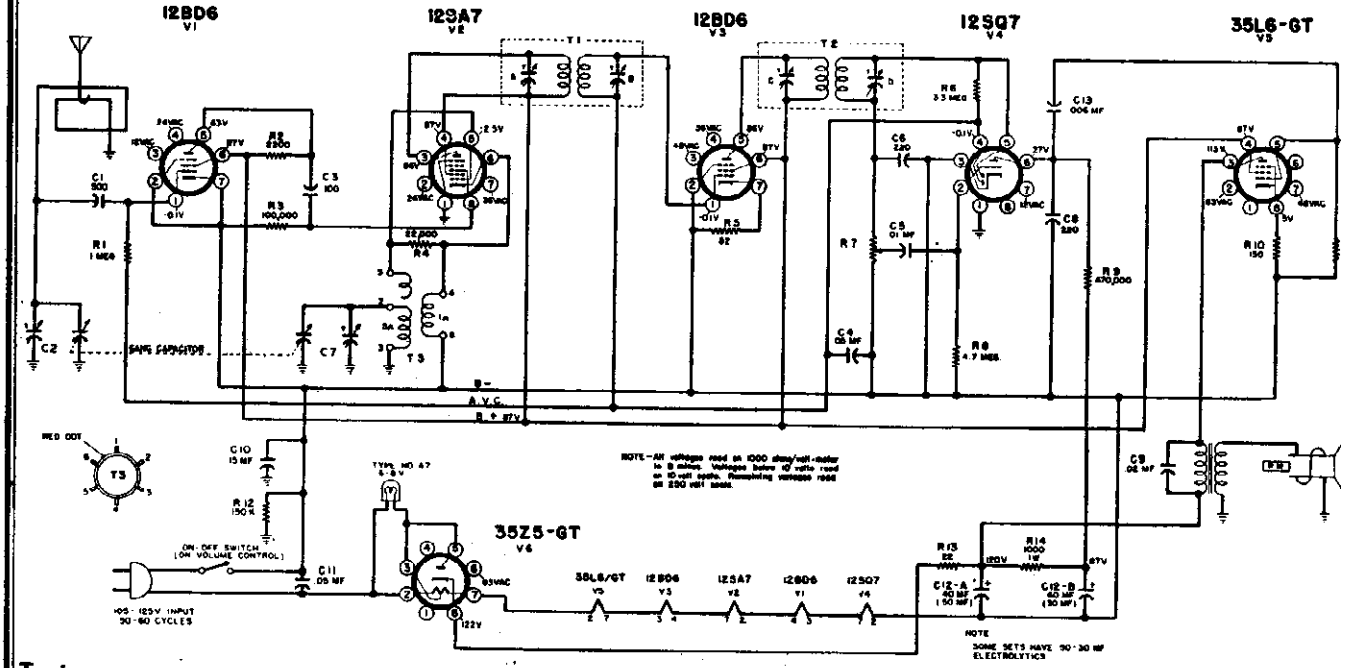
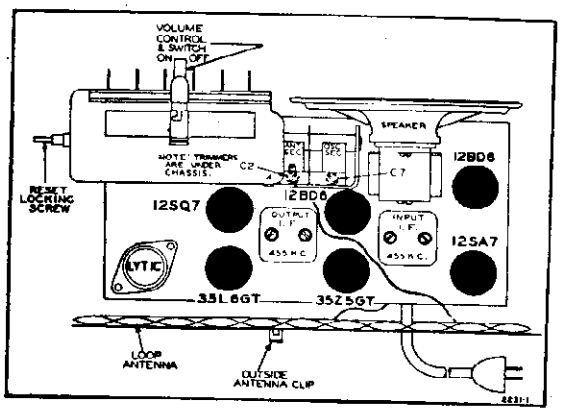
BELMONT RADIO CORP.



Tuning range	530 to 1650 Kc.
Intermediate frequency	455 Kc.
Power consumption	35 Watts
Sensitivity (for 0.05 watt output)	40 microvolts average
Selectivity	55 Kc. broad at 1000 x signal at 1000 Kc.
Power output (in voice coil)	
Undistorted	0.8 watt
Maximum	1.0 watt
Voice coil impedance	3.2 ohms

NOTE: On some sets slug tuned I. F.'s are used instead of trimmer tuned I. F.'s. 108-140Q and 108-145H are trimmer tuned. B-13A-12023-1 and B-13B-12022-1 are slug tuned. The slug tuned I. F.'s are tuned from the top and bottom (secondary on top, primary on bottom).

When trimmer tuned I. F.'s are used, R5 is 270 ohms.



Chassis View, showing tube locations

ALIGNMENT PROCEDURE

- No aligning adjustments should be attempted until all other possible causes of trouble have been checked.
- Chassis must be removed from cabinet for proper alignment. Slight adjustments of the oscillator and antenna circuits can be made, without removing the chassis, through two holes provided on the bottom of the cabinet. The two adjustment screws can be reached with a long insulated screwdriver.
- It is important that during alignment the loop antenna be maintained at the same distance from the chassis as when the chassis is installed in the cabinet.
- Turn volume control to maximum for all adjustments.
- Connect ground post of signal generator to B— of radio through a 0.1 mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Tuning Condenser Setting	Adjust for Maximum Output (see chassis view)
I.F.	455 Kc.	0.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	4 trimmers on input a output I.F. transforme
Broadcast	1650 Kc.	0.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	Oscillator trimmer C on bottom of radio
	1400 Kc.	None	See note A	Set dial at 1400 Kc.	Antenna trimmer C2 on bottom of radio

Note A: Lay output lead of generator in back of loop antenna. Turn up generator output. Loop antenna will pick up energy.

MODEL 6D130
SERIES A

BELMONT RADIO CORP.

IMPORTANT!

This receiver, unless otherwise marked, must be operated on an AC voltage of 105 to 125 volts, 50 to 60 cycles, or on a DC voltage of 105 to 125 volts. If you are in doubt as to the voltage of your power supply, consult your local power company. DO NOT INSERT THE PLUG IN THE POWER RECEPTACLE UNLESS YOU ARE SURE THAT THE CORRECT VOLTAGE IS AVAILABLE. Receivers of this same model which are for use on voltages other than those specified above are so marked.

SETTING THE PUSHBUTTONS

The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.
2. Push out the call letters of the six stations from the call-letter sheet supplied with this manual.
3. Insert one call-letter tab in the rectangular opening in each of the pushbuttons, in any sequence. Press an acetate tab (supplied in small envelope) into each of of the pushbuttons.
4. With the screwdriver supplied, check to see that the locking screw in the center of the tuning knob (see illustration) is loose. If it is not, turn it several turns to the left (counterclockwise).
5. Press the first pushbutton down *all the way*. With one hand hold the button down *firmly* and with the other carefully tune in the desired station. Release the pushbutton.
6. Follow this procedure for each of the five other buttons, adjusting each one for a different station.
7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.
8. The pushbuttons are now properly set for automatic tuning. Any of the six stations may now be tuned in simply by pressing the proper button down as far as it will go. If it is desired to reset any of the buttons for a new station, loosen the locking screw in the center of the tuning knob, set the pushbutton as described above, and re-tighten the locking screw.

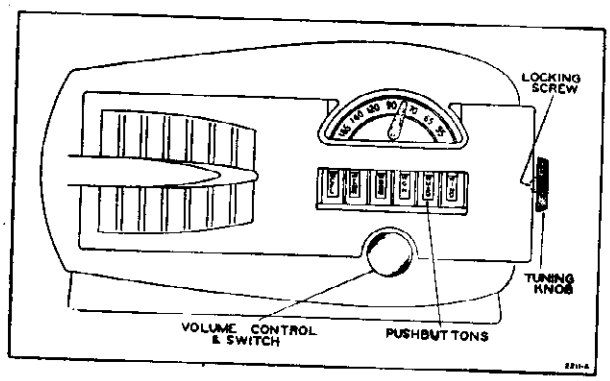
ANTENNA AND GROUND

The antenna (aerial) built into the rear of the cabinet is sufficient for receiving programs from strong local stations and from powerful nearby stations. This antenna may be somewhat directional, that is, reception is improved when the antenna is facing in certain directions. Therefore tune in a station and try the radio in several positions.

In locations remote from broadcasting stations or where receiving conditions are poor, an outside antenna, 50 to 75 feet long, will give best results. The antenna should be erected as high as possible, as far from surrounding objects as is practical, and at right angles to street car lines and power lines. Connect the antenna lead-in wire to the antenna clip at the rear of the radio

Periodic inspection of the antenna is recommended to make sure that all connections are clean and tight and that the antenna is well insulated from the ground at all points.

No ground wire is required with this radio.



1. Check the power at the receptacle by inserting the plug of a lamp cord and noticing whether the lamp lights. If the radio is being operated on direct current, try reversing the plug of the radio line cord.
2. If an outside antenna is being used, check all connections to be sure they are clean and tight. Make sure that the antenna is insulated from the ground at all points.
3. Take out the tubes and have them tested. The tubes may be removed as follows: First disconnect the line cord from the power receptacle. Then remove the four buttons which hold the back of the cabinet in place. Unclip the two leads connected to the loop antenna on the inside of the back. Remove each tube by holding it near its base, rocking it back and forth, and pulling upward. WHEN REPLACING TUBES, BE SURE THAT THE TYPE NUMBER OF EACH TUBE CORRESPONDS TO THE TYPE NUMBER STAMPED ON THE CHASSIS ALONGSIDE THE TUBE SOCKET.

If for any reason it is found necessary to remove the chassis, proceed as follows: Make sure the line cord is disconnected from the power receptacle. Remove the back as described above. Pull the volume knob off its shaft. Unscrew the locking screw in the center of the tuning knob and pull the tuning knob off its shaft. Remove the four chassis mounting screws from the bottom of the cabinet. Move the chassis toward the back of the cabinet so that the control shafts and tuner assembly clear the holes. The chassis can then be slipped out. After the chassis is replaced the automatic pushbuttons will probably have to be reset.

APPLYING POWER TO RADIO

Insert the line plug in the power receptacle. If no sound is heard after one minute, and the set is operating on direct current (DC), reverse the plug. If the set is operating on alternating current (AC), a low steady hum may be noticeable after the set warms up. Reverse the plug and notice whether or not there is any difference. Leave the plug in the position which gives less hum.

The power consumption of this radio is 35 watts, slightly less than that of a 40-watt electric light bulb.

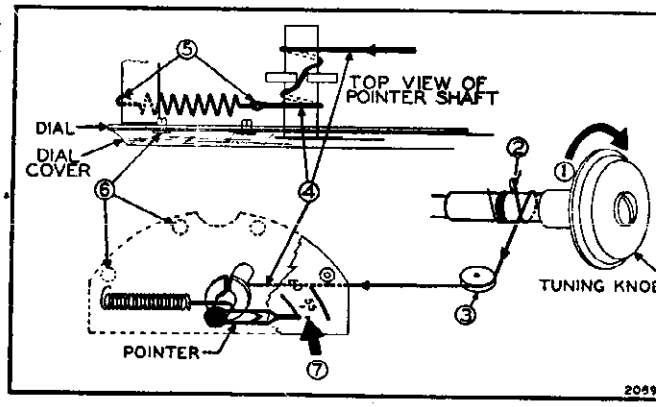
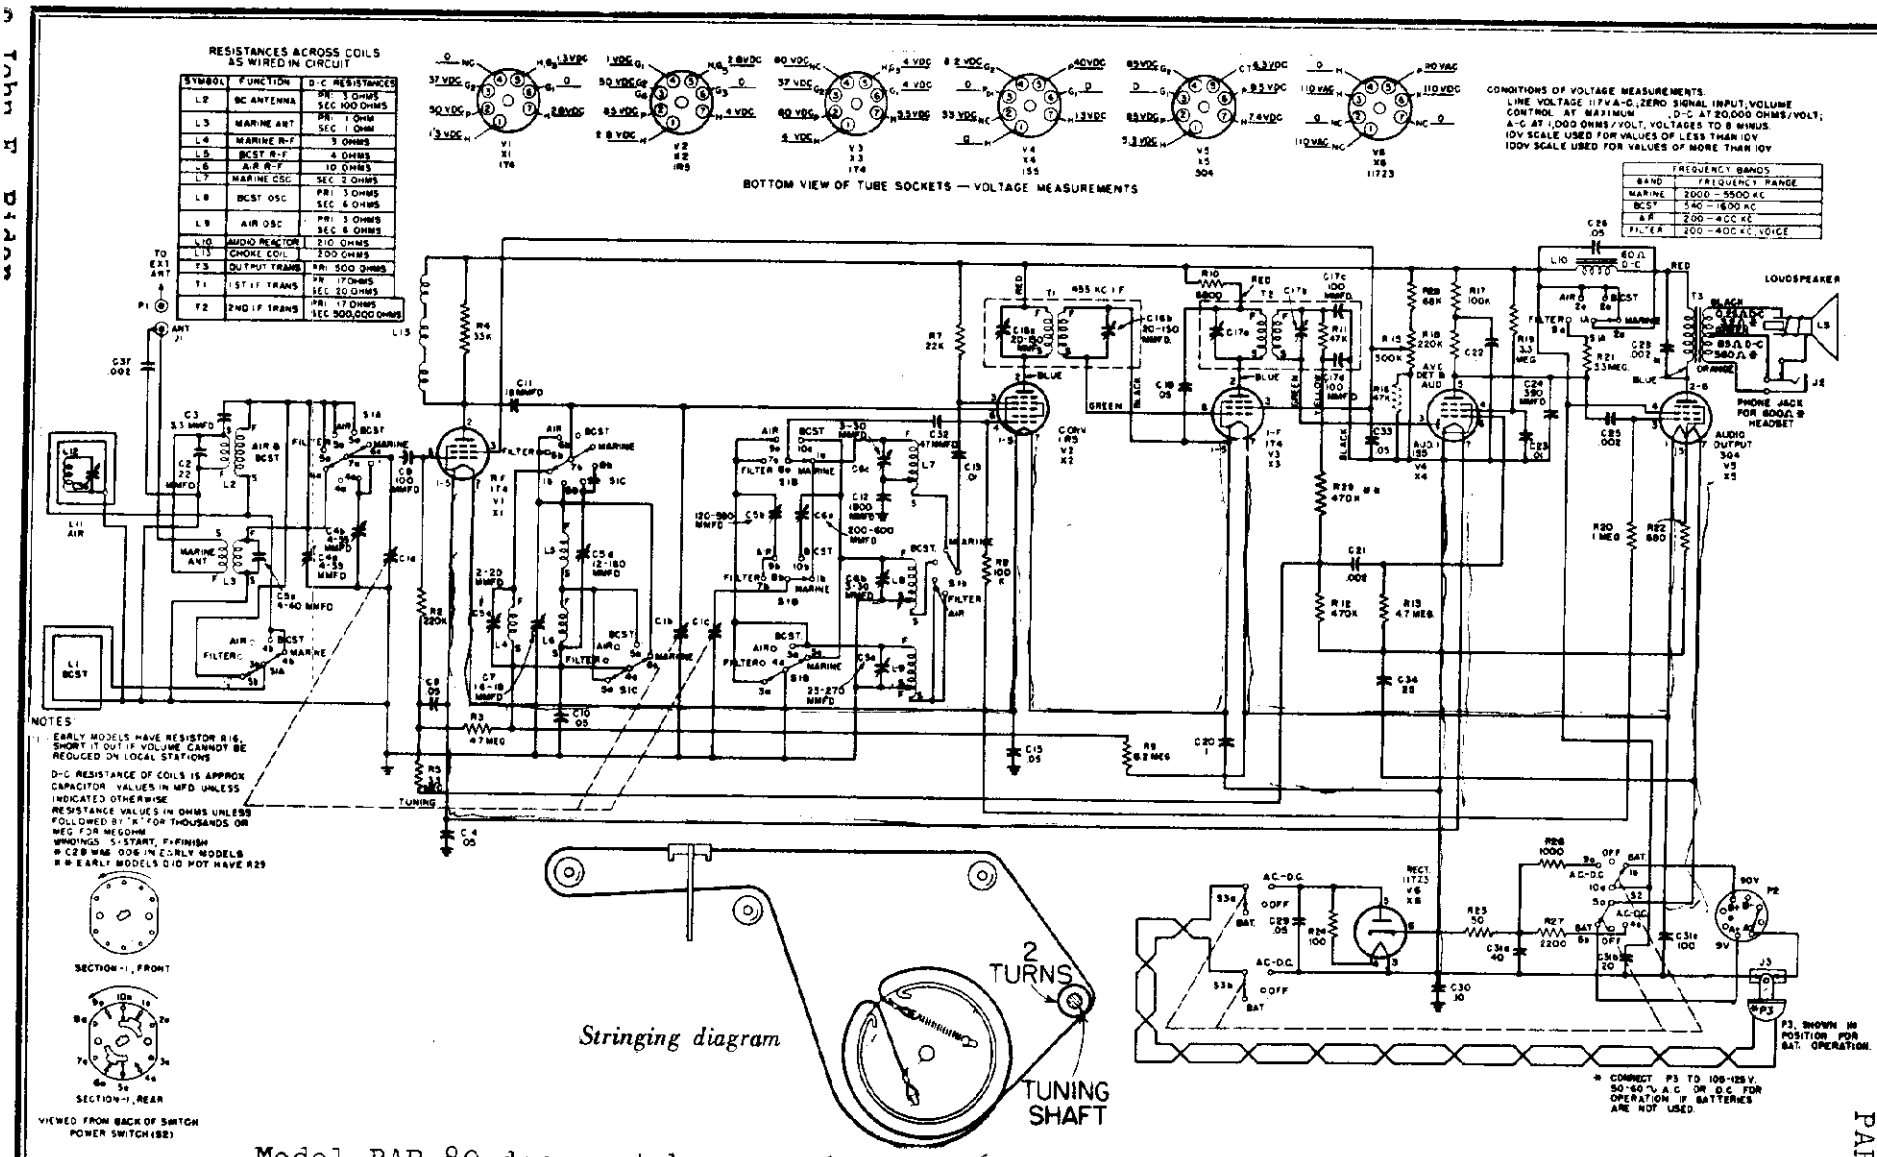
REPLACING DIAL POINTER DRIVE CORD

Six inches of cord are required in the set. Use a piece slightly longer so that knots may be tied at each end. Numbers below correspond to circled numbers in diagram.

1. Rotate tuning knob to extreme clockwise position. This closes tuning condenser. Knob should remain in this position until installation is completed.
2. Tie cord to loop in spring as shown. Wind cord one turn around shaft in direction shown.
3. Pass cord over idler pulley.
4. Pass cord *over* pointer shaft; wind it one turn around shaft; pass it through key washer; wind it one more turn around shaft.
5. Hook spring over end of dial support. Tie cord to spring. IMPORTANT: Before tying knot stretch spring enough so that full contraction of spring will rotate pointer shaft at least one-half turn.
6. Remove dial crystal by removing Cinch buttons.
7. Make sure tuning knob is in extreme clockwise position. Then rotate pointer clockwise, against friction of shaft, until it is in horizontal position, as shown.



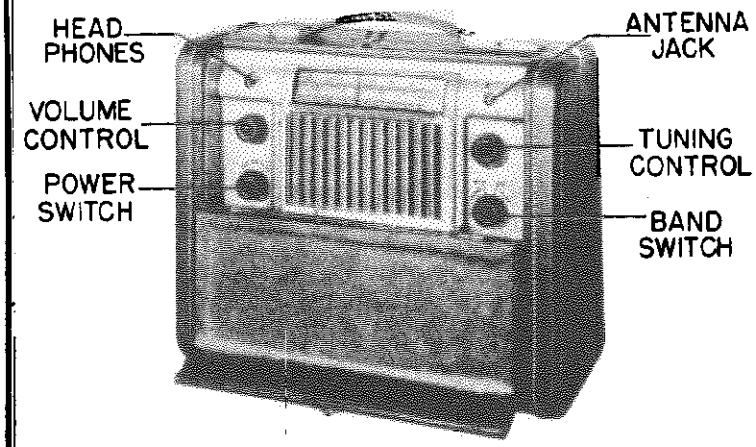


Model PAR-80 does not have resistor R16.

SELECTIVITY—**Bandwidth at 10 X down; 15 kc for 1000 kc, 22 kc for 300 kc, 19 kc for 3500 kc.**

STANDARD AUDIO OUTPUT—Approximately 150 milliwatts. Speaker integral with receiver.

TUBE COMPLEMENT—1T4 R-F, 1R5 Converter, 1T4 I-F, 1S5 Detector, AVC and First Audio, 3Q4 Audio Output, 1173 Rectifier.



Model PAR 80

SPECIFICATIONS

Power Requirements
(a) 105 - 125 DC or 60 cycle AC
(b) Bendix Battery Pack AB225
Power Consumption
19 Watts
Tuning Frequency Range
Air Band 200 - 400 KC
Broadcast Band 540 - 1600 KC
Marine Band 2000 - 5500 KC
Immediate Frequency
455 KC
Power Output
Maximum .320 Watts
Tube Complement
2-1T4, 1-1R5, 1-1S5, 1-3Q4
Total 5, Plus 117Z3 Rectifier
Loudspeaker
5" diameter PM

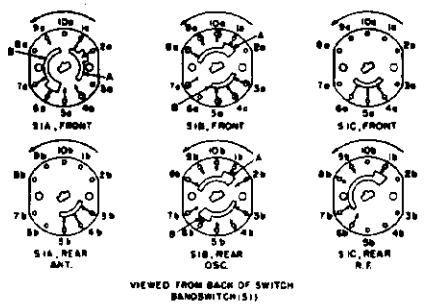
GENERAL

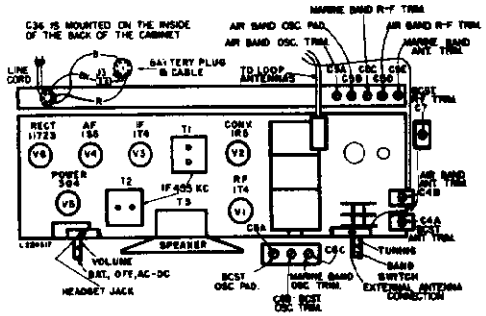
The Bendix Radio Model Par 80 provides reception of the Air, Standard Broadcast, and Marine bands. The Filter position of the band switch selects Air Band (200-400 KC) for voice reception with minimum interference from A and N code signals or the 1020 cycle tone. This receiver can be operated on AC, DC, or from a self-contained Bendix Battery Pack AB225, or equivalent. Battery must provide B supply of 90V and A supply of 9V, 8 prong plug, and dimensions not greater than 10½" x 3¼" x $4\frac{1}{16}$". Line cord must be plugged into battery switch located in cabinet rear compartment before receiver can be operated on battery power. An external antenna is required for Marine band reception, and will improve reception on other bands as well. Attach antenna to plug at upper left of front panel. Headphones with 600 ohm impedance may be used, and when plugged into jack at upper right of front panel, disconnect speaker from circuit.

SENSITIVITY measurements made for 50 mw output, using Hazeltine standard loop (24" spacing) for the broadcast and air bands and using RMA standard dummy antenna for the marine band.

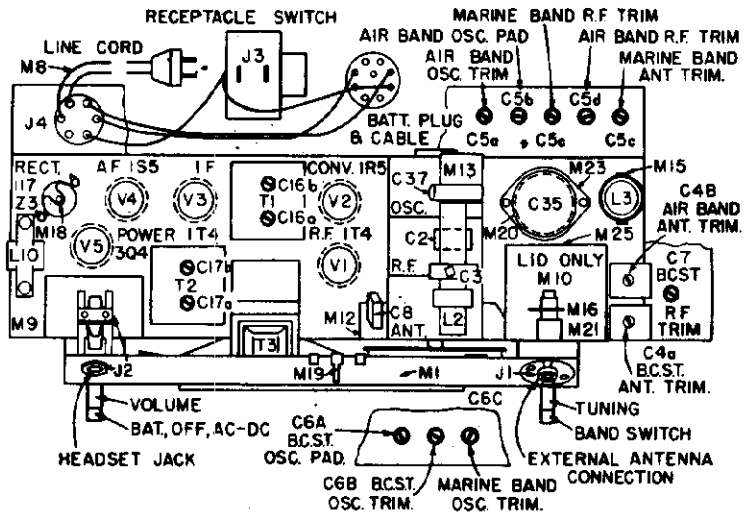
Freq.	Approx. Sens.	Freq.	Approx. Sens.
1475 KC	20 uv/M	400 KC	15 uv/M
1000 KC	25 uv/M	2000 KC	50 uv
580 KC	40 uv/M	3000 KC	25 uv
200 KC	45 uv/M	5000 KC	20 uv
300 KC	25 uv/M		

Model PAR-80A only.

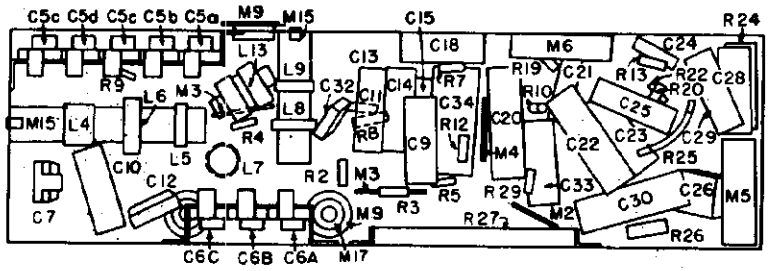




MODEL PAR-80 ONLY



Trimmer Location Diagram



Component Diagram Bottom View

ALIGNMENT PROCEDURE

Connect line cord plug to 117V, 60 cycle AC power source. Use full volume and set signal generator to produce .05 W (9.38V, AC) or less of receiver output to prevent AVC action. Plug output meter (560-600 ohms impedance) or AC meter (shunted by 560-600 ohms) into phone jack. Use 30% modulated AM signal for RF alignment.

ALIGNMENT CHART

INPUT FREQ.	THROUGH	TO	BAND SWITCH POSITION (Circuit)	DIAL POINTER POSITION	ADJUSTMENTS	REMARKS
455 KC	.01 mf or Larger	Pin #6 V2, I8S	BCST. (IF)	High end of band	C17b, C17a C16b, C16a	Adjust for Max.
5500 KC	400 ohms	J1	Marine (RF)	5500 KC	C4, C5c C5e	Adjust for Max.
Adjustment of the BCST. Trimmers, RF and ANT., will necessitate adjustment of AIR Trimmers, RF and ANT.						
1550 KC	100 mmf	J1	BCST. (RF)	1550 KC	C4b, C7 C4a	Adjust for Max.
600 KC	100 mmf	J1	BCST. (RF)	600 KC	C4a	Rock tuning control for Max. output
1550 KC	100 mmf	J1	BCST. (RF)	1550 KC	C4b, C7 C4a	Adjust for Max.
400 KC	100 mmf	J1	Air (RF)	400 KC	C5a, C5d C4b	Adjust for Max.
200 KC	100 mmf	J1	Air (RF)	200 KC	C5b	Rock tuning control for Max. output
400 KC	.00 mmf	J1	Air (RF)	400 KC	C5a, C5d C4b	Adjust for Max.
455 KC	100 mmf	J1	Air (IF Trap)	High end of band	C34	Adjust for Minimum

ALIGNMENT CHART

CIRCUITS ALIGNED	DIAL POINTER	INPUT FREQUENCY	APPLY THROUGH	ADJUST
I. F.	Max. to Right	+ 455 K.C.	.01 Mfd	C3a, C3b, C6a, C6b,
Broadcast	1475 Ref. Mark	1475 K.C.	50 Mmf	C1d C1b
Broadcast	965 Ref. Mark	965 K.C.	50 Mmf	Check Calibration*
Broadcast	580 Ref. Mark	580 K.C.	50 Mmf	Check Calibration*

* If calibration does not check within the frequency mark, both oscillator and antenna sections of the gang condenser must be bent to correct tracking.

\+ Signal Generator connected to external antenna connection for complete alignment.

GENERAL

Before making any alignment adjustments, turn the receiver and all power operated test equipment on and allow to warm up, if at all possible, for at least five minutes. Turn tuning gang fully closed and set dial pointer directly over Reference mark on dial. See Fig. 3.

After receiver has warmed up and dial pointer has been properly set, turn volume control full on and rotate tuning gang to full open (high frequency end of broadcast band) position. Connect low range of output meter across voice coil and refer to ALIGNMENT CHART

Signal generator to be connected to external antenna connection through an isolating capacitor as given in ALIGNMENT CHART. Keep input signal as low as practical at all times and make all adjustments for maximum output meter reading.

PRECAUTIONS

An isolating transformer should be used between the AC power line and the receiver for protection of any test equipment that must be operated from the same power line.

ALIGNMENT PROCEDURE

Connect line cord plug to 117 volt, 60 cycles AC power source. Set volume control at maximum clockwise position and tone control (S2) in counterclockwise position. Connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord to Reference Mark on dial back plate, (See Fig. 5). Make all adjustments in order given in ALIGNMENT CHART on opposite page and for maximum output. Keep input as low as possible at all times.

PRECAUTIONS

An isolating transformer should be used between the power supply and the receiver if any of the test equipment is AC operated. The use of isolating capacitors is not recommended as AC though the capacitor may introduce hum modulation, and if the capacitors should break down the test instruments will likely be damaged.

ALIGNMENT CHART

Circuit Aligned	*Input Freq.*	*Dial Pointer Position*	*Adjustments*
IF	*455 KC	Max. to right	C9b, C9a, C7b, C7a
OSC.	**1475 KC	1475 Ref. Mark	C1c

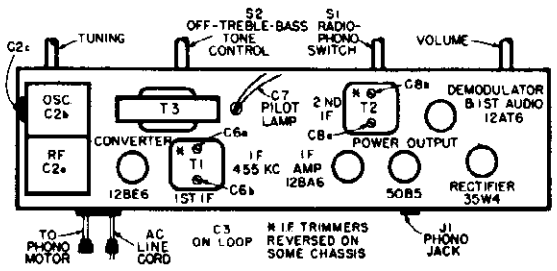
Model 613 Radio-Phonograph



Trimmer Location Diagram

ALIGNMENT PROCEDURE

Refer to page 1 for general instructions and precautions. The builtin loop antenna must be connected to the chassis during alignment or a 192 u.h. inductance substituted in place of the loop. During alignment of the IF channel the tuning gang should be fully open (high frequency end of band). If calibration does not check within the dial reference marks at 965 and 580 KCS the tuning gang rotor plates must be bent to obtain proper tracking. This is a difficult operation and must be attempted by experienced technicians only.

ALIGNMENT CHART

Circuit Aligned	Input Frequency	Apply Through	Adjust
IF	455 KCS	.01 mfd.	C8b, C8a C6b, C6a
Osc.	1475 KCS	50 mmf.	C2c
Antenna	1475 KCS	50 mmf.	C3
	965 KCS 580 KCS	50 mmf.	Check Calibration

The radio chassis used in the model 613A Receiver-Phonograph combination is an AC-DC superheterodyne design, using four tubes in the radio circuit and one as a vacuum tube rectifier. The chassis will operate on DC but the record changer will operate only on 105-125 volts, 60 cycles AC. All tubes are of the miniature type.

Before making any alignment adjustments, turn the receiver and all power operated test equipment on and allow to warm up, if at all possible, for at least five minutes. Turn tuning gang fully closed and set dial pointer directly over Reference Mark on dial.

After receiver has warmed up and dial pointer has been properly set, turn volume control full on and rotate tuning gang to full open (high frequency end of broadcast band) position. Connect low range of output meter across voice coil and refer to ALIGNMENT CHART on Page 3 for detailed procedure to follow in making adjustments.

Signal generator to be connected to external antenna connection through an isolating capacitor as given in ALIGNMENT CHART. Keep input signal as low as practical at all times and make all adjustments for maximum output meter reading.

PRECAUTIONS

If any test instruments used for alignment or servicing are operated from the AC power line, an isolating transformer should be used to isolate the receiver from the power source. Isolating capacitors are not recommended as hum-modulation may be introduced into the receiver.

SPECIFICATIONS

Power Requirements
105-125 volts, 60 cycles AC

Power Consumption (including phonograph)
60 watts

Speaker
6 inch P.M.

Voice coil impedance
Ohms at 400 cycles - 3.2

Record Changer
Automatic twelve 10-inch or ten 12-inch standard records

Dial Lamp
1 - No. C-7 dial lamp
110 volt, candelabra base

Tuning or Frequency Range
540-1620 KCS

IF Frequency
455 KCS

Tube Complement
1 - 12BE6, 1 - 12BA6, 1 - 12AT6, 1 - 50B5
1 - 35W4

Maximum Power Output
2.0 watts

97 mc.	"	"	"	Approx. 97 mc ref. mark	---------	"	----------	****Check Calibration
90 mc.	"	"	"	Approx. 90 mc. refer. mark	---------	"	----------	****Check Calibration

* See Fig. #2 "Test Circuit for FM Alignment".

** A VTVM with a zero center scale is very convenient for use in this alignment step. A50 microammeter may be used in place of the VTVM, but is not as accurate.

*** The oscillator circuit has been designed to operate on the high freq. side of the incoming signal. It is possible to adjust the trimmer (C11) at 106 MC such that the osc. is operating on the "image" or low freq. side of the signal. To check the osc. (C11) adjustment, set sig. gen. to 84.6 MC, freq. modulated, dial pointer at 106 MC. If signal is NOT heard, adjustment of C11 is correct, but if signal IS heard, osc. trimmer C11 has been incorrectly adjusted on the "image" frequency. Readjust C11 to other setting at 106 MC and recheck with gen. freq. at 84.6 MC. Signal MUST NOT be heard with pointer at 106 MC and sig. gen., freq. modulated, set at 84.6 MC.

**** If calibration is not within reasonable tolerance at these points, the osc. coil inductance must be adjusted. If dial pointer reading is on low freq. side, inductance is too low, and turns must be compressed slightly. If pointer reading is on high freq. side, osc. coil is too high and coil turns must be spread slightly.

To check and adjust inductance of ant. and RF coils, tune receiver to 90 MC signal and observe AVC reading. Insert iron core end of "tuning wand" into RF coil, at same time rocking tuning control to max. AVC. If reading increases as wand is inserted, RF coil inductance is too low and turns must be compressed slightly. If reading decreases, reverse wand and insert metal end into coil, again rocking tuning control to max. AVC. If reading decreases, (after iron core check), inductance is properly adjusted. If reading increases, inductance is too high and turns must be spread slightly.

Ant coil is checked and adjusted exactly like RF coil.

NOTE: THE LATTER OPERATIONS ARE VERY DELICATE AND DIFFICULT PROCEDURE AND MUST BE ATTEMPTED ONLY BY TECHNICIANS WITH CONSIDERABLE HIGH FREQUENCY EXPERIENCE.

* Some phase shift between the Signal Generator and the scope horizontal sweep may be encountered, resulting in a double trace pattern, shown in Fig. 6. In some Oscilloscopes, provision is made for connecting this phase shift directly in the oscilloscope circuit. If so, rotate the "phase shift" control until the curves coincide as in Fig. 5. If no provision is made in the scope, the connection might be accomplished by inserting a condenser of suitable value in series with the signal generator "Synchronized Sweep Voltage" output. The condenser value will depend upon the amount of phase shift and the horizontal input impedance of the scope - approximate condenser range .01 to .1 mfd. See Fig. 7 for instrument connection diagram.

** See *** Page 5.

*** If calibration is not within tolerance at these points, the inductance of local FM oscillator coil, RF and antenna coils must be adjusted. See **** Page 5.

NOTE: The latter operation is a very delicate and difficult procedure, and must be attempted only by technicians of considerable high frequency experience.

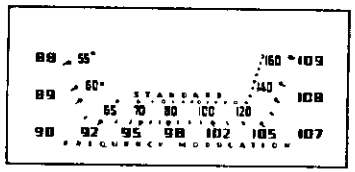
AM.....540-1620 KC
FM.....88-108 MC

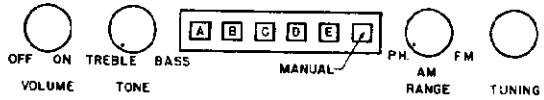
INTERMEDIATE FREQUENCY
AM.....455 KC
FM.....10.7 MC

POWER OUTPUT
Maximum.....4.2 Watts

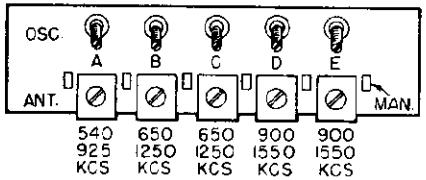
LOUDSPEAKER - PM.
Cone diameter.....10 inches
VC impedance at 400 cycle.....3.2 ohms

CABINET
33" high, 34-1/2" wide, 18-3/16" deep
Shipping Weight.....95 pounds





Controls--The various controls are shown in the above drawing. Controls as arranged from left to right are: Volume control, Tone control, Pushbuttons, Range control, and Tuning control. Tone Control rotates to the Bass position in a clockwise direction, to the Treble position in the counterclockwise direction. The range switch is in F.M. position at maximum CCW, broadcast position is mid-position, and phono position is maximum clockwise.



Pushbuttons--The adjustment position of the pushbutton assembly is shown below. Pushbutton operation is provided by rotating the band switch to the center position and depressing the desired Pushbutton. The extreme right hand pushbutton is depressed when MANUAL tuning operation is desired.

Access to the adjustment screws is obtained by pulling the Pushbuttons off the shaft vertically. The osc. and antenna adjustment screws, with the Pushbutton frequency ranges, is shown in the above diagram.

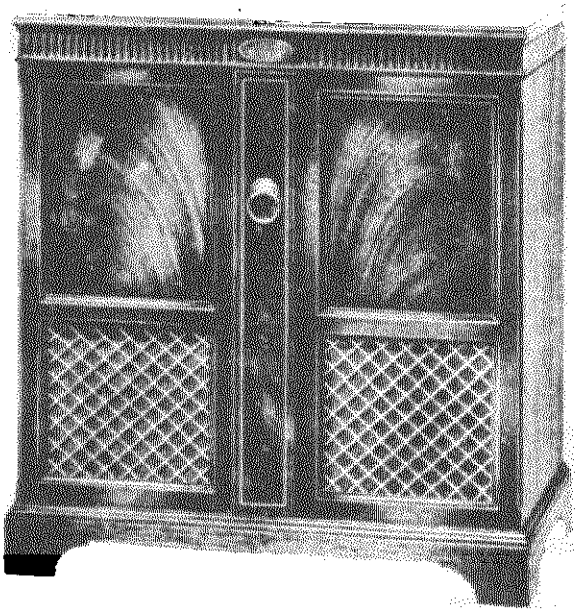
BENDIX RADIO DIV. MODELS 1518, 15
1524, 1525

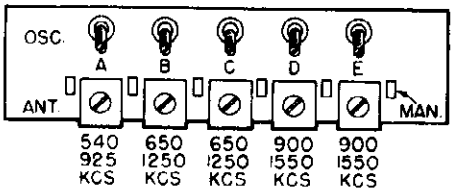


Models 1518 & 1524 Mahogany
Models 1519 & 1525 Walnut

GENERAL

The Bendix models 1518 and 1519 are sever tube (plus vacuum tube rectifier) superheterodyn radio-phonograph combinations designed to re ceive the Standard AM Broadcast Band (540 1620 KC) and the 88 - 108 MC FM Band. The onl difference between the chassis used in the 151 and 1519 and the 1524 and 1525 models is in th phono-input circuit used in the 1524 and 152 models. These two later models incorporate tw additional miniature tubes in a dynamic nois reduction circuit designed to reduce to a min imum all noise originating from needle-scratc or from old and worn records. This circui functions only on phonograph operation and i completely out of the radio circuit.

The schematic diagram shown in Fig. 3 i basically that of models 1524 and 1525, bu since this circuit is identically the same a the circuit used in models 1518 and 1519, plu the Hush-O-Matic feature, the one schemati contains all the circuits found in any one o the four models. If either the 1518 or 151 chassis is being considered then the Hush-O Matic circuit contained within the dotted line at the lower-right hand corner of Fig. 3 shoul be disregarded, together with the power cor and jack J8 connected to the main chassis.



Pushbutton Frequencies

PUSHBUTTON ADJUSTMENT

The pushbuttons may be adjusted as follows:

1. Place the receiver in operation on the Standard Broadcast Band (AM) and tune in manually one of the stations to be selected by pushbuttons and whose carrier frequency is between 540 and 925 KCS. (The MANUAL pushbutton must be depressed when tuning manually. See Fig. 9)
2. Remove all the pushbuttons by pulling them straight up from the panel.
3. Depress the shank for pushbutton "A" and increase the volume slightly.
4. Using a small screwdriver, tune in the desired station by adjusting the long brass screw located above pushbutton "A". It can be reached through the opening in the panel after the pushbuttons have been removed. This screw adjusts the oscillator coil and is marked "OSC" in Fig. 9. Now press the shank for the MANUAL pushbutton and check to make certain the correct station has been tuned in.
5. With pushbutton "A" again depressed and OSC screw adjusted for maximum signal, similarly adjust the screw located just below push-button "A". This screw tunes the antenna is marked ANT in Fig. 9.
6. Repeat steps 4 and 5 to obtain the best bined adjustments.
7. Pushbuttons B, C, D, and E may be adjuste exactly the same manner as pushbutton except that the same carrier frequency of station selected must be within the speci range as given in Fig. 9.
8. Select from the call letter tabs enclosed station call letters to which the pushbut have been tuned and insert through the s in the side of the pushbuttons. The cellu protector tabs provided are to be placed the call letter tabs by the same proced followed in inserting the call lette
9. Replace the pushbuttons on the receiver g ing proper attention to the location of call letters.

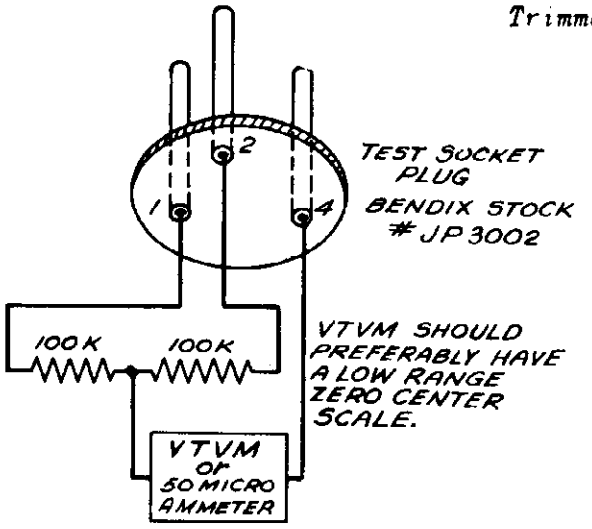
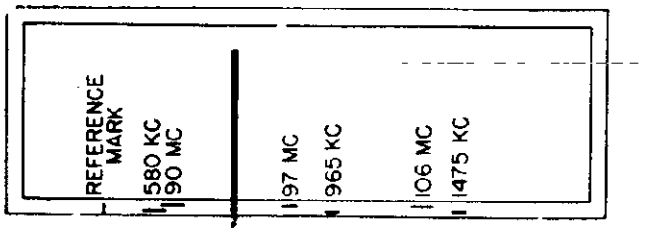
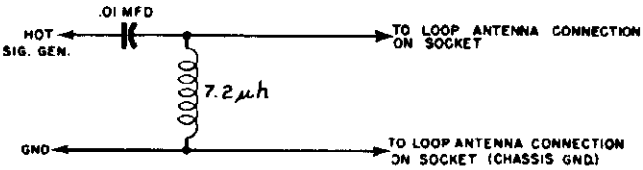
Trimmer Location Diagram



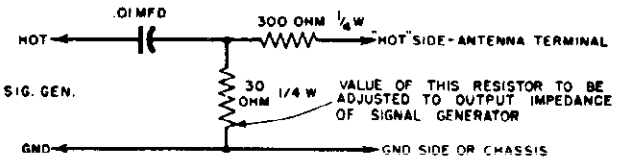
Test Circuit Plug



Alignment Reference Marks



AM DUMMY Antenna
Bendix Part No. AD0L01



FM DUMMY Antenna

The chassis must be removed from the cabinet in order to align the FM channels. If only the AM channels are to be aligned this is not necessary but will be found to be much more convenient if it is removed. However, if the chassis is removed a dummy antenna, described in detail later in the text, must be used when aligning the antenna circuits, unless these circuits are adjusted after the chassis is again installed in the cabinet.

Unless the various circuits of each channel are much out of alignment, adjustments made on the FM circuits will not appreciably affect the adjustments previously made on the AM circuits. However, if the FM circuits are badly out of alignment, necessitating considerable adjustment, it is best after these adjustments have been made, to go back and check the AM alignment.

An amplitude modulated (AM) signal of the proper frequency may be used for aligning both the AM and FM channels. However- if convenient, an oscilloscope and frequency-modulated signal may be used for aligning the FM channel.

Before making any adjustments, turn "on" the receiver and all AC operated test equipment and allow to warm up for at least five minutes. IMPORTANT: All adjustments must be made in the order in which they are given; i.e., the AM band must be completely aligned before aligning the FM band. The manual push-button must be pressed before the AM oscillator and RF circuits can be aligned.

EQUIPMENT REQUIRED

Signal Generator
  AM, 455 KC to 106 MC
Vacuum Tube Voltmeter
  DC ranges up to approximately 20 Volts. Ground, or minus, lead must be isolated from the power line.
Low Range Output Meter
Capacitors
  One .01 mfd. and one 50 mmf.
Dummy Antennas
  FM Dummy Antenna (See Fig. 8)
  AM Dummy Antenna, Bendix Part No. AD0L01, (See Fig. 7).
Test Circuit Plug
  See Fig. 5 and text for details.
Alignment Screwdrivers
  Must be 100% non-metallic.
Tuning Wand
  May be made from a 1/4" x 8" polystyrene rod with a small brass slug attached to one end and a powdered iron core attached to the other end.
Miscellaneous Hand Tools

AM ALIGNMENT

After the set has warmed up proceed with the alignment in steps as follows:

1. Rotate gang condenser all the way closed and set dial pointer to reference mark. See Fig. 6.
2. Short AM oscillator terminal #4 to chassis. (C1e).
3. Rotate band switch to AM - midposition and press manual push-button.
4. Rotate volume control full on (Clockwise).
5. Set output meter on low range and connect across voice coil.
6. Signal generator adjusted to 455 kc AM.
7. Connect 455 KC signal to terminal #2 (7F8 grid input) through a .01 mfd. capacitor, generator shield lead to receiver chassis and ground. See Fig. 4 for diagram.
8. Align IF AM slug, (center of T6), C41B, C43A, C43B, C45A and C45B for maximum reading on output meter. Keep generator output as low as practical. Refer to Fig. 4 for trimmer location diagram.
9. Rotate tuning control until pointer is at 580 KC reference mark.
10. Set generator to 580 KC, amplitude modulated.
11. Connect signal generator through AM Dummy Antenna to AM antenna terminal,
12. Remove short from gang terminal #4 to chassis.
13. Adjust oscillator padder C13 for maximum output.
14. Turn dial pointer to 1475 KC reference mark.
15. Set Signal Generator at 1475 KC amplitude modulated.
16. Adjust oscillator trimmer C12 and antenna trimmer C10 for maximum output.
17. Turn pointer to 580 KC reference mark.
18. Set generator at 580 KC amplitude modulated.
19. Again adjust oscillator padder C13 to maximum, at same time "rock" gang condenser to obtain maximum output.
20. Repeat steps 13 through 19 several times, until it is apparent receiver is properly aligned.
21. Check calibration at 965 KC and 580 KC reference points.
22. If 965 and 580 calibration do not check within 10 KC, oscillator and antenna sections of gang condenser must be bent to obtain proper tracking.

CAUTION: This last operation must be attempted by experienced technicians only.

MODELS 1518, 1519, 1524, 1525 BENDIX RADIO DIV.

FM ALIGNMENT

1. Preliminary:
   a. Rotate gang condenser until fully closed. Set pointer to Reference Mark.
   b. Rotate band selector to FM band - Maximum counterclockwise position.
   c. Short stator FM oscillator gang (C1d) to chassis - #5 terminal.

I.F. ALIGNMENT

2. Adjust Signal Generator to 10.7 mc, either CW or AM.
3. Connect generator output lead through .01 Mfd. capacitor to terminal #3 (C1c) of tuning gang.
4. Connect D.C. Vacuum Tube Voltmeter to test socket pins #1 (+) and #2 (-) using low scale.
5. Align 1st, 2nd and 3rd IF trimmers fo maximum AVC voltage, C40 on 1st IF, C42A and C42B on 2nd, C44A on 3rd. Reduce signal generator output as alignment proceeds, such that reasonable reading is obtained on low scale of D.C. VTVM. If no indication is obtained with maximum signal applied, apply signal to test jack in 1st IF can and tune C42A, C42B, and C44A to approximate peak before moving generator lead to #3 terminal.

   Realign IF trimmers (C40, C42A, C42B, and C44A) carefully several times for absolute maximum AVC voltage.
6. Insert test circuit plug in test socket and reconnect DC VTVM between center tap of shunt test resistors and test socket pin #4. See Fig. 5 for details.
7. Remove IF Signal input from receiver.
8. Set DC VTVM to zero reading.
9. Inject 10.7 MC signal to terminal #3, as in Step 3.
10. Adjust secondary of 3rd IF, C44B, to absolute zero reading on VTVM.
11. Alternate adjustments in steps 5 and 10 several times until correct adjustment is obtained.
    a. Correct adjustment is obtained when Step 5 produces no increase in AVC reading, and Step 10 remains at zero reading.
12. Remove short from terminal #5 to chassis.

R.F. AND OSCILLATOR ALIGNMENT

13. Reconnect VTVM to test socket terminals #1 (+) and #2 (-).
14. Adjust signal generator to 106 MC either CW or AM.
15. Connect generator output to receiver FM antenna posts through standard FM dummy antenna. See Fig. 8.
16. Set dial pointer to 106 MC reference mark - Fig. 6.
17. Adjust FM oscillator C11, RF - C5 and Ant. - C4 to maximum AVC reading.
    a. Tuning control must be "rocked" while adjusting C5 and C4 due to reaction on C11.
    b. The oscillator circuit has been designed to operate on the high frequency side of the incoming signal. It is possible to adjust the trimmer (C11) at 106 MC such that the oscillator is operating on the "image" or low frequency side of the signal. To check the oscillator (C11) adjustment, set signal generator to 84.6 AM, dial pointer still at 106 MC. If signal is NOT heard, adjustment of C11 is correct, but if signal IS heard, oscillator trimmer C11 has been incorrectly set on the "image" frequency. Readjust C11 to other setting at 106 MC and recheck with generator at 84.6 MC. SIGNAL MUST NOT be heard with pointer at 106 MC, and signal generator set at 84.6 MC.
18. Check calibration at 97 MC and 90 MC.
    a. If calibration is not within reasonable tolerance at these points, the inductance of the FM oscillator coil must be adjusted. If dial pointer reading is on low frequency side, inductance of oscillator coil is too low and turns must be compressed slightly. If pointer reading is on high frequency side, oscillator coil inductance is too high and coil turns must be spread slightly. Alternate Steps 17 and 18 until correct calibration is obtained.
19. Check and adjust inductance of RF coil.
    a. Tune receiver to 90 MC signal. Observe AVC reading. Insert iron core end of "tuning wand"* into RF coil, at same time rocking tuning control to maximum reading. If reading increases as wand is inserted, RF coil inductance is too low and turns must be compressed slightly. If reading decreases, reverse wand and insert brass end into coil, again rocking gang to maximum reading. If reading increases, inductance is too high and turns must be separated slightly. If reading decreases (after iron core check) inductance is properly adjusted.
20. Check and adjust inductance of antenna coil.
    a. Use exactly same procedure on antenna coil as in Step 19.

NOTE: Operations 18, 19 and 20 are very difficult and should be attempted only by technicians having had considerable high frequency experience.

* A round rod of insulating material, approximately 8" in length, with an iron core slug on one end, and a non-ferrous metallic slug on the opposite end.

Model 1521
Walnut

GENERAL

The Bendix Model 1521 is an eight tube AM-FM superheterodyne receiver providing AM reception from 540 KC to 1620 KC and FM reception from 88 MC to 108 MC. A jack on the radio chassis provides 110 volts AC to the record changer motor only when the radio OFF-ON switch is in the ON position. The output of the phonograph is injected into the audio amplifier of the main chassis through a high impedance phono jack also mounted on the rear of the main chassis.

The standard superheterodyne circuit is used, with one stage of tuned Radio Frequency on the FM band; an AM signal is fed directly into the Converter Stage. A low impedance AM Loop Antenna is located on the rear cover of the cabinet as well as the built-in FM Dipole Antenna. AM or FM external antennas may be used with this receiver. When making use of an external FM antenna, *disconnect* the internal FM antenna at the chassis and replace with the external antenna lead-in. The proper external antenna to be used for FM is a 300 ohm Dipole Antenna such as the Bendix AD1F00.

The 7F8 dual triode is used as a mixer and oscillator for both FM and AM. One diode of the 6SQ7 is used for DAVC in the FM circuit; the remaining diode and triode are the AM detector and 1st audio circuits respectively.

SPECIFICATIONS

Power Requirements
105 - 125 volts, 60 cycles AC
Power Consumption
Radio - 60 watts; Phono-turntable - 25 watts.
Tuning Frequency Range
AM 540 - 1620 KC
FM 88 - 108 MC
Intermediate Frequency
AM 455 KC
FM 10.7 MC
Power Output
Maximum — 4 Watts
Tube Complement
1-6AG5, 1-7F8, 1-7AH7, 1-7AG7, 1-6H6, 1-6SQ7, 1-6V6GT, 1-5Y3GT. Total 8
Loudspeaker
12-inch diameter PM

Record Changer
Automatic - twelve 10-inch or ten 12-inch standard lateral cut records.

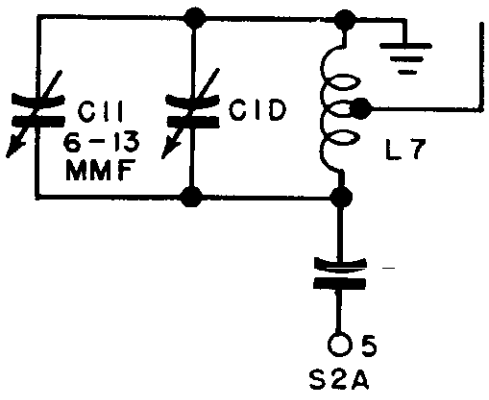
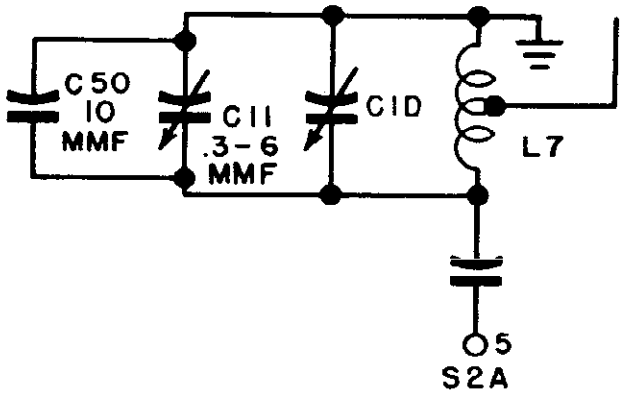
CIRCUIT CHANGES

Some sets of this model, capacitor CT1A09 (C11) has been replaced by two capacitors CT2A14 (C11) and CC5A22 (C50). The FM oscillator is changed as shown



Circuit using 6 - 13 mmf for C11



Circuit using 10 mmf in parallel with .3 - 6 mmf C11.

ALIGNMENT PROCEDURE

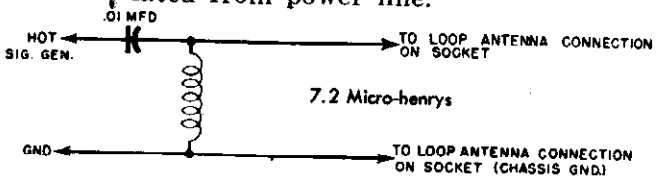
Remove chassis from cabinet and, if possible, have a speaker connected while alignment procedure is carried out. By using an amplitude modulated (30%) test signal whenever possible, weak signals in a detuned receiver may readily be identified. Plug the line cord into 117 volts, 60 cycle A.C. power source and turn the set on. Allow the set and test equipment to "warm up" for five minutes before beginning alignment procedures.

The AM channel is aligned first since the FM alignment will be affected if the AM section is not tuned properly. Refer to Figs. 3, 8, 9, 10 and 11 for trimmer locations, dial reference points, etc.

To set dial pointer, rotate gang condenser until fully closed and set pointer to reference mark at left of scale. See Fig. 10.

TEST EQUIPMENT REQUIRED

Standard AM Signal Generator
FM Signal Generator with range to approximately 108 MC. (For visual alignment.)
Bendix AM Dummy Antenna (See Fig. 3)
FM Dummy Antenna (See Fig. 9)
.01 mfd Capacitor
Alignment Screwdriver
Special Test Circuit Plug (See Fig. 11)
Standard Output Meter
Vacuum Tube Voltmeter - Preferable with a zero center scale.
a. Minus or "ground" lead must be isolated from power line.



A M Dummy Antenna
Bendix No. AD0L01

AM ALIGNMENT

PRELIMINARY:
Connect the output meter across voice coil. Set meter on lowest A C Range.
Signal Generator Amplitude Modulated (Approx. 30% modulation)
Rotate Volume Control full on. Keep Generator output low as possible.

	Generator Freq.	Dummy Antenna	Generator Coupling	Band Position	Special Conditions	Dial Setting	Adjust	Remarks
1)	455 KC	.05 mfd	High Side—Term. #2 of gang Cond. Low Side—Chassis Gnd.	AM—Mid-Position	Short AM Osc.—Term. #4 to Chassis	Gang Closed	IF Slug; C64A, C60A, C60B, C63A, C63B.	Adjust for Max. Outpu
2)	580 KC	Bendix Dummy Antenna AD0L01	Dummy Antenna Plugged in AM Ant. Socket on Rear of Chassis See Fig. 8	AM—Mid-Position	Remove short from Term. #4	580 KC Ref. Mark	AM Osc. Padder C13	"
3)	1475 KC	"	"	"	———	1475 KC Ref. Mark	AM Osc. Trimmer C12, AM Ant. Trimmer C10	"
4)	580 KC	"	"	"	———	580 KC Ref. Mark	C13	Rock Gang Cond. Adjust for Max. Outpu
5)	REPEAT STEPS 3 & 4 UNTIL RECEIVER IS PROPERLY ALIGNED							
6)	965 KC	Bendix Dummy Antenna AD0L01	Dummy Antenna Plugged in AM Ant. Socket on Rear of Chassis, See Fig. 8	AM—Mid-Position	———	965 KC Ref. Mark	———	*Check Calibration
7)	580 KC	"	"	"	———	580 KC Ref. Mark	———	Check Calibration

*If calibration is not within 10 KC in steps 6 & 7, oscillator & antenna gang rotor sections must be bent. This operation should be attempted by experienced technicians only.

FM ALIGNMENT

CW METER METHOD

BE CERTAIN "AM" CHANNEL IS ALIGNED BEFORE BEGINNING "FM" ALIGNMENT.

The CW Meter Method has proved to be very satisfactory for aligning the FM section of a correctly operating Bendix Model 1521 receiver. The advantage of this method over the Visual Alignment procedure is that the equipment required is generally associated with AM receiver alignment. A check by use of the Visual method will reveal any distortion in the output, which is difficult to locate using only the CW Meter Method.

1. Preliminary
   a. Rotate band selector to FM band - Max. counter-clockwise
   b. Short stator of FM oscillator gang to chassis - #5 terminal. See Fig. 8.
2. Signal Generator Setting
   a. Power "ON"
   b. Frequency - 10.7 MC
   c. Modulation - pure RF or, preferably, amplitude modulated.
3. Connect generator lead through .01 mfd capacitor to terminal #3 (C1d) of gang condenser.
4. Connect DC Vacuum Tube Voltmeter to test socket pins #1 (+) and #2 (-) using low scale.
5. Align 1st, 2nd, and 3rd IF trimmers for maximum AVC voltage - C64B on 1st IF, C61A and C61B on 2nd, C62A on 3rd. As alignment proceeds, reduce signal generator output, such that reasonable reading is obtained on lowest scale of DC vacuum tube voltmeter. If no indication is obtained with maximum signal applied, apply signal to test jack in 1st IF can and tune C61A, C61B, and C62A to approximate peak before moving generator lead to #3 terminal. Realign all IF trimmers (C64B, C61A, C61B, and C62A) carefully several time for *absolute maximum* AVC voltage.
6. Insert test circuit plug in test socket and connect DC Vacuum Tube Voltmeter between center tap of shunt test resistors and test socket pin #4. See Sketch, Fig. 11.
7. Remove IF signal input from receiver. (Vacuum Tube Voltmeter remains connected to test socket and receiver is still "ON".)
8. Adjust DC Vacuum Tube Voltmeter to zero reading under conditions stated in Step 7.
9. Re-connect Signal Generator to terminal #3 as in Step 2, using the same 10.7 MC signal.
10. Adjust secondary of 3rd IF (C62B) to absolute zero reading on Vacuum Tube Voltmeter. (Same "zero reading" as in Step 8.)
11. Alternate adjustments in Steps 5 and 10 several times until correct adjustment is obtained.
    a. Correct adjustment is obtained when Step 5 produces no increase in AVC reading, and Step 10 remains at zero reading.
    (Note: When changing from Step 5 to Step 10, Vacuum Tube Voltmeter is adjusted for zero with Signal Generator output removed from chassis. *Do not remove* Vacuum Tube Voltmeter leads from chassis and adjust for zero.)
12. Remove short from terminal #5 to chassis.
13. Reconnect Vacuum Tube Voltmeter to test socket terminals #1 (+) and #2 (-).
14. Reset Signal Generator
    a. Frequency - 106 MC
    b. Output - pure RF or amplitude modulated.
15. Connect generator output to receiver FM antenna posts through standard FM dummy antenna. See Fig. 9.
16. Set pointer to 106 MC Reference Mark - Fig. 10.
17. Adjust FM oscillator C11, RF - C5, and antenna - C4, to obtain maximum AVC reading. Repeat several times to insure maximum reading.
    a. Tuning control must be rocked while adjusting C5 and C4 due to reaction on C11.
18. Check calibration by setting dial pointer on 97 MC Reference Mark (See Fig. 10) and change Signal Generator to 97 MC pure RF or amplitude modulated.
19. Repeat Step 18 for a signal of 90 MC. If calibration in Steps 18 and 19 is off, it will be necessary to readjust inductance of oscillator coil, (RF and antenna coils also, if needed). See Text "FM Alignment - Visual Method" - Paragraph 17.
    NOTE: *This operation should be attempted by well experienced technicians ONLY.*

VISUAL ALIGNMENT

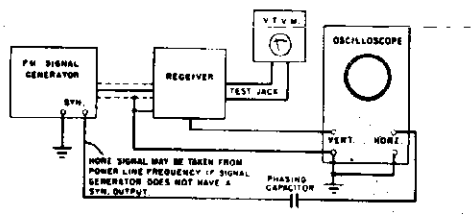
The Bendix Radio Model 1521 receiver uses the ratio detector type of demodulator. Since the limiter stage is omitted, a direct visual alignment of the IF stages by means of an oscilloscope is impractical. However, the ratio detector may readily be aligned visually, and upon completion of the entire alignment procedure, a visual alignment analysis of a signal from antenna to discriminator load will indirectly determine whether the IF transformers are symmetrically aligned.

The general method of alignment, hereafter described, is to first align the IF transformers and the primary of the detector at 10.7 MC by means of a pure RF signal and a Vacuum Tube Voltmeter. After this preliminary alignment, the secondary of the IF detector is aligned visually by means of a frequency modulated RF signal at 10.7 MC and an Oscilloscope across the ratio detector output. It is a definite advantage to use 60 cycle modulation with the frequency modulated RF signal, since no syn-

chronization is needed between the horizontal and vertical signals to keep the scope pattern stationary.

Connect the test instruments as diagramed in Fig. 4 and as directed in the procedure hereafter. The connections for the Vacuum Tube Voltmeter and vertical input to the oscilloscope are changed to different test jack terminals as different steps in the alignment procedure are completed.

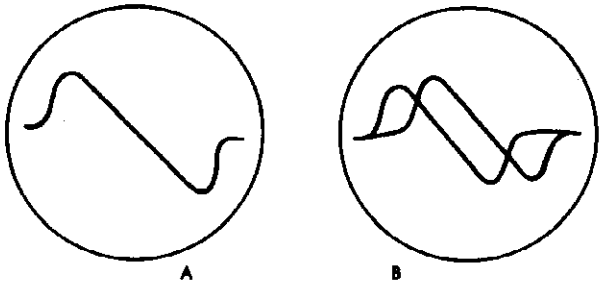
1. Signal Generator Setting
   a. Power - "ON"
   b. Frequency setting - 10.7 MC
   c. Modulation - pure RF or amplitude modulated.
   d. Output controls - set for workable receiver output.
2. Receiver Settings
   a. Rotate band selector to FM band - Maximum counter-clockwise.
   b. Short stator of local FM oscillator to ground.
   This connection is #5 terminal on the gang condenser, easily accessible from the top of the chassis. See Fig. 8.
3. Connect generator lead to terminal #3 of gang condenser using .01 mfd coupling capacitor and ground shield to receiver chassis.
4. Connect Vacuum Tube Voltmeter to test socket pins #1 (+) and #2 (-). See Figs. 8 and 11.
5. Align 1st and 2nd IF transformers for maximum AVC voltage, - trimmer C64B on 1st IF, trimmers C61A, C61B on 2nd. As alignment proceeds, reduce signal generator output such that reasonable reading is obtained on lowest scale of DC Vacuum Tube Voltmeter. If no indication is obtained with maximum signal applied, apply signal to test jack in 1st IF can and tune 2nd IF transformer to approximate peak before moving generator input back to #3 terminal. Adjust primary of detector transformer (trimmer C62A) for maximum AVC voltage. Carefully realign all IF trimmers (C64B, C61A, C61B, C62A) several times for absolute maximum AVC voltage.
6. Reset Signal Generator
   a. Frequency 10.7 MC
   b. Modulation - 60 cycle FM
   c. Sweep width - maximum possible (should be a minimum of 200 KC).
7. Connect vertical input of scope to test socket pin #4 and ground as shown in Figs. 4, 8, and 11 and connect a 60 cycle sine wave signal to horizontal input.



Connections for Visual Alignment

A suitable 60 cycle signal may be obtained by removing one of the dial lamp sockets from its bracket and connecting the horizontal input lead directly to the socket or through a small capacitor if required for proper phasing. The sweep circuit in the scope is not used.

8. Adjust Signal Generator frequency until ratio detector curve is centered on the horizontal scope sweep - (This may deviate slightly from 10.7 MC.)
9. Adjust secondary of detector transformer (C62B) for a maximum "S" curve similar to Fig. 5a - (the "S" curve may be reversed depending on the internal circuit of the scope used.) Alternate adjustment of primary (C62A) and secondary (C62B) to obtain maximum desired curve. Some phase shift between the Signal Generator and scope horizontal sweep may be encountered, resulting in a double trace pattern, shown in Fig. 5b. In some oscilloscopes, provision is made for correcting this phase shift directly in the oscilloscope circuit. If so, rotate the "phase shift" control until the curves coincide as in Fig. 5a. If no provision is made in the 'scope, the correction might be accomplished by inserting a capacitor of suitable value in series with the 60 cycle signal and the horizontal input to the scope. The capacitor value will depend upon the amount of phase shift and the horizontal input impedance of the scope. Approximate capacitors range from .01 to 0.1 mfd. When aligning the secondary of the detector transformer visually, it is advantageous to leave the Vacuum Tube Voltmeter connected to test socket pins #1 (+) and #2 (-) as in Step 4. This will facilitate the adjustment for maximum "S" curve since the meter will indicate the maximum AVC voltage and the scope will indicate the most linear "S" curve. Maximum meter reading obtained at same time best linearity is obtained, indicates correct alignment.
10. Rotate gang condenser such that the pointer is resting on 106 MC reference mark on dial face. Remove short from FM oscillator terminal #5 to ground.
11. Reset Generator
    a. Frequency - 106 MC
    b. Modulation - 60 cycle FM
    c. Sweep - maximum width (should be between 200 KC and 450 KC).
12. Connect Signal Generator lead to receiver antenna post through standard FM dummy antenna (See Fig. 9).
13. Oscilloscope should be connected as in Step #7.
14. Adjust C11, local oscillator trimmer, until "S" curve is centered on scope.
    The Oscillator has been designed to operate on the high side of the incoming signal. It is possible to adjust the trimmer (C11) at 106 MC so that the oscillator is operating on the "image" or low frequency side



"S" Curves

of the signal. To check the oscillator (C11) adjustment, set Signal Generator to 84.6 MC, frequency modulated, dial pointer still at 106 MC. If signal is NOT heard, adjustment of C11 is correct, but if signal is heard, oscillator trimmer C11 has been incorrectly set on the "image" frequency. Readjust C11 to other setting at 106 MC and recheck with generator at 84.6 MC. Signal MUST NOT be heard with pointer at 106 MC, and Signal Generator, frequency modulated, set at 84.6 MC.

15. Adjust C5, at same time "rocking" receiver tuning control to keep "S" curve centered on horizontal sweep line on scope, for maximum height of the "S" pattern.
16. Adjust C4 for maximum height of the "S" pattern.
17. Check calibration of 97 MC and 90 MC.
    a. If calibration is not within reasonable tolerance at these points, the inductance of the FM oscillator coil must be adjusted. If dial pointer reading is on low frequency side, inductance of oscillator coil is too low and turns must be compressed slightly. If pointer reading is on high frequency side, oscillator coil inductance is too high and coil turns must be spread slightly. Repeat Steps 14 to 17 until correct calibration is obtained.
18. Check and adjust inductance of RF coil.
    a. Tune receiver at 90 MC signal. Observe AVC reading. Insert iron core end of "tuning wand" * into RF coil at same time "rocking" tuning control to maximum reading. If reading increases as wand is inserted, RF coil inductance is too low and turns must be compressed slightly. If reading decreases, reverse wand and insert brass end into coil, again "rocking" gang to maximum reading. If reading increases, inductance is too high and turns must be separated slightly. Insertion of either end of tuning wand should cause meter reading to decrease.
19. Check and adjust inductance of antenna coil.
    a. Use exactly same procedure on antenna coil as in Step 18.

    NOTE. Operations 17, 18 and 19 are very difficult and should be attempted only by technicians who have had more than average high frequency experience.

* A round rod of insulating material, approximately 6" in length, with an iron core slug on one end, and a non-ferrous metallic slug on the opposite end.

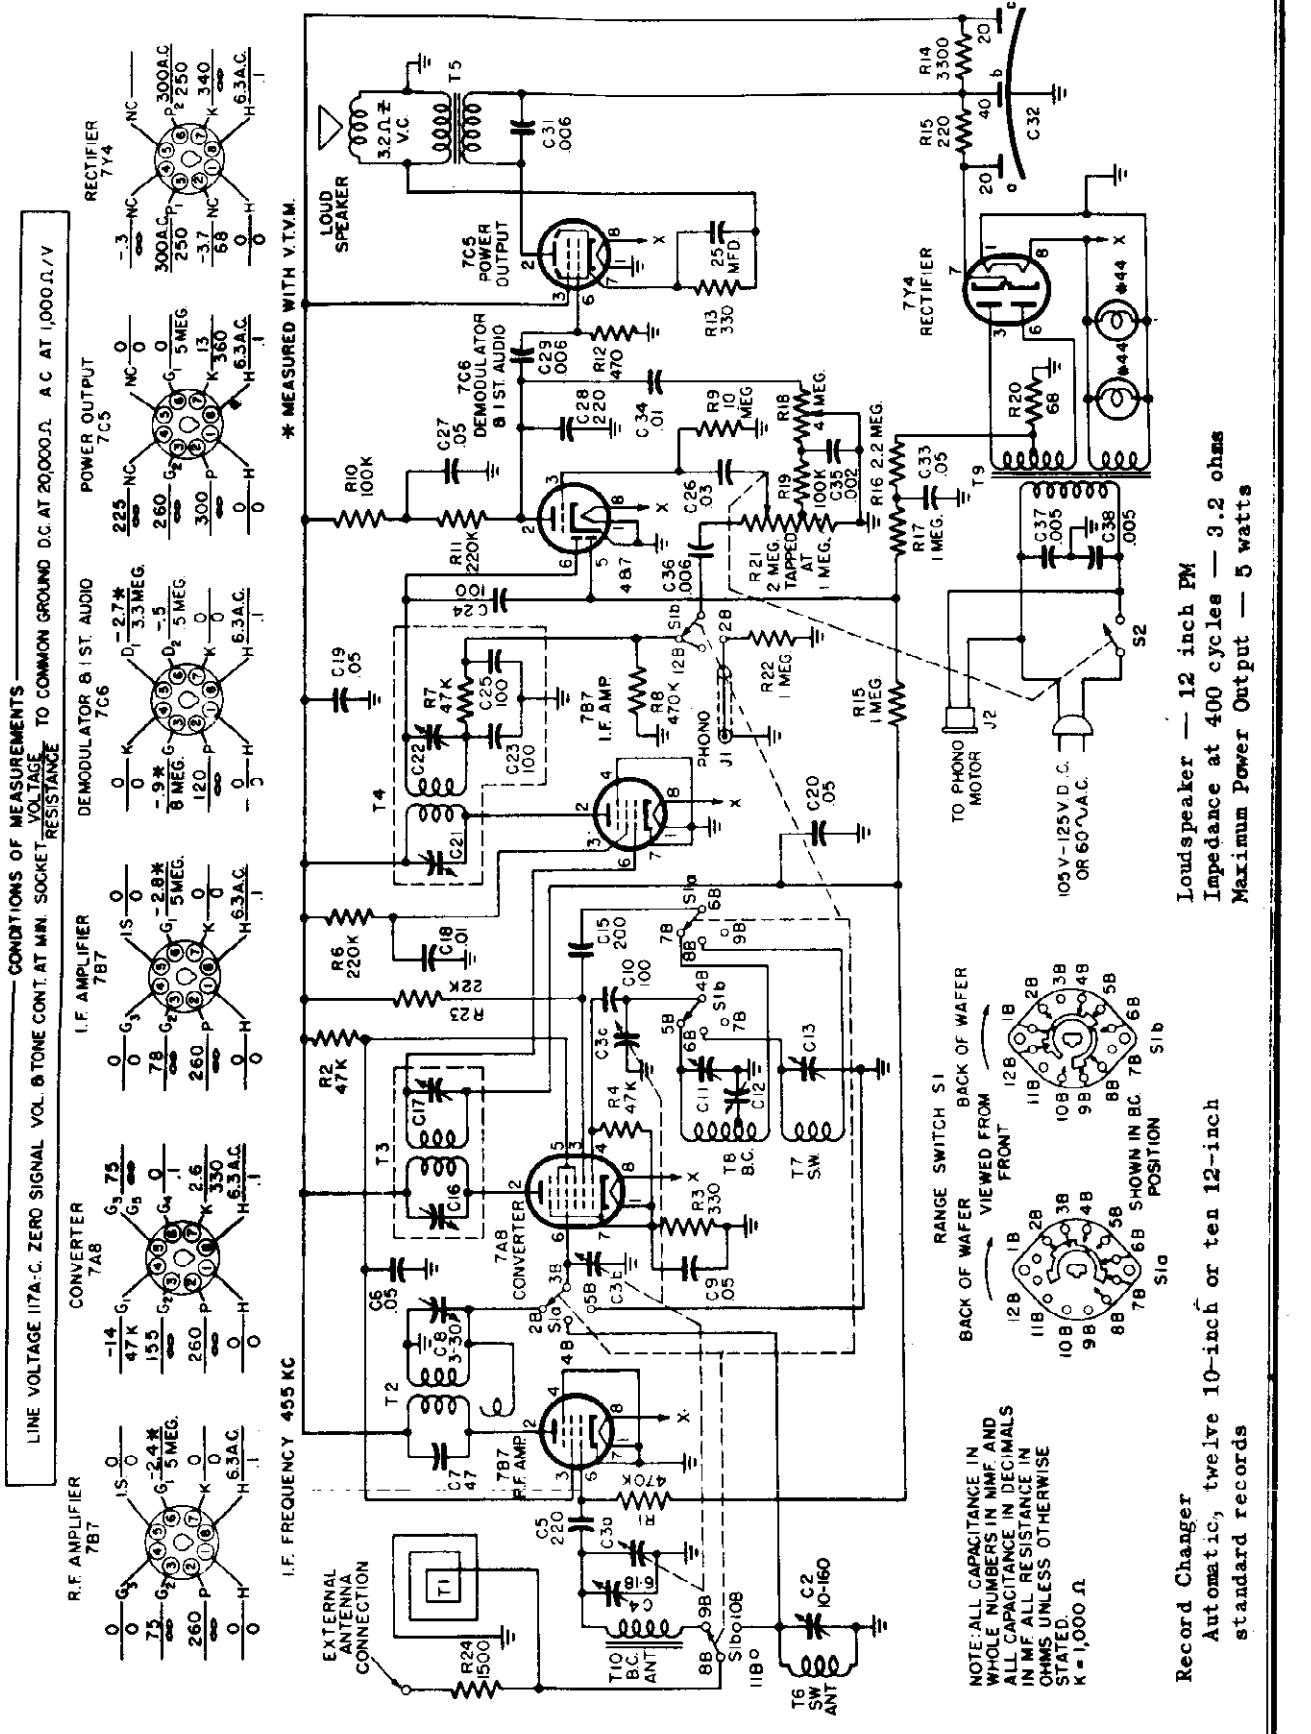
BENDIX RADIO DIV.



ALIGNMENT PROCEDURE

Connect line cord plug to 117 volt, 60 cycles AC power source. Set volume control at maximum clockwise position and tone control (R18) in counterclockwise position. Connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord until it is exactly over Reference Mark on dial back plate. (See Fig. 7.) Make all adjustments in order given in table and for maximum output. Keep input as low as possible at all times. Range switch in ST'D position except as noted in table. The dial back plate is marked as shown in Fig. 7 giving the tolerance at all alignment points called for in the ALIGNMENT CHART. Tuning gang to be fully open during alignment of I.F.

The builtin loop consists of approximately 4-3/4 turns of polyethylene covered wire, close wound, on a 14-5/16" x 22-5/16" frame. If loop is detached during alignment a 43 uh inductance must be connected across the loop terminals when adjusting the antenna trimmers on either the Standard Broadcast or Shortwave Band. If such an inductance is not connected across the loop terminals, C4 (Broadcast Antenna Trimmer) and C2 (Shortwave Antenna Trimmer) must be adjusted after the chassis is installed in the cabinet and the builtin loop attached.

ALIGNMENT CHART

Circuit Aligned	Input Frequency	Adjustments
IF	*455 KCS	C22, C21, C17, C16
OSC Broadcast	**580 KCS	C12
	**1475 KCS	C11
RF, Broadcast	**1475 KCS	C8, C4
	965 KCS 580 KCS	Check Calibration
+OSC Shortwave	**11 MCS	C13
+RF Shortwave	**11 MCS	C2

NOTE: Repeat above procedure until no further improvement can be made on any adjustments. Tuning gang rotor plates must be bent if tracking is not correct at 965 and 580 KCS check points.

*Applied to antenna through .1 mfd. or less.
**Applied to antenna through 50 mmf. or less.
+Range switch in SW position.

The Bendix models 1531 & 1533 radios incorporate the same model chassis. It is a six tube superheterodyne, two-band circuit, providing radio reception on the Standard AM Broadcast Band (540 to 1620 KC) and the 6 to 12 MC Shortwave Band. A high-impedance phono input jack is provided. The continually variable tone control is of the high frequency cut, bass boost, feed-back type. All six tubes are of the locktal type. One stage of tuned RF is provided on the Standard Broadcast Band. The builtin low-impedance loop antenna functions on both the Broadcast and Shortwave Bands. Better shortwave reception will of course be obtained by using a good outside antenna. A suitable binding screw for attaching such an antenna is provided on the rear of the cabinet.

SPECIFICATIONS

Power Requirements
105-125 volts, 60 cycles AC
Power Consumption (including record changer)
75 watts
Tuning Frequency Range
Broadcast Band 540-1620 KCS
Shortwave Band 6-12 MCS
Intermediate Frequency — 455 KCS
Tube Complement
2-7B7, 1-7A8, 1-7C6, 1-7C5, 1-7Y4
Two No. 44 dial lamps are used

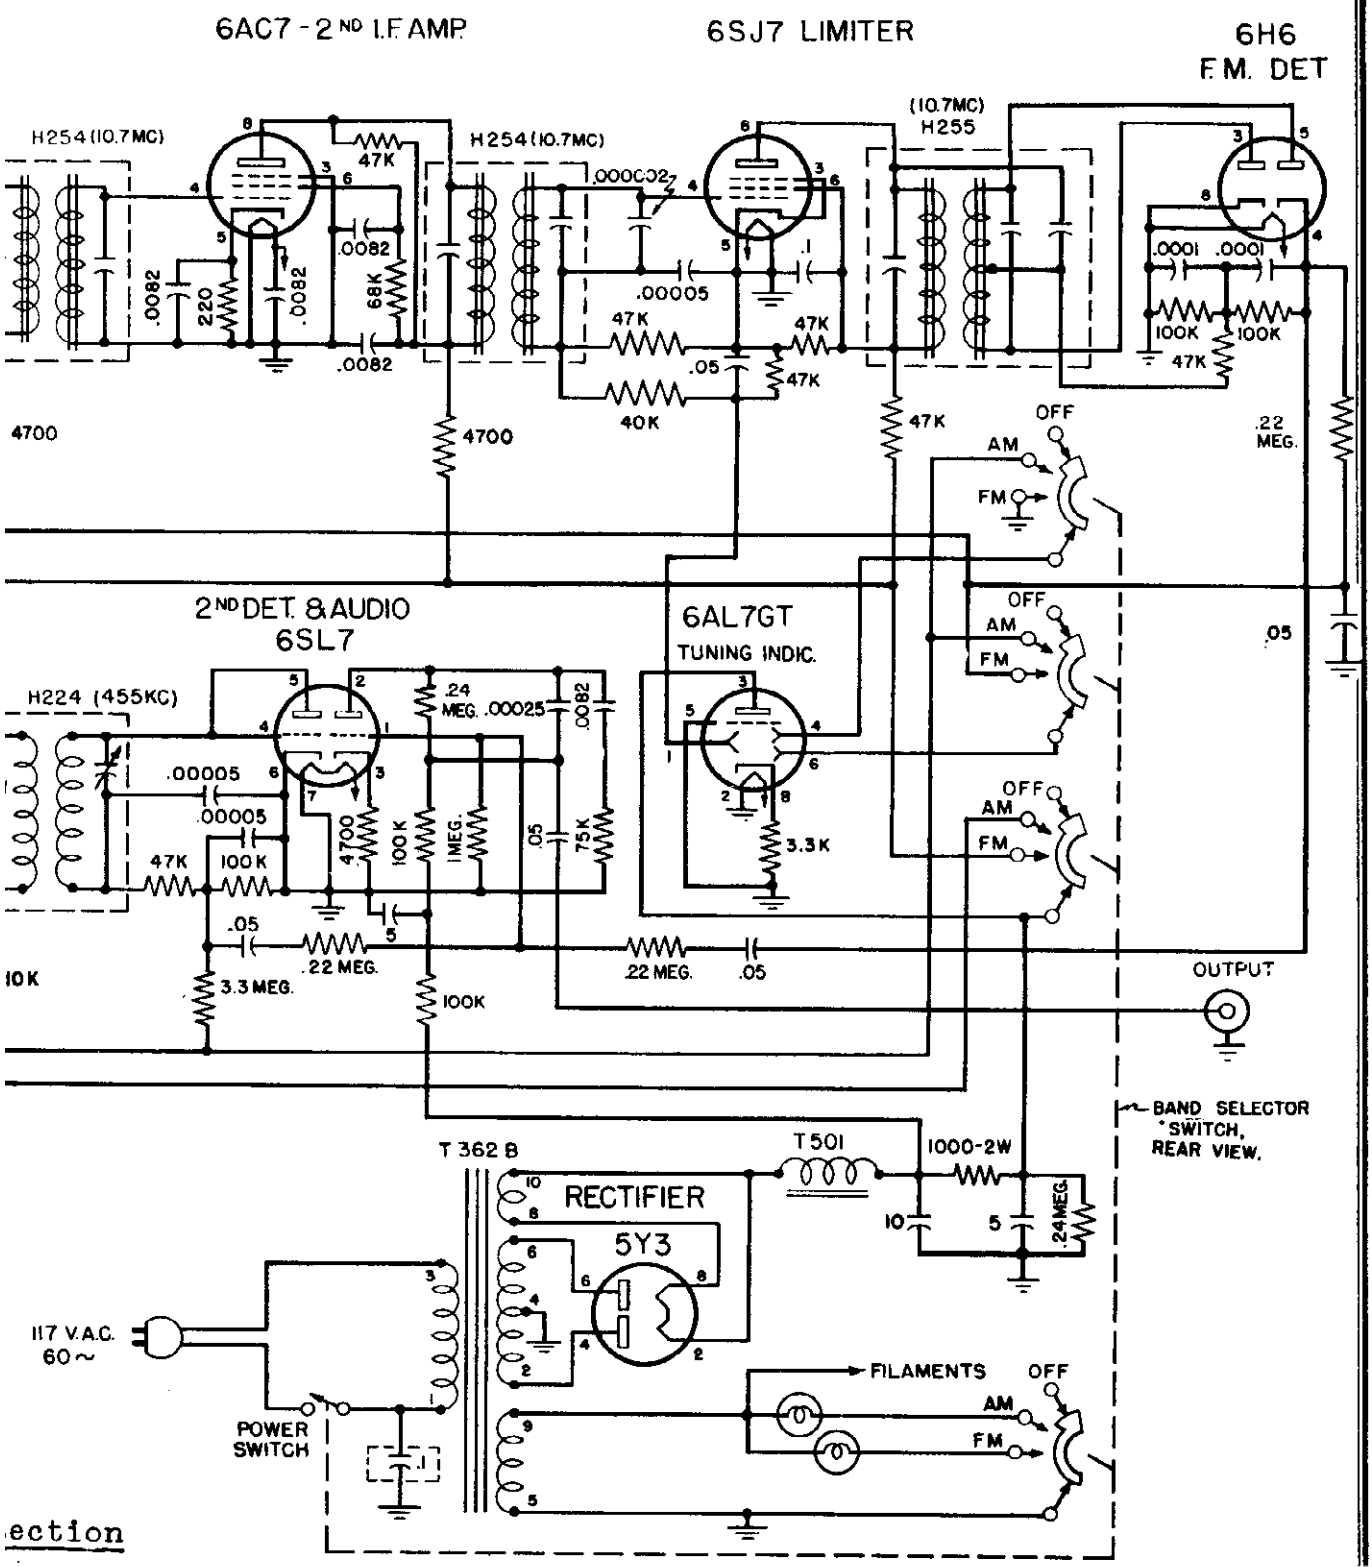
CO., INC. MODEL R601



ection

Range: 540 to 1630 KC
I.F. Frequency: 455 KC

Power Requirements: 117 volts - 60 cps - 80 watts

ection

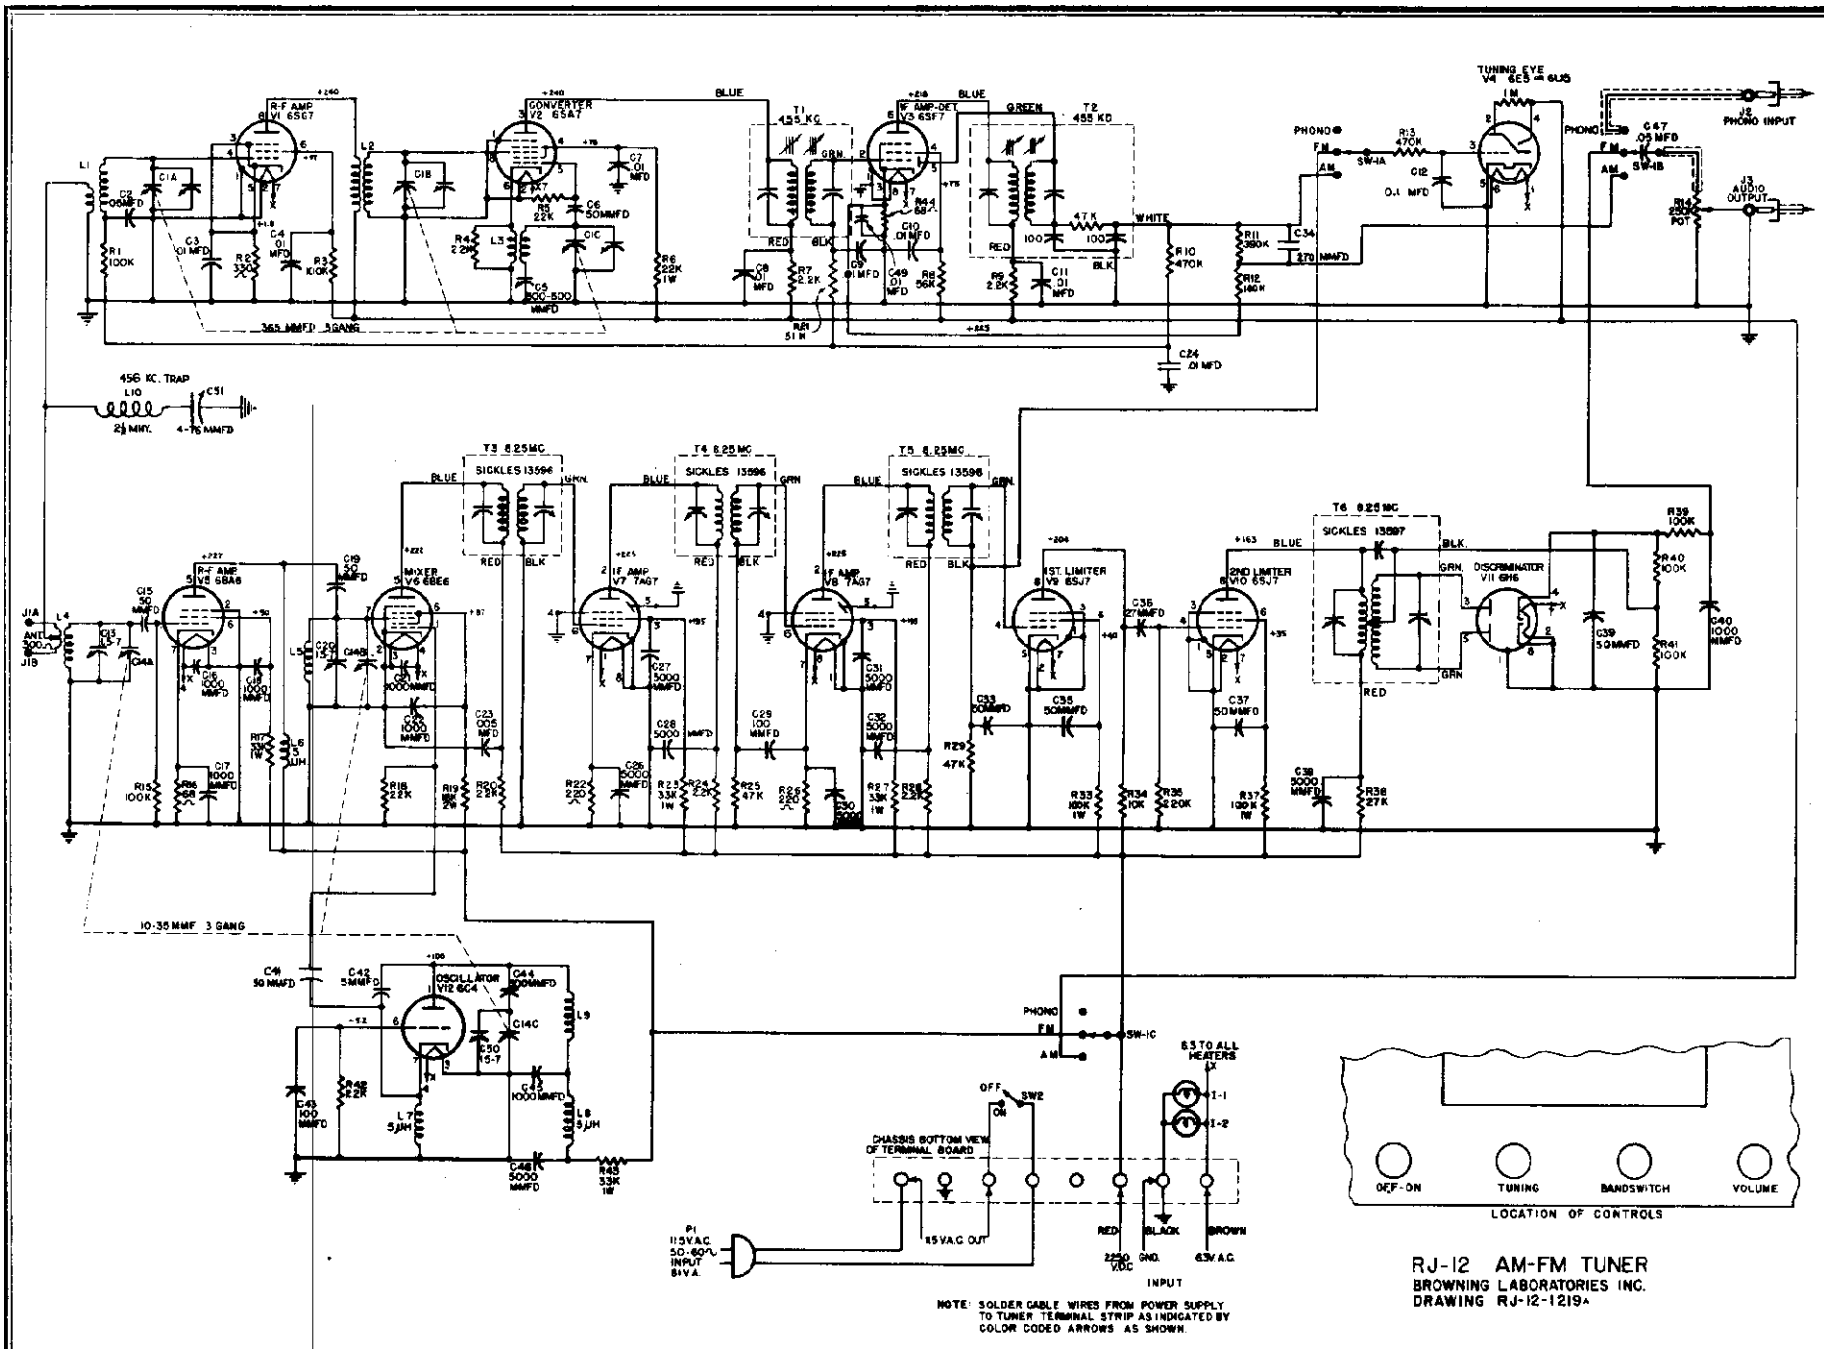
Range: 88 to 108 MC
I.F. Frequency: 10.7 MC

Input Voltage: 117 volts
Power Frequency: 60 cycles
Range: 540 KC to 1630 KC and 5.3 MC to 18 MC.
Intermediate Frequency: 455 KC
Tubes: Total, 6: 1-6SG7, 1-6SA7, 1-6SK7, 1-6H6, 1-6U5, 1-6X5
Output: The output matches a high impedance phonograph line.
Installation: Connect an antenna and ground to the terminals marked "ANT" and "GND". From the audio output jack, connect with a single conductor shielded wire (to reduce the possibility of hum pickup) to the amplifiers.
Aligning Instructions: Allow tuner to warm up for 10 minutes before aligning.
I.F. Alignment:
1- Connect the test oscillator output to R.F. section of variable condenser.
2- With "Band Selector Switch" in "Broadcast" position turn station selector to 540 KC.
3- Tune test oscillator to 455KC and adjust its output so that the tuning indicator tube starts to close.
4- Adjust the I.F. trimmers for the narrowest shadow in the tuning eye, readjusting the oscillator output as necessary.

Short Wave Band Alignment:

1- Connect the test oscillator output to the "ANT" and "GND" terminals of the tuner.
2- Set both the test oscillator and tuner dials to 18 MC.
3- Make certain that the tuner's variable condenser plates are fully open when the dial pointer is at 18 MC.
4- Adjust trimmer on the oscillator section of the variable condenser for minimum shadow in tuning indicator.
5- Set both test oscillator and tuner dials to 16 MC.
6- Adjust trimmers on the Antenna and R.F. sections of the variable condenser for minimum shadow in tuning indicator.

Broadcast Band Alignment:
1- Put "Band Selector Switch" in the "Broadcast" position.
2- Set both the test oscillator and tuner dials to 540 KC.
3- Adjust padder condenser for minimum shadow in indicator tube.
4- Set both the test oscillator and tuner dials to 1630 KC.
5- Make certain that the tuner's variable condenser plates are fully open when the dial pointer is at 1630 KC.
6- Adjust "broadcast" trimmer of oscillator for minimum shadow in tuning indicator.
7- Set both test oscillator and tuner dials to 1400 KC.
8- Adjust "Broadcast" trimmers of antenna and R.F. circuit for minimum shadow in indicator tube.
9- Set both the test oscillator and tuner dials to 600 KC.
10- Readjust padder condenser for minimum shadow in indicator tube
11- Set both the test oscillator and tuner dials to 1400 KC.
12- Readjust "broadcast" trimmers of antenna and R.F. circuit for minimum shadow in indicator tube.



NOTE: SOLDER CABLE WIRES FROM POWER SUPPLY TO TUNER TERMINAL STRIP AS INDICATED BY COLOR CODED ARROWS AS SHOWN.

MODELS RJ-12
RJ-14

Designed for high-fidelity reception in the new high frequency FM band as well as quality reception in the standard AM broadcast band, the Browning Universal FM-AM Tuner Model RJ-12 is primarily intended for those who wish to build radio sets into bookcases, drawers, shelves, walls, or cabinets. Its extreme sensitivity and high fidelity are not exceeded in the most expensive of commercial home radios. The Model RJ-14 is the RJ-12 mounted on a rack panel for laboratory and special uses. Employs Major Armstrong's circuit on FM.

INSTALLATION:

In mounting the unit, due consideration must be given to ventilation. Approximately 65 watts of heat must be dissipated. Position of mounting of the unit is unimportant.

The loudspeaker used should, for best results, be located a few feet from the RJ-12 and the audio amplifier. If the speaker is in the same cabinet with the tuner and audio amplifier, placing these latter two units on felt or rubber padding may improve the quality of reception.

The following components are necessary to complete a radio receiving system with the RJ-12: a high-fidelity audio amplifier, loudspeaker, antenna, and a power supply. The power supply may be omitted if the audio amplifier can provide the proper voltages and currents.

Any high quality audio amplifier and loudspeaker should work satisfactorily with the RJ-12 tuner. The audio gain should be such that an input voltage of 0.1 volt will provide ample volume.

The tuner is designed for maximum performance when used with a 300 ohm FM antenna. Most any commercial FM antenna having this impedance should work satisfactorily. It is important that no part of the antenna system be grounded, because of the balanced feed required on FM operation. On AM operation the entire antenna and feeder system act as the antenna. The antenna system should be located as high as possible. For those who wish to build their own, a drawing has been provided to furnish the necessary information.

Shielded leads from the tuner to the amplifier and also from the phonograph pickup to the female connectors in the rear of the RJ-12 chassis are essential. The two male connectors will be found plugged into the female connectors in the RJ-12 and several feet of shielded wire is packed with each tuner. Since individual installations will vary, this wire is uncut and not attached to the male connectors.

When making up the cables, the center conductor should be stripped and tinned, inserted in the center sleeve of the male connector, and heated until the solder flows making a good joint. Bring the braid up on the outside shell of the plug and solder all the way around.

There are some cases where the shield on the lead between the audio output of the RJ-12 and the amplifier employed may not be a sufficient ground bond between the two. In cases where there is any hum (not present in the audio amplifier itself), try bonding the RJ-12 chassis to the audio amplifier with copper braid or number 16 or larger wire.

Power requirements for the RJ-12 tuner are 250 volts DC at 65 milliamperes and 6.3 volts AC or DC at 4 amperes. Often times these voltages can be made available from the audio amplifier. If these voltages are not available, a separate power supply should be provided such as the Browning Model PF-12, a schematic diagram of which is shown.

OPERATION:

After proper installation, the set may be put into operation by turning the ON-OFF switch clockwise; the dial should be immediately illuminated. Within a minute of warming up, the tuning eye should emit a bright green glow. The set is ready for operation on AM. Allow a 10 minute warm-up period for FM.

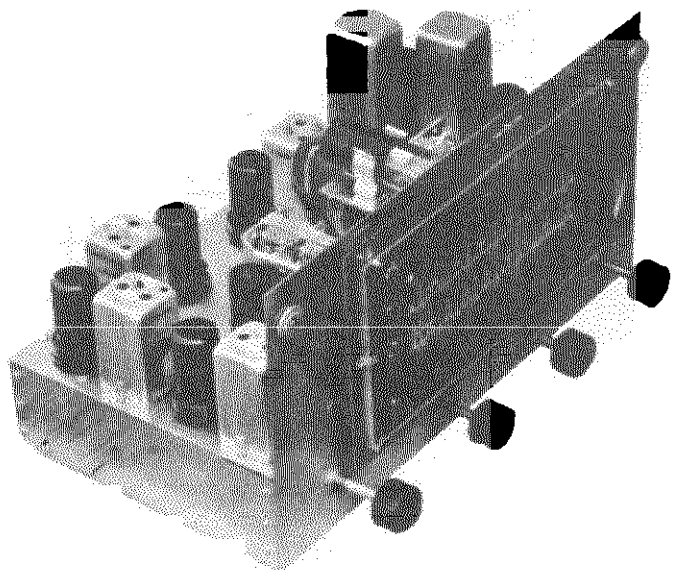
AM or FM reception can be selected by the AM-FM-PHONO switch. Starting with the band switch knob in the farthest counter-clockwise position and rotating clockwise gives AM-FM-PHONO reception. Rotate the TUNING knob to select the desired station. As the tuning approaches the station, the tuning eye will gradually close. Correct tuning is indicated by maximum eye closing. Increase the volume to the desired level by rotating the VOLUME knob clockwise. In tuning in FM stations, always tune for the complete elimination of noise. In cases where the signal strength of the FM station is too low to saturate the dual limiter, some background noise may be expected.

For those who wish to incorporate phonograph connections to the tuner, a phono input connector is provided at the rear of the chassis. By turning the selector switch to the PHONO position, the phonograph input is connected to the amplifier through the VOLUME control; thus eliminating a separate volume control for phonograph operation.

It should be noted that while tuning between stations, both on FM and AM, the rushing noise is normal for the tuner. The extreme high sensitivity is responsible for picking up random atmospherics, but this will be eliminated when a station is tuned in unless the signal strength of the station is of the same order of magnitude as that of the atmospheric noise.

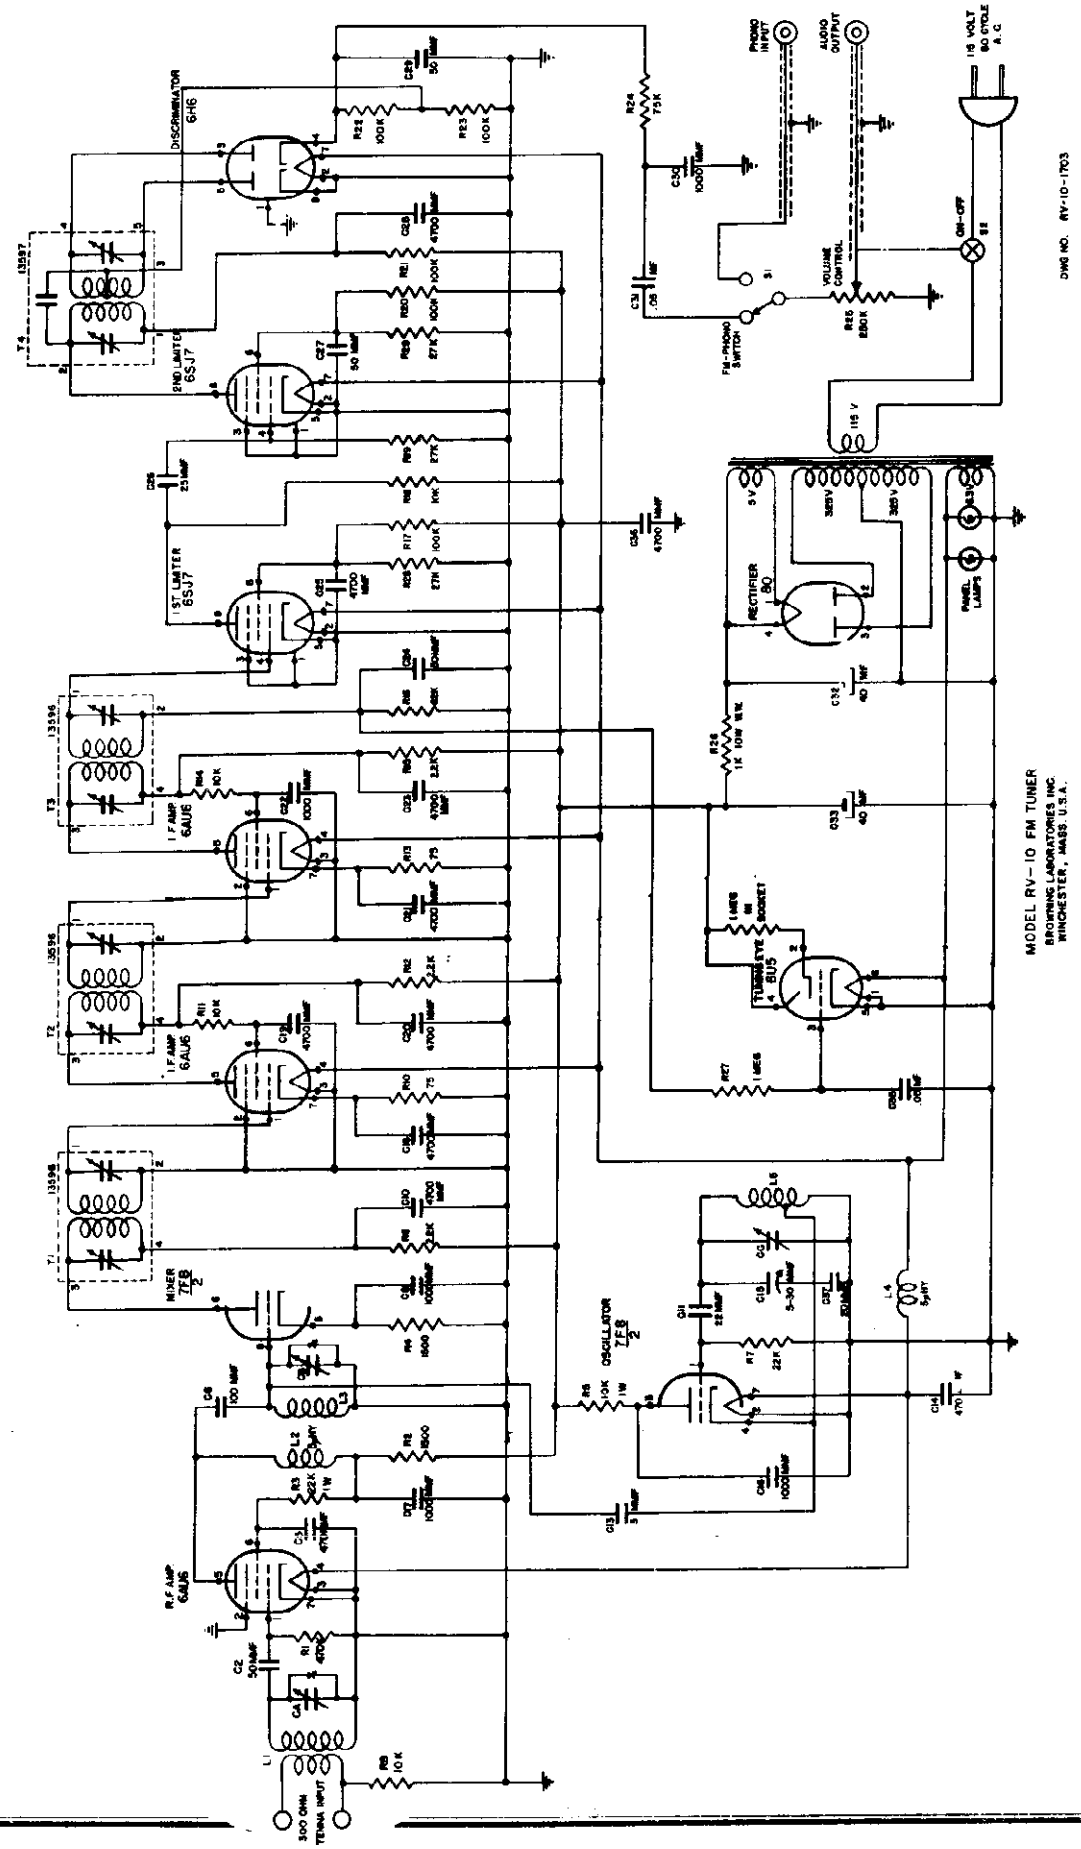
ADJUSTMENT:

No adjustment should be made on the tuner aside from the panel controls. Adjustments and alignment on the FM portion should only be made by experienced personnel with the proper visual alignment equipment. Ordinary meters or aural methods are in general unsatisfactory for alignment. Replacement of tubes can usually be made without realignment.



MODELS RV-10, RV-11

BROWNING LABORATORIES, INC.



ALIGNMENT PROCEDURE:

The following equipment is recommended for alignment of these models:

1. Standard signal generator.
2. FM signal generator capable of sweeping at least 200 kc. at 8.25 mc.
3. Oscilloscope.
4. Voltmeter of 20,000 ohm/volt or better.

RV-10 IF ALIGNMENT:

Visual Method: To align the IF section of the tuner using the visual method, connect the sweep voltage output of the frequency-modulated signal generator to the horizontal deflection input of the oscilloscope, and adjust the controls until the horizontal sweep nearly fills the screen. Adjust the FM signal generator to sweep from about 8.0 to 8.4 mc., and apply the output to the grid of the second IF stage. Connect the vertical deflection input of the oscilloscope across C24 in the grid circuit of the first limiter. The rectifying action of the grid circuit of this stage will provide a signal corresponding to the amplitude response of the preceding circuits. Adjusting the controls of the scope should produce a picture of the response curve. Always use as small a signal from the generator as possible consistent with a good image. In order to provide a frequency marker for alignment, apply a signal of exactly 8.25 mc. from the AM signal generator to the same grid where the FM signal is applied. This is best done by using a small mica isolation condenser in series with the 8.25 mc. source. Adjust the amplitude of the 8.25 mc. AM signal until a small marker pip appears on the response pattern, as shown in Fig. 7. Use only enough marker voltage in all cases so that the pip is just discernible. The location of this marker pip on the curve indicates the center alignment frequency of the amplifier. The adjustment screws of T3 should now be set for the desired characteristic. In all cases, the marker pip should be left at the center or axis of symmetry of the curve. Adjustment of the screws will produce varied patterns. For guidance, the curves of typical misalignment and proper alignment are shown in Fig. 7. Greater amplitude of the pattern indicates higher gain, so adjustments should be made not only for best symmetry but for optimum gain as well. Having adjusted T3 in this fashion, the output from the signal generators must now be applied to the grid of the first IF amplifier. Next, T2 should be adjusted in the same manner. Signal generator outputs should be reduced as a stage of gain has been added. When T2 is aligned satisfactorily, apply the signal

generators to the grid of the mixer tube. Align T2 for the best possible response curve. The pattern appearing on the screen at this point is the overall response of the whole IF amplifier and should be similar to that shown in Fig. 7 for proper alignment before going on to align the discriminator.

Meter Method: Satisfactory alignment can be made using only an AM signal generator and a high impedance DC voltmeter by the following method, although it is considerably more time-consuming than the visual procedure. The meter should have an impedance of at least 20,000 ohms per volt, and be capable of reading negative DC voltage of approximately 3 volts. Connect this meter across C24 in the grid circuit of the first limiter, with the ground side of the meter going to the grounded side of the condenser. The tuning eye employed in the tuner can be used for indicating maximum response. However, this is not as satisfactory as a meter. Apply the output of the AM signal generator to the control grid of the second IF amplifier tube. Set the signal generator to 8.25 mc. When making these adjustments, always use an input signal level which results in meter readings of from 1 to 2 volts.

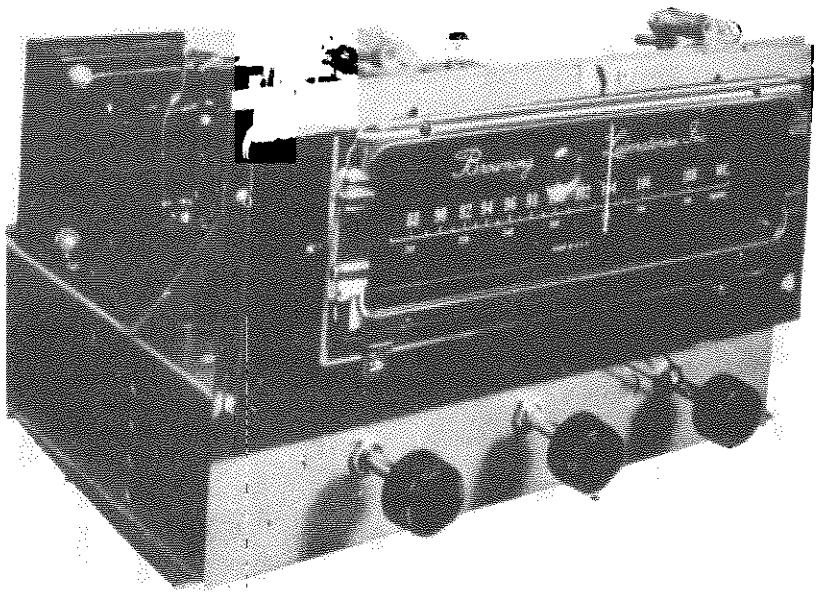
Adjust the screws on T3 for maximum meter reading. The frequency of the signal generator should be changed in steps of 20 or 30 kc. above and below 8.25 mc., and the readings noted in order to determine if the curve is symmetrical about the 8.25 mc. center frequency. If the results show that the curve is not symmetrical, further adjustments must be made and rechecked until a well-balanced curve results. When checks show the desired result, apply the signal to the grid of the first IF stage. Tune transformer T2 in the manner prescribed for T3. When this has been accomplished, transfer the AM signal generator to the grid of the mixer.

FM DISCRIMINATOR ALIGNMENT:

Visual Method: Alignment of the discriminator is easy with the visual method. Apply the output of the frequency-modulated generator to the grid of the first limiter. Apply a signal from the AM generator at 8.25 mc. to the same point. Connect the vertical input of the oscilloscope across C29 in the output of the discriminator. Make certain that the ground of the oscilloscope goes to the ground side of this condenser. Adjust the controls for the best image, using as small RF signals from both generators as practical. Alignment must be made for symmetry about the 8.25 mc. marker pip, and linearity above and below this point as shown in Fig. 8.

Meter Method: When only a meter and AM signal generator are available, connect the output of the generator to the grid of the first limiter, and a vacuum tube voltmeter, reading plus or minus DC voltage of about 2.0 volts, across C29 in the discriminator output. Set the frequency of the signal generator to exactly 8.25 mc. Adjust the secondary of the discriminator until the meter reads zero. Change the frequency of the generator in 20 kc. steps above and below 8.25 mc., and note the voltage generated at each step. Readings should increase linearly each side of center frequency out to 75 kc. Should more voltage be generated on one side than the other, adjust the primary of this transformer and recheck. A number of trials and checks should result in a curve very similar to that shown in Fig. 8.

FM RF ALIGNMENT: To align the RF portion of the tuner, a signal generator covering 88 to 108 mc. and a DC meter having an impedance of at least 20,000 ohms per volt and capable of reading 3.0 volts are required. Apply the signal generator to the antenna terminals and connect the meter across C24 in the first limiter. Set the signal generator at 108 mc. and set the tuner dial to the same frequency. Adjust the HF Osc. Trimmer (on top of chassis at rear of variable condenser) until the signal is heard or the meter indicates maximum voltage. Set the tuner dial at 90 mc., and the signal generator to correspond. With a non-conducting rod, compress or expand the oscillator inductance as needed to tune in the signal. Return the generator and dial to the high-frequency end and recheck. Readjust the trimmer if necessary. Adjustments of the inductance and trimmer are interacting, and several adjustments of each may be required for exact alignment. Reset the signal generator and tuner dial to 108 mc. Rock the tuning for maximum voltage indication on the meter. Adjust the signal level as necessary to maintain the voltage at less than 2.0 volts. Adjust the "RF Trimmer" (trimmer on the center section of variable) for highest meter reading. Set the generator and dial to 90 mc. and rock the tuning for highest meter reading. Adjust the RF coil inductance with the non-conducting rod for best gain. Here again, several adjustments at both ends of the band will be necessary for the best alignment since adjustment at the one end will affect tuning at the other. The antenna circuit can simply be trimmed at the high frequency end of the band and left, since the application of antenna or signal generator to the antenna terminals severely damps this circuit and the tuning is not critical. When this adjustment has been made, the tuner is completely aligned.



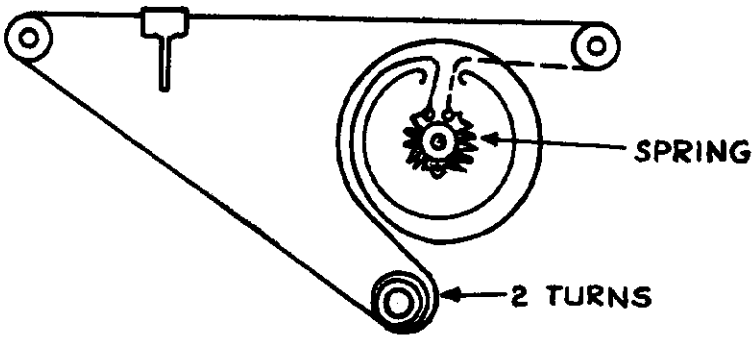
The tuner is designed for best performance with a 300 ohm FM antenna. Many such antennae are commercially available and should produce good results. Signal strength increases as the height of the antenna is increased, therefore, the antenna should be erected in the highest possible location. Losses in lead-in up to 75 ft. in length are unimportant. For those who wish to build their own antenna, dimensions are given on the drawing. The folded dipole shown gives good results over the entire band. It possesses a directional pickup pattern and should be oriented broadside toward the station of most interest or most difficult to receive.

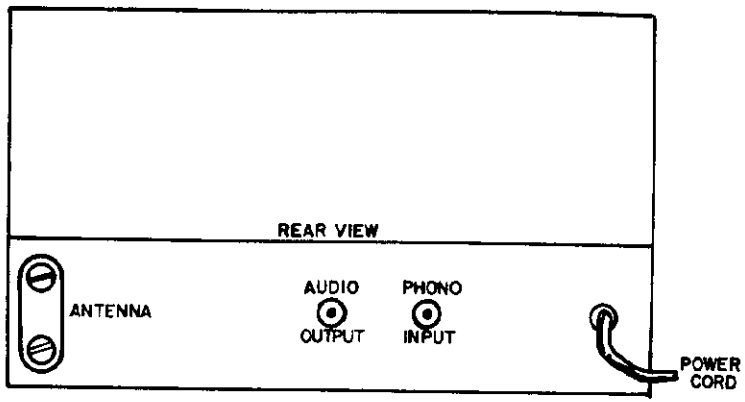
Shielded leads from tuner to amplifier and from phono pickup to tuner are essential. Two male connectors will be found plugged into the female connectors in the RV-10 and eight feet of shielded wire is packed with each unit. Since individual requirements vary, this wire is supplied uncut and not attached to the male connectors.

When making up the cables, the center conductor should be stripped of insulation and tinned, inserted in the center sleeve of the male connector, and heated until the solder flows making a good joint. Bring the braid up on the outside shell of the plug and solder all the way around.

DIAL STRINGING CHART:

NOTE: Remove dial plate to make pulleys and drum accessible.





In most cases, the shield braid will provide sufficient ground between tuner and amplifier. In infrequent cases, some hum may be encountered which can be cured by connecting the amplifier chassis to the tuner chassis with a piece of heavy copper braid. The hum level out of the tuner is very low and the hum experienced will generally be found in the amplifier used or in the method of connection to the tuner.

Remove chassis from cabinet for alignment. A signal generato is required having the following frequencies: 455 KC and 1400 KC An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT section of the gang condenser, through a .1 MFD. condenser. Th ground lead from the generator may be connected to any spot on th metal chassis. Turn the gang condenser to complete minimum ca pacity. Set the generator to 455 KC. Adjust the movable trimmers in th IF cans, until a maximum reading is noted on the output meter.

The volume control of the receiver should be turned to maximun during the IF and all subsequent alignment and the generator outpu as low as possible to prevent the AVC from working and giving fals readings.

SECOND STEP: With the leads from the generator still connected a in IF alignment, adjust the generator to 400 KC. Set the dial pointe to 1400 KC on the dial scale. Adjust the oscillator trimmer until th signal is tuned in.

THIRD STEP: Remove the generator leads from the condenser. Connec the hot lead from the generator through a 200 MMFD. condenser t one of the leads which project from the back of the loop antenna Connect the ground lead of the generator to the remaining lead. Wit the generator and the receiver still tuned to 1400 KC, adjust the antenn trimmer until a maximum reading is noted on the output meter.

ELECTRICAL CHARACTERISTICS

Tuning Range: Standard Broadcast 540-1640 KCS

Power Supply: Direct Current 105-125 volts or alternating current 105-125 volts, 50-60 Cycle or Batteries.

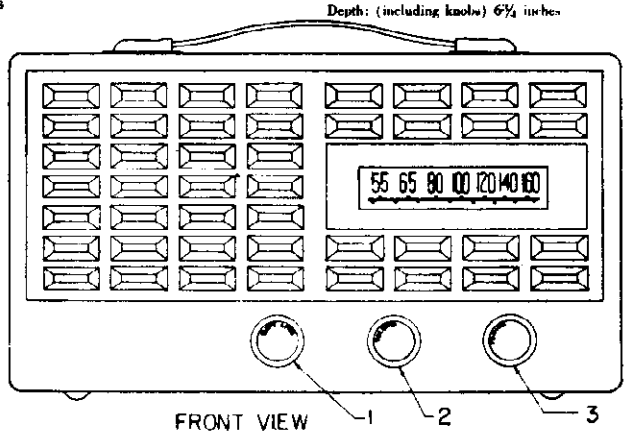
Power Consumption: AC or DC 12 watts

Battery Complement: 2—4½ Volt "A" Batteries
Eveready No. 746 or equivalent.

2—45 Volt "B" Batteries
Eveready No. 482 or equivalent.

Tube Complement: 1R5—Converter
1T4—1. F. Amplifier
1S5—2nd Det.—AVC—1st Audio
3Q4—Power Amplifier
117Z3—Rectifier

Mechanical Characteristics: Dimensions — Height: (including feet) 7⅛ inches
Width: 13 inches
Depth: (including knobs) 6¾ inches



SERVICING NOTES

All specifications and measurements based on 117 Volts, 60 Cycles, and all readings based on a 20,000 ohms per volt meter. All readings are taken with volume control (switch No. 2) in maximum clockwise position. Apply the lowest signallevel from the signal generator.

Output: 50 mw into a 3.2 ohm voice coil impedance.

Approximate reading 0.4 Volt.

I. F. ALIGNMENT: With signal generator, set a 455 KC, apply signal through a .1 MFD condenser dummy to R.F. grid of convertor (1R5) or the stator of RF section of the variable condenser (condenser must be fully meshed). Peak I.F. trimmers 1, 2, 3, 4 (top view diagram) to give maximum reading on output meter connected across voice coil. (Note: If for any possible reason the signal does not come through indicating the receiver is way out of alignment, apply the signal to the grid of the I.F. Amplifier (1T4) and tune signal in by trimmers 3, 4 of second I.F. Transformer. Peak for maximum and once this stage is tuned, repeat above procedure.)

R.F. Alignment: With signal generator, set at 1400 KC, apply signal through a dummy antenna (200 mmf condenser) to the antenna loop wire. Set dial of receiver to 1400 KC and peak trimmers 5 & 6 to give maximum reading of output meter. Then set signal generator at 600 KC and tune receiver to 600 KC mark on dial. This setting should fall on calibrated point.

ALL VOLTAGE AND RESISTANCE MEASUREMENT MADE WITH RESPECT TO CHASSIS GROUND AND WITH A LINE VOLTAGE OF 116 V. A. C.

A L I G N M E N T

THE CHASSIS MUST BE REMOVED FROM THE CABINET IN ORDER TO ALIGN THE RECEIVER. CONNECT THE OUTPUT METER ACROSS THE VOICE COIL. CONNECT THE SIGNAL GENERATOR TO THE STANDARD HAZELTINE MODEL 1150 LOOP, AND COUPLE LOOSELY TO THE RECEIVER LOOP. SET THE RECEIVER VOLUME CONTROL AT MAXIMUM.

THE TUNING CONDENSER PLATES SHOULD BE FULLY MESHED WHEN THE DIAL POINTER IS AT THE INDEX MARK AT THE LOW FREQUENCY END OF THE DIAL. THE SIGNAL GENERATOR OUTPUT SHOULD BE SUFFICIENT TO GIVE HALF SCALE DEFLECTION ON THE LOWEST SCALE OF THE OUTPUT METER. SET THE SIGNAL GENERATOR TO 455 KC. ADJUST THE I.F. TUNING SLUGS FOR MAXIMUM METER DEFLECTION IN THE FOLLOWING SEQUENCE: L2, L1. SET THE GENERATOR AND RECEIVER TO 700 KC AND ADJUST OSCILLATOR TRIMMER C2 FOR MAXIMUM OUTPUT. SET THE GENERATOR AND RECEIVER TO 1400 KC AND ADJUST LOOP TRIMMER C4 FOR MAXIMUM OUTPUT.

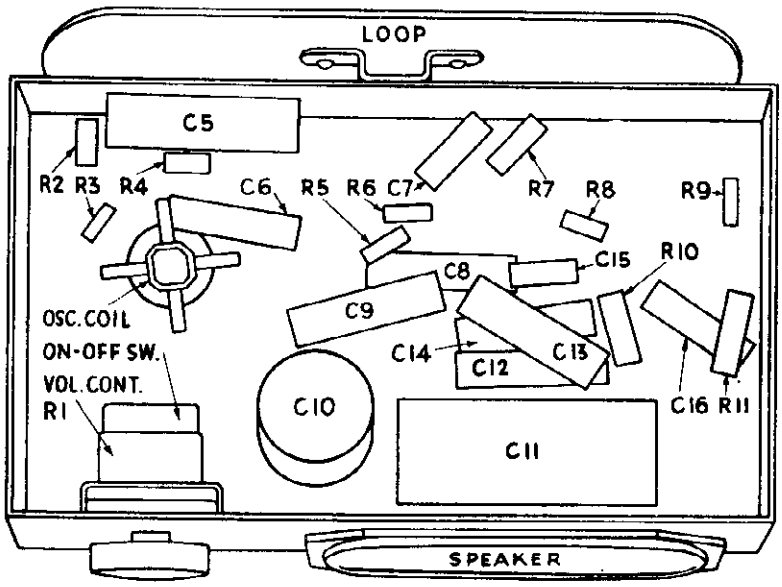
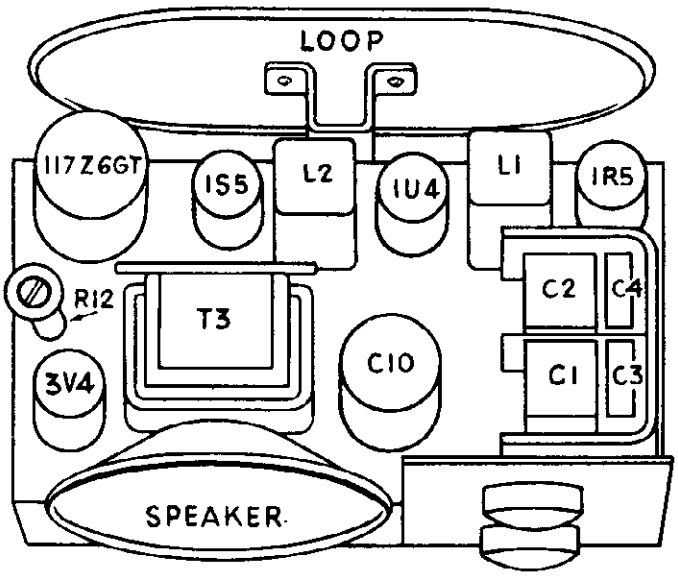
MODEL 1-518 CONCORD RADIO CORP.





ALIGNMENT

The chassis is removed from the cabinet in order to align this receiver.

Connect the output meter across the voice coil. Connect the signal generator to the standard Hazeltine loop, Model 1150, and couple loosely to the receiver loop. Set the receiver volume control to maximum. The tuning condenser plates should be fully meshed when the dial pointer is at the index mark at the low frequency end of the dial. The signal generator output should be sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc. Adjust the I.F. tuning slugs, L4, L3, L2, L1, for maximum output on the output meter. Set the signal generator and receiver to 1600 kc and adjust the oscillator trimmer C4 for maximum output. Set the signal generator and receiver to 1400 kc and adjust R.F. trimmer C3 for maximum output.

ALIGNMENT PROCEDURE

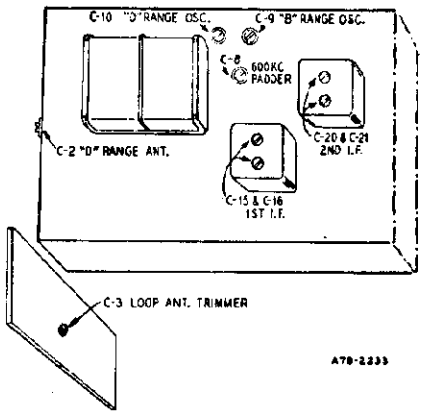
Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output See Note A	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.					
RANGE D	15.6 MC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	14 MC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2)
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)

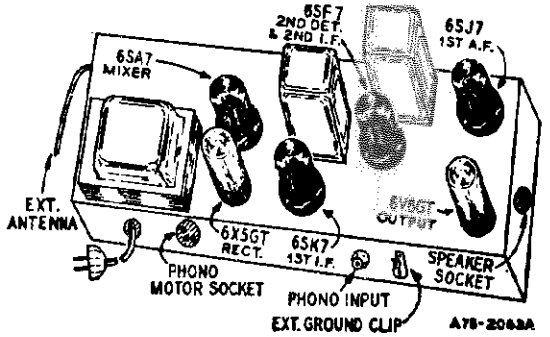


NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth and adjust the trimmer until peak of greatest intensity is obtained.

REMOVAL OF CHASSIS FROM CABINET

Before the chassis may be taken from the cabinet, it is necessary to pull off the 4 control knobs, remove the 4 chassis mounting bolts, disconnect the leads running to the loop antenna, record changer and speaker and loosen the screw and remove the black lead fastened to the lower left corner of the chassis.



SPECIFICATIONS

Power Consumption (at 117 Volts AC) ..... 40 Watts (normal) 58 Watts (phono operating)

Power Output ..... 4 Watts, Maximum 2.3 Watts, 10% Distortion

Tuning Frequency Range
- B Range ..... 540-1600 Kilocycles
- D Range ..... 9.25-15 Megacycles

Intermediate Frequency ..... 455 KC

Selectivity ..... 40 KC Broad at 1000 Times Signal

Sensitivity (For 0.5 Watt Output, with External Antenna)
- B Range ..... 9 Microvolts Average
- D Range ..... 20 Microvolts Average

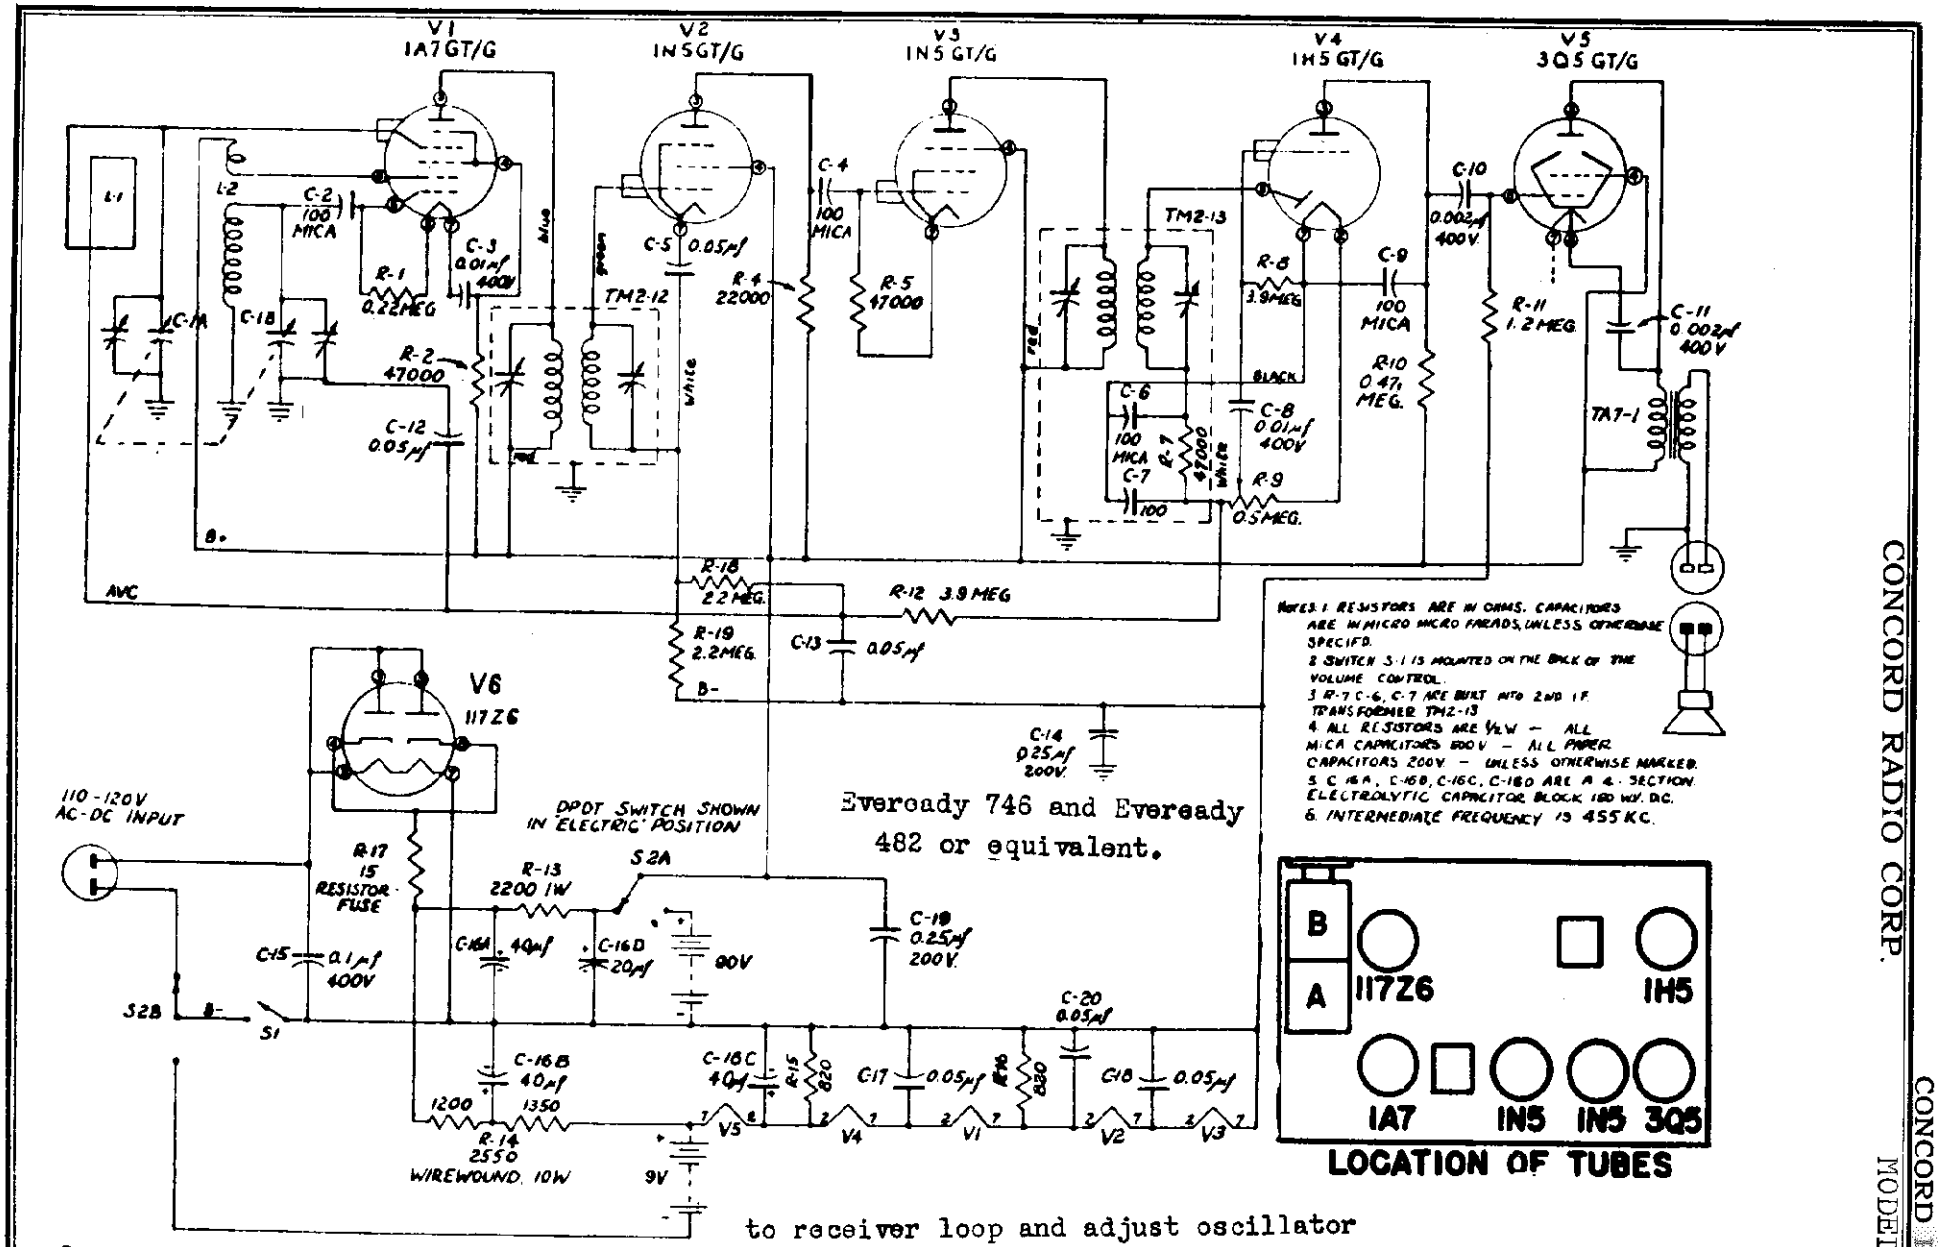
Motor Noise Elimination

1. Disconnect the center lead in the distributor head of the motor and insert a "distributor suppressor" in the cavity and then place the lead in the top receptacle of the suppressor.

2. Clamp a "generator condenser" under the screw which mounts the cut-out on the generator. Connect the flexible terminal of the condenser to the lead on the cut-out.

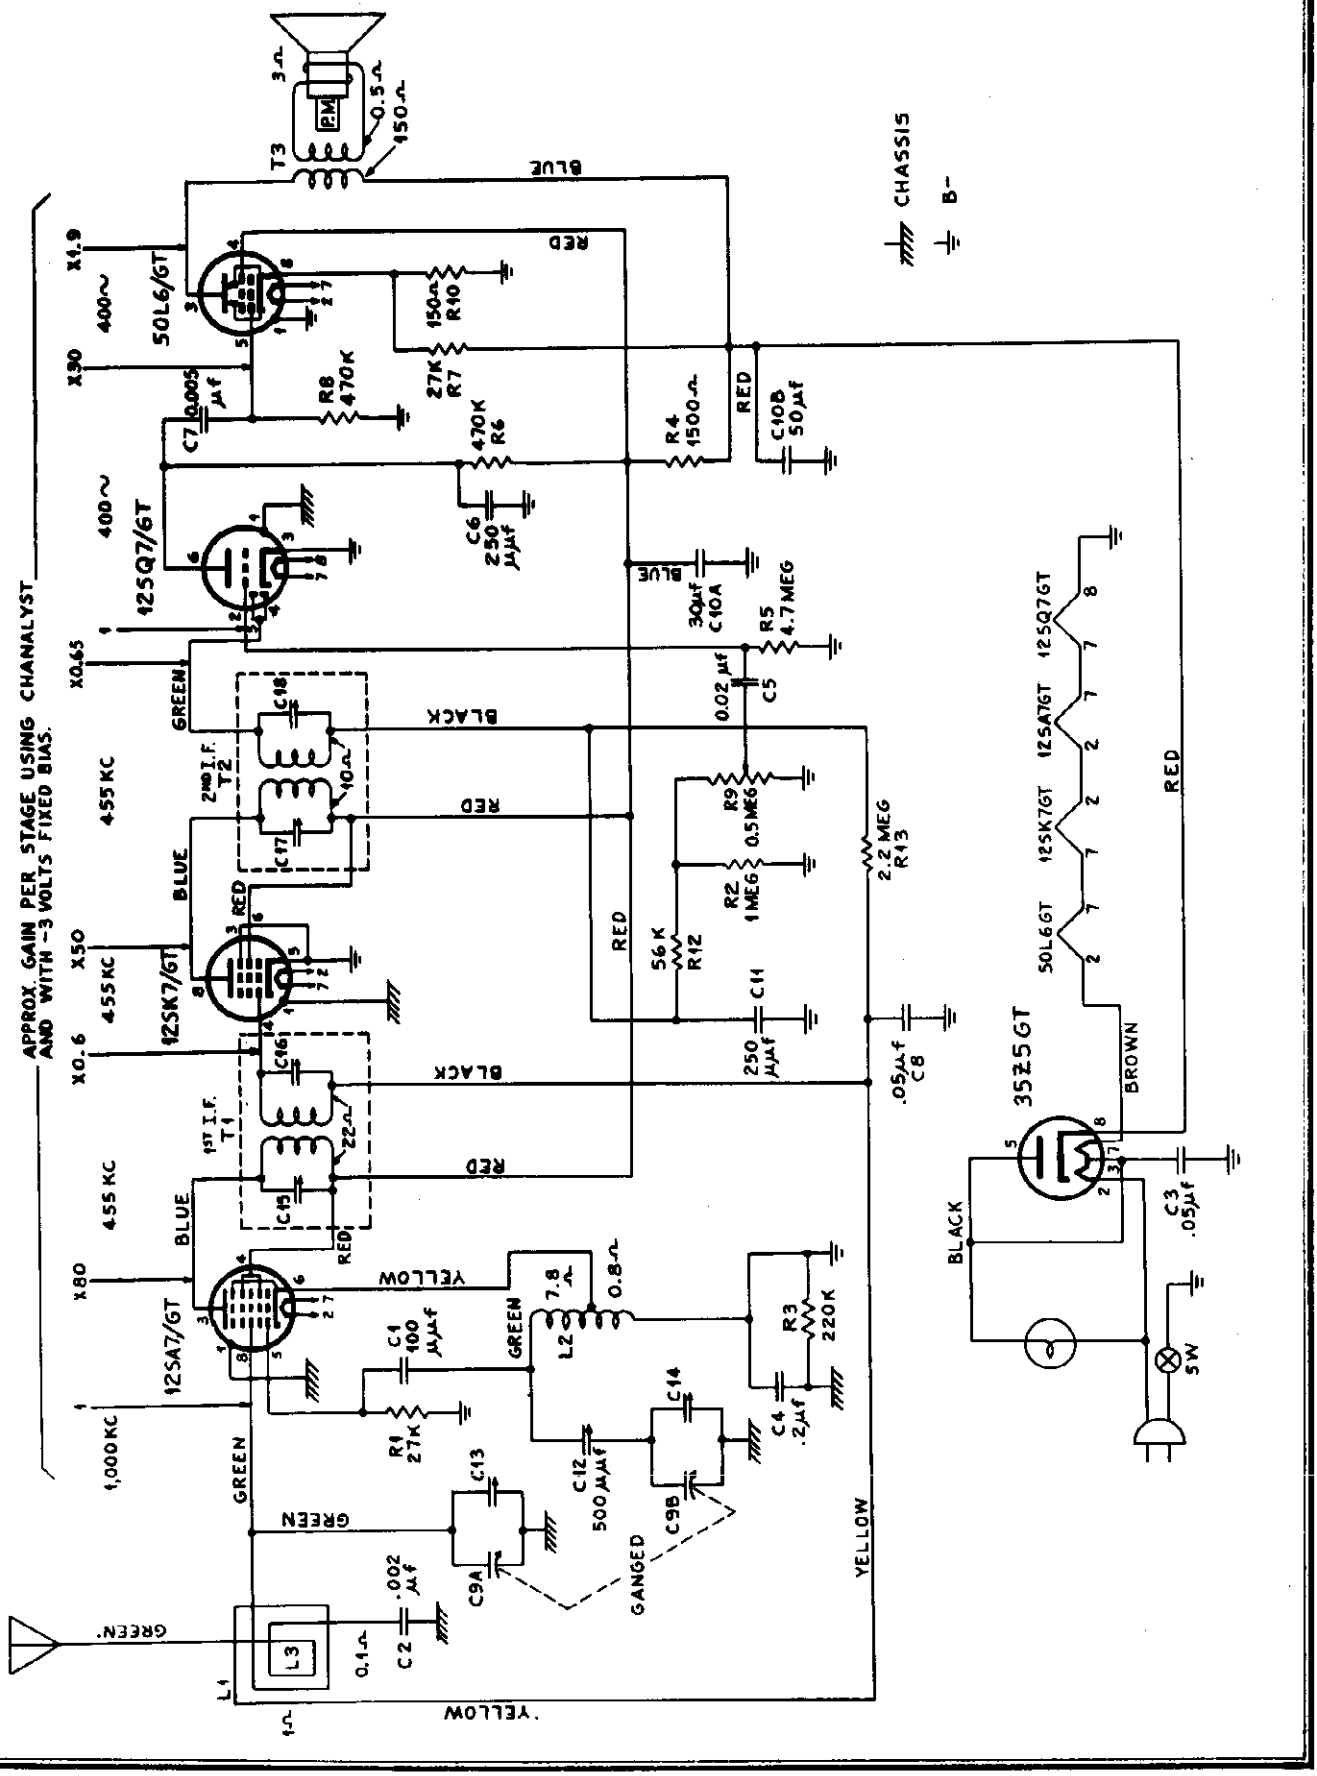
Caution: Do not screw stud in case beyond point necessary to insure support, otherwise, it may penetrate rear wall of case and cause damage to the instrument.



1. Using .01 mfd. capacitor, align i-f trimmers to 455 kc with smallest input.
2. With capacitor plates out of mesh, to receiver loop and adjust oscillator trimmer B to 1700 kc.
3. Adjust r-f trimmer A to 1550 kc for maximum response.

MODEL 6E51B

CONCORD RADIO CORP.



ALIGNMENT

Remove the chassis from the cabinet. Connect the output meter across the voice coil. Connect the signal generator to the Standard Hazeltine Model 1150 loop and couple loosely to the receiver loop. Set the receiver volume control at maximum.

The tuning condenser plates should be fully meshed when the dial pointer is at the low-frequency index. The signal generator output should be just sufficient to obtain a small deflection on the output meter.

Short the oscillator grid (12SA) pin 5 to B-). Set the signal generator to 455 KC. Adjust the IF trimmers in the following order: C18, C17, C16, C15. Set the generator and receiver at 1600 KC and remove the short from the oscillator and adjust oscillator trimmer C14 for maximum output. Set the signal generator and receiver at 600 KC and adjust oscillator padder C 12 for maximum output.

Go back to 1600 KC and adjust oscillator trimmer C 14 for maximum output. Return to 600 KC and readjust oscillator padder C 12 for maximum output, rocking the main tuning condenser during this adjustment for maximum output. Set the receiver and signal generator at 1400 KC and adjust the RF trimmer for maximum output. This completes the alignment.

ALIGNMENT OF CORONET MODEL 1701X
I.F. ALIGNMENT

Connect on output meter across the voice coil.

Connect the signal generator to pin 8 of the 12SA7GT, through a 0.01 mf capacitor. Tune the signal generator to 455 KC, and fully mesh the main tuning capacitor of the receiver.

Keep the receiver volume control at maximum and the output of the signal generator sufficient to give a readable deflection on the output meter.

Adjust for maximum IF Trimmers C11, C10, C9, and C8.

R.F. - Osc. Adjustments.

The short wave band 3 should be tuned first, short wave band 2, second, and Broadcast band 1 last.

Turn the band switch clockwise to position 3.

Keep the same setup used for I.F. alignment, and apply a 16 mc. signal to antenna coupling capacitor C12, located on top rear of chassis. Tune the receiver to 16 mc. and adjust for maximum oscillator trimmer C2.

Adjust antenna trimmer C7 for maximum ouptut at 16 mc.

Turn the band switch counter clockwise to position 2.

This band has no trimmer for the antenna coil, and since Oscillator trimmer C2 is used for both band 3 and 2, the calibration of band 2 is dependent on the calibration of band 3; And vice versa.

Tune the signal generator and receiver to 5 mc., and check the calibration of band 2. It should be fairly accurate. If it is off to any great extent, Oscillator trimmer C2 can be used to balance the descrepancy in frequency between band 3 and 2.

Turn the band switch counter clockwise to position 1 broadcast band.

Tune the signal generator and receiver to 1560 KC. Adjust oscillator trimmer C5 for maximum.

Tune the signal gnnerator and receiver to 600 KC and adjust low frequency padder C6 for maximum while rocking the main tuning capacitor.

Tune the signal generator and receiver to 1560 KC and adjust antenna trimmer C4 for maximum output. Then tune the signal generator and receiver to 600 KC and adjust tuning slug L1 for maximum output.

The entire prceedure for the broadcast band should be repeated for best results.

AVCO MFG. CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be fed to the receiver as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.
4. Turn the tone control to its treble position.
5. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on page 1, Chassis, Rear View.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the low frequency end of the dial scale.
2. Turn the tone control to the treble (clockwise) position.
3. Connect the output meter across the speaker voice coil.
4. The r. f. signal input from the signal generator should be connected through a condenser as indicated in the alignment chart. Connect the signal generator ground to the receiver chassis.
5. Turn the volume control on full and adjust the signal generator output to produce approximately normal scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
6. Loop antenna must remain connected at all times.

CROSLEY DIV.
AVCO MFG. CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference notch at the low frequency end of the dial background.
2. Turn the tone control to the treble (clockwise) position.
3. Connect the output meter across the speaker voice coil.
4. The r. f. signal input from the signal generator should be connected through a condenser as indicated in the alignment chart. Connect the signal generator ground through a 0.1 mfd. condenser to B— (pin 2 on 6BJ6 tube socket).
5. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
6. Loop antenna must remain connected at all times.

ALIGNMENT NOTES

1. Turn I. F. trap core "A" counter-clockwise to stop.
2. To perform step 5 and 6, attach the chassis bottom to chassis and move loop antenna as far away from chassis as the loop brackets will permit.
3. Adjust for maximum output.

ALIGNMENT CHART

Alignment adjustments are shown in "CHASSIS VIEW,"

Alignment Sequence	Signal Generator Output			Position of Tuning Dial or Var. Cond.	Adjust	Remarks

MODELS 9-11
9-120W

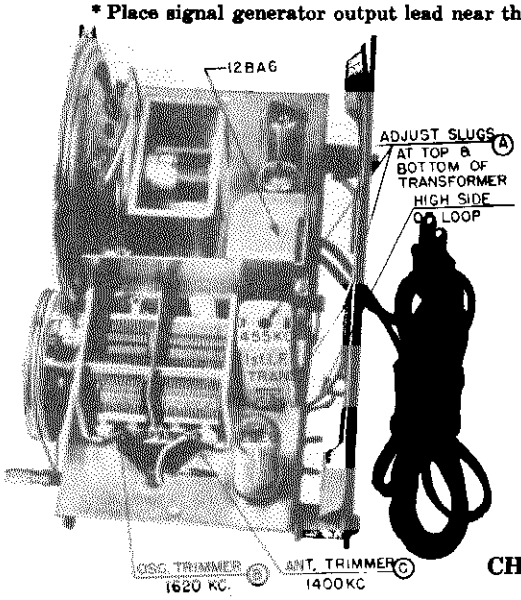
ALIGNMENT PROCEDURE

1. Connect an output meter across the speaker voice coil.
2. The r.f. signal input from the signal generator should be connected to the high side of loop antenna. Connect the signal generator ground through a 0.1 mfd. condenser to B— (pin 2 on 12BA6 tube socket).
3. Turn the volume control on full and adjust the signal generator output to produce approximately midscale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment Sequence	Signal Generator Output			Position of Dial Pointer	Adjust for Maximum Output
	Frequency in kc.	In Series with	To		
1	455	200 mmf.	High Side of Loop	1620	A
2	1620	*Radiated to Loop		1620	B
3	1400	*Radiated to Loop		1400	C

* Place signal generator output lead near the loop antenna.



When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce hum.

Under no circumstances should a ground be connected to this receiver.

AVCO MFG. CORP.

ALIGNMENT PROCEDURE NOTES

1. Shunt a 1000 ohm resistor across the primary (A to E) on the first I.F. transformer (5) and adjust transformer secondary trimmer for maximum output. Remove shunt and transfer it to transformer secondary (C to D) and adjust transformer primary trimmer for maximum output.
2. Connect the two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6T8 to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 33,000 ohm resistor (68) and the 1000 mmf. condenser, (33). Adjust the ratio detector transformer secondary (D) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.
3. Connect the electronic voltmeter across the 27,000 ohm load resistor (77) and adjust primary of core (A) of the ratio detector transformer (7) for maximum DC output.
4. Connect output of marker generator across sweep generator output. Connect CRO across the 22,000 ohm resistor (64) in the grid circuit of the second I.F. amplifier.
5. CRO connections same as note 4.
6. For dummy antenna see figure 1.

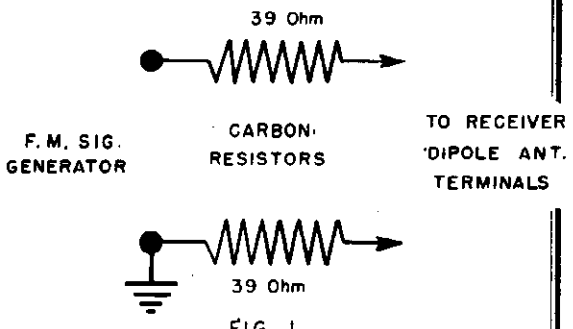

FIG. 1

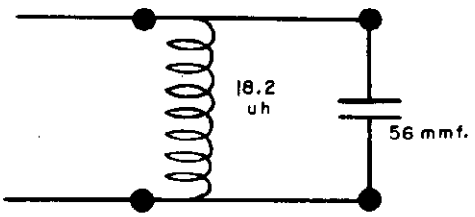

7. Tune in signal and adjust for maximum sensitivity by a slight movement in either direction from the hairpin loop.
8. Tune in signal and adjust for greatest sensitivity.
9. Connect CRO in series with 100,000 ohm resistor to grid of R.F. amplifier and chassis. Connect output of marker generator across output of sweep generator. Adjust (M-N) until pattern and markers approximate figure in alignment chart.

9a. Shunt primary of FM antenna transformer with a 10 ohm carbon resistor and adjust (M) for maximum output. Remove shunt and place it across FM antenna transformer secondary and adjust (N) for maximum output. Remove shunt.

10. Connect BC. dummy loop (Fig. 2) across loop terminals on rear of chassis.

MEGACYCLES TO CHANNEL NUMBERS

Cross index between frequency calibrations in megacycles on the dial and channel numbers follow:

Frequency in Megacycles	Channel No.	Frequency in Megacycles	Channel No.
87.9	200	98.9	255
88.9	205	99.9	260
89.9	210	100.9	265
90.9	215	101.9	270
91.9	220	102.9	275
92.9	225	103.9	280
93.9	230	104.9	285
94.9	235	105.9	290
95.9	240	106.9	295
96.9	245	107.9	300
97.9	250		

To find the frequency in megacycles for CHANNEL NUMBERS between those given above, add .2 megacycle for every whole number added to the CHANNEL NUMBER; for example Channel 204 would be 88.7 megacycles and 251 would be 98.1 megacycles.

MODELS 9-201,
9-202M, 9-203

ALIGNMENT PROCEDURE

1. This receiver has been aligned at the factory for best performance, and no attempt should be made realign it unless the proper test equipment is available.
2. Turn the tuning condenser to full mesh against stop and position the pointer 2-3/8 inches from l side of dial background. In the FM band, the pointer is 5-7/16" from the left side at 98 mc. and in t AM band 8-13/32" from the left side for 1400 kc.
3. Connect the output meter across the speaker voice coil (3.2 ohms). Connect the CRO as indicated the alignment procedure notes.
4. Feed an R.F. amplitude modulated signal, modulated 30% at 400 cycles to the receiver as indicat in the alignment chart. When the FM signal generator is used, connect as indicated in the alignme chart. A 30% modulated signal is equal to a deviation of 22.5 kc.
5. Turn the volume control knob to maximum clockwise position and adjust the signal generator o put to produce a noticeable output meter reading. Keep the signal generator output as low as possi to prevent excessive AVC action in the receiver.
6. Set the tone control to treble position.
7. The broadcast band must be aligned with the built-in loop antenna connected. If the chassis is moved from the cabinet, a suitable dummy antenna consisting of a coil of 18.2 uh. inductance parallel with a 56 mmf. capacitor must be used. (See circuit)
8. The short lead wire with the spade lug on the rear of the chassis should be removed from the upp screw on the antenna terminal strip, if it is connected.
9. For complete receiver alignment, see the alignment procedure chart ------- and alignment pro dure notes.
10. For position of trimmers, refer to chassis rear view -------and socket voltage chart. — — (S schematic diagram - - - - for item No's.)

MODEL 9-302

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial poin to the reference line at the 550 kilocycle end of the scale.
2. Connect the output meter across the speaker voice coil.
3. Connect a 47,000 ohm resistor from the antenna trimmer lug on the tuning condenser to the lug the terminal board next to the tuning condenser.
4. Connect the high side of the signal generator, through a 200 mmf. condenser, to the antenna trimm lug. Connect the signal generator ground through a 0.1 mmf. condenser to B—(Black wire or El trolytic Filter Condenser.)
5. Turn the volume control on full and adjust the signal generator output to produce approximately mi scale deflection of the output meter, but maintain signal generator output as low as possible to pr vent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on Chassis View—Model 9-302

Alignment Sequence	Signal Generator Output			Position of Dial pointer or Var. Cond.	Adjust for Maximum Output	Remarks
	Frequency in KC	In Series with	To			
1	455	200 mmf.	Antenna Trimmer Lug	Closed	A & B	See steps 3 & 4 of Alignment procedure
2	1620	200 mmf.	Antenna Trimmer Lug	Open	D	See note 1 of Alignment notes
3	1400	200 mmf.	Antenna Trimmer Lug	1400 kc	E	See note 2 of Alignment notes
4	1400	200 mmf.	Antenna Clip	1400 kc	F	See note 3 of Alignment notes

ALIGNMENT NOTES

1. Preset "C" to ⅛ turn from its closed position before adjusting "D".
2. Preset "G" to ¼ turn from its closed position before adjusting "E".
3. Remove the 47,000 ohm resistor from the antenna trimmer lug and the Terminal board lug. Repla the chassis in the cabinet, install the battery pack in the cabinet under the chassis and close the cab net back panel. Remove the hole plug from the cabinet back and adjust trimmer "F". Replace ho plug.

AVCO MFG. CORP.

DESCRIPTION

TYPE: Five-tube, combination, battery Portable and AC-DC Superheterodyne with Selenium Rectifier.

FREQUENCY RANGE: 540 to 1600 kilocycles.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: AC-DC or Battery.

VOLTAGE RATING: AC-DC, 110 to 120 volts. Battery "A" 7½ volts, "B" 90 volts.

POWER OUTPUT: 200 M.W. maximum

POWER CONSUMPTION: 15 watts at 125 volts, 60 cycle.

"A-B" BATTERY PACK: one Crosley CR68, 7.5 "A" volts—90 "B" volts.

TUBE COMPLEMENT:

Type	Function
1L4	R.F. Amplifier
1R5	Mixer
1L4	I.F. Amplifier
1U5	Detector, AVC, 1st A.F. Amplifier
3V4	A.F. Power Output

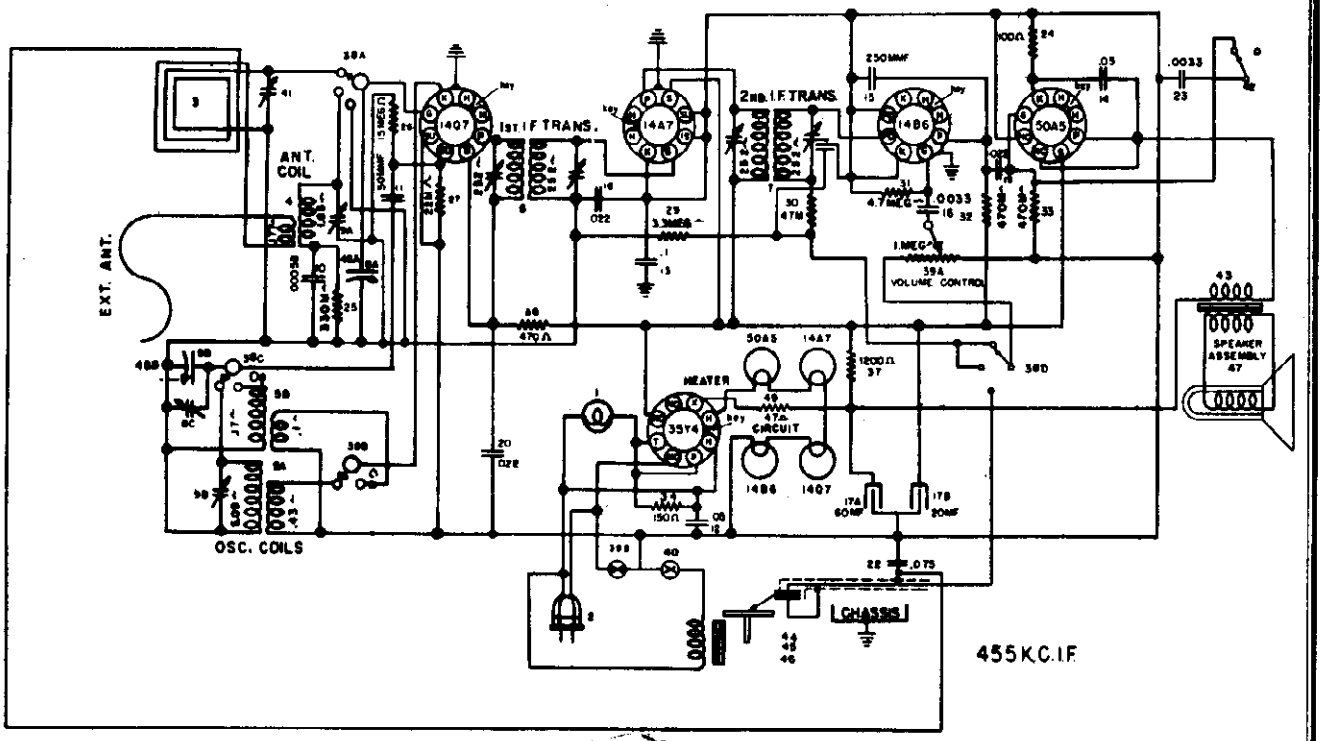
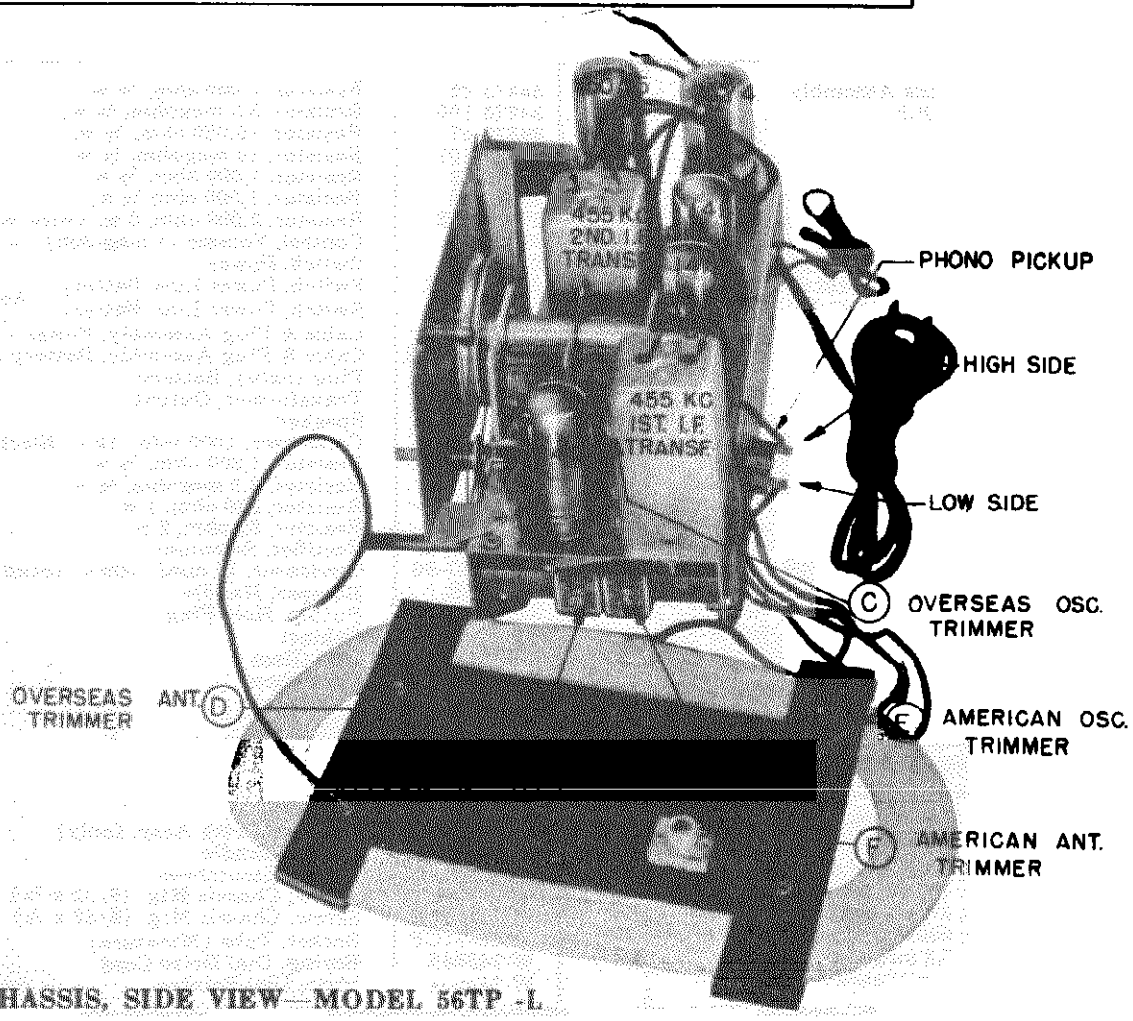
MODEL 56TP-L

CROSLEY DIV.
AVCO MFG. CORP.





CHASSIS, SIDE VIEW—MODEL 56TP-L

CROSLEY DIV.
AVCO MFG. CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be connected to the external antenna lead. Connect the signal generator ground through a 0.1 mfd. condenser to —B (pin 3 on 12SK7 tube socket).
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on Chassis, Side View—Model 56TP -L

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	Left	1,620	A & B
2	15,300	400 ohms	Ant.	Right	15,300	C
3	15,000	400 ohms	Ant.	Right	15,000	D
4	1,620	200 mmf.	Ant.	A	1,620	E
5	1,400	200 mmf.	Ant.	A	1,400	F

NOTE: When aligning the short-wave oscillator trimmer (C), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i.e., the oscillator trimmer may be adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

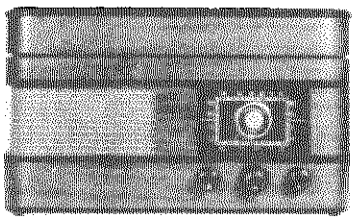
MODEL: 56TP-L



Reversing the position of the power plug when alternating current is used may reduce power hum. *Under no circumstances should a ground be connected to this receiver.*

TYPE: Five-tube, two-band, superheterodyne.

FREQUENCY RANGE: American Broadcast Band: 540 to 1600 kc. (Selector switch at A.)

Overseas Short-wave Band: 5.8 to 15 mc. (Selector switch at 0.)

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: 60 cycle a.c. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 35 watts nominal.

POWER OUTPUT: 1.5 watts minimum.

TUBE COMPLEMENT:

Type	Function
14Q7	Mixer
14A7	I. F. Amplifier
14B6	Detector, AVC, 1st A.F. Amplifier
50A5	A.F. Power Output
35Y4	Rectifier

DIAL BULB: Type 47, 6.3 volts, .15 amp.

CROSLEY DIV.
AVCO MFG. CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Turn tone control switch to normal tone position.
3. Connect the output meter across the speaker voice coil.
4. The r.f. signal input from the signal generator should be connected to the external antenna clip. Connect the signal generator ground through a 0.1 mfd. condenser to—B (pin 3 on 12SK7 tube socket).
5. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

CHASSIS, SIDE VIEW

TYPE: Five-tube, single band, superheterodyne.

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: a.c—d.c.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 35 watts nominal.

POWER OUTPUT: (E.M. Speaker) 1 watt maximum (P.M. Speaker) 1.75 watts maximum

VOLTAGE DROP ACROSS SPEAKER FIELD: 27 volts.

When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce power hum.

Under no circumstances should a ground be connected to this receiver.

58TH-O

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. input from the signal generator should be connected to the external antenna lead. Connect signal generator ground through a 0.1 mfd. condenser to —B (See Socket Voltage Chart).
4. Turn the volume control on full and adjust the signal generator output to produce approximately m scale deflection of the output meter, but maintain signal generator output as low as possible to prev AVC action in the receiver.

ALIGNMENT CHART

2	35Z5GT/G)	Rectifier

DIAL BULB: Type 47, 6.3 volts, .15 amp.

When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce power hum.

Under no circumstances should a ground be connected to this receiver.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop, and set the dial pointer to the reference line at the low frequency end of the dial scale.
2. Turn the tone control to the high or treble position.
3. Connect the output meter across the speaker voice coil.
4. The r. f. signal input from the signal generator should be connected to the external antenna terminal (A-2), as indicated in the alignment chart. Connect the signal generator ground to the chassis.
5. Turn the volume control on full, and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment Sequence	SIGNAL GENERATOR OUTPUT			POSITION OF		Adjust for Maximum	Osc. Frequency	Remarks
	Frequency	In Series with	To	Band Switch Knob to	Dial Pointer			
1	455 kc.	200 mmf.	Ant. (A-2)	Left	1650 kc.	A & B	.....	
2	21.0 mc.	70 ohm Resistor	Ant. (A-2)	Right	21.0 mc.	C	Above	Ground Ant. (A-1).
3	21.0 mc.	70 ohm Resistor	Ant. (A-2)	Right	21.0 mc.	D	Above	Rock gang as trimmer is aligned.
4	7.0 mc.	70 ohm Resistor	Ant. (A-2)	Midway	7.0 mc.	E	Above	Ground Ant. (A-1)
5	7.0 mc.	70 ohm Resistor	Ant. (A-2)	Midway	7.0 mc.	F	Above	Rock gang as trimmer is aligned.
6	1400 kc.	200 mmf.	Ant. (A-2)	Left	1400 kc.	G	Above	Remove ground from Ant. (A-1).
7	1400 kc.	200 mmf.	Ant. (A-2)	Left	1400 kc.	H	Above	

NOTE: When aligning the short-wave oscillator trimmer (C), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

CROSLEY DIV.
AVCO MFG. CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r. f. signal input from the signal generator should be connected to the external antenna post as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain the signal generator output as low as possible to prevent AVC action in the receiver.

NOTE: The Signal Web antenna must remain connected, or if the chassis is removed from cabinet, a suitable dummy loop antenna should be connected in its place.

ALIGNMENT CHART

Alignment adjustment locations are shown on Chassis, Rear View—Model 66CS(O)

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series With	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	A	1620	A & B
2	455	200 mmf.	Ant.	A	1620	C*
3	15,300	400 ohms	Ant.	O	15.3	D
4	15,000	400 ohms	Ant.	O	15.0	E
5	1620	200 mmf.	Ant.	A	1620	F
6	1400	200 mmf.	Ant.	A	1400	G
7	600	200 mmf.	Ant.	A	600	H
8	1400	200 mmf.	Ant.	A	1400	Recheck G

*Adjust for Minimum Output (Wave Trap).

NOTE: When aligning the "Overseas" oscillator (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower in frequency as indicated on the dial. To check: tune in signal generator frequency, then increase the generator output and tune in the image frequency which should be audible, but weaker than the fundamental frequency. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak. The correct peak is the second peak of the trimmer from the closed position.

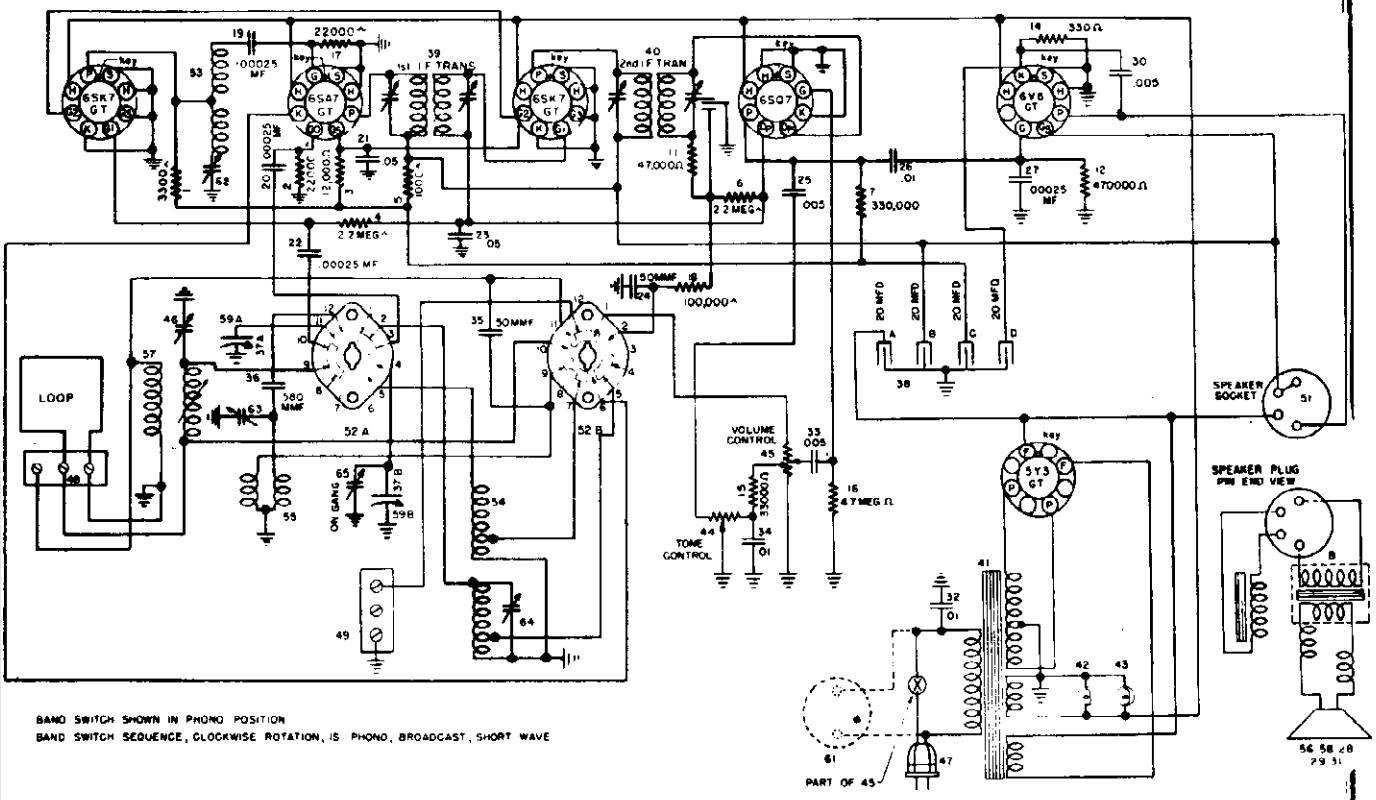
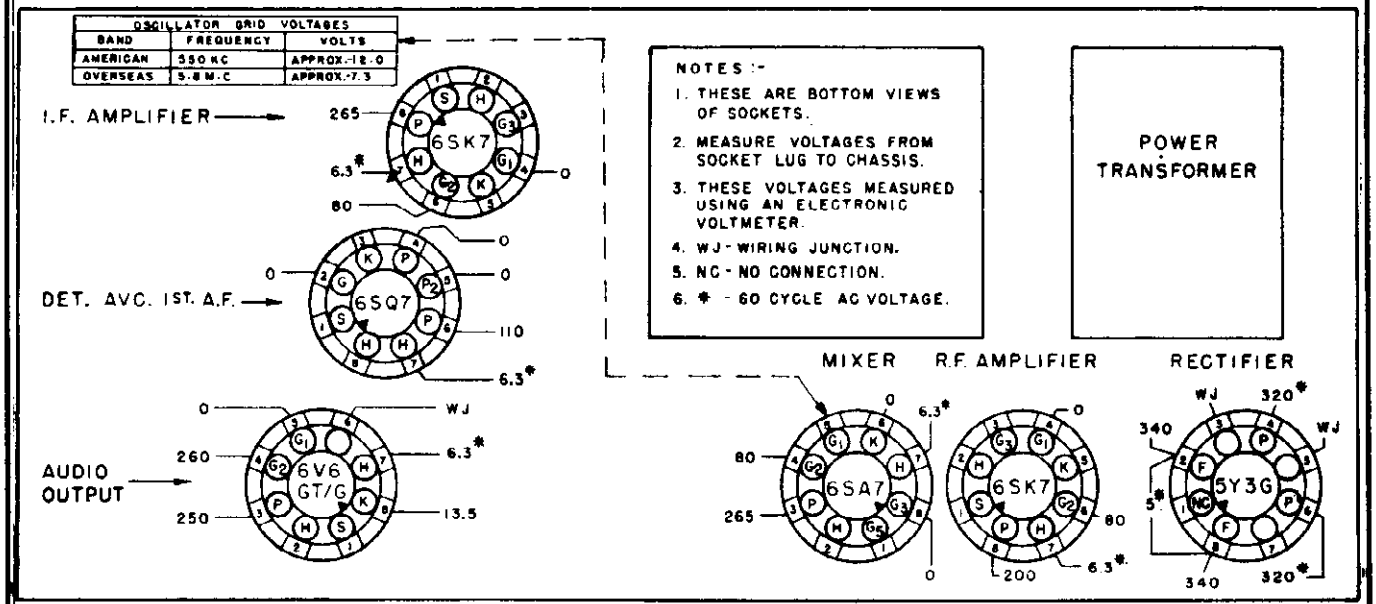
MODEL 66CT

CROSLEY DIV.
AVCO MFG. CORP.



SOCKET VOLTAGE CHART



SOCKET VOLTAGE TOLERANCE: 10%

TYPE: Six-tube, two-band, superheterodyne.

FREQUENCY RANGE: American Broadcast Band, 540 to 1600 kc. (Selector Switch at A.)

Overseas Short-wave Band, 5.8 to 15 mc. (Selector Switch at 0.)

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: 60 cycle a. c. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 60 watts maximum.

POWER OUPUT: 4.5 watts minimum.

VOLTAGE DROP ACROSS SPEAKER FIELD: 76 volts.

RESISTANCE OF SPEAKER FIELD: 900 ohms.

RECORD CHANGER: Seeburg Model K, RCD.CH. 15-2

CROSLEY DIV.
AVCO MFG. CORP.
MODEL CO(

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r. f. signal input from the signal generator should be connected to the external antenna post as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain the signal generator output as low as possible to prevent AVC action in the receiver.

Alignment adjustment locations are shown on Chassis, Rear View-

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series With	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	A	1620	A & B
2	455	200 mmf.	Ant.	A	1620	C*
3	15,300	400 ohms	Ant.	O	15,300	D
4	15,000	400 ohms	Ant.	O	15,000	E
5	1620	200 mmf.	Ant.	A	1620	F
6	1400	200 mmf.	Ant.	A	1400	G
7	600	200 mmf.	Ant.	A	600	H
8	1400	200 mmf.	Ant.	A	1400	Recheck G

*Adjust for Minimum Output (Wave Trap).

NOTE: When aligning the "Overseas" oscillator trimmer (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak of the trimmer from the closed position.

ALIGNMENT PROCEDURE

1. Turn the tuning capacitor to the completely closed position against the stop, and set the dial pointer to the reference line at the end of the dial scale.
2. Turn the tone control to the high or treble position.
3. Connect the output meter across the speaker voice coil.
4. The r. f. signal input from the signal generator should be connected to the external antenna post. Connect the signal generator ground to the chassis.
5. Turn the volume control on full, and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
6. Loop antenna must be connected when making alignments.

ALIGNMENT CHART

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in k c.	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	M	1650 KC	A & B
2	455	200 mmf.	Ant.	M	1650 KC	C*
3	15,500	400 ohms	Ant.	S	15.5 MC	D
4	15,000	400 ohms	Ant.	S	20 M	E
5	1650	200 mmf.	Ant.	M	1650 KC	F
6	1400	200 mmf.	Ant.	M	1400 KC	G
7	600	200 mmf.	Ant.	M	500 M	H
8	1400	200 mmf.	Ant.	M	1400 KC	Recheck G

*Adjust for minimum output (wavetrap).

NOTE: When aligning the short-wave oscillator trimmer (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

TYPE: Six-tube, two band superheterodyne with ter minals provided for record player.

FREQUENCY RANGE: Medium wave band: 540 to 1650 kc. (555 to 182 meters), Band Switch at (M). Shortwave Band: 4.7 to 15.5 mc. (63 to 19.35 meters), Band Switch at (S).

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: Models 66XTA, 66XTA-10, 50-60 cycle a. c. only. Model 66XTA-20, 25-40 cycles a. c. only.

VOLTAGE RATING: Models 66XTA, 66XTA-20, 105-125 volts. Model 66XTA-10, 210-250 volts.

POWER CONSUMPTION: 60 watts maximum.

POWER OUTPUT: 4.5 watts maximum.

Under no circumstances should a ground be connected to this receiver. Never place the receiver chassis on a metal bench or grounded object when the power plug is connected to the electric outlet. To avoid shock, when making repairs or adjustments, do not permit any part of the body to contact grounded metal objects.

ALIGNMENT EQUIPMENT

The following equipment is used as indicated in the alignment chart and alignment notes:

SIGNAL GENERATORS:

1. Amplitude Modulated Signal Generator with 400 cycle modulated signal to cover 455 to 1600 kc.
2. Frequency Modulated Signal Generator to cover 10.7 to 108 mc., with sweep to cover 450 kc. for the 10.7 mc. alignment.

CATHODE RAY OSCILLOGRAPH:

METERS:

1. Suitable Output Meter.
2. Field Strength Meter (Fig. 1). This meter may consist of a D.C.100 microampere (full scale) meter, shunted by a 1000 mmf. mica by-pass condenser; a germanium crystal rectifier connected in series with the meter and a five foot, 75 ohm twisted, pair of leads. Shunt the meter end of the leads with a 75 ohm carbon resistor. The open ends of the leads are connected to the F.M. dipole antenna terminals. *Connect the condenser directly across meter terminals, and the crystal directly to one terminal of meter. Keep connecting leads as short as possible*

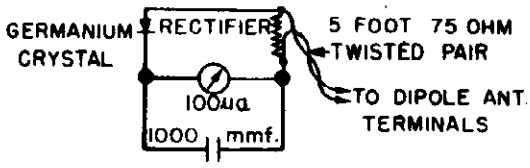

FIGURE 1

DUMMY ANTENNA:

1. 78 ohm Dummy Antenna (Fig. 2).

CONDENSERS:

1. 0.1 mfd. Condenser.
2. 100 mmf. Condenser.
3. 220 mmf. Condenser.
4. 30 mmf. Condenser.

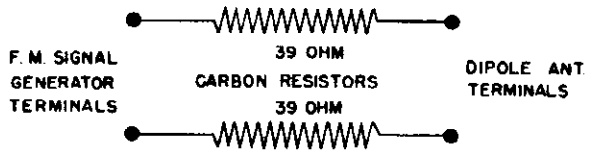

FIGURE 2

SHUNT:

1. 10 ohm carbon Resistor.

ALIGNMENT PROCEDURE

This receiver has been aligned at the factory for best performance and no attempt should be made to realign it unless the proper test equipment is available.

1. Turn the tuning condenser to full mesh, against stop, and set the dial pointer to the reference point at the left end of the dial.
2. Set the tone control knob to the full treble position (extreme right).
3. For Amplitude Modulated signal readings, connect output meter across voice coil (3.2 ohms).
4. All Amplitude Modulated input signals are modulated 30% at 400 cycles with the High side of the signal generator connected to receiver as indicated in the alignment chart. Connect the low side of signal generator thru a 0.1 mfd condenser to the receiver chassis. If hum is encountered, use a 1 to 1 isolating transformer between the power line outlet and the receiver power line cord. Then connect the low side of the signal generator directly to the receiver chassis.
5. All Frequency Modulated signals are modulated 30% at 400 cycles. 30% modulation is equal to a deviation of 22.5 kilocycles.
6. Turn the volume control to maximum clockwise position and adjust signal generator output to produce a noticeable output meter reading. Keep signal generator output as low as possible to prevent AVC action in the receiver.

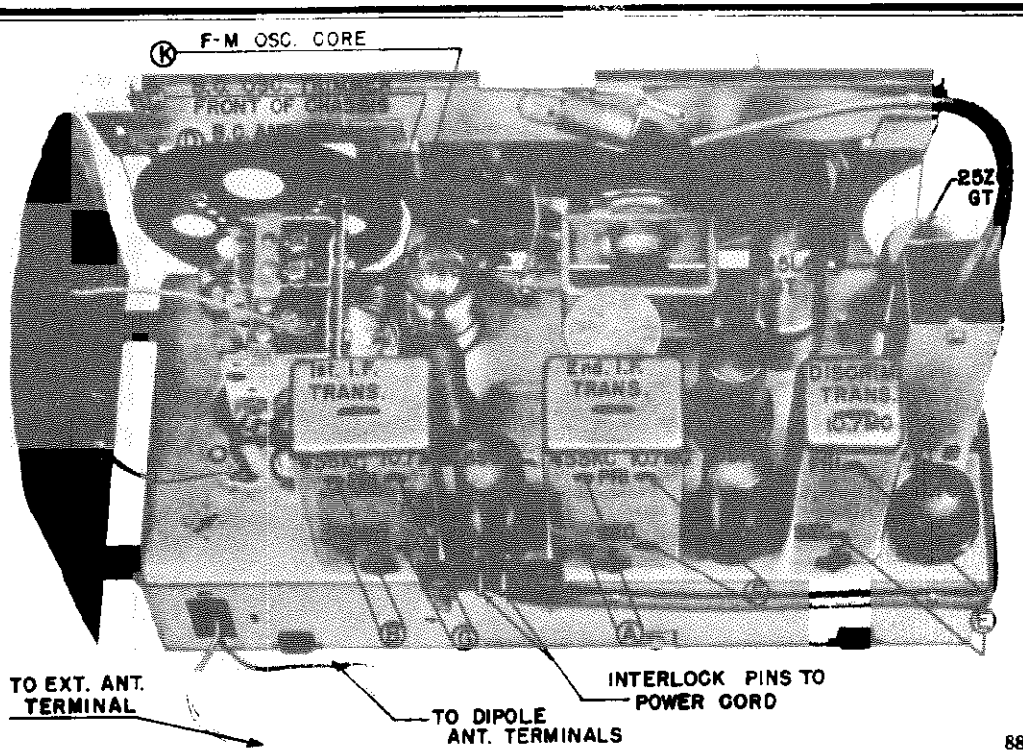
8	Disconnect Generator. Connect Field Strength Meter.*				FM	92 mc.	J	.....	.....	Adjust for null point. See Note 8.
9	If Trimmer (J) in Step 8 is turned more than ¼ turn, repeat Step 7.									
10	Repeat Step 8 if Step 9 was necessary.									
11	FM	98.0 mc.	*78 ohm Dummy	F.M. Ant. Terminals	FM	98 mc.	K	.....	.....	Adjust for maximum output.

*See Circuit.

ALIGNMENT NOTES

1. Connect low side of signal generator as explained in "Alignment Procedure".
2. Receiver should tune thru peaks at 540 and 1600 kc.
3. Sweep generator alignment. (For 10.7 mc. I.F. alignment use approximately 450 kc. sweep width).
4. Sweep generator output 0.1 to 1 volt R. M. S.
5. Connect high side of scope to discriminator transformer terminal at shielded lead wire junction. Connect low side of scope to the receiver chassis.
6. Align for maximum peak amplitude. Peak separations should be 150 to 170 kc.
7. Disconnect scope. Connect output meter to voice coil (3.2 ohms).
8. It is important that the radiation balance trimmer be adjusted to the null point for proper operation of the Frequency Modulation band. To check the null point, connect a Field Strength Meter across the F.M. antenna primary trimmer.
9. Align F.M. Antenna band pass circuit as follows:
   (a) With the F.M. signal generator set to 98.0 megacycles, feed a signal, modulated with 400 cycles at 30% to the receiver as indicated in the alignment chart. Shunt the antenna primary trimmer with a 10 ohm carbon resistor and adjust trimmer (H) for maximum output.
   (b) Place the 10 ohm carbon resistor across the F.M. antenna secondary trimmer and adjust trimmer (I) for maximum output. Remove 10 ohm carbon resistor from secondary trimmer.



DESCRIPTION

TYPE: Eight-tube, two-band, superheterodyne.

FREQUENCY RANGE: Standard American Broadcast Band; 540 to 1600 kc. (Selector Switch to left).

Frequency Modulation Band; 88 to 108 megacycles (Selector Switch to right).

INTERMEDIATE FREQUENCY: Standard American Broadcast Band; 455 kc.

Frequency Modulation Band; 10.7 mc.

POWER SUPPLY: a.c.—d.c.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 45 watts at normal power supply voltage (117 volts).

POWER OUTPUT: 1.5 watts maximum.

NOTES

Fig. 1

MODELS 88TA, 88TC

CROSLEY DIV.
AVCO MFG. CORP.

A kit of materials (part No. 143964) will be forwarded, free of charge, upon receipt of a request and the serial number of the radio for which it is required.

1. Change the resistor (item No. 32) to a 22,000 ohm, ½ watt, resistor (part No. 39373-60) as shown in Fig. 1.
2. Add one 10,000 ohm ½ watt, resistor (part No. 39373-54) as shown in Fig. 1. (88TC only)
3. Add one 1,000 mmf., 300 volt ceramic condenser (part No. 137727-8) as shown in Fig. 1.
4. Change the condenser (item No. 61) to a 1000 mmf., 300 volt ceramic condenser (part No. 137727-8) as shown in Fig. 1. (88TC only)
5. Replace the two lower screws, that fasten the speaker brackets to the front of the chassis, with two No. 8 x 1" hex. headed self threading screws (part No. 39220-36 CP). Add one headed bushing (part No.41405-3) to each of these screws, and add one rubber bumper (part No. 135164) to the head of each of these screws. (88TC only)
6. Add one Shock mount (part No. 46065) in the upper right hole of speaker mounting bracket. Do not fasten the speaker to this shock mount.
7. Cement condenser (item No. 85 in schematic wiring diagram) to the chassis with Plastic adhesive (part No. 138905).
8. Apply a heavy coat of plastic adhesive (part No. 138905) to the original variable condenser as shown in Fig. 2. Care must be taken so that the adhesive does not interfere with the mechanical operation of the condenser.

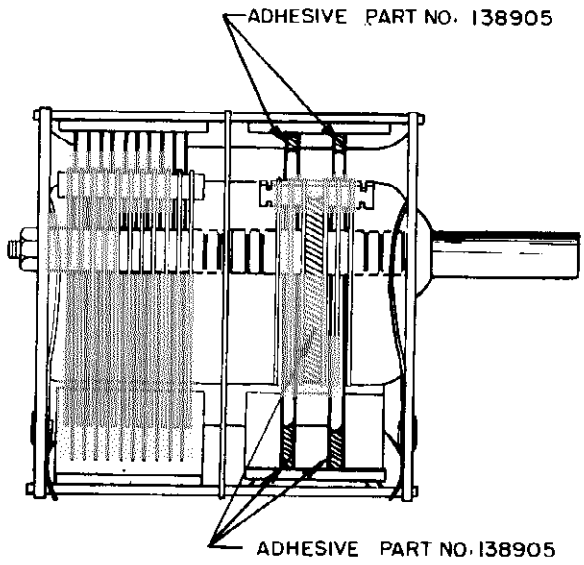

FIG. 2

9. Secure the insulator at the top of the 1st I.F., 2nd I.F., and discriminator transformers to the transformer shields with a heavy coat of adhesive (part No. 86646).
10. Add one rubber washer (part No. 136584) between the underneath side of the cabinet and each large metal washer used on the chassis mounting screws. (88TC only)

CROSLEY DIV. AVCO MFG. CORP.

MODELS 88TA, 88TC, LONG DISTANCE SWITCH INSTALL

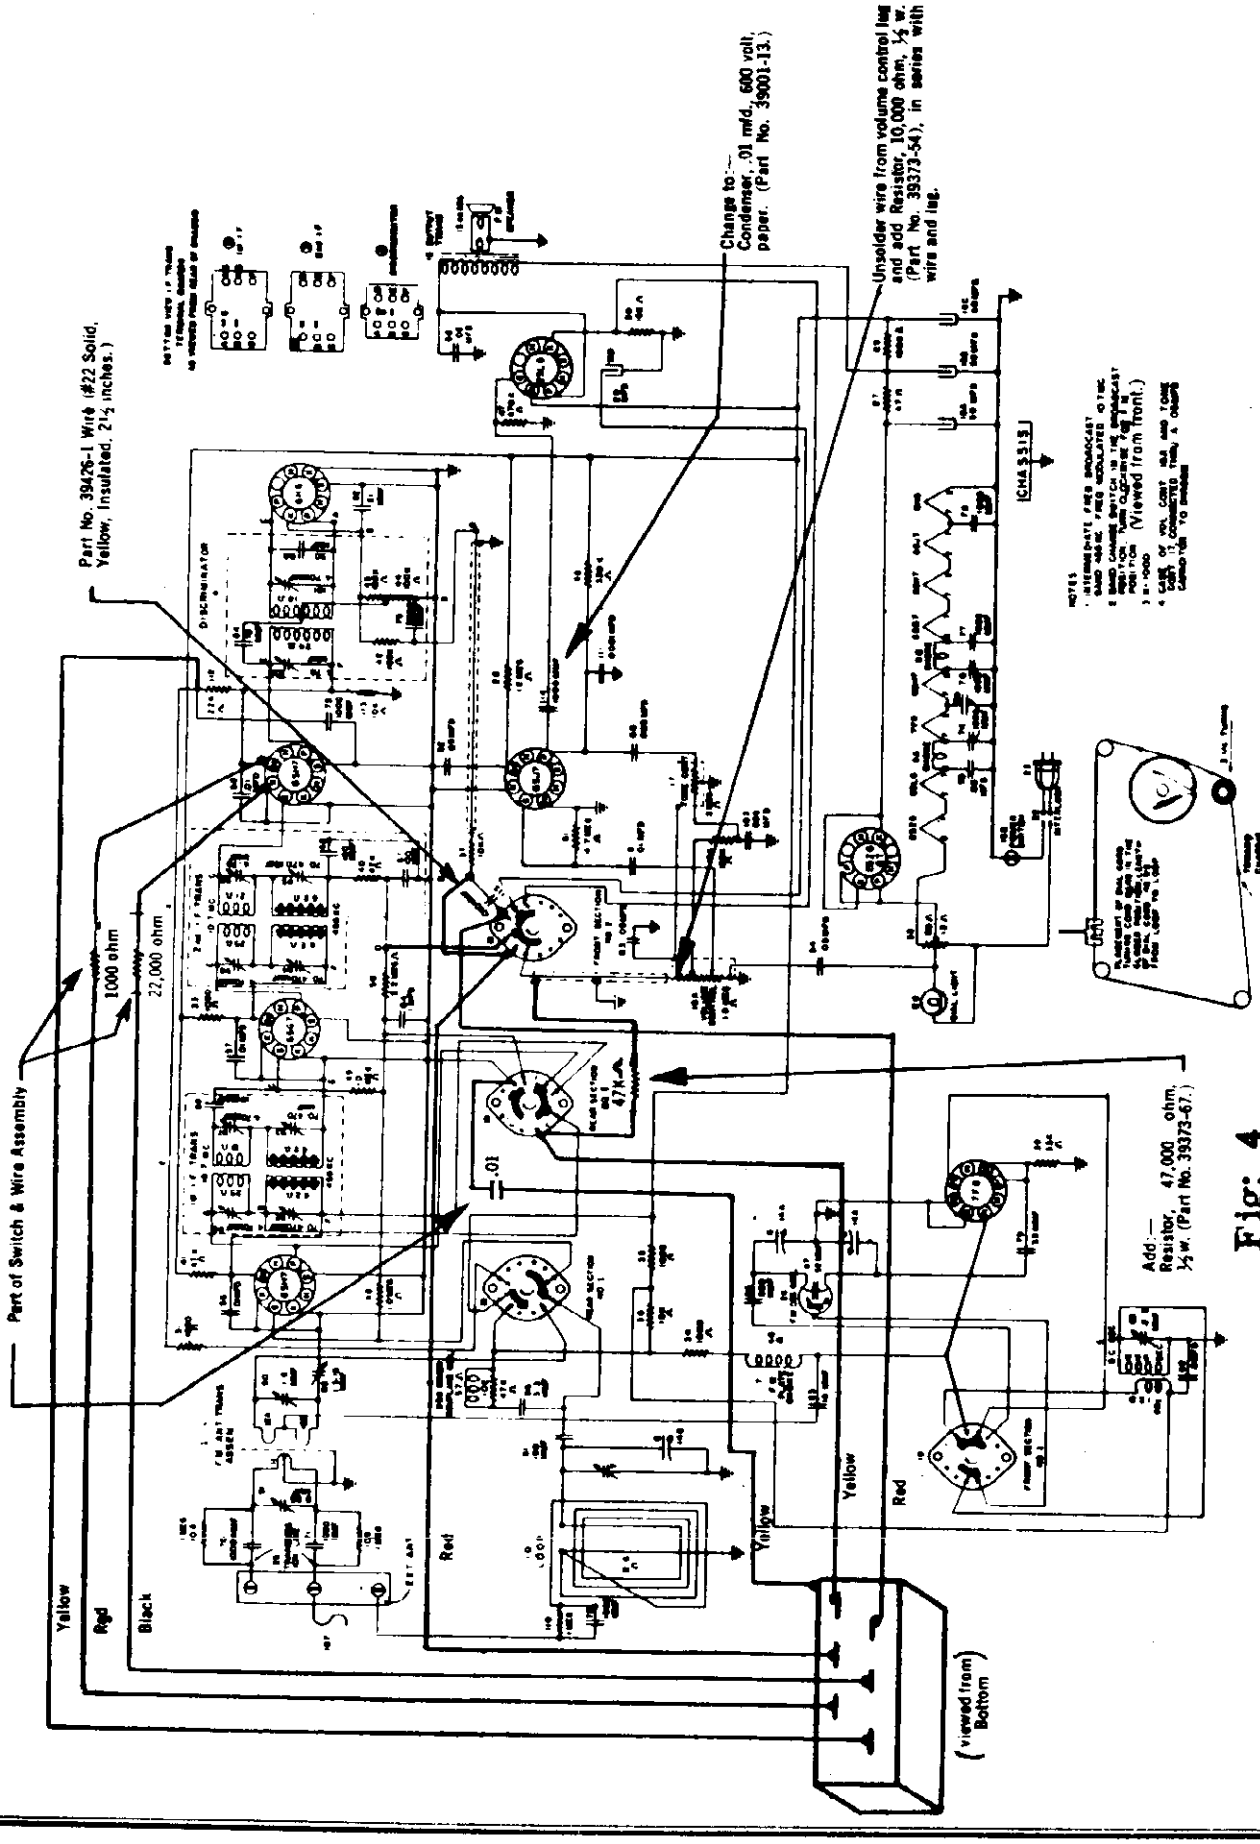

Fig: 4

INSTALLATION OF KIT (PART NO. AW-144330) - To install this kit, proceed as follows:

1. **Mounting The Switch** - The switch is mounted to the inside of the cabinet back in the following manner:

(a) Mark dimensions on cabinet back as shown in Fig. 3.

(b) Drill the two small holes "A" and "B" with a 1/8 drill.

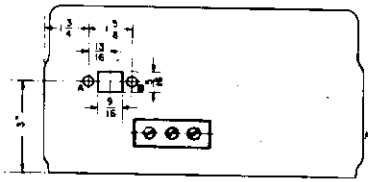

Fig. 3

(c) The large hole may be started by drilling a hole 9/32 of an inch in diameter and then enlarge it with a small hole saw or file to the illustrated dimensions.

(d) With the two small screws (part No. 39170-31CP), washers (part No. 39027-2CP), and nuts (part No. 39033-6CP), secure the switch to the inside of the cabinet back, in a position so that the side of the switch case with the yellow wire soldered to it is toward the top of the cabinet back.

(e) The gummed local-distance label (part No. W-144338) should be fastened on the outside of the cabinet back at approximately 1/8" directly above the switch.

2. Placement of the Switch Wires and Their Connection to the Chassis Circuits - With the chassis and cabinet back turned upside down proceed as explained in the following:

(a) Place the red wire, black wire, and yellow wire, from the three lugs at the left of the switch, (looking down on switch from rear) through the large hole located in the rear of the receiver chassis, near the

(b) Tie an overhand knot in the wires, making certain that no surplus wire remains inside the chassis. These three wires must be placed against the inside of the chassis and dressed under the shield, which is located near the 6SH7 tube socket. (2nd F.M. I.F. Amplifier and A.M. Detector tube).

(c) If a 1000 ohm resistor is connected from lug 5 to lug 6 of this socket, remove and discard the resistor.

(d) With reference to Fig. 4, solder the 22,000 ohm resistor, from the black wire, to lug 5 and the 1000 ohm resistor, from the red wire, to lug 6 of this 6SH7 socket. Be sure to slide the two pieces of tubing over the resistors, permitting it to cover the soldered connections to the wires.

(e) The yellow wire must be soldered to the junction of the 22,000 ohm resistor (item 112, Fig. 4) and 1000 mmf., condenser (item 73, Fig.4), which is secured to the center lug (viewed in chassis) of the discriminator transformer.

(f) The twisted pair of wires (red wire and yellow wire), which has the yellow wire soldered to the switch case, must be placed through the middle hole in the insulating strip located at the right rear of chassis. Tie an overhand knot in these wires, making certain that no surplus wire remains inside the chassis.

(g) With the chassis upside down and viewing it from the front, solder the red wire to the first lug of the front portion of band switch section No. 2 (to locate lugs, count clockwise from the band switch section spacer that is uninsulated).

(h) Slip the short piece of tubing (part No. 39431-16) over the yellow wire which is soldered to the local-distance switch case. Solder a .01 mfd. condenser (part No. 39001-13) to this wire and slide the tubing over the connection. Solder the other end of this condenser to the first lug of the rear portion of band switch section No. 2.

(i) Place the remaining pair of twisted wires (red wire and yellow wire) through the remaining hole in the insulating strip and tie an overhand knot in the wires, being careful that no surplus wire remains inside the chassis.

(j) Solder the yellow wire to the sixth lug of the rear portion of band switch section no. 2. Also solder one end of the 47,000 ohm resistor (part No 39373-67) to this lug.

(k) Unsolder the shielded wire from both the band switch spacer and the fourth lug of the front portion of band switch section No. 2. Slip the 3 inch length of tubing (part No. 39431-14) over the shielded wire so that the braided shield protrudes slightly from the end of the tubing. Resolder the shielded wire to the fourth lug. The loose end of the 47,000 ohm resistor should be soldered to the protruding end of the wire's braided shield. Do not resolder braided shield to the band switch spacer.

(l) Unsolder the other end of the shielded wire from the volume control lug and solder the 10,000 ohm resistor (part No. 39373-54) in series with the wire and lug. Push the tubing over the resistor and dress the shielded wire against the inside of the chassis front over the volume control.

(m) Remove the condenser (item 114, Fig. 4) and replace it with a .01 mfd. condenser (part No. 39001-13).

(n) The remaining red wire from the local-distance switch and one end of the $2\frac{1}{2}$ inch piece of yellow insulated wire (Part No. 39426-1) should be soldered to the fifth lug of the front portion of band switch section No. 2. The other end of the $2\frac{1}{2}$ inch piece of wire must be soldered to the junction of resistor (item 37, Fig. 4) and condenser (item 115, Fig. 4).

(o) The four wires placed through the insulated strip must be twisted together inside the chassis and dressed in a direct line to their place of connection on the band switch. Solder the $1\frac{1}{2}$ inch piece of bare wire (part No. 39209-22) to the pressed out grounding loop, which is located inside the rear of chassis, near the insulating strip. Then wrap this wire around the four wires so that the four wires are held toward the rear of chassis.

The following socket voltage chart shows the proper voltages of a receiver that incorporates a local distance switch.

SOCKET VOLTAGE NOTES:

1. BOTTOM VIEW OF TUBE SOCKETS.
2. MEASURE VOLTAGE WITH AN ELECTRONIC VOLTMETER FROM SOCKET LUG TO CHASSIS.
3. ALL VOLTAGES ARE THE SAME FOR BC. & FM. EXCEPT WHERE MARKED WITH DELTA (▲), THIS IS THE VOLTAGE WITH BAND SWITCH IN THE FM. POSITION.

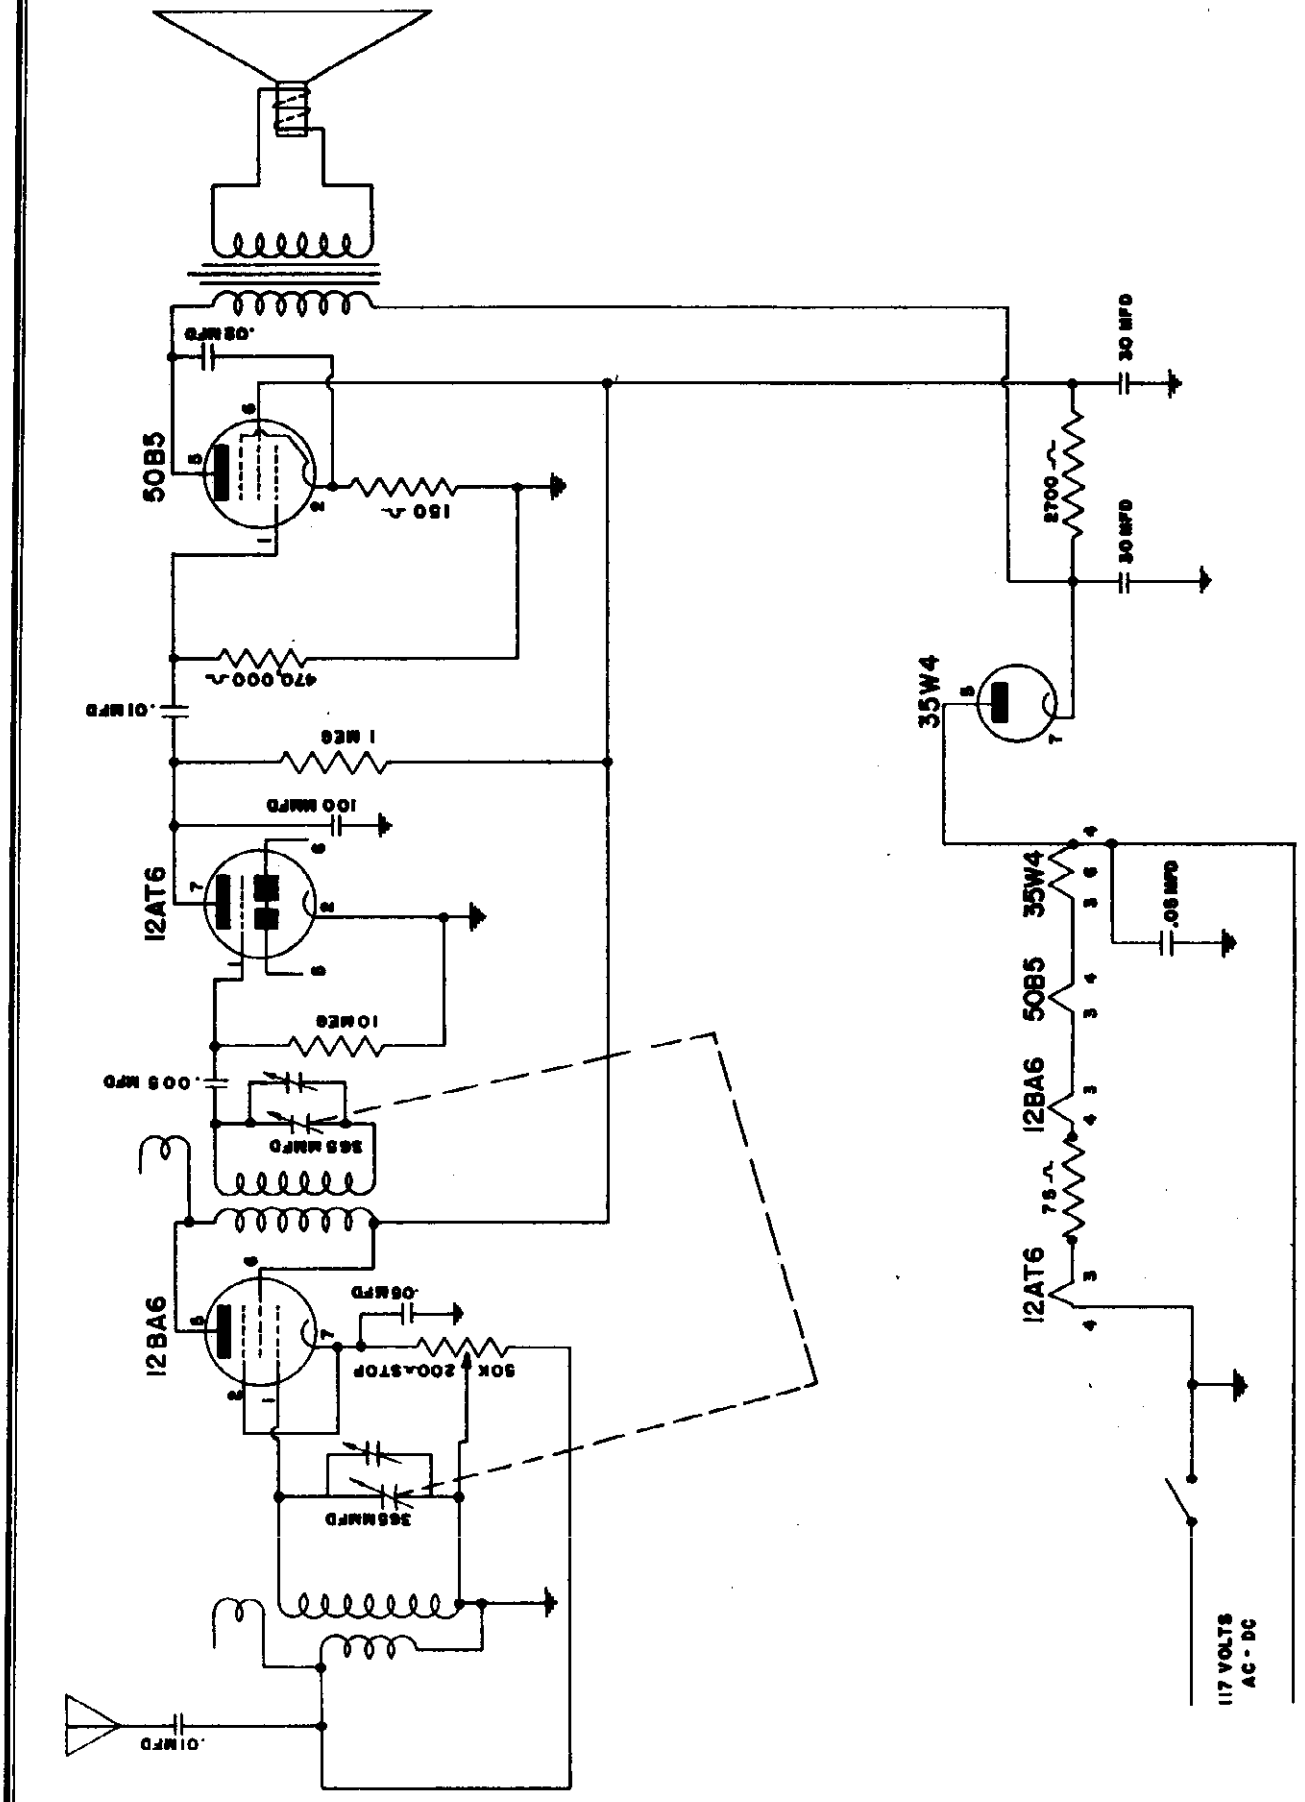
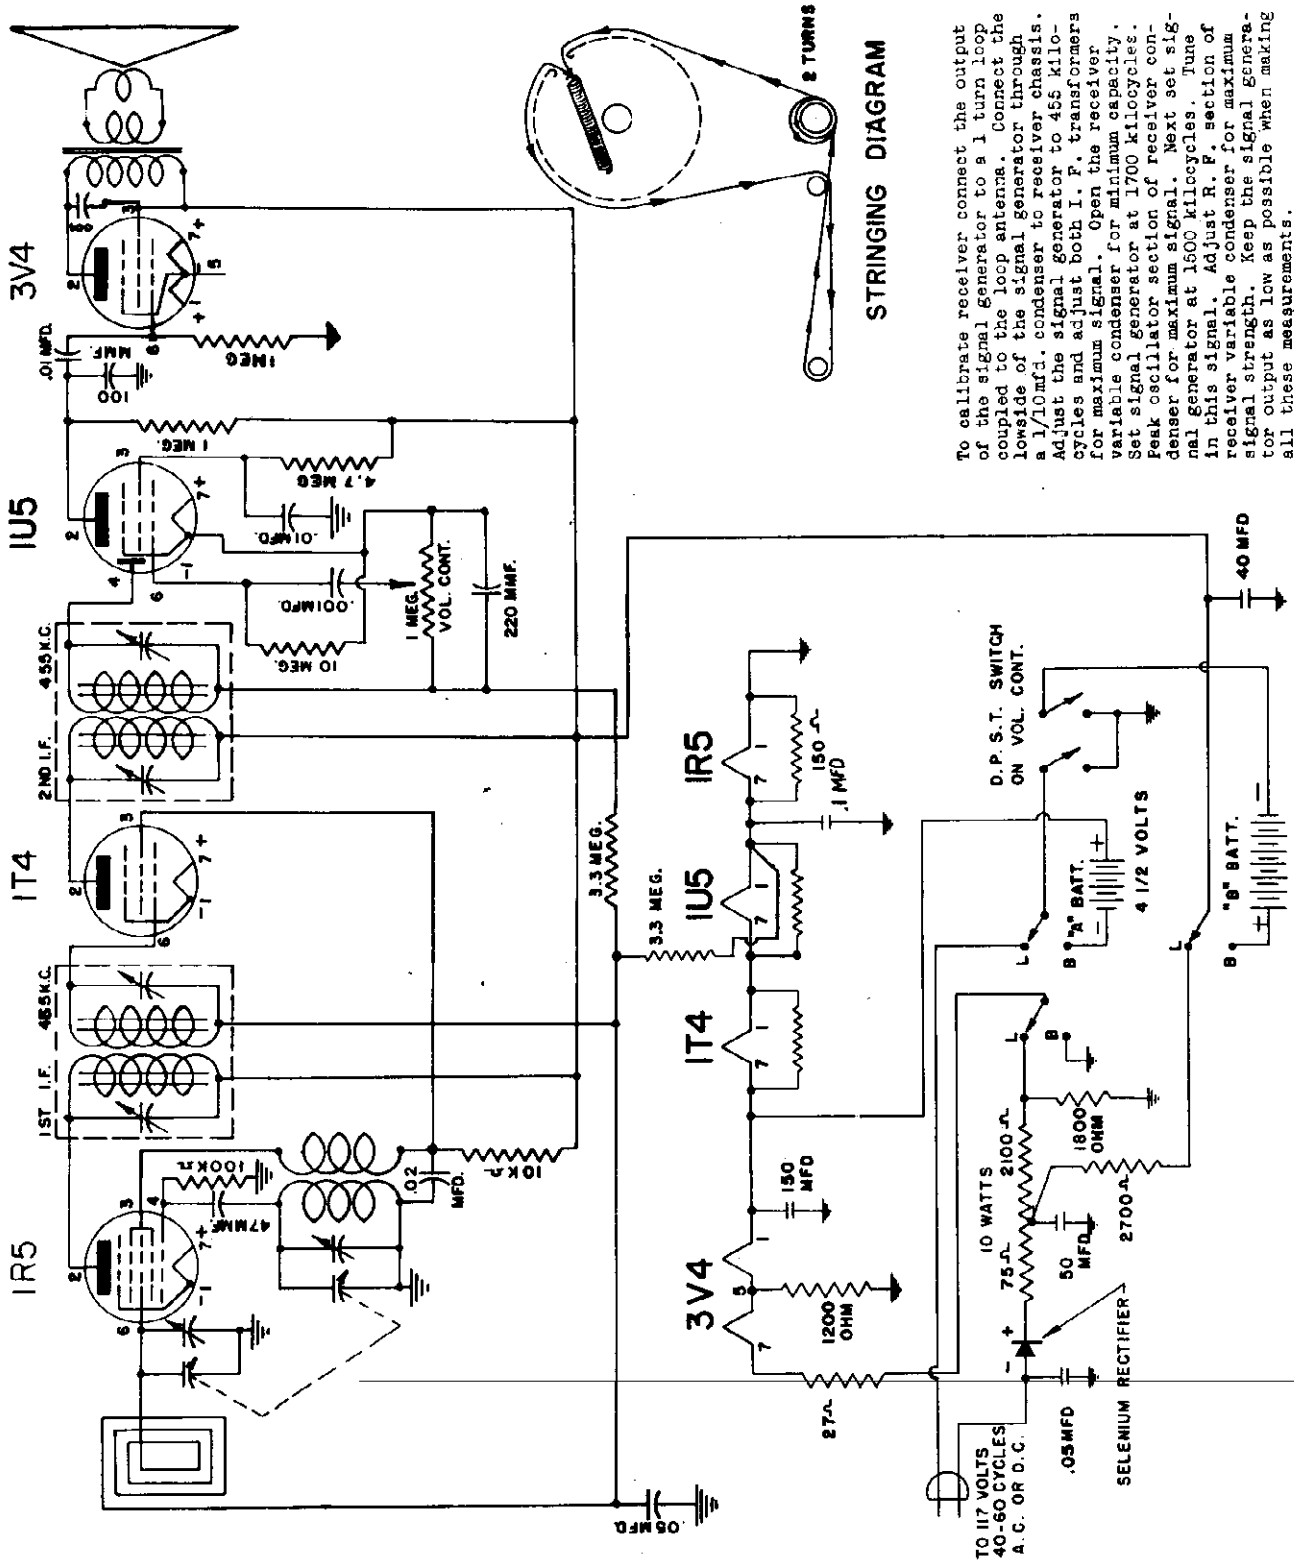
DEWALD RADIO

MODEL B-40



MODEL B-504

DEWALD RADIO



DEWALD RADIO

MODEL B-50

The DeWald model B-504 is a combination portable battery receiver. This receiver uses the latest type tubes for best performance. The circuit used is designed for excellent reception and long battery lif

The receiver uses an "A" supply of 4½ volts and a "B" supply of 67½ volts.

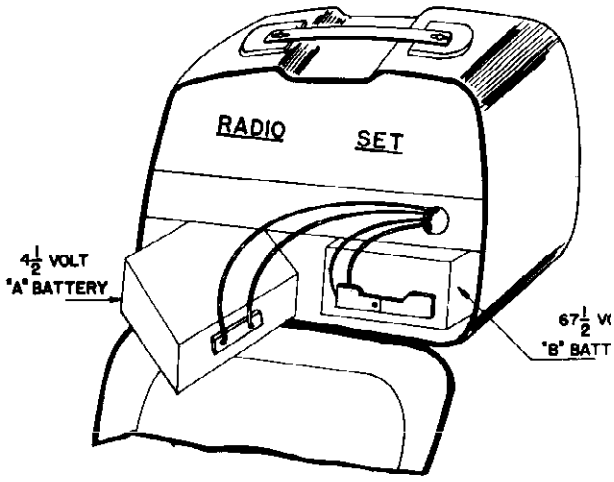
For good reception the life of the batteries is from 70 to 80 hours when the receiver is used abo two hours per day.

The following or similar batteries may be used with this receiver:

	"A" BATTERY 4½ V	"B" BATTERY 67½ V
Eveready	#746	#467
General	#3H3	#W45A
Ray O Vac	#P83A	#P4367
Burgess	#G3	#XX45

To install the batteries in the receiver, proceed as follows:

1. Open back by inserting fingers in slots provided on top of cabinet and pull back open.
2. Connect battery clips to batteries.
3. Put batteries in set as shown in sketch. BE CAREFUL NOT TO BREAK WIRES CONNECTED TO LOOPTENNA.



LIST OF REPLACEMENT PARTS

1st I.F.	1027C-4	Variable Cond.	2017B
2nd I.F.	1027-1	Electrolytic Cond.	2020B

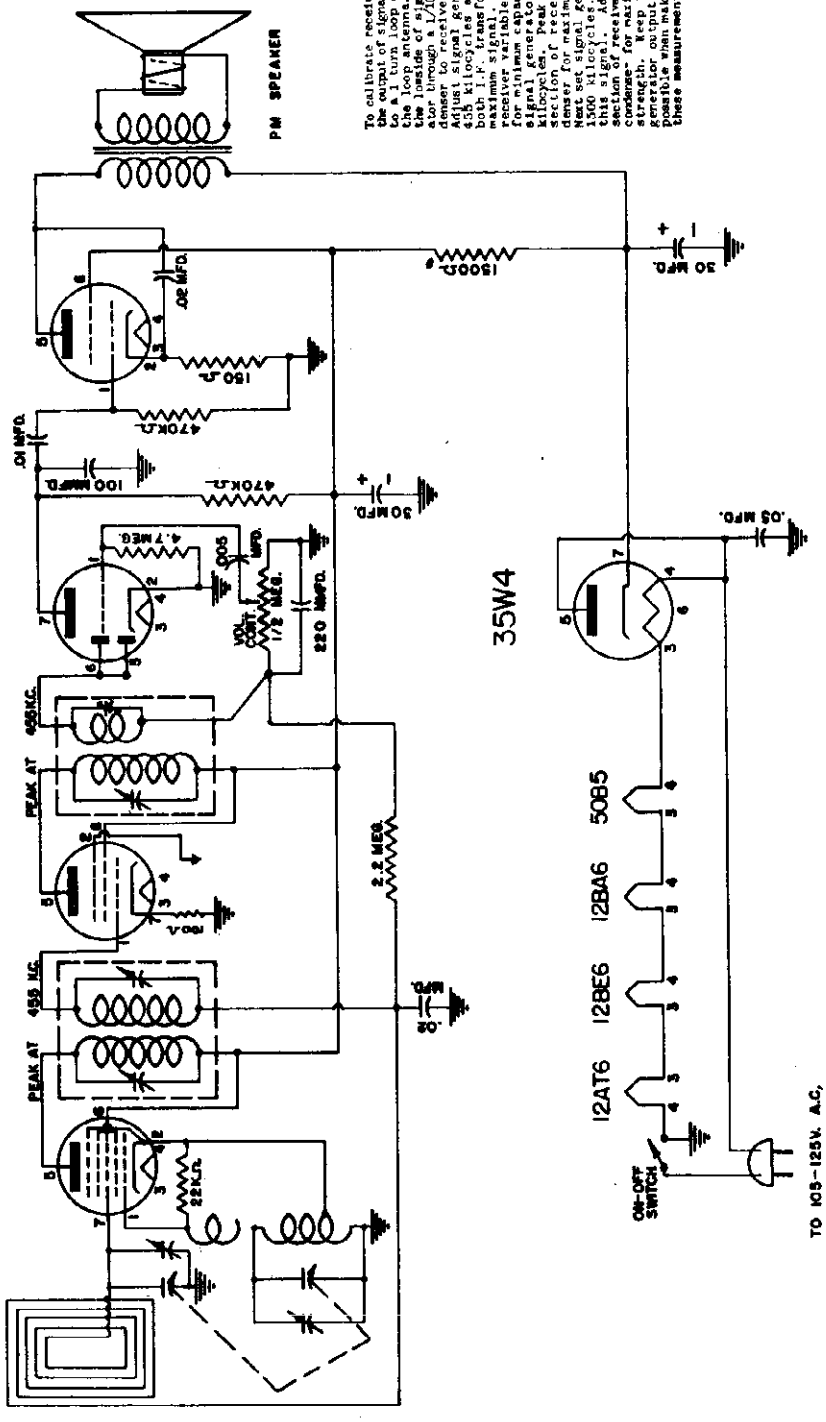
Batt. Cable	5005	Speaker	7003B3
Knobs	4055A	Sel. Rect.	8018A

MODEL B-506

DEWALD RADIO



To calibrate receiver connect the output of signal generator to a 1 turn loop coupled to the loop antenna. Connect the loopside of signal generator through a 1/10 mfd. condenser to receiver chassis. Adjust signal generator to 455 kilocycles and adjust both I.F. trimmer screws for maximum signal. Open the receiver variable condenser for minimum capacity. Set signal generator at 1720 kilocycles. Peak oscillator section of receiver condenser for maximum signal. Next set signal generator at 1500 kilocycles. Tune in this signal. Adjust R.F. section of receiver variable condenser for maximum signal strength. Keep the signal generator output as low as possible when making all of these measurements.

REPLACEMENT PARTS

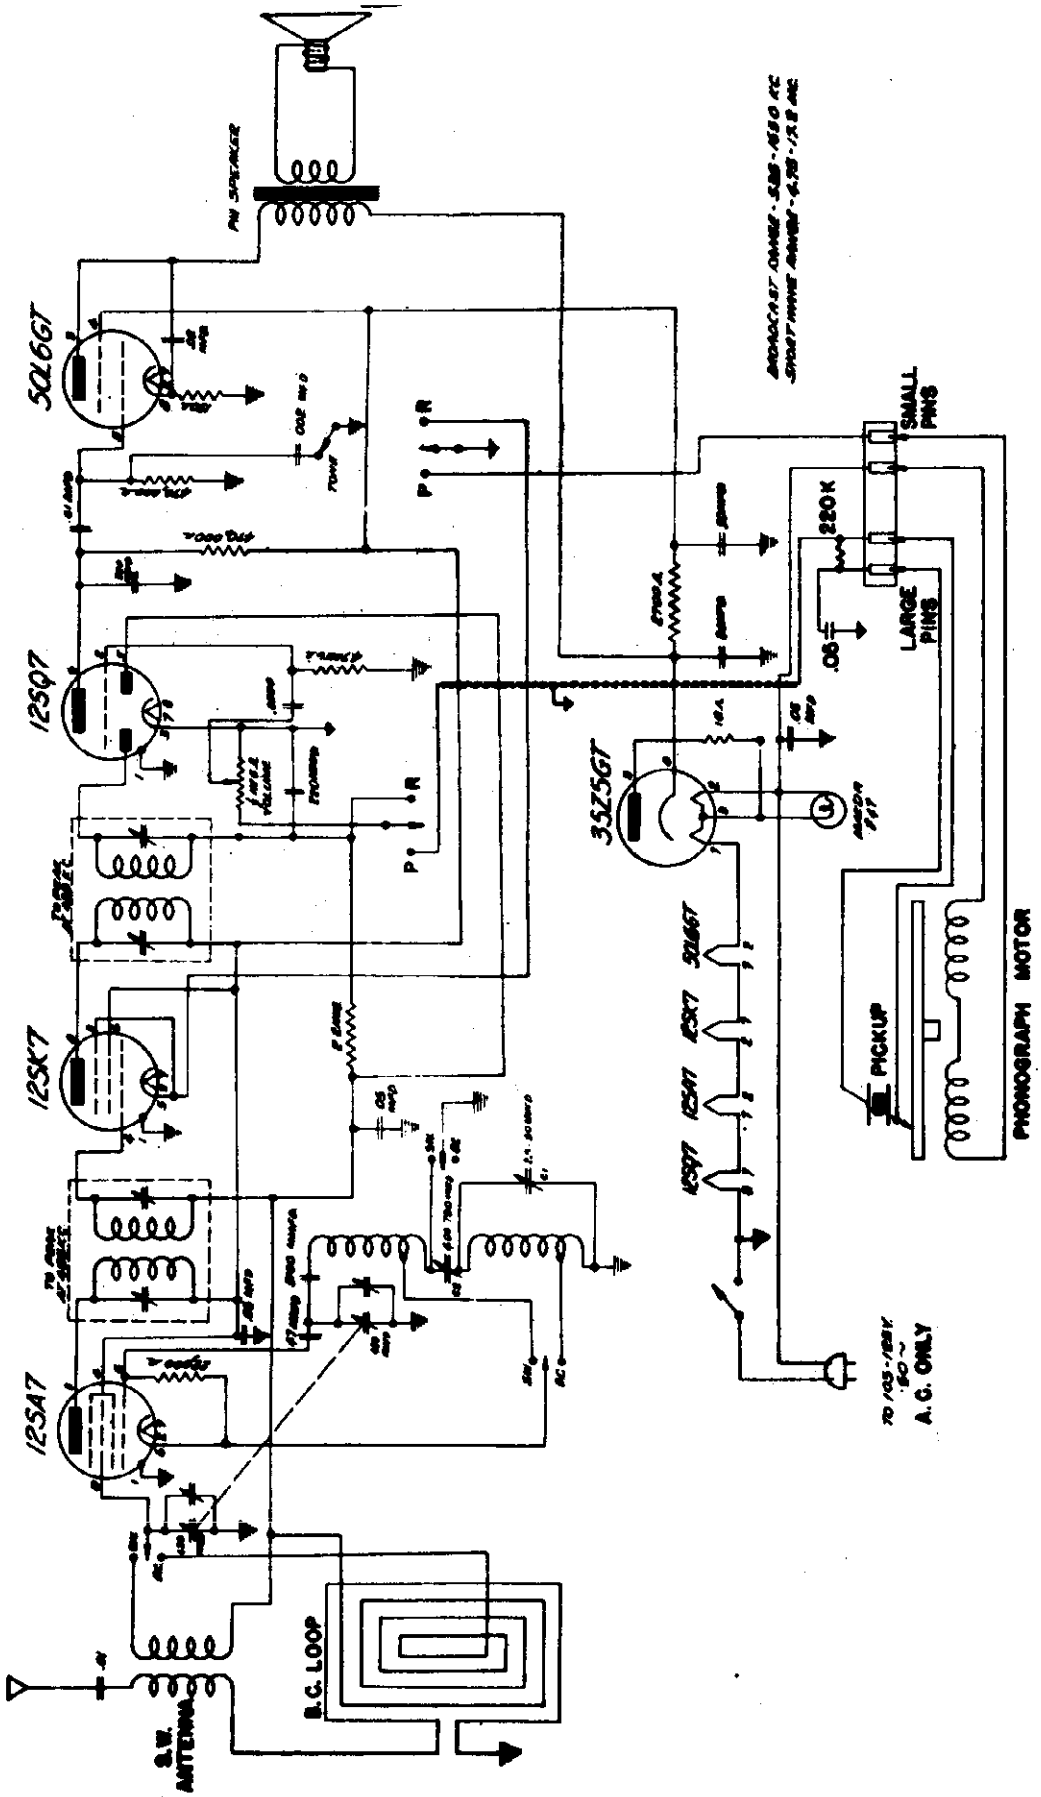
DEWALD RADIO

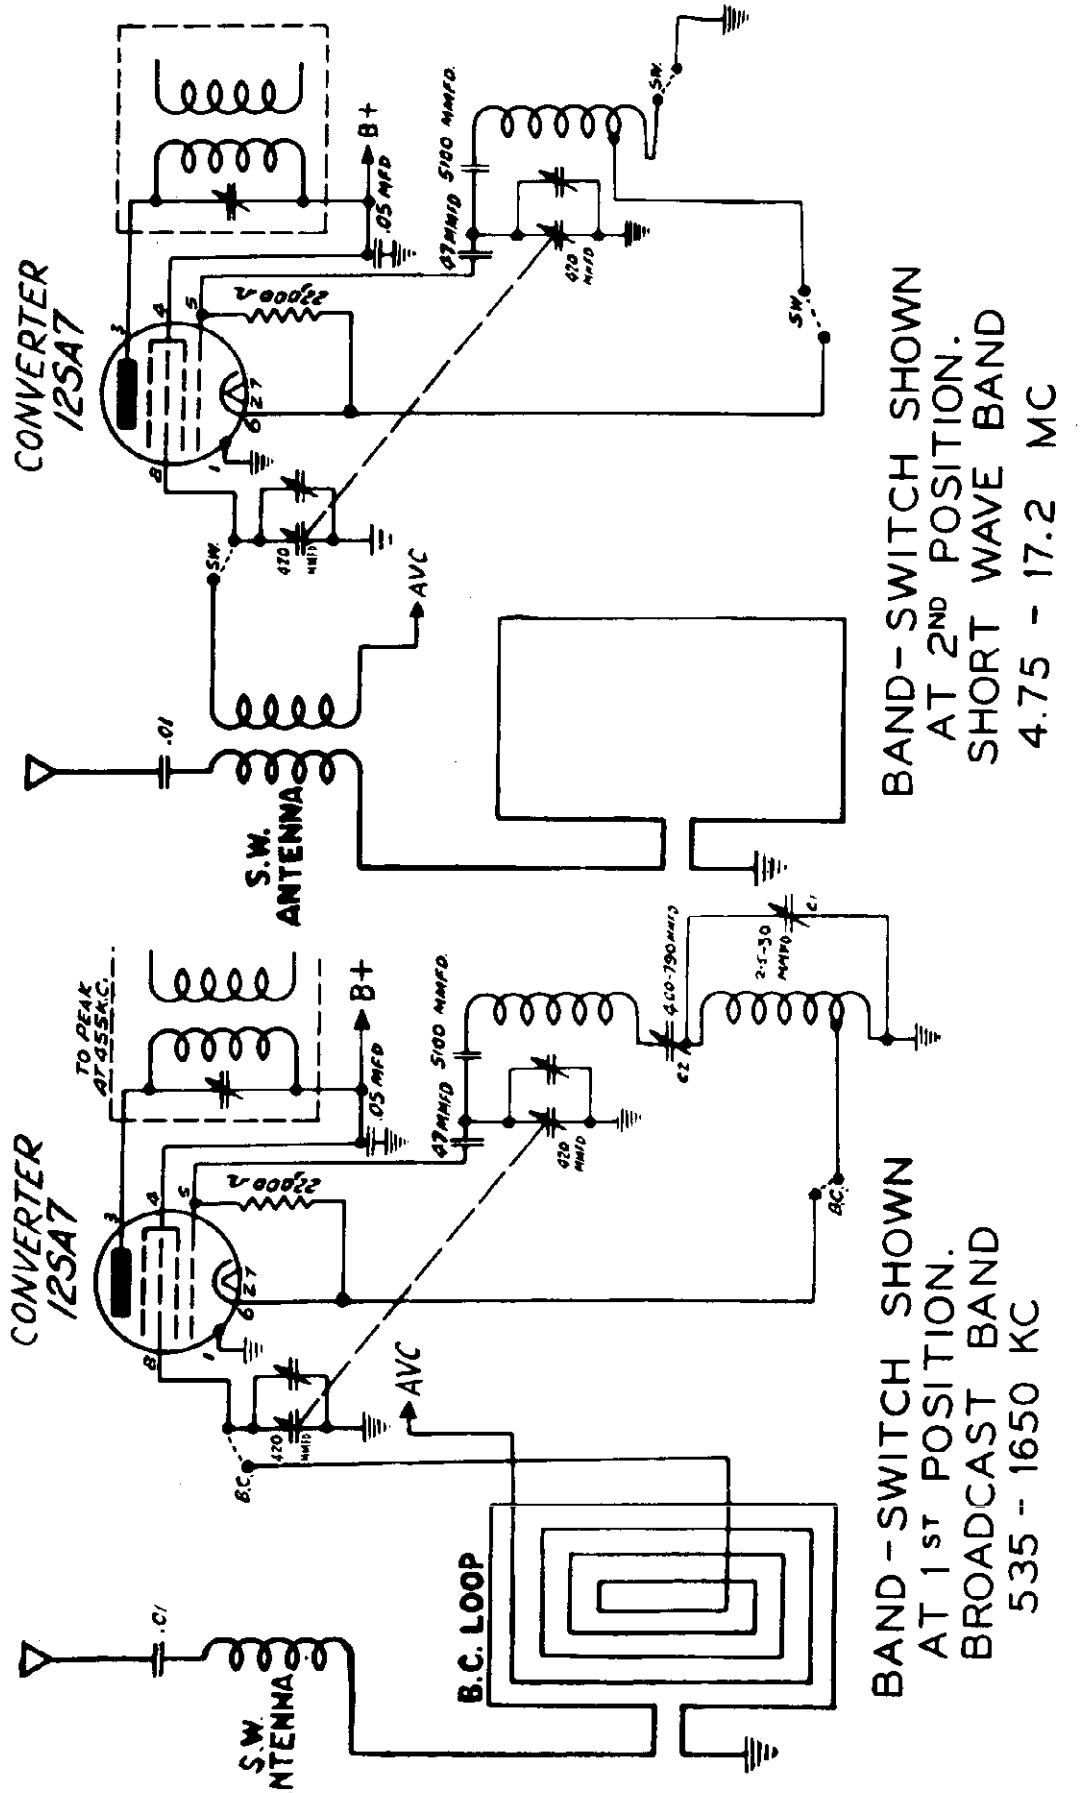
MODEL B-51



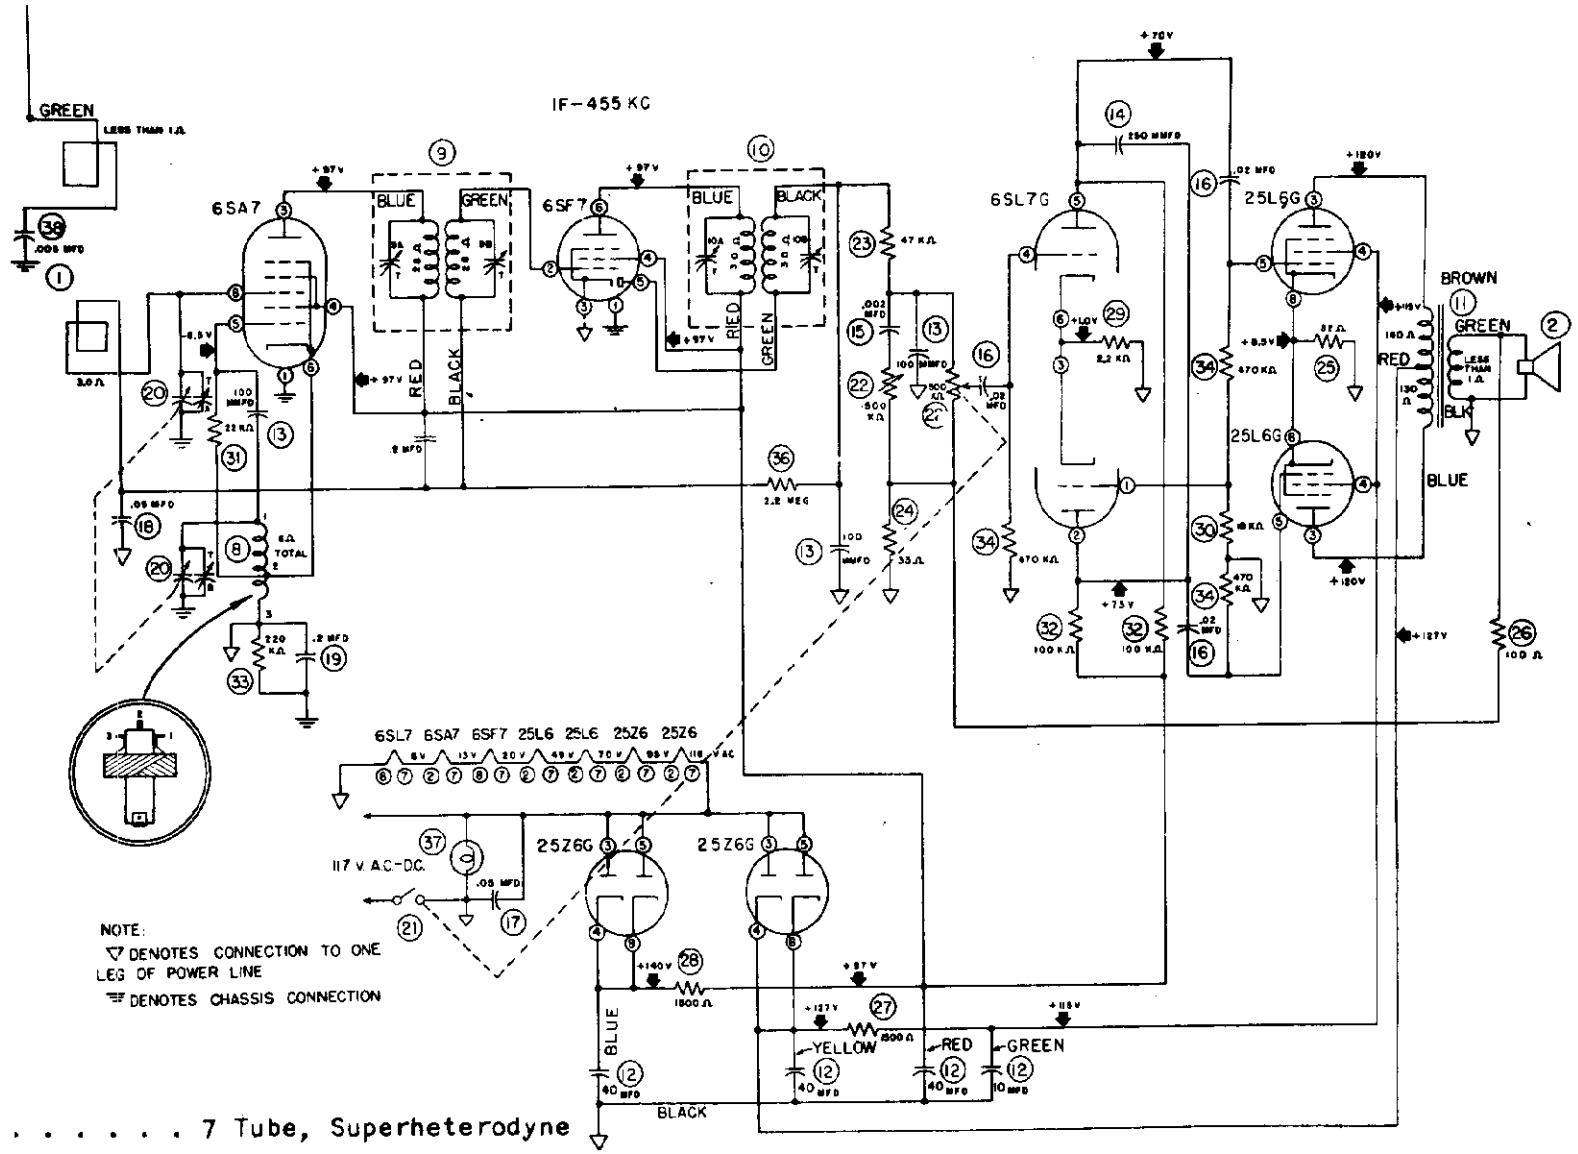
CLARI-SKEMATIX
Registered Trademark

MODEL B-511

DEWALD RADIO



ELECTRONIC CORP. OF AMERICA



CIRCUIT . . . . . 7 Tube, Superheterodyne
FREQUENCY RANGE . . . 540 to 1720 KC
INTERMEDIATE FREQ. . 455 KC
POWER INPUT . . . . . 110 to 125 V. AC-DC
POWER CONSUMPTION . . . 60 Watts

ANTENNA . . . . . Built-in Loop
SPEAKER . . . . . Alnico V PM Dynamic 6"
V.C. IMPEDANCE . . . . 3.2 ohms at 400 Cycles
POWER OUTPUT . . . . . 3 Watts Undistorted

With the receiver on and the volume control at maximum, connect the signal generator to the coupling loop and bring the loop close to the receiver chassis. Adjust the signal generator output to minimum necessary to give a suitable indication on the output meter, which should be connected from B minus to the plate of one output tube. CAUTION: Make sure the output meter is isolated from DC by a series blocking condenser.

With the gang condenser fully meshed, adjust the pointer so that the left hand edge of the pointer saddle is one inch from the end of the dial frame. *(See Dial Installation drawing)* Using the dial scale contained in this Service Bulletin, align the pointer to the indicated reference mark with the pointer set as above. Then proceed with the alignment in accordance with the chart below:

SET SIGNAL GENERATOR AT	SET GANG	LOOP DISTANCE	ADJUST TRIMMER	TUNE FOR	OPERATION
455 KC	Meshed	Close	9a 9b 10a 10b	Max.	Align - I.F.
1720 KC	Fully Open	Close	20a	Max.	Align Oscillator
1400 KC	1400 KC	Close	20b	Max.	Align - R.F.

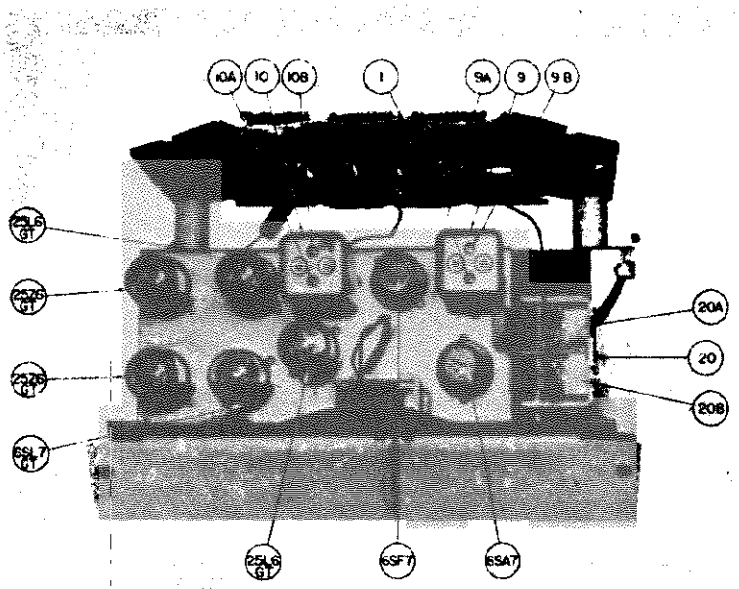
All DC voltage measurements in this Service Bulletin have been made with a 20,000 ohms per volt voltmeter, using B minus as a common reference point. All AC voltage measurements are with 1000 ohms per volt voltmeter. Line voltage was maintained at 117 volts for all voltage measurements. The condenser gang should be fully meshed and the volume control at its minimum point. Voltages may vary ±10% from the indicated nominal value.

Measurements of oscillator grid bias voltage should be made with a 50,000 ohm resistor in series with the negative probe of the meter, and the positive prod connected to B minus. Rotate the tuning condenser throughout its complete range with the meter connected. Absence of bias voltage at any point is an indication that the oscillator is not functioning.

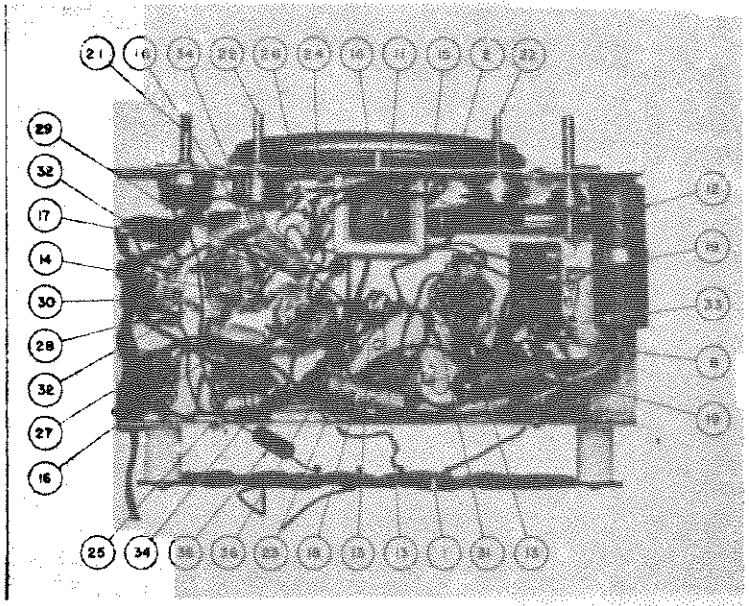
Alignment Procedure

In order to make a proper alignment, the following equipment is required:

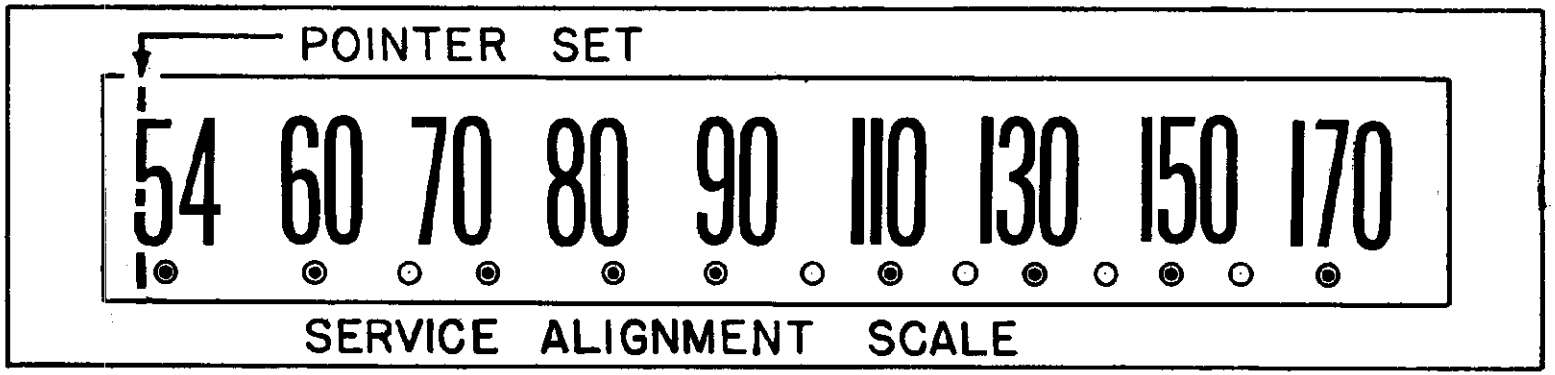
1. A signal generator capable of providing a modulated radio frequency output over the frequencies required.
2. A suitable output meter or sensitive AC voltmeter with a .1 mfd series blocking condenser.
3. A coupling loop, made of three turns of stiff hookup wire, 4 inches in diameter, mounted on a suitable block of wood or stand.
4. A non-metallic screwdriver.



Chassis Top View



Chassis Underside View



Replacement of I.F. Transformers

When replacing intermediate frequency transformers, either input or output, use caution to observe original lead dress.

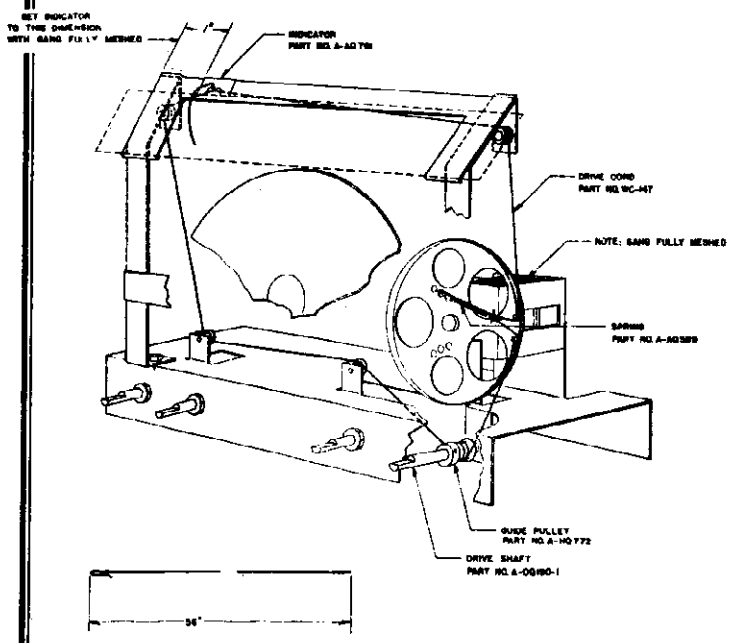
MODEL 132

ELECTRONIC CORP. OF AMERICA

Replacement of Dial Drive Cord

Completely remove remainder of defective dial cord. Inspect all pulleys and make sure they revolve freely. Determine that no grease or oil is present on any pulley surface. Attach the cord spring, part #A-AQ589, to one end of the drive cord. Fully mesh the gang condenser and hook the spring to the hole closest to the cord cutout on the dial drum. Proceed to string dial cord in accordance with the detail drawing. Take two full turns around the drive drum, part #A-HQ772. Pull the cord snug at this point. Wrap one complete turn around gang drum and pull cord snug. Securely tie free end of cord to the cord spring. Next, adjust spring tension by moving the hook end of the spring into the next spring hole.

Clip the pointer on to the dial cord with sufficient tension so as to prevent slippage and adjust pointer position, so that with fully meshed gang, the left edge of the pointer saddle is one inch from the edge of the dial support frame. Insert chassis in cabinet and check pointer and scale agreement. Then make final adjustment of pointer position. Remove the chassis and firmly crimp the pointer prongs on the dial cord, and secure with a small drop of speaker cement.



Replacement of Audio Output Transformers

When replacing the audio output transformer, original lead dress must be maintained. If either primary or secondary windings are reversed, the set will have a a severe audio oscillation, due to the inverse feedback network.

DESCRIPTION

TYPE: Amplitude modulation (AM) and frequency modulation (FM) superheterodyne.

FREQUENCY RANGE:

Broadcast band (AM)—530-1620 kilocycles
Frequency modulation band (FM)—87.75-108.5

TYPE OF TUBES:

1—6AG5, r-f amplifier
1—6BE6, converter
2—6BA6, first i-f amplifier and FM second i-f amplifier
1—6AL5, FM-AM detector, a.v.c.
1—6AU6, a-f amplifier
1—6V6GT, power output

POWER SUPPLY: 60-cycle a.c.
VOLTAGE RATING: 105-125 volts.
POWER CONSUMPTION: 80 watts.

EMERSON RADIO AND PHONO. CORP. MODEL 528, CHASSIS 1200

ALIGNMENT

To set pointer turn variable condenser fully closed and set pointer to last reference mark at low-frequency end of dial. To inject signal in Steps 4, 5 and 6, remove tube and connect wire to pin 1. Replace tube, making certain that wire does not short to shield base. For Step 8, connect two 100,000 ohm resistors in series from pin 7 of 6AL5 to chassis. After Step 8, turn variable condenser fully counterclockwise and check adjustment of FM tuning unit per dial cord drawing. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading. Use an alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to stator of front section of the variable condenser. Low side to chassis.	455 kc	BC (center position)	High frequency end of dial.	Across voice coil.	A1, A2, A3, A4	Adjust for maximum output.
2	0.1 mfd.	High side to stator of front section of the variable condenser. Low side to chassis.	455 kc	BC (center position)	Low frequency end of dial.	Across voice coil.	A5	Adjust for minimum output.
3	0.05 mfd.	High side to pin 1 (grid) of 6BA6, 1st i-f tube (3). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected to pin 7 of 6AL5 and chassis.	A6	Adjust for maximum deflection.
4	0.05 mfd.	High side to pin 1 (grid) of 6BE6. Low side to chassis.	10.6 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected to pin 7 of 6AL5 and chassis.	A7	Adjust for maximum deflection.
5	0.05 mfd.	High side to pin 1 (grid) of 6BE6. Low side to chassis.	10.8 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected to pin 7 of 6AL5 and chassis.	A8	Adjust for maximum deflection.
6	0.05 mfd.	High side to pin 1 (grid) of 6BE6. Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected to pin 7 of 6AL5 and chassis.	A9	Adjust for maximum deflection.
7	0.05 mfd.	High side to pin 1 (grid) of 6BA6, 2nd i-f tube (4). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected to pin 7 of 6AL5 and chassis.	A10	Adjust for maximum deflection.
8	0.05 mfd.	High side to pin 1 (grid) of 6BA6, 2nd i-f tube (4). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from junction of two 100,000 ohm resistors and junction of condensers 25 and 26. (See preliminary alignment notes.)	A11	Adjust for zero deflection.
9	150 ohms in series with each lead.	High side to "A," low side to "G" on FM antenna terminals. Disconnect internal antenna.	108 mc (unmodulated)	FM (fully clockwise)	108 mc	VTVM connected to pin 7 of 6AL5 and chassis.	A 12	Adjust for maximum deflection.
10	150 ohms in series with each lead.	High side to "A," low side to "G" on FM antenna terminals. Disconnect internal antenna.	88 mc (unmodulated)	FM (fully clockwise)	88 mc	VTVM connected to pin 7 of 6AL5 and chassis.	A 13	Adjust iron core (ho brass in position) for maximum deflection.
11	150 ohms in series with each lead.	High side to "A," low side to "G" on FM antenna terminals. Disconnect internal antenna.	98 mc	FM (fully clockwise)	98 mc	VTVM connected to pin 7 of 6AL5 and chassis.	A 13	Adjust brass and iro cores (one screw) fo maximum deflection. R peat steps 9, 10 and until no further impro ment can be made.
12	150 ohms in series with each lead.	High side to "A," low side to "G" on FM antenna terminals. Disconnect internal antenna.	106 mc	FM (fully clockwise)	Tune for maximum deflection.	VTVM connected to pin 7 of 6AL5 and chassis.	A 14, A 15	Adjust for maximum deflection.
13	150 ohms in series with each lead.	High side to "A," low side to "G" on FM antenna terminals. Disconnect internal antenna.	90 mc	FM (fully clockwise)	Tune for maximum deflection.	VTVM connected to pin 7 of 6AL5 and chassis.	A 16, A 17	Adjust iron cores (ho brass in place) for maximum deflection.
14	150 ohms in series with each lead.	High side to "A," low side to "G" on FM antenna terminals. Disconnect internal antenna.	100 mc	FM (fully clockwise)	Tune for maximum deflection.	VTVM connected to pin 7 of 6AL5 and chassis.	A16, A17	Adjust both iron an brass cores for maxim deflection. Repeat ste 12, 13, and 14 until n further improvement can be made.
15	200 mmfd.	High side to "A," low side to "G" terminals of AM antenna terminals.	1600 kc	BC	1600 kc	Across voice coil.	A18	Adjust for maximum output.
16	20 mmfd.	High side to "A," low side to "G" terminals of AM antenna terminals.	1400 kc	BC	Tune for maximum output.	Across voice coil.	A19	Adjust for maximum output.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. All readings taken in broadcast position except those for item 4A, 6BA6 tube, which should be taken in FM position.
2. Voltage readings are in volts and resistance readings in ohms unless otherwise specified.
3. D-C voltage measurements are at 20,000 ohms per volt; a-c voltages measured at 1,000 ohms.
4. Socket connections are shown as bottom views.
5. Measured values are from socket pin to common negative.
6. Line voltage maintained at 117 volts for voltage readings.
7. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
8. Volume control at maximum, no signal applied for voltage measurements.
9. Resistance readings in the B+ circuits may vary widely according td the condition of the filter capacitors.

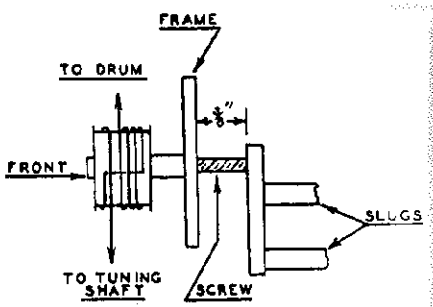
1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. The color coding of the i-f transformer leads is as follows: Grid—green Plate—blue
3. A self-contained loop antenna is provided for broadcast band reception. For permanent home installation, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. Connect the outdoor antenna to the single screw terminal on the loop terminal marked BCST. ANT. The loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. Once the station is tuned in, rotate the cabinet back and forth through a quarter of a circle, leaving it in the position where the station is received with maximum volume.
4. An internal power line antenna is provided for FM operation in relatively strong signal areas. An external dipole antenna is recommended for maximum FM operation. To connect the dipole, remove the wire from the FM ANT. screw terminal "A" and connect the dipole leads to "A" and "G."
5. A ground connection is not required for AM or FM operation.
6. An external phonograph can be connected to the jack provided at the rear of the chassis base.



DETAIL OF FM COLLAR STRINGING AND CORRECT SETTING OF SLUG TUNER WITH TUNING CONTROL FULLY COUNTER—CLOCKWISE.

MODELS 540, 564, 572

EMERSON RADIO AND PHONO. CORP.

ALIGNMENT

To set pointer on Models 540 and 564, turn tuning slugs completely in and set pointer to top reference dot on right side of dial backplate. On Model 572 set pointer in extreme clockwise position. Use isolation transformer if available. If not, connect a condenser in series with low side of signal generator and chassis. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to pin 7 (grid) of 12BE6. Low side to B—.	455 kc	Tuning slugs completely out.	Across voice coil.	A1, A2, A3, A4	Adjust for maximum output. If isolation transformer is not used, reduce dummy antenna to 0.001 mfd. to reduce hum modulation.
2	200 mmfd.	High side to external antenna lead. Low side to chassis.	1600 kc for Models 540 and 564. 1620 kc for Model 572	Bottom reference dot at right side of dial backplate for Models 540 and 564. Tuning slugs completely out on Model 572.	Across voice coil.	A5,. A6	Adjust for maximum output.
3	200 mmfd.	High side to external antenna lead. Low side to chassis.	1400 kc	Tune for maximum output.	Across voice coil.	Antenna coil (34)	Loosen screws on bracket of antenna coil (34). Adjust position of coil for maximum output. Tighten screws.

5	35W4	40,000	100,000	75	102	110	97	40,000

VOLTAGE AND RESISTANCE READING INSTRUCTIONS

1. Voltage readings are in volts and resistance readings in ohms unless otherwise specified.
2. D-C voltage measurements are at 20,000 ohms per volt; a-c voltages measured at 1,000 ohms per volt.
3. Socket connections are shown as bottom views.
4. Measured values are from socket pin to common negative.
5. Line voltage maintained at 117 volts for voltage readings.
6. Nominal tolerance on component values makes possible a variation of ± 10% in voltage and resistance readings.
7. Volume control at maximum, no signal applied for voltage measurements.

DESCRIPTION

TYPE: Single-band superheterodyne.

FREQUENCY RANGE: 540-1620 kc.

TYPE OF TUBES:

1—12BE6, pentagrid oscillator-modulator
1—12BA6, first i-f amplifier
1—12AT6, diode detector, a-f amplifier, a.v.c.
1—50B5, beam power output
1—35W4, half-wave rectifier

POWER SUPPLY: A.C. or D.C.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 30 watts.

CURRENT DRAIN: 0.24 amp. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. In operating the receiver on d.c., it may be necessary to reverse the line plug for correct polarity.
3. The color coding of the i-f transformer leads is as follows:

Grid—green	Plate—blue
Grid return—black	B+—red

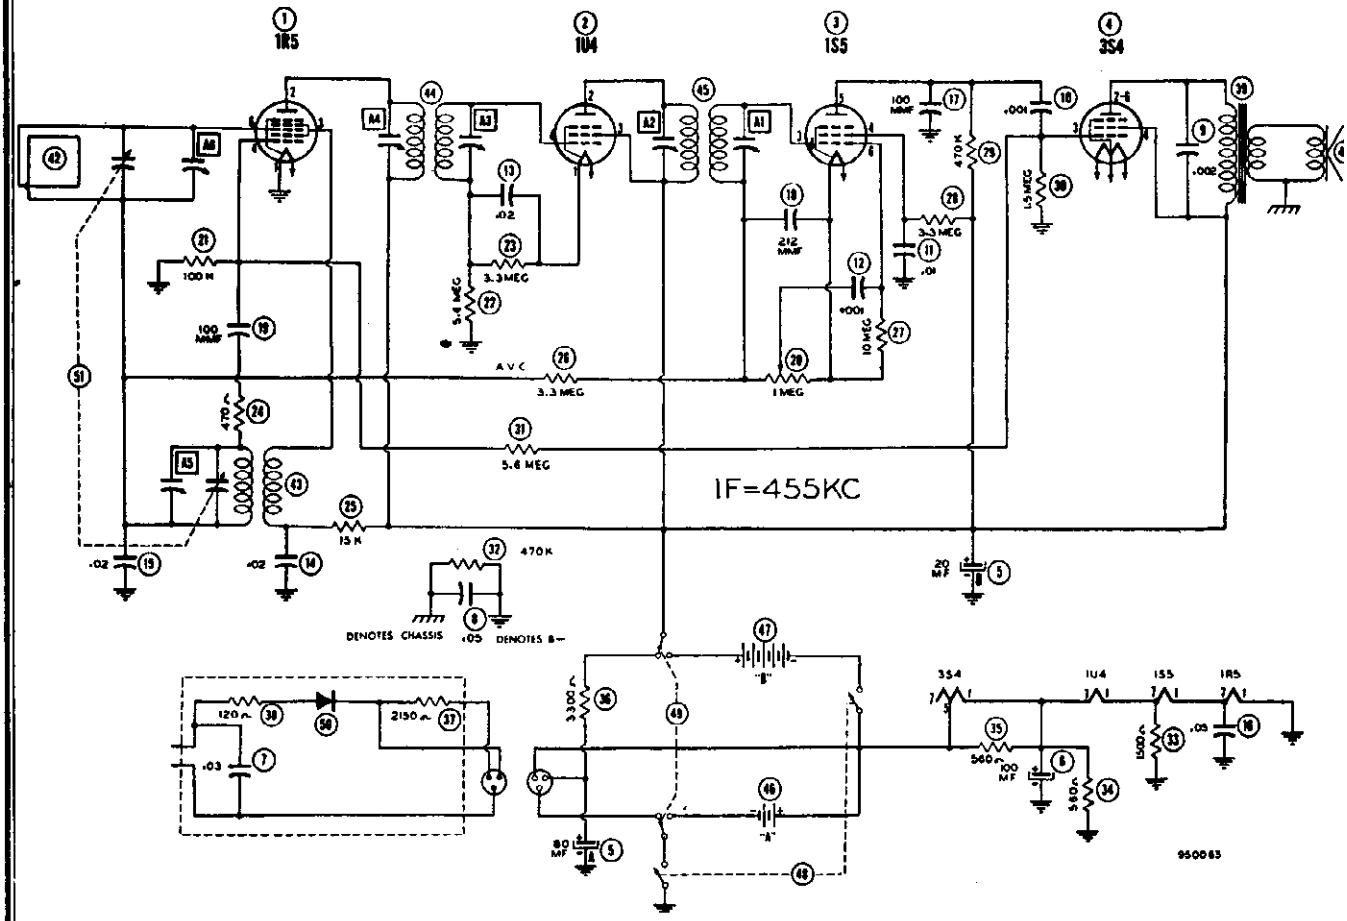
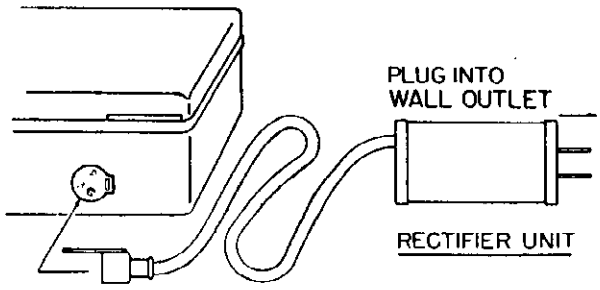
EMERSON RADIO AND PHONO. CORP. MODEL 569, CHASSIS 120062





POWER SUPPLY PLUG

PLUG INTO RECEPTACLE IN RECEIVER. INSERT PLUG ALL THE WAY. FOR BATTERY OPERATION REMOVE PLUG.

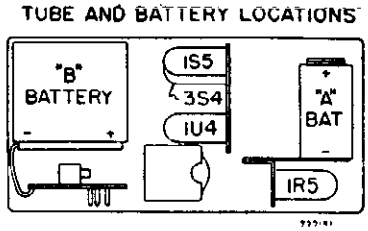
BATTERIES USED IN THIS RECEIVER		
TYPE	MANUFACTURER'S NUMBER	
6 Volt "A"	Olin No. 4919	Eveready No. 724
67½ Volt "B"	Olin No. 1712	Eveready No. 457

A.C.-D.C. OPERATION—Insert three-prong plug into socket on side of receiver. Plug Rectifier Unit into 105-125 volt wall outlet. Rectifier Unit will normally operate warm. Keep unit free from dust and in a well ventilated location. *OPERATE RECTIFIER UNIT IN HORIZONTAL POSITION ONLY.* If set is inoperative on D.C., reverse plug in wall outlet.

BATTERY OPERATION — Remove the three-prong plug from the receiver; the self-contained batteries will then supply power. Removal of Rectifier Unit from wall outlet is desirable.

BATTERY REPLACEMENT

TUBE AND BATTERY LOCATIONS



1. Remove power supply plug from set.
2. Slide the button on the release catch near the handle in the direction of the arrow. This loosens the bottom shell and permits it to be swung open on the hinge, making the batteries accessible.
3. Insert the batteries as shown in the diagram.
4. To reassemble, hold the chassis face down with the batteries in place. Close the bottom shell over the chassis and press the handle end of the shell so that it snaps into place.

MODEL 569 EMERSON RADIO AND PHONO. CORP.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1—DC Voltage measurements are at 20,000 ohms per volt; AC voltages measured at 1,000 ohms.
2—Socket connections are shown as bottom views.
3—Measured values are from socket pin to common negative.
4—Line voltage maintained at 117 volts for voltage readings.
5—Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
6—Volume control at maximum; no signal applied for voltage measurements

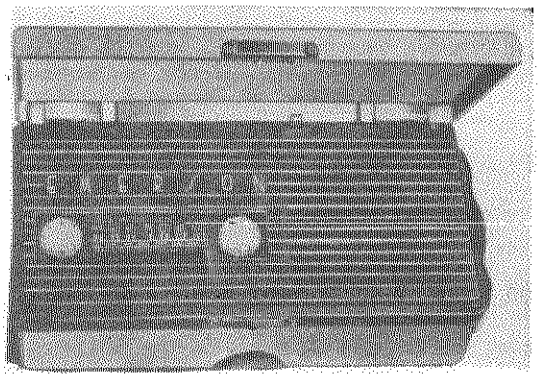
ALIGNMENT INSTRUCTIONS

Use battery power when available. If AC power is used, use an isolation transformer when available. If not, connect a .1 mfd. capacitor in series with low side of the signal generator and B—.

Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin 6 (grid) of 1R5. Low side to B—.	455KC	Tuning cap. fully open.	Across voice coil.	A1, A2, A3, A4	Adjust for maximum output. If AC power is used without an isolation transformer reduce dummy ant. to 200 mmf. to reduce hum modulation.
2		Loop	1620KC	"	"	A5	Fashion loop of several turns of wire and radiate signal into loop of receiver. Adjust for maximum output.
3		"	600KC	Tune for maximum output.	"	A6	Rock tuning cap. and adjust for maximum output. Repeat Steps 2 and 3 until no further improvement can be made.



DESCRIPTION

TYPE: Three-way pocket portable superheterodyne.

FREQUENCY RANGE: 540-1600 kc.

TYPE OF TUBES:
1—1R5, oscillator-modulator
1—1U4, i-f amplifier
1—1S5, 2nd detector, a.v.c., a-f amplifier
1—3S4, pentode output

POWER SUPPLY: A.C.-D.C. (105-125 volts) or self-contained batteries

VOLTAGE RATING:
"A" Battery—6 volts
"B" Battery—67.5 volts

POWER CONSUMPTION: 11 watts

CURRENT DRAIN:
"A" Battery—60 ma.
"B" Battery—8 ma.

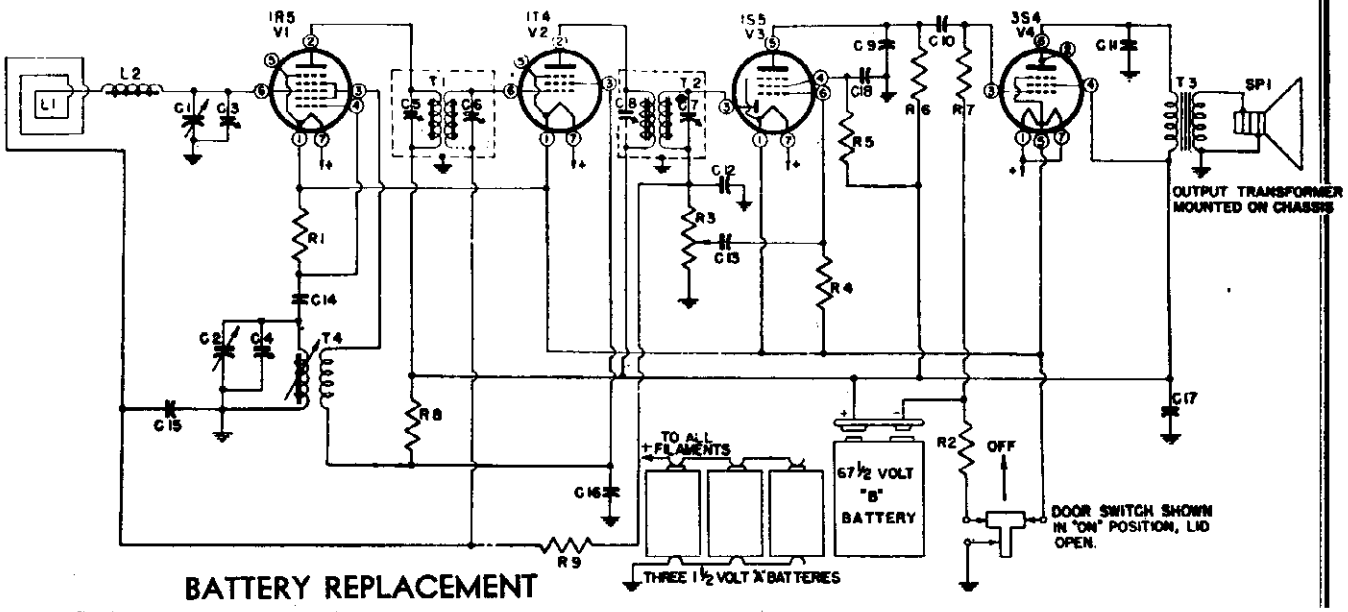
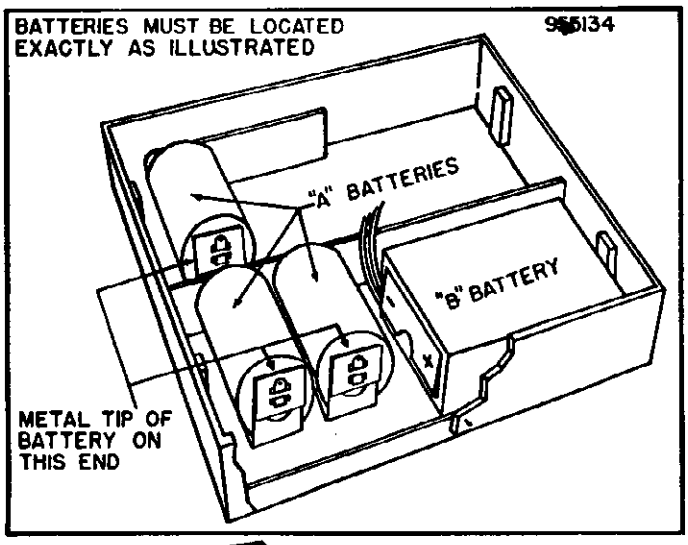
EMERSON RADIO AND PHONO. CORP.



BATTERY REPLACEMENT

TO REPLACE BATTERIES: Close cover and turn set over. Unscrew large screw in center of base and remove bottom panel. This makes batteries accessible. Replace batteries as shown in illustration. Replace bottom panel and tighten screw.



DESCRIPTION

DESIGNATION: "Memento."

TYPE: Battery-operated superheterodyne.

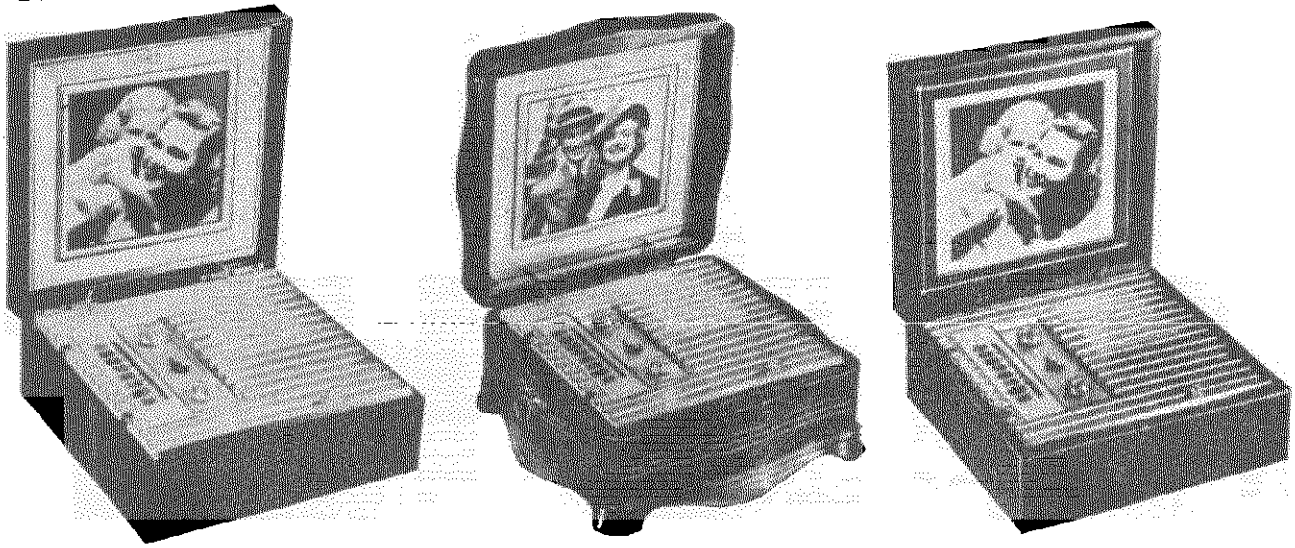
FREQUENCY RANGE: 540-1600 kc.

TYPE OF TUBES:
1—1S5, 2nd detector, a.v.c, a-f amplifier
1—1R5, oscillator-modulator
1—1T4, i-f amplifier
1—3S4, pentode output

POWER SUPPLY: "A" and "B" batteries.

VOLTAGE RATING:
"A" Battery—1.5 volts
"B" Battery—67.5 volts

CURRENT DRAIN:
"A" Battery—0.25 amp.
"B" Battery—0.0075 amp.



MODEL 570 MODEL 574 MODEL 580

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1420, and 1620 kc is required.

An output meter should be connected across the primary or secondary of the output transformer for observing maximum response.

Always use as weak a test signal as possible, turning down the output of the test oscillator as the alignment of the receiver progresses.

Turn the volume control on full.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located next to the 1R5 tube. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is located between the 1T4 and 1S5 tubes. Trimmers are accessible through holes in the top of the can.

The oscillator coil is located behind the on-off switch. The trimmer for the oscillator is located on the smaller variable condenser section. The 600 kc oscillator core adjustment is the brass screw protruding from the end of the oscillator coil.

The loop antenna acts as the antenna coil. The trimmer for the loop is located on the larger section of the variable condenser.

I-f Alignment

1. Rotate the variable condenser to the minimum capacity position.
2. Feed 455 kc to the grid (pin 6) of the 1R5 tube through a 0.01 mfd. condenser.
3. Adjust the four i-f trimmer screws for maximum response. (Clip the test signal lead to the stator of the larger capacity section of the variable condenser.)

R-f Alignment

1. Connect the test oscillator to a coil composed of three or four turns of wire wound in a circle approximately 12 inches in diameter. This coil should be placed parallel to and in line with the receiver loop at a distance of approximately 15 to 20 inches.
2. Radiate a signal at 1620 kc, rotate the variable condenser to minimum capacity, and adjust the oscillator trimmer, on the smaller section of the variable condenser, for maximum response.
3. Radiate a signal at 1420 kc, tune in the 1420 kc signal, and adjust the antenna trimmer, on the larger section of the variable condenser, for maximum response.
4. Radiate a signal at 600 kc, set the dial indicator to 60, and adjust the oscillator coil core trimmer while rocking the variable condenser for maximum response.
5. Return to 1620 kc and check alignment. If readjustment is necessary, repeat Steps 2 to 4 until no further improvement is noted.

VOLTAGE ANALYSIS

The following voltage readings are d-c measurements taken from B— (chassis) to the indicated tube-socket pin. A 1000 ohms-per-volt meter should be used for all readings except those indicated by an asterisk (*), which should be taken with a d-c vacuum-tube voltmeter. Take readings with the volume control set at minimum and the variable condenser closed. Use fresh batteries.

	PIN NUMBER

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1—D.C. Voltage measurements are at 20,000 ohms per volt; AC Voltages measured at 1,000 ohms per volt.

2—Socket connections are shown as bottom views.

3—Measured values are from socket pin to common negative.

4—Line voltage maintained at 117 volts for voltage readings.

5—Nominal tolerance on component values makes possible a variation of ± 10% in voltage and resistance readings.

6—Volume control at maximum, no signal applied for voltage measurements.

TYPE OF TUBES:

1—6SK7 r-f amplifier
1—6SA7 converter
1—6SK7 i-f amplifier
1—6SQ7 a-f amplifier
1—6SQ7 detector—a.v.c. phase inverter
2—6V6GT power output
1—5Y3GT rectifier

TYPE: A.C. Superheterodyne.

FREQUENCY RANGE: 540-1620 kc.

POWER SUPPLY: 60 cycle a.c.

VOLTAGE RATING: 105-125 volts a.c., 60 cycles

POWER CONSUMPTION: 90 watts

CURRENT DRAIN: .75 amp. at 117 volts a.c.

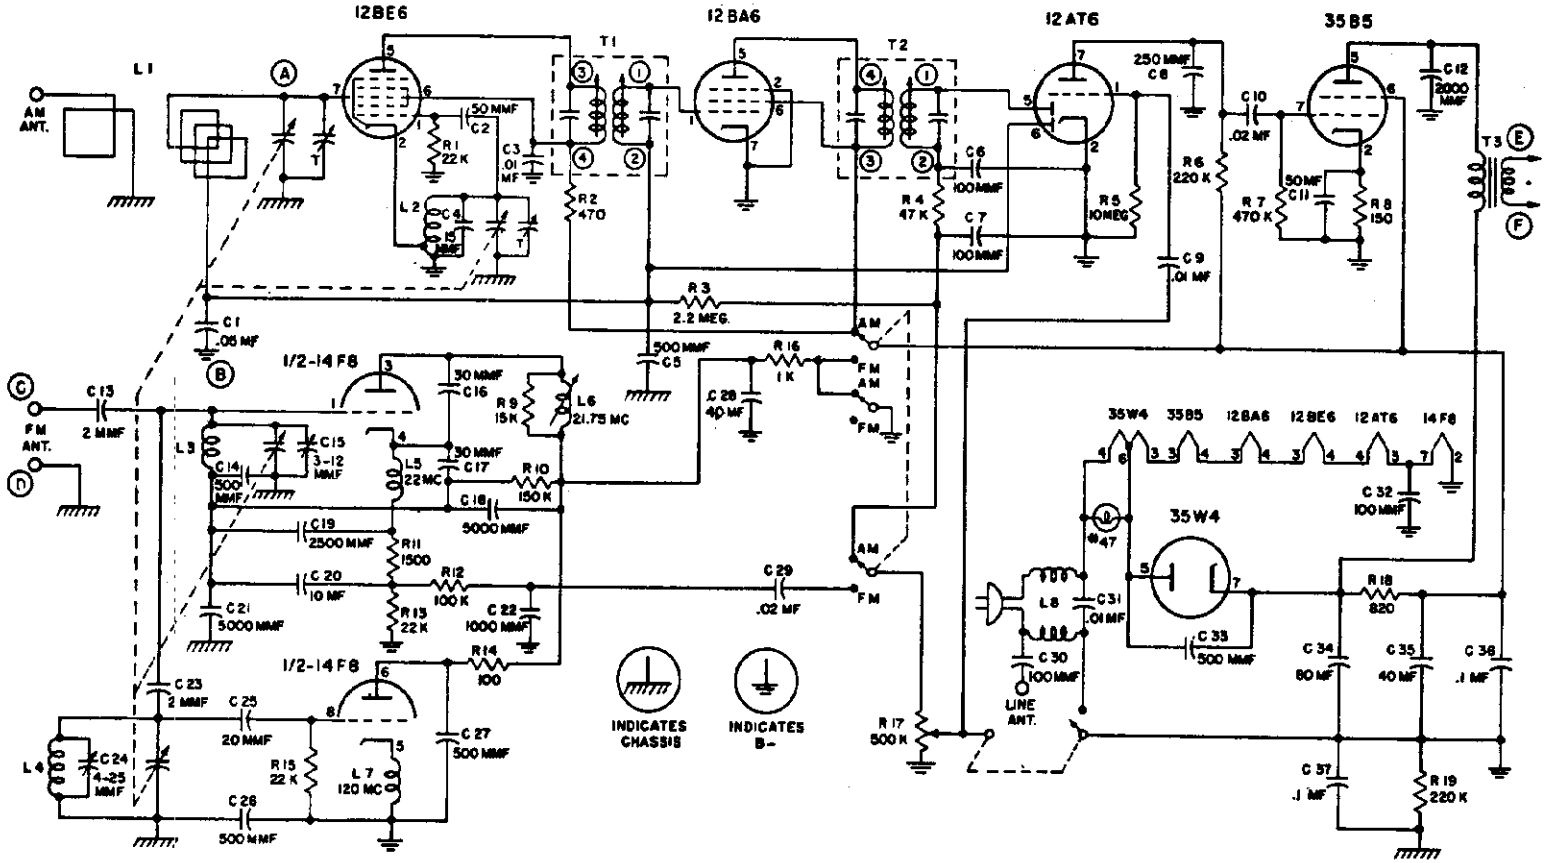
	280004	Dial drive shaft
	587070	Drive cord spring

* Not supplied separately.

† Specify part numbers when ordering.



4. Connect the "high" side of the Generator to the antenna terminal with a 200 mmf condenser inserted in series. Connect the "ground" side of the Generator to point "B".
5. Tune receiver to 150 on the dial. Adjust Signal Generator to 1500 kc. Adjust BC oscillator and BC antenna trimmers for maximum output. Use a weak signal for final adjustment.

FM Equipment:

Equipment Required:

a) 21.75 kc oscillator.
b) FM Signal Generator for 88 to 108 megacycle range.
c) Output meter.

1. Connect output meter across points "E" and "F".
3. Adjust tank coil for maximum response on output meter.
4. Disconnect 21.75 kc oscillator and connect FM signal generator to points "C" and "D".
5. Set receiver dial to 88 megacycles and adjust Signal Generator for same frequency. Adjust spacing of FM oscillator coil for maximum signal response.
6. Tune receiver to 108 megacycles and adjust Signal Generator to same frequency. Adjust FM oscillator trimmer for maximum signal response.
7. Repeat operation 5 and 6.
8. Tune receiver to 90 megacycles and adjust Signal Generator for same frequency. Adjust spacing of the FM antenna coil for maximum signal response with minimum background noise. Slowly rock tuning control while performing this adjustment.

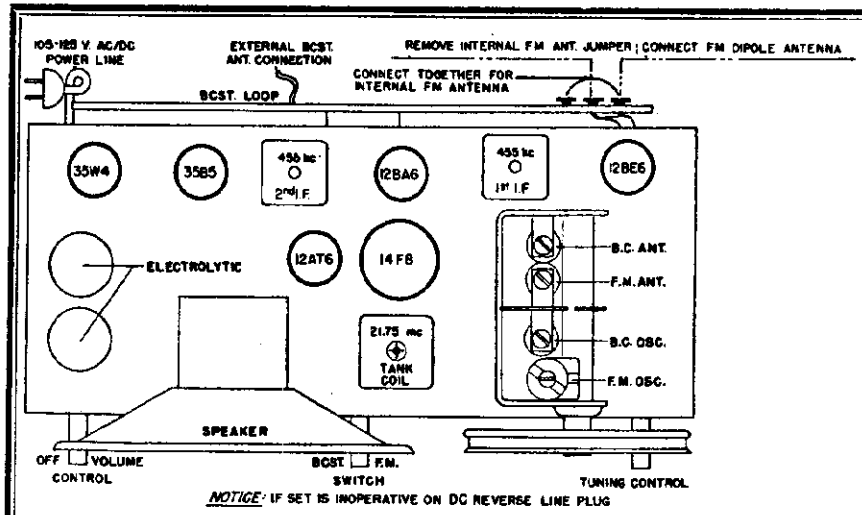
VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO CHASSIS AND ARE TAKEN WITH NO SIGNAL WITH 1000Ω PER VOLT METER⁄ SWITCH IN F-M POSITION FOR ALL TUBES EXCEPT 7Q7 WHERE SWITCH IS IN AM(BC) POSITION. LINE VOLTAGE AT 117V. WHERE NO READING IS GIVEN VOLTAGE IS ZERO OR TOO LOW TO READ.

* THESE CAPACITORS ARE ENCLOSED IN EACH CAN AND ARE PART OF EACH COIL.



NOTICE: IF SET IS INOPERATIVE ON DC REVERSE LINE PLUG

POWER SOURCE:

This receiver may be operated from either an AC or DC line, between 105 and 125 volts. On AC lines the frequency must be 50 to 60 cycles.

TUBE COMPLEMENT:

1 12BE6 — AM converter.
1 12BA6 — AM intermediate frequency amplifier.
1 12AT6 — AM demodulator and AVC; AM-FM 1st audio amplifier.
1 14F8 — FM oscillator-mixer-Super Regenerative I.F. amp.
1 35B5 — Audio output amplifier.
1 35W4 — Power rectifier.

INSTALLATION:

1. Antenna Connection.

AM—A self contained loop antenna is provided, which will give satisfactory reception on the standard broadcast band without requiring any additional external antenna. However, if stronger signals are desired from weak or distant stations an external antenna may be connected to the wire extending from the loop.

FM—A self contained line antenna system is provided for reception of stations appearing in the FM band. To use this line antenna a short wire jumper should be connected between the two outside screw terminals of the FM antenna panel, which is mounted on the broadcast loop antenna form. Should poor reception conditions make it necessary, an FM dipole antenna may be connected to the left hand and center screw terminals of the FM antenna panel. In such a case, the line antenna link should be disconnected.

2. Ground.

This set has been designed to operate without an external ground, and the use of any ground connection is not recommended.

3. Power Connection.

After making certain that the power circuit is rated between 105 and 125 volts extend the line cord to its full length and insert the plug into the nearest convenient outlet. If the supply is DC, and the set fails to operate, it may be necessary to reverse the plug connection to secure operation of the set.

OPERATION:

The left hand knob controls the ON-OFF power switch and volume level. To turn receiver on, rotate this knob in a clockwise direction. Within a few degrees of rotation an audible click will be heard, and the dial will become luminous. After a half minute of warm up the receiver will be in an operating condition. Further advance of this control in a clockwise direction will provide an increase in volume level.

The center knob controls the selection of AM or FM stations. When rotated to the counterclockwise position, operation in the AM (standard broadcast) band is provided. When this control is rotated to the clockwise position, FM stations may be tuned in.

The right hand or tuning knob enables the selection of any desired station as indicated on the calibrated dial. The upper row of numbers is calibrated directly in megacycles and covers the FM band. The lower scale is used to tune in stations in the standard broadcast band. Add one zero to the numbers on this scale to obtain the station frequency in kilocycles.

VI. SERVICE ADJUSTMENTS:

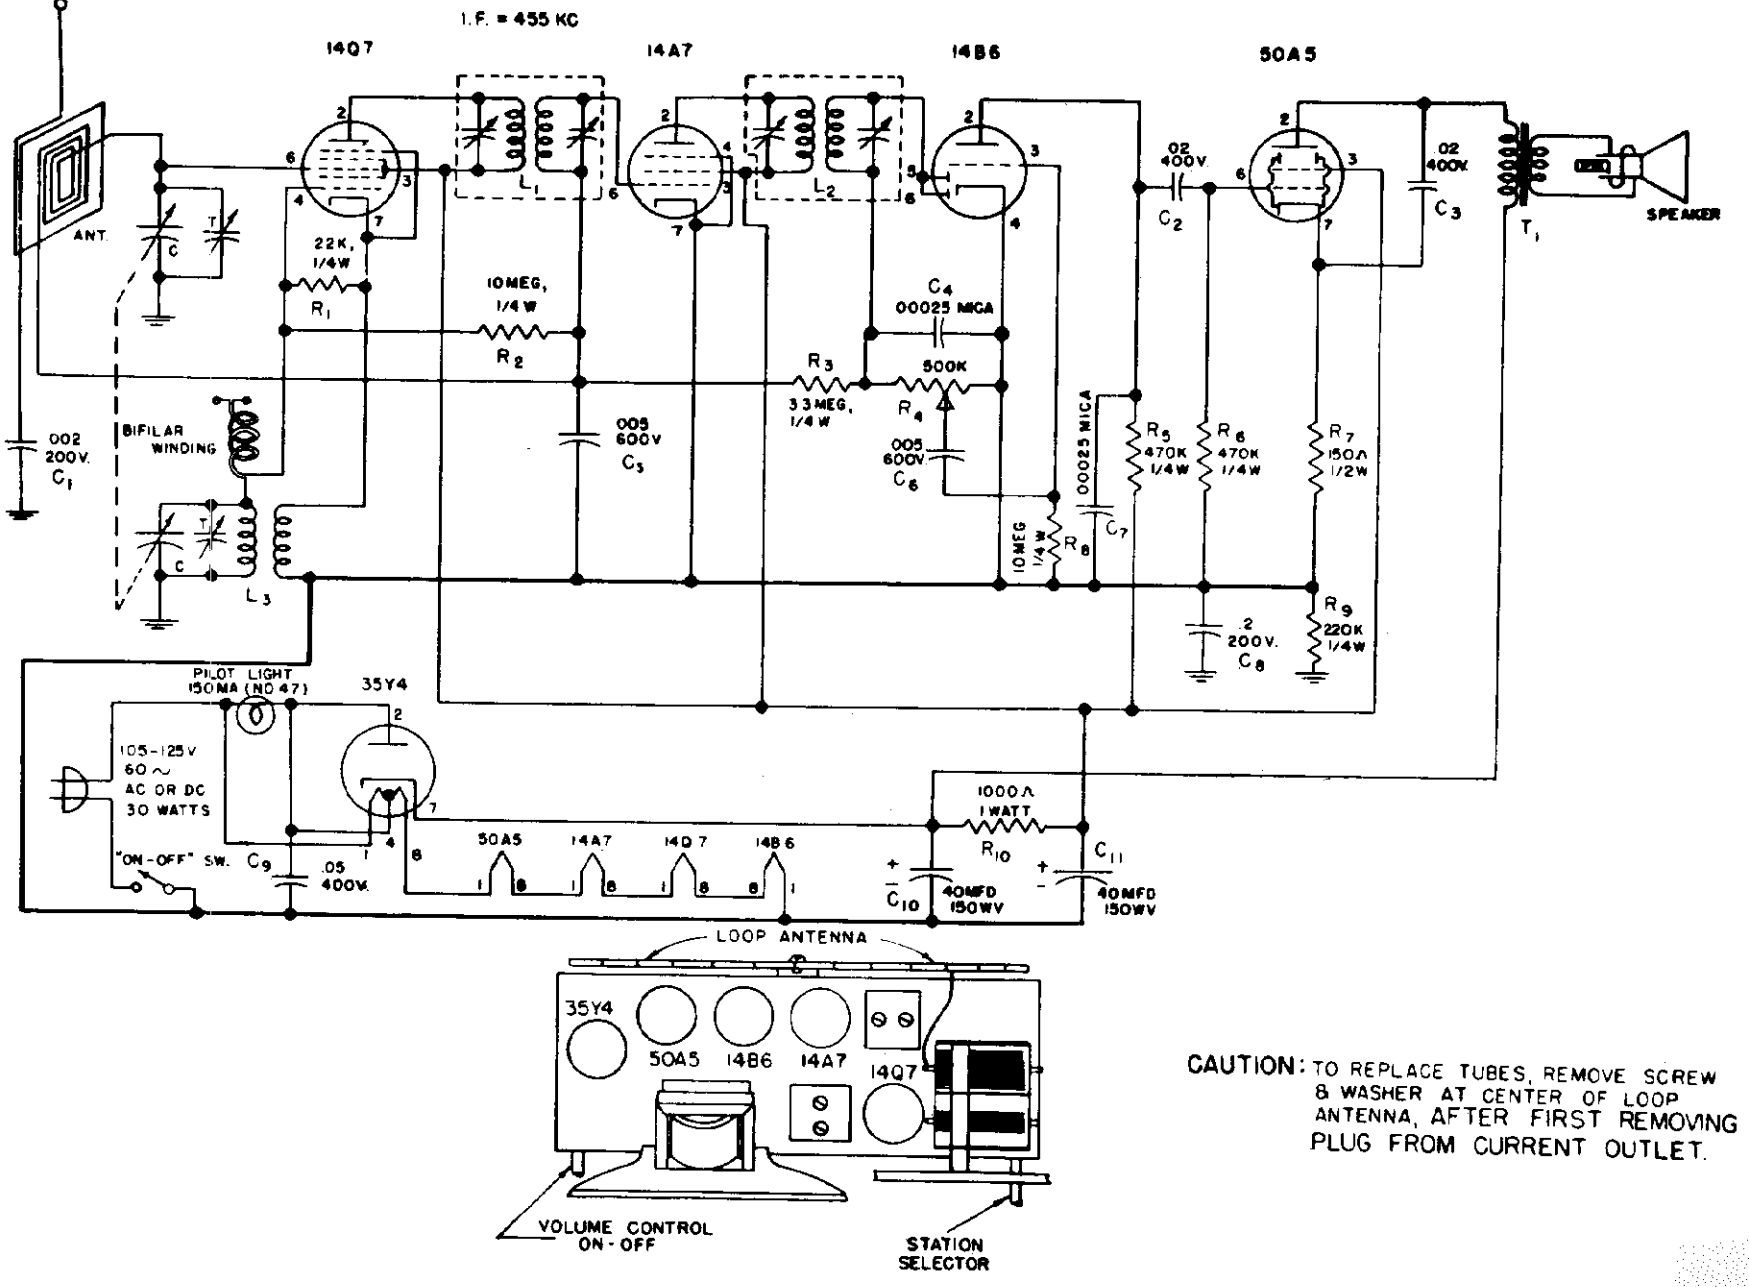
Alignment or adjustment of the various circuits of this receiver can only be made by a skilled radio technician with the proper equipment.

NOTE: Points A, B, C, D, E, and F are noted on the circuit diagram.

AM Equipment:

Equipment Required:
a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch at AM. Advance volume control to full volume setting.
2. Connect output meter across voice control at points "E" and "F".
3. Connect the "high" side of the Signal Generator to point "A" through a .01 mfd condenser. Connect the "ground" side to point "B". Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I.F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.



CAUTION: TO REPLACE TUBES, REMOVE SCREW & WASHER AT CENTER OF LOOP ANTENNA, AFTER FIRST REMOVING PLUG FROM CURRENT OUTLET.

F.M. SPECIALTIES, INC.

ALIGNMENT PROCEDURE

GENERAL NOTES

THE FIDELOTUNER SHOULD HAVE A WARMUP PERIOD OF ABOUT 30 MINUTES BEFORE ALIGNMENT PROCEDURE IS TO BE CARRIED OUT. IN ALL ADJUSTMENTS AN INSULATED ALIGNMENT TOOL IS TO BE USED. IF THE SIGNAL GENERATOR (USED IN EITHER THE METER OR VISUAL ALIGNMENT PROCEDURE) DOES NOT HAVE SUFFICIENT OUTPUT FOR AN INDICATION ON THE METER OR OSCILLOSCOPE WHEN THE OUTPUT OF THE GENERATOR IS FED INTO THE LIMITER OR THE LAST I-F AMPLIFIER THEN IT IS SUGGESTED THAT THE OUTPUT BE PLACED AT THE GRID INPUT TO THE R-F SECTION OF THE 6J6 CONVERTER AND THE REST OF THE ALIGNMENT PROCEDURE FOLLOWED AS IS. HOWEVER IF THE SIGNAL GENERATORS ARE CAPABLE OF STRONG SIGNAL OUTPUTS, THIS OUTPUT SHOULD BE JUST HIGH ENOUGH TO PRODUCE A DEFINITE INDICATION ON THE METER OR OSCILLOSCOPE.

I. METER METHOD OF ALIGNMENT

EQUIPMENT: A STANDARD SIGNAL GENERATOR CAPABLE OF FREQUENCIES ILLUSTRATED BELOW AND A VACUUM TUBE VOLTMETER (VTVM) AS AN OUTPUT INDICATOR. IF NO VTVM IS AVAILABLE USE AS HIGH A RESISTANCE PER VOLT DC VOLTMETER (PREFERABLY 20,000 OHMS PER VOLT METER). THE LOW SIDE OF THE SIGNAL GENERATOR AND METER SHOULD BE CONNECTED FOR ALL ALIGNMENTS TO CHASSIS GROUND OR PIN 2 OF THE TERMINAL STRIP.

STEPS	TUNER DIAL SETTING	SIGNAL GENERATOR FREQUENCY	CONNECT SIGNAL GENERATOR TO	DUMMY ANTENNA	METER CONNECTION	ADJUST TRIMMERS OR COILS IN ORDER SHOWN	REMARKS
A	HIGH FREQ. END OF BAND	10.7 MC UNMODULATED	PIN 4 GRID OF 6SH7 2ND IF AMPLIFIER	0.02 MF	TO PIN 3 OF TERMINAL STRIP	S5, S6	MAXIMUM DEFLECTION ON METER
B	"	"	PIN 4 GRID OF 6SH7 1ST IF	"	"	S3, S4	" " " "
C	"	"	PIN 6 RF GRID OF 6J6 CONVERTER TUBE	"	"	S1, S2	" " " "
D	98 MC	98MC UNMODULATED	PIN 1 OF TERMINAL STRIP	500 OHM CARBON RESISTOR	"	T1, T2	MAXIMUM DEFLECTION ON METER ROCK DIAL WHILE TUNING T2 FOR MAXIMUM
E	105 MC	105 MC UNMODULATED	"	"	"	T1	MAXIMUM DEFLECTION ON METER
F	TUNE DIAL FOR MAXIMUM METER DEFLECTION	90 MC UNMODULATED	"	"	"	OSCILLATOR COIL	IF DIAL READING IS TOO LOW ACCORDING TO THE FREQUENCY OF THE GENERATOR EXPAND OSCILLATOR COIL SLIGHTLY; IF DIAL READING IS HIGH, THEN COMPRESS COIL. IN EITHER CASE IT IS FOR MAXIMUM DEFLECTION. REPEAT STEPS E AND F FOR BEST POSSIBLE INDICATION.
G	REPEAT STEP D FOR FINAL ADJUSTMENTS OF R-F AND OSCILLATOR SECTIONS						
H	HIGH FREQ. END OF BAND	10.7 MC UNMODULATED	PIN 4 GRID OF 6SH7 LIMITER	0.02 MF	TO JUNCTION OF R11 AND R12 DISCRIMINATOR LOAD RESISTORS	S8	MAXIMUM DEFLECTION ON METER
I	"	"	"	"	TO PIN 6 OF TERMINAL STRIP	S7	ZERO DEFLECTION (ZERO READING)* ON METER

*VARY SIGNAL GENERATOR BY A SIMILAR AMOUNT ON EITHER SIDE OF THE 10.7 MC SIGNAL AND OBSERVE METER. THE READINGS SHOULD BE THE SAME BUT OF OPPOSITE POLARITY. IF THEY ARE NOT, REPEAT STEPS H AND I IN THE ORDER INDICATED.

II. VISUAL METHOD OF ALIGNMENT

EQUIPMENT: OSCILLOSCOPE AND ANY GOOD STANDARD FM SIGNAL GENERATOR CAPABLE OF FREQUENCIES AND DEVIATIONS LISTED BELOW. THE OUTPUT FREQUENCY OF THE SIGNAL GENERATOR WILL ALWAYS BE FREQUENCY MODULATED. THE LOW SIDE OF THE SIGNAL GENERATOR AND OSCILLOSCOPE HORIZONTAL AND VERTICAL TERMINALS SHOULD BE CONNECTED FOR ALL ALIGNMENTS TO CHASSIS GROUND OR PIN 2 OF THE TERMINAL STRIP. THE MODULATING SIGNAL FROM THE F-M SIGNAL GENERATOR SHOULD, FOR ALL ALIGNMENTS BE ATTACHED TO THE HORIZONTAL TERMINALS OF THE OSCILLOSCOPE.

PATTERN A

PATTERN B

STEPS	TUNER DIAL SETTING	SIGNAL* GENERATOR FREQUENCY AND DEVIATION SETTING	CONNECT SIGNAL GENERATOR TO	DUMMY ANTENNA	METER CONNECTION	ADJUST TRIMMERS ON COILS IN ORDER SHOWN	REMARKS
A	HIGH FREQ. END OF BAND	10.7 MC (FREQ. MOD) WITH ABOUT 500 KC FREQ. DEVIATION	PIN 4 GRID OF 6SH7 2ND IF AMPLIFIER	0.02 MF	VERTICAL TERMINAL TO PIN 3 ON TERMINAL STRIP	S5, S6	ADJUST FOR SYMMETRY AND MAXIMUM AMPLITUDE AS INDICATED IN PATTERN (A) ABOVE
B	"	"	PIN 4 GRID OF 6SH7 1ST IF	"	"	S3, S4	SAME AS ABOVE

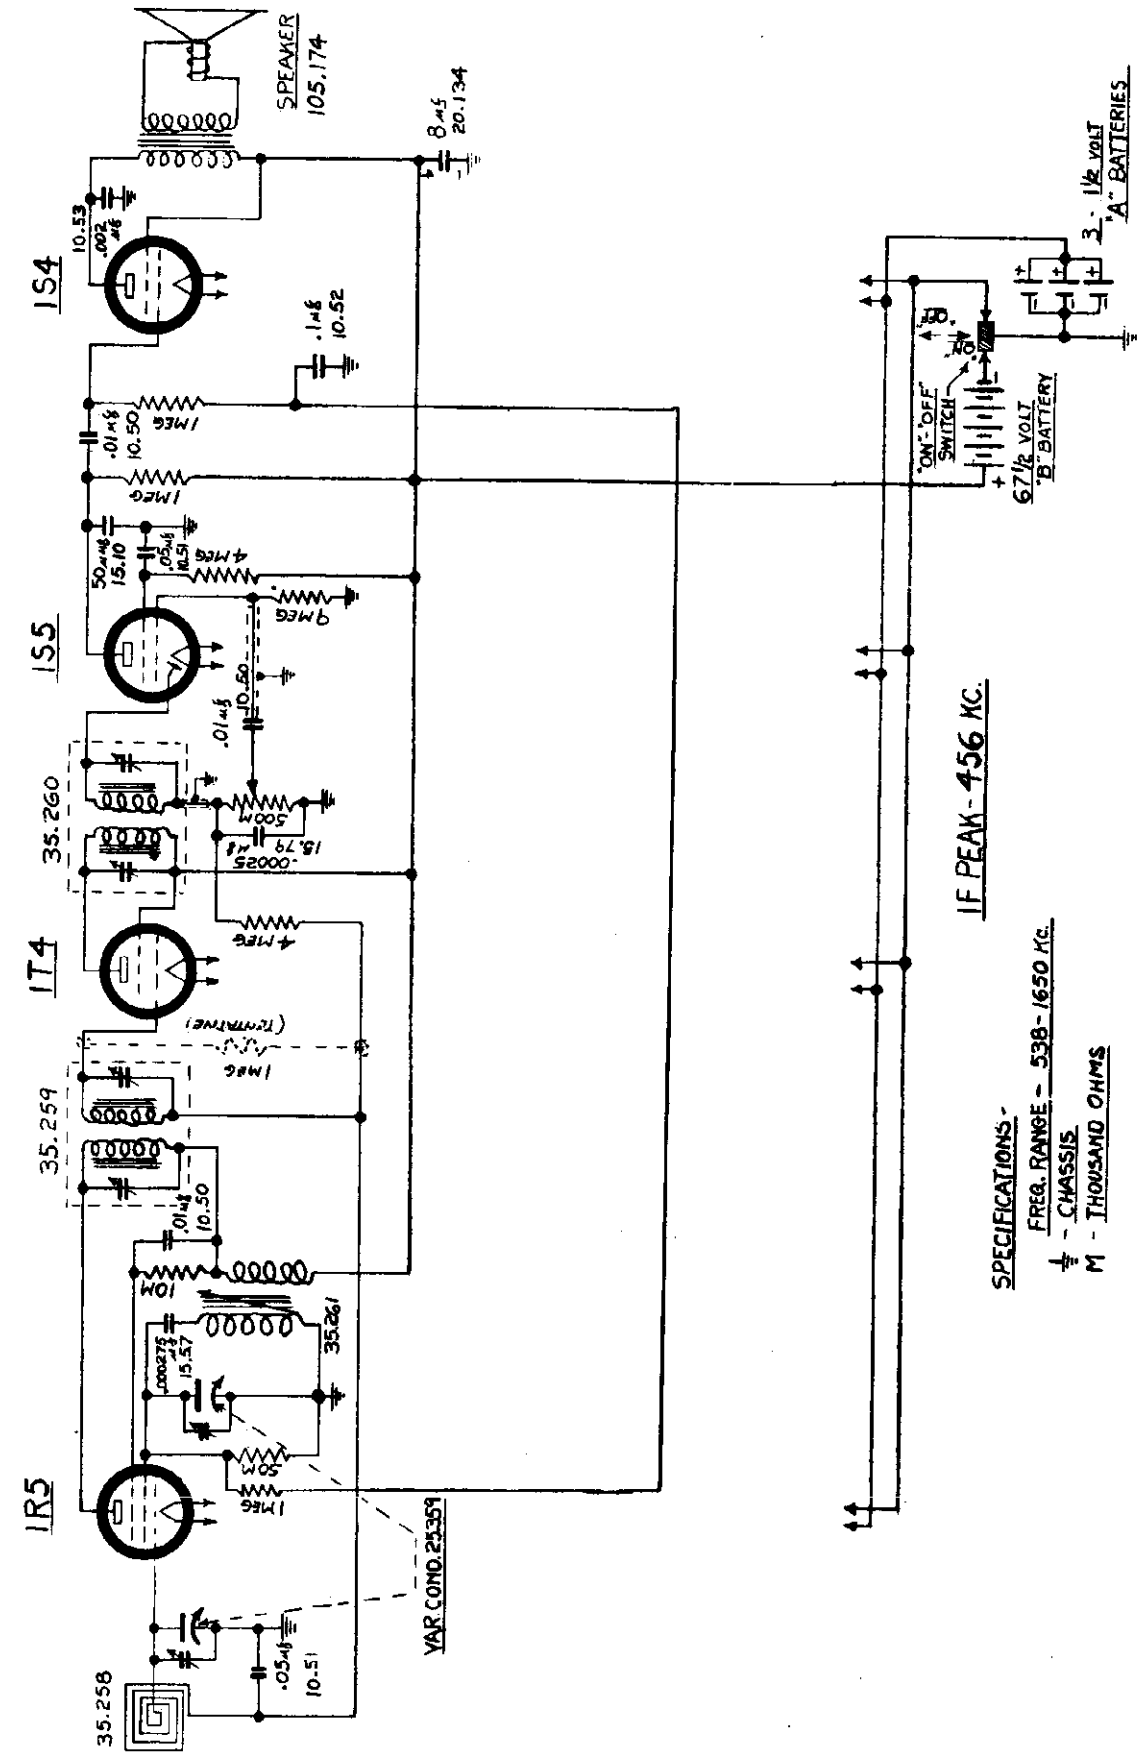
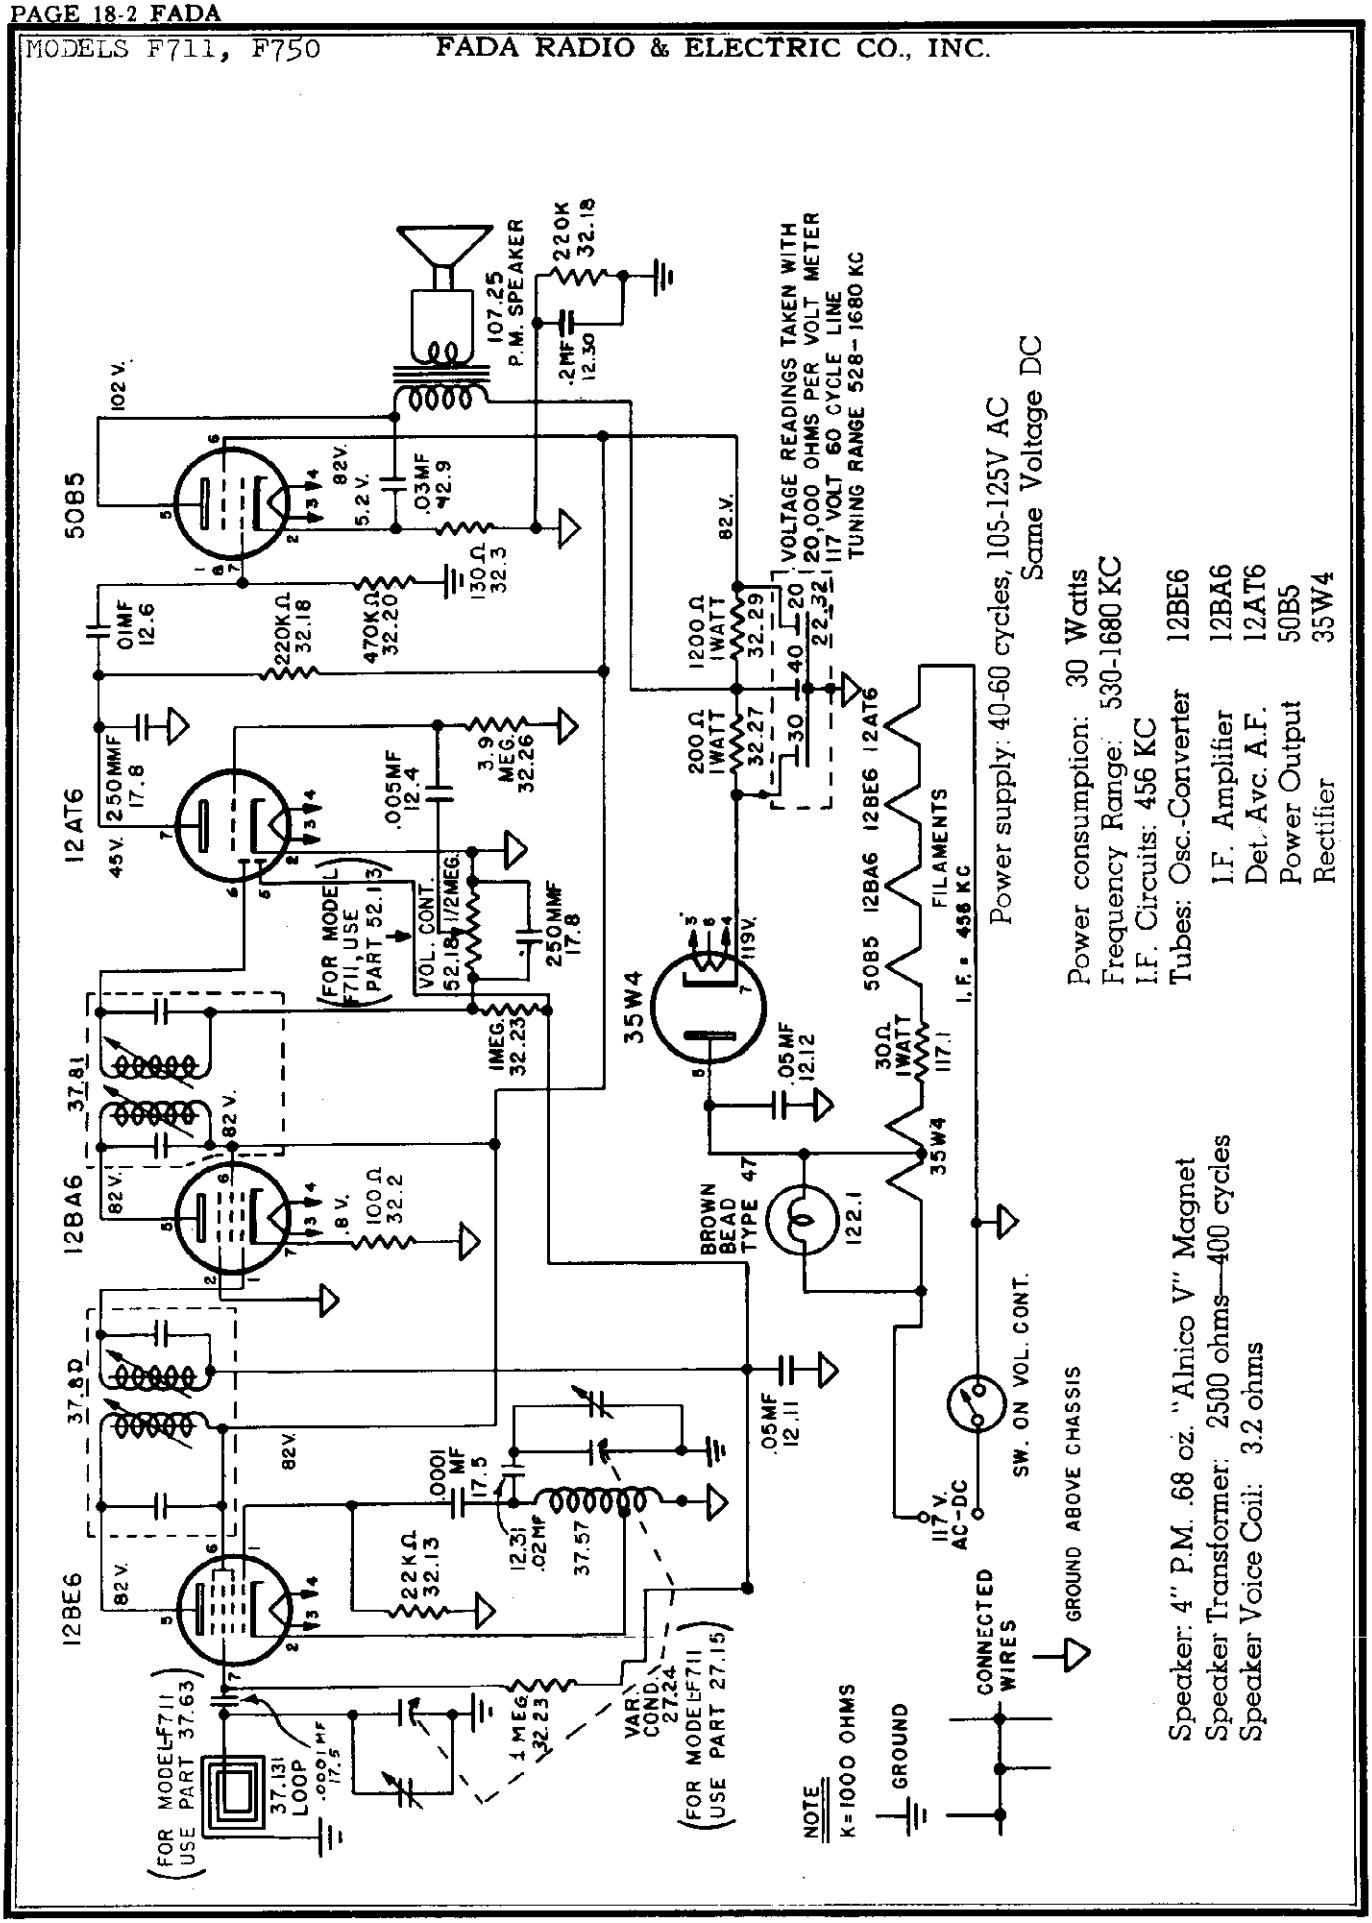
E	105 MC	105 MC (FREQ. MODULATED) WITH ABOUT 500 KC DEVIATION	"	"	"	T1	SAME AS REMARKS FOR STEP A
F	TUNE DIAL FOR MAXIMUM AND SYMMETRICAL RESPONSE	90 MC (FREQ. MODULATED) WITH ABOUT 500 KC DEVIATION	"	"	"	OSCILLATOR COIL	IF DIAL READING IS TOO LOW ACCORDING TO THE FREQUENCY OF THE GENERATOR, EXPAND OSCILLATOR COIL SLIGHTLY; IF DIAL READING IS HIGH THEN COMPRESS COIL. IN EITHER CASE THE ADJUSTMENT IS FOR MAXIMUM AND SYMMETRICAL RESPONSE AS SHOWN IN PATTERN (A) ABOVE
G	REPEAT STEP D FOR FINAL ADJUSTMENTS OF R-F AND OSCILLATOR SECTION						
H	HIGH FREQ. END OF BAND	10.7 MC (FREQ. MOD) WITH ABOUT 300 KC FREQ. DEVIATION	PIN 4 GRID OF 6SH7 LIMITER	0.02 MF	PIN 6 OF TERMINAL STRIP	S8	ADJUST S8 FOR GOOD LINEARITY AND MAXIMUM AMPLITUDE AS INDICATED IN PATTERN (B) ABOVE
I	"	"	"	"	"	S7	ADJUST S7 FOR CORRECT SYMMETRY OF THE MID POINT OF THE CURVE.

*IF THE F-M SIGNAL GENERATOR CANNOT PRODUCE THE FREQUENCY DEVIATION (i.e.)SWEEP FREQUENCY) INDICATED THEN THE LARGEST FREQUENCY DEVIATION THAT THE GENERATOR CAN PRODUCE SHOULD BE USED.

FADA RADIO & ELECTRIC CO., INC. MODEL C



MODELS F711, F750 FADA RADIO & ELECTRIC CO., INC.



ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Volume Control full on.

Low range A.C. meter connected across voice coil to indicate output.

Keep signal generator attenuated so as to maintain 1/2 scale reading on output meter.

Make certain that dial pointer is exactly horizontal when variable condenser is fully meshed.

Receiver Dial at:	Signal Generator	Dummy Antenna	Connect Signal Generator to:	Refer to Chassis Layout for Location of Trimmers
1 Full Open	Exactly 456 KC	.1 MF	Control Grid 12BE6 Tube (Top) Rear Section Variable Condenser	Adjust for Maximum Output L1, L2, L3 & L4
2 Full Open	Exactly 1680 KC		Radiating Loop (1/2 meter) 20" from Receiver Loop	Adjust for Maximum Output T1
3 Approx. 1500 KC	Approx. 1500 KC		Radiating Loop (1/2 meter) 20" from Receiver Loop	Adjust for Maximum Output T2
4 Approx. 600 KC	Approx. 600 KC		Radiating Loop (1/2 meter) 20" from Receiver Loop	Check tracking and bend slotted end plate (rear section) of variable, if necessary.

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Disconnect Loop leads—Remove Chassis from Cabinet.
Volume Control full on.
Low range A.C. meter connected across voice coil to indicate output.
Keep signal generator attenuated so as to maintain ½ scale reading on output meter.
Use battery power when available.

Receiver Condenser at:	Signal Generator	Dummy Antenna	Connect Signal Generator to:	Refer to Chassis Layout for Location of Trimmers
1 Fully closed	Exactly 456 KC	.1 MF	Chassis Ground and Control Grid 1R5 Rear Section Var. Cond.	Adjust for maximum output T1, T2, T3, and T4.
2 Fully closed	Approx. 538 KC	.1 MF	"	Adjust for maximum output T7
3 Fully open	Exactly 1640 KC	.1 MF	"	Adjust for maximum output T5
Repeat Operations 2 and 3. The next two operations are performed with the chassis in the cabinet, the loop connected and tuning indicator in position.				
4 Approx. 1500 KC	Approx. 1500 KC		Radiating Loop 20" from Receiver	Adjust T6 for maximum output.
5 Approx. 600 KC	Approx. 600 KC		Radiating Loop 20" from Receiver	Adjust T7 for max. while rocking variable cond.

To set transformer tap switch: Remove line cord plug from power outlet. Loosen the lock screw above the window. The switch knob should now be turned until the figures appearing in the center of the window area corresponds to, or are greater than the voltage of the power supply. The setting is locked by tightening the lock screw.

EQUIPMENT AND PROCEDURE FOR ALIGNMENT

An output meter and a signal generator are required for proper alignment of these sets. The signal generator should be calibrated at the following points: 455 Kc., 600 Kc., 1000 Kc., 1500 Kc., 3.5 Mc., 7.5 Mc., 9.5 Mc. and 20 Mc. All adjustments should be made with the volume control set for maximum, keeping the signal generator output as low as possible to prevent AVC action and incorrect settings.

Connect the low side of the signal generator to the ground terminal on the chassis. Connect the high side of generator to antenna terminal through dummy load of 200 MMF for broadcast band and a dummy load of 400 ohms for shortwave.

STEPS	DUMMY ANTENNA	SET GENERATOR AT	SET GANG AT	ADJUST	LOCATED	TO OBTAIN
1	SET VOLUME CONTROL AT MAXIMUM					Maximum Output
2	.1 Mfd.	455 Kc.	Minimum	2nd. I.F. Trimmers	Top of I.F. Trans.	
3				1st. I.F. Trimmers		
4	Broadcast 200 MMF		1000 Kc.	Wave Trap Trimmer	See Illustration on page one	Minimum Output
5		1500 Kc.	1500 Kc.	B.C. Osc. Trimmer		MAXIMUM OUTPUT
6		1500 Kc.	1500 Kc.	B.C. RF Trimmer		
7		CHECK POINTER CALIBRATION AT 1000 Kc. & 600 Kc.				
8	S.W. 1 400 ohms	7.5 Mc.	7.5 Mc.	S.W. 1 Osc. Trimmer *	See Illustration on page one	
9		7.5 Mc.	7.5 Mc.	S.W. 1 RF Trimmer **		
10		CHECK 3.5 Mc.				
11	S.W. 2 400 ohms	20 Mc.	20 Mc.	S.W. 2 Osc. Trimmer *		
12		20 Mc.	20 Mc.	S.W. 2 RF Trimmer **		
13		CHECK 9.5 Mc.				

*When aligning the Shortwave oscillators use the peak found farthest out from maximum capacity on the oscillator trimmers.

**Use the peak nearest maximum capacity on the R.F. trimmers and rock gang for maximum output.

INSTRUCTIONS FOR ALIGNMENT OF FM BAND

1. *Necessary Equipment:*

RF Signal Generator, Vacuum Tube Voltmeter, Insulated Screw Driver.

NOTE—All alignment should be done with only sufficient signal amplitude to provide satisfactory signal to noise ratio, and readable output on output meter. The use of excessively strong signal is almost certain to produce misalignment.

2. *Procedure for IF Alignment, FM Band*

a. Connect V.T.V.M. from ground to audio lead of ratio detector (discriminator). Connect generator tuned to 10.7 mc. to grid of third FM IF tube through 0.1 MFD capacitor.

b. Turn secondary slug of ratio detector transformer (bottom) out as far as it will turn.

c. Tune primary for maximum output.

d. Connect generator to grid of second FM IF tube.

e. Turn bottom slug of third FM IF transformer out as far as possible. Tune primary for maximum output. Secondary may now be tuned for maximum.

f. Connect generator to the grid of first FM IF tube.

g. Turn bottom slug on second FM IF transformer out as far as possible. Using slug number 2, tune primary for maximum out. Tune secondary for maximum, using slug number 4 (bottom).

h. Connect generator to converter grid through 10,000 ohm resistor and 0.1 Mfd capacitor.

i. Follow same procedure given in paragraph (g), substituting first FM IF transformer in lieu of second IF transformer.

j. Tune secondary (bottom) of ratio detector transformer *for zero or minimum* output.

k. The FM IF system should be aligned if instructions have been carefully pursued.

3. *Instructions for Aligning FM RF Channel*

a. Equipment required: RF Signal Generator, Range 88 to 106 Mc., Output Meter, Insulated Screw Driver.

b. Connect RF signal generator in series with 300 ohm carbon or metalized resistor to "high" side of FM antenna socket. Connect output meter across voice coil of speaker.

c. Set tuning control for pointer to calibrate at the equivalent of half way between channels 280 and 300.

d. Apply 106 Mc. signal.

e. Set converter and antenna trimmers at minimum capacity.

f. Adjust oscillator by changing physical location of 9 mmf ceramic capacitor until signal is heard at maximum output.

g. Adjust antenna and converter trimmers for maximum output.

h. Set tuning controls so that dial pointer calibrates at the pointer's width higher than channel 220.

i. Apply 92 Mc. signal.

j. Adjust oscillator slug until signal is heard. Adjust converter and antenna slugs to maximum output.

k. Repeat operations c to j inclusive.

NOTE—The degree of adjustment required in the tuning of the oscillator slug will determine the number of times operations c to j must be repeated *until no further gain in sensitivity is obtained.*

l. Carefully tune across the entire FM band for the observance of dead or weak spots that may be a result of improper alignment or defective components. This can be determined by carefully noting the degree of receiver hiss in the absence of a received signal.

ALIGNMENT INSTRUCTIONS FOR AM BAND

EQUIPMENT REQUIRED

For proper alignment, a calibrated signal generator having fundamental frequencies from 455 Kc to 1500 Kc should be provided.

The indicating device for showing correct alignment may be a high resistance AC voltmeter or a vacuum tube voltmeter.

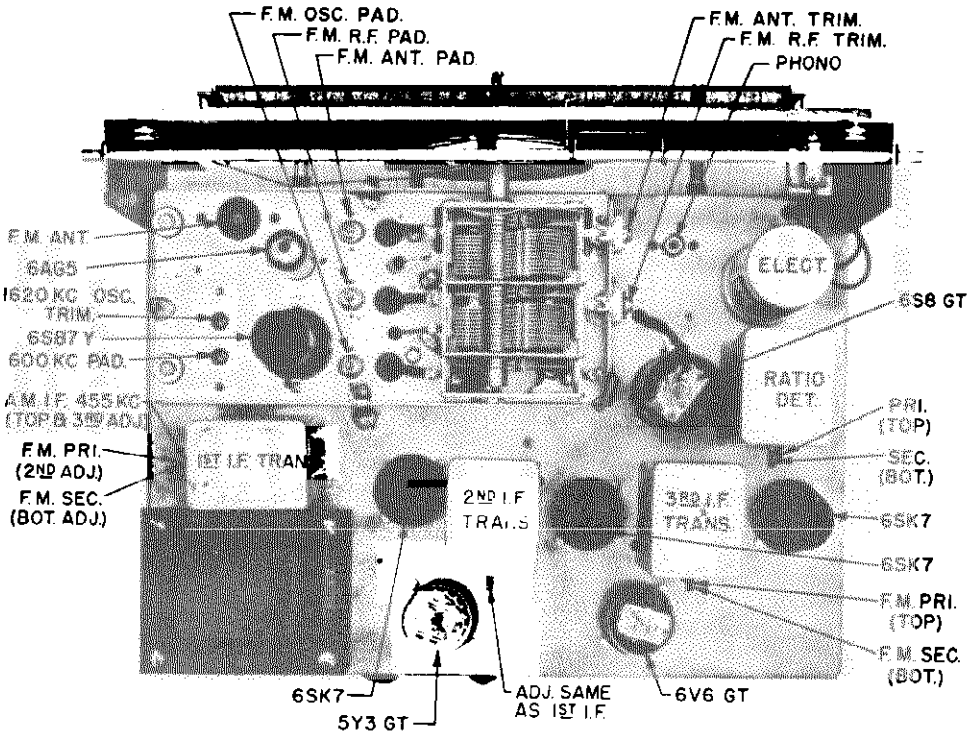
Connect the AC voltmeter either across the voice coil of the loud speaker, or if the meter range is high enough, to the plate in the output stage (through a condenser [0.1 Mfd.] to keep the DC out of the meter).

Maintain the output of the signal generator as low as possible to prevent AVC action and false settings.

TABULATION FOR AM ALIGNMENT

STEPS		CONNECT GENERATOR	SET GENERATOR AT	SET GANG AT	ADJUST	TO OBTAIN
1			Set tone and volume controls at maximum			MAXIMUM OUTPUT
2	Through 1 Mfd.	Sig. Grid (pin 8) Conv. Tube	455 Kc	Quiet Point	2nd IF Slugs #1 and 3	
3					1st IF Slugs #1 and 3	
4	Through 200 mmf	External Antenna Post on Loop	1500 Kc	1500 Kc	BC Osc. Trimmer	
5			600 Kc	600 Kc	Osc. Padder*	
6		Check dial calibration at several frequencies. If not reasonably correct, adjust oscillator padder. See note 1.				
7		Ext. Ant. Binding Post	1500 Kc	1500 Kc	Loop Trimmer	

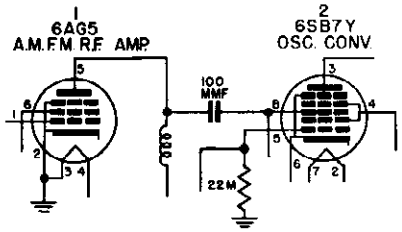
Through RMA dummy antenna.
*This adjustment should be made while gang is rocked.
Note 1. After any adjustment of oscillator padder, repeat steps 4 and 5.

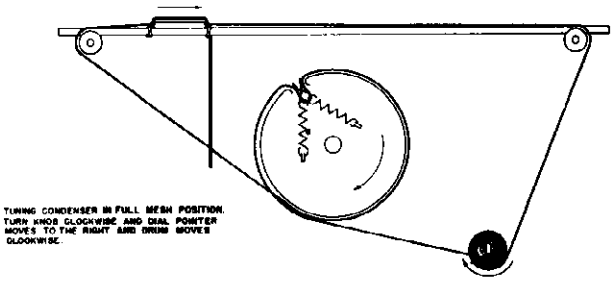


MODELS K-084, K-086, -287-P — FARNSWORTH TELEV. & RADIO CORP. — MODELS GK-084, -085, -086, -08

CIRCUIT MODIFICATION

Early sets did not incorporate the coil-condenser combination connecting between the plate of the RF amplifier and the grid of the converter. Below is an excerpt indicating that portion of the schematic of the early-production receiver.





Dial Stringing Diagram

The GK-080 series instruments incorporate two internal antennas; a loop antenna used in broadcast band reception and a folded-dipole antenna used for FM reception.

These internal antennas are intended for use only in the presence of adequate field strength, as in large metropolitan areas where local stations supply the majority of desired programs. Neither a loop nor a dipole element which is within the confines of the cabinet can be considered as efficient signal pickup devices and, should field strength requirements be not fulfilled, it will be necessary, for satisfactory reception, to install an efficient outside folded dipole antenna which feeds the receiver through a 300 ohm transmission line.

Both the loop and the dipole (internal or external) antennas exhibit certain characteristics of directivity, with which the experienced serviceman is familiar, which should be borne in mind when locating the receiver (or external antenna) in the home. Slight orientation of the receiver may effect more satisfactory reception of desired weak signals.

MULTIPLE RESPONSE AND WHISTLES

In metropolitan areas with close proximity t several strong transmitting stations, it may b necessary, on early production receivers, to co nect a 200 mmf mica capacitor across the wa trap. This must be placed on the band switch s it is switched out on FM. Should oscillation c low end of the band be experienced in the GK-08 (chairside) instrument, it is recommended that modified wave trap (part No. 38930) be subst tuted for wave trap connected between ground an terminal C1 of Section 2, front, of band switc

MODELS CAPEHART, FARNSWORTH TELEV. & RADIO CORP.
PANAMUSE N SERIES

GENERAL DESCRIPTION

SECTION 2

This Maintenance Manual is intended to assist the serviceman in understanding and adjusting for proper operation of the Capehart, Panamuse ... N series instruments. No attempt has been made toward a theoretical analysis of the various electrical and mechanical functional parts, for it is assumed that none but qualified technicians shall attempt adjustments.

An entirely new instrument, in most respects, is this first post-war product of Capehart. Cabinets remain the authentic styling that was offered pre-war and basic principles of the 16-E changer are yet unique but otherwise, little semblance is seen to the previous De-Luxe Capehart. This change has been brought about largely by new standards of dependability and excellence, particularly as concerns the tuner-amplifier-speaker combination, established in the many military applications of communications equipment.

In specifically enumerating these outstanding features and advancements, the several portions of the instrument shall be considered individually.

SECTION 3

THE RADIO TUNER

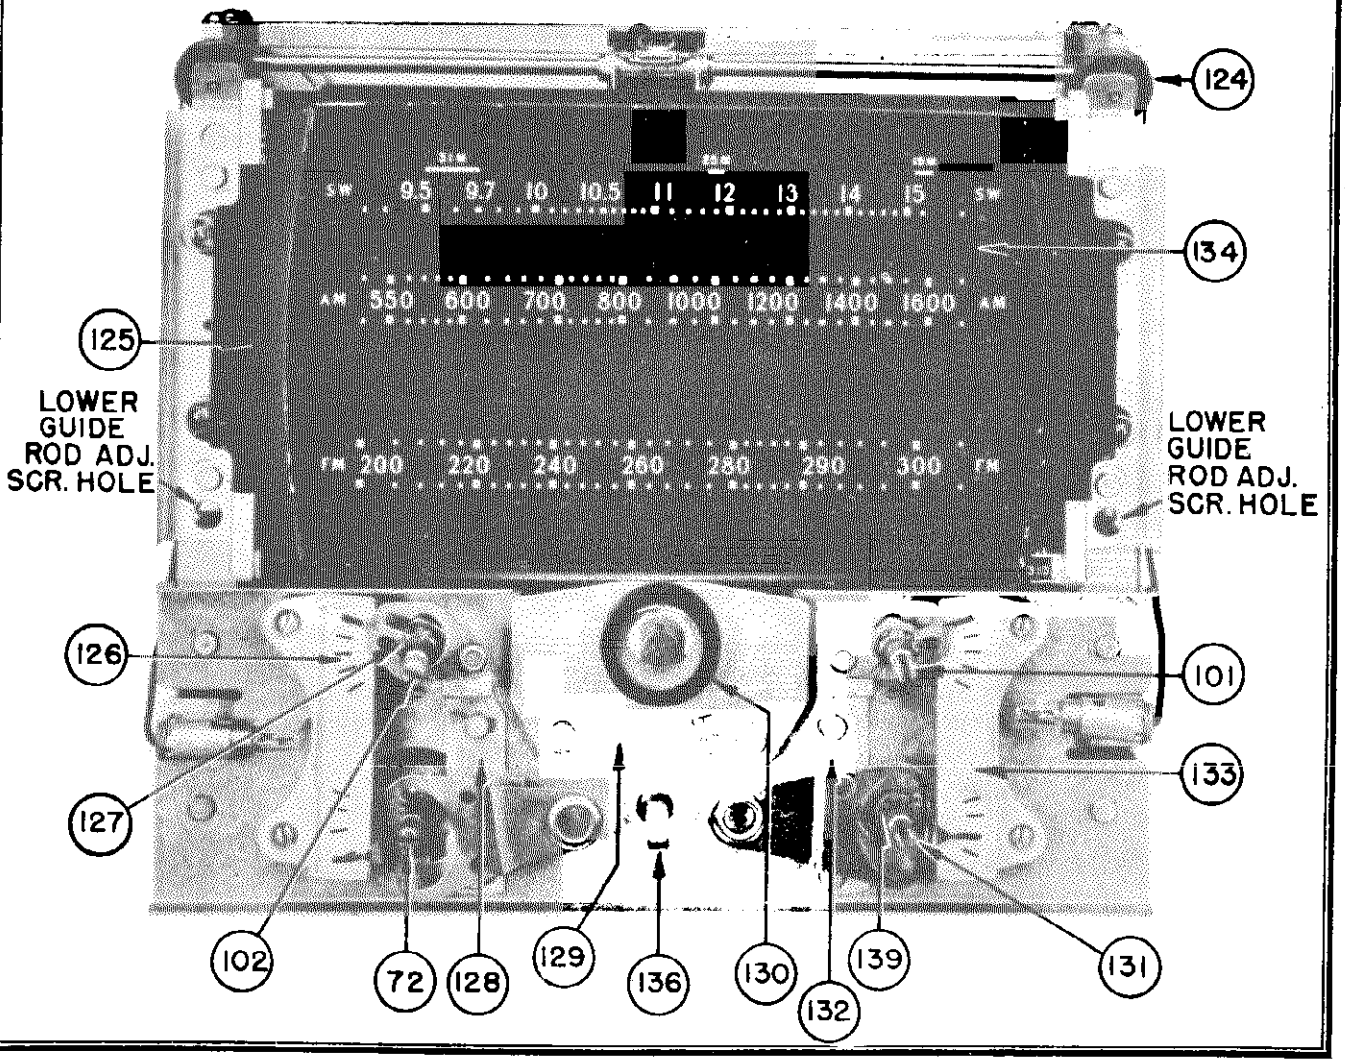
Those servicemen who dealt with the war-time application of communications equipment will readily recognize "the military" in the radio tuner. Paint over the cadmium chassis plating, bathtub-type oil-filled condensers, strip-mounting of small parts and extensive cabling are all new innovations which were basic to the armed forces' equipment. Other features also contribute to make this chassis, we believe, electrically and mechanically a masterworks:

A. Completely separate FM-AM circuits up to entry into the audio system, leading to maximum efficiency in each circuit.

B. Copper FM tuning condenser plates, rubber-mounting of R-F assembly reduce microphonics.

C. R-F sub-assembly at the rear of chassis, easily removable for service.

D. Miniature tubes are employed in the FM R-F section for optimum performance in the 100 mc. range of FM.



E. Negligible thermal effects in high frequency circuits. Low-drift ceramic condensers, temperature-compensation condensers, silver-plated invar wire to form the oscillator coil and polystyrene coil forms all contribute to frequency stability.

F. Adjustments for accurate tracking calibration. Adjustments are made to inductance, as well as capacity of tracking circuits—a feature usually to be had only in high-grade communications-type equipment.

G. Separate AM antenna coil and selector switch for use of either a loop or an external antenna.

H. Slug-tuned IF transformers and large capacity across tube input afford a high degree of stability. Changing of tubes and the "Miller effect" (a change of tuning under varying AVC potential) produce no detuning.

I. Quarter-wave resonant lines for FM RF circuit elements, accomplish image rejection of 100 decibels—a phenomenally high figure.

J. Cathode degeneration in IF stages enhances stability.

K. Ratio FM detector discriminates against AM (noise), particularly at low signal levels where the discriminator-limiter combination fail. Increased output also allows less gain in IF amplifier, effecting greater stability.

L. No critical wire placement. Detuning is practically impossible as a result of wire misplacement.

M. Improved tuning-eye circuit, showing proper tuning of FM, as well as AM.

N. Low impedance output stage. A cathode-follower provides an output of less than 500 ohms impedance. High frequencies are therefore not attenuated in the inter-chassis connecting line.

O. Reduced potential on those pilot lamps which necessitate chassis-removal for replacement. Lamp life-expectancy in excess of 10,000 hours--probably the life of the instrument.

P. Travel-light dial. By optically projecting a line of light upon the glass face, parallax is wholly eliminated. Positive band-indication is also thereby had.

These enumerate but major features of the tuner. Others, such as separate decoupling R-C networks for each stage, separate bass and treble controls, FM calibration to the new FCC channel assignments are apparant from inspection of the set and schematic. Neither esthetic appeal nor electrical efficiency have been neglected or compromised.

SECTION 4 AUDIO AMPLIFIERS

A portion of the audio system is incorporated in the tuner chassis. This is a 6SN7 tube, one section of which serves as an amplifier, the second section being used as a cathode-follower for low-impedance output. In addition, a 6J7 (triode-connected) gives added amplification in the "phono" position only.

Outstanding features of the amplifier chassis are:

A. *N-1 amplifier:* Individual output tube bias and hum-bucking adjustment. *N-2 amplifier:* Inverse feedback affords low distortion at high power levels.

N-1 and N-2 amplifiers:

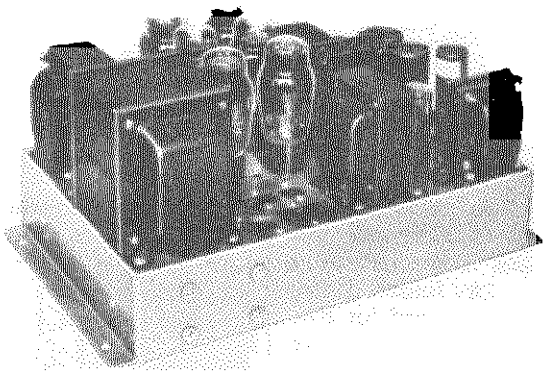
B. Very low inter-modulation distortion. Compensation of deficiencies in one amplifie stage may be made in another stage. Such a prac tice however, gives rise to intermodulation or "cross talk," resulting in the production of new and ur wanted frequencies. This effect, often overlooke in amplifier design, has here been given particula attention, such distortion being held to less tha one-half of one per cent.

C. Frequency response uniform from 50 cycle to 12,000 cycles per record.

D. Gain control in amplifier permits any "refe ence level" setting of the tuner-chassis contro

E. Auxiliary input provides for the use of wi recorder or other signal source.

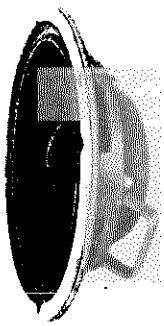
F. Fuses in both primary of transformer an output of rectifier, affording complete transforme rectifier protection.



G. Resistor in —B lead to avoid shock. T prevent hum pickup in the power cable, groundir between the two chassis is made through the aud cable. Should this cable be removed, there r mains 33 ohms between chassis, maintaining co tinuity and preventing high electrical potential b tween chassis.

SECTION 5 SPEAKERS

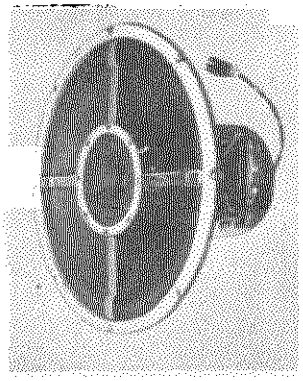
400N Series Instruments. The single speake in the 400N Series instruments results from military-sponsored design to produce the finest of sound-reproducing units. This speaker, exclusively used for home-reproduction in The Capehart, is in reality a 2-cone unit for high-fidelity response to both high and low frequencies. Both cones are driven by a 4-inch voice coil of 4 ohms impedance, a helix of spirally-wound copper ribbon, operating in the intense magnetic field produced by 5 pounds of alnico metal. Its power capacity is in excess of the thirty watts delivered b the N-1 amplifier.



For proper frequency response, the speaker mus be contained within a full enclosure of volume no less than 2½ nor more than 4 cubic feet, havin firmly attached a lining of suitable absorbent ma terial such as hair-felt.

MODELS CAPEHART, FARNSWORTH TELEV. & RADIO CORP.
PANAMUSE N SERIES

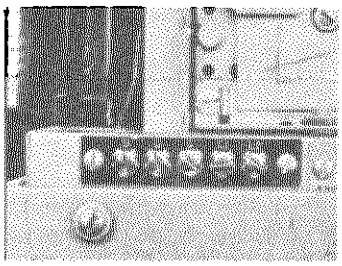
N Series Instruments. Although but a single mounting is required for the reproducing unit of the 100-Series instrument, it consists of 2 speakers coaxially-mounted. One, with 15-inch cone, is responsive to low frequencies while the other, a 5-inch unit, acts as high-frequency reproducer. Both are field-excited by heavy alnico permanent magnets. Such a "woofer-tweeter" combination has long been accepted in high-fidelity sound reproduction since but a single cone is incapable of proper response to both low and high-frequency electrical impulses.



The combined voice-coil impedance of the 2 units is 8 ohms.

SECTION 7 ANTENNAS

Capehart N-series instruments incoprorate 2 internal antennas; a loop antenna used in broadcast-band reception only and a folded-dipole antenna used for FM reception. The latter is also, as a straight-wire antenna, employed in short-wave reception, and, if desired, in broadcast reception. This latter function is accomplished by a switch at the rear of the chassis.



These internal antennas are intended for use only in the presence of adequate field strength, as in large metropolitan areas where local stations supply the majority of desired programs. Neither a loop nor a dipole element which is within the confines of the cabinet can be considered as efficient signal pickup devices and, should field strength requirements be not fulfilled, it will be necessary, for satisfactory reception, to install an efficient outside folded dipole antenna which feeds the receiver through a 300 ohm transmission line.

Both the loop and the dipole (internal or external) antennas exhibit certain characteristics of directivity, with which the experienced serviceman is familiar, which should be borne in mind when locating the receiver (or external antenna) in the home. Slight orientation of the receiver may effect more satisfactory reception of desired weak signals.

An external folded-dipole antenna will, of course, afford optimum signal pickup on FM or short-wave AM and, when the rear-chassis switch is at the "antenna" position, it will provide a good external "flat-top" for broadcast-band reception.

The internal loop antenna connects to terminals L1, L2 of the rear-chassis terminal strip; the internal or external folded-dipole antenna connects to terminals D, D on the same strip—both without regard to polarity. Terminal "G" is the connection to an earth ground.

SECTION 8

SETTING UP FOR OPERATION

We cannot overemphasize the necessity for more than a perfunctory check of the instrument prior to demonstration on the dealer's floor or to installation in the home. Improperly installed or improperly operating when installed, extra service costs and customer dissatisfaction rise rapidly, overshadowing the short added time necessary to a thorough checking routine. At least the following items should be covered and if you are thorough in your work, you undoubtedly will make additions to the list.

SUGGESTED INSPECTION ROUTINE FOR THE CAPEHART INSTRUMENTS

1. Unpacking. Carefully remove the instrument from its shipping case.

2. Inspect condition of cabinet. Packing case should be scrutinized. If panel is broken, look for concealed damage—if cabinet is damaged by rough handling in transit, concealed damaged claim should be filed with the "carrier."

3. See that all shipping tie-downs are removed from back of magazine, reverse-arm guide, tone-changer-arm and swing lever and that the cardboard block is removed from under the reverse arm lock. It is important that the reverse-arm lock be checked to see that it is not caught behind the stop, which would cause the changer to jam when started. To release such a jam, remove screws 55010 (see 41-E changer instruction manual). Set selector lever in one side position and run through 1 cycle. Although changer is shipped in 1 side position to prevent jam, main cam switch 57155 (see 41-E manual) may shift in transit, resulting in a jam.

4. The record changer must be free-floating and all 4 cushion supports in proper position. If changer is not free-floating, its position should be shifted slightly until there is no tendency to touch against any part of the mounting frame.

5. Level the cabinet with adjustable glides which are contained in a separate bag attached to the inside of shipping case. This is important for proper automatic phonograph operation.

6. Check level of changer mechanism in cabinet.

7. Determine whether the power-line voltage and frequency agree with the electrical specifications on plate on rear of the instrument.

8. Read carefully operating instructions accompanying the instrument.

9. Place a phonograph record on the turntable. Place "on-off" switch on changer to "on" position. Set all controls; volume, bass, treble, in wide-open position for acoustic feedback test. RCA record No. 49196 is good for this purpose. This test will indicate any excessive noise or rumble. Shifting the changer to a free-floating position while this record is playing should clear up any rumble which may be present.

10. Operate volume, bass, and treble controls to observe proper action.

11. Check for reproduction quality. To do this, use a good record, of quality and type of reproduction with which you are familiar. Check record reproduction at both high and low volume levels.

12. Examine antenna connections. Check reception and calibration of radio tuner on all bands.

13. Observe action of the "Electric Eye" tube and position so that tuning segments are horizontal.

14. Tap tubes in tuner to locate any excessively microphonic tubes.

15. Affix station call letter tabs on the dial, following procedure in operating instructions. The knobs must be removed before the escutcheon can be replaced. The escutcheon is wrapped in the cardboard screwed to the inside of the cabinet near the base. After the escutcheon is attached, replace the knobs.

16. Effect a complete check of the record changer

17. Carefully clean cabinet to remove finger marks. A piece of cheesecloth folded into a pad and moistened with water to which a few drops of vinegar have been added is recommended. The use of furniture polish on Capehart cabinets is not recommended.

18. Instruct customer on all phases of operation of the machine. Personally place in the customer's hands the operation manual which accompanies the instrument.

DRIVE CORD ASSEMBLIES

SECTION 9

The dial cord assemblies are 2 in number; the main drive cord which causes rotation of the drum, and a second cord which operates the traveling-light dial scale indicator. As an aid in stringin these cords, the schematics of both the vertical an horizontal type dials are shown below:

"LINE OF LIGHT" AND PULLEY STRINGING DIAGRAM
(REAR VIEW)
DIAL DRUM IS SHOWN IN THIS POSITION FOR CLARITY ONLY. AFTER BOTH DRIVE CORDS ARE INSTALLED, TURN TUNING KNOB COUNTER-CLOCKWISE UNTIL DRUM STRIKES STOP.

SET "LINE OF LIGHT" INDICATOR ON MARKS ON EXTREME LEFT END OF DIAL GLASS, TURN VARIABLE CONDENSER TO FULL MESH POSITION AND TIGHTEN SET SCREWS IN FLEXIBLE COUPLING.

RECEIVER ALIGNMENT

SECTION 10

Herewith are presented two methods of alignment of the Capehart receivers. Those service shops possessing a suitable sweep generator and oscillograph will effect considerable saving of time, as well as assuring more precise alignment, by using the first method, Section 1.00 through Section 7.08. This method is employed in factory alignment.

An alternative method, using the amplitude-modulated signal generator, is presented in the second portion of the papers which covers alignment of the FM-IF stages (Section 10.00 through Section 13.00) and of the AM portion of receiver (the chart showing Steps 1-22 which should be followed in sequence).

By following these detailed procedures, the original factory alignment of the receiver may be duplicated.

The conversion of FM dial scale readings to frequency may be made from the following analysis: The FM band extends from 88 to 108 mc., each station channel 200 kc. in width. Channel 201, that lowest in frequency, has center frequency at 88.1 mc. Each succeeding channel is successively 200 kc. higher, so channel 202 is centered at 88.3 (200 kc. higher), channel 203 is centered at 88.5 mc., 206 at 89.1 mc., etc.

PANAMUSE N SERIES

ALIGNMENT OF THE RECEIVER, SWEEP GENERATOR METHOD

1.00 GENERAL INSTRUCTIONS

1.01 *Adjustments of Dial Pointer*

a. Tune receiver to extreme low frequency end of dial and set pointer to index at the last calibration mark.

b. Carefully determine that the gang condenser plates are completely meshed with the pointer in this position.

WARNING: This adjustment is extremely important if subsequent alignment is to provide accurate calibration.

c. With the pointer at the extreme low end of the range, rotate band switch through all positions and note that the pointer line is accurately indexed on all three bands, and that the pointer is illuminated for the proper band in respect to the position of the band switch.

Note: The pointer remains dark when the band switch is in the phonograph position.

d. Tune the dial across the entire range and observe that the pointer line is a single sharply defined line of uniform brilliance. If this is not obtained, it indicates that mechanical adjustment of the spacing of the light box from the dial glass is necessary. Do not proceed with alignment until all mechanical adjustments have been made.

1.02 TUNING EYE BALANCE ADJUSTMENT

Remove last FM IF tube from its socket. Turn band switch to FM position, and adjust tuning eye balance control (located on top of the chassis between the 6H6 discriminator tube and discriminator transformer) for balance of the 2 sections of the eye. No further adjustment of this control is necessary or should be attempted. The IF tube is then replaced. If, after alignment has been completed the tuning eye does not assume this same degree of balance, it is an indication the FM IF alignment is incorrect and should be reworked. This observation must be made with no signal input to receiver. After electrical balance has been obtained, the tuning eye must be rotated in its mounting such that the 2 wedge shaped dark areas will be in horizontal alignment to the chassis.

1.03 SETTING OF RECEIVER CONTROLS

Unless otherwise indicated, the receiver controls shall be set as follows during all alignment operations:

a. Set treble tone control to maximum treble position (pointer up).

b. Set bass tone control to maximum bass position (pointer up).

c. Set volume control to maximum.

1.04 TEST SIGNAL CONDITIONS

All alignment shall be done with only sufficient signal amplitude to provide satisfactory, signal to noise ratio, and acceptable pattern size on oscilloscope or readable output on output meter. *The use of excessively strong signal is almost certain to produce misalignment.*

2.00 *Equipment Required*

2.01 455 KC IF sweep generator.

2.02 10.7 MC IF sweep generator.

2.03 5" cathode ray oscilloscope.

2.04 RF signal generator, range 400 KC to 18 MC.

2.05 RF signal generator (frequency modulation desirable). Range 88 to 108 MC.

2.06 Output meter.

2.07 Insulated screw driver.

2.08 Voltohmyst.

3.00 FM IF ALIGNMENT

3.01 Equipment required: From Section 2.00 use items numbers 2.02, 2.03, and 2.08.

3.02 Set band switch in FM position and other controls as in Section 1.03.

3.03 Make connection from vertical deflection amplifier of oscilloscope to pin #3 of 6H6 discriminator tube. Make certain that the 4 MFD electrolytic condenser is disconnected from this same circuit. It is necessary that the lead to the oscilloscope be shielded, of low total capacity, and connection to receiver isolated by means of a 1 meg. resistor.

3.04 Connect sweep generator to last FM IF grid (Pin 4) through a .1 MFD coupling capacitor.

3.05 Align discriminator to obtain a picture similar to an over coupled IF transformer.

3.06 Place 10K resistor across primary of discriminator transformer and retouch alignment to obtain symmetrical pattern. It will be noted that the pattern is now single peaked but rather broad. This does NOT constitute a final alignment of discriminator, but is a convenient expedient to assist in the alignment of the IF stages.

3.07 Shift connection of sweep signal generator the grid of the second FM IF tube (Pin 4).

3.08 Align third FM IF transformer for a symmetrical flat top pattern.

3.09 Shift signal generator to the grid of the first IF tube (Pin 4).

3.10 Align second IF transformer in same manner as described in Section 3.07. NOTE: The width of the nose of the curve is the same as before, but the sides have become steeper.

3.11 Connect the signal generator to the grid of the converter tube grid (Pin 1) in series with 10,000 ohm resistor and a .1 MFD capacitor, or loosely couple by stray capacity of an insulated wire.

3.12 Align first FM IF transformer in the same manner as in Section 3.07. NOTE: The sides of the curve have further steepened, but that the nose of the curve has retained approximately the same width.

3.13 Remove load resistor from primary of discriminator transformer and connect 4 MFD electrolytic capacitor that was previously disconnected.

3.14 Connect oscilloscope to audio output terminal of the discriminator. There are several points where this contact can be made and can be identified as the circuit connected to the terminal of the discriminator transformer to which a shielded lead is connected.

3.15 With sweep signal input to converter grid, (Pin 1) align discriminator transformer for conventional discriminator pattern.

3.16 Connect signal generator to converter tube grid (Pin 1) in series with a 10,000 ohm resistor and a .1 MFD condenser capacitor. A signal input of 4,000 uV at 10.7 MC shall develop 3 volts AVC as measured with a voltohmyst.

4.00 FM RF ALIGNMENT

4.01 Equipment required: From Section 2.00 use items 2.05, 2.06, 2.07, and 2.08.

4.02 Connect RF signal generator in series with 400 ohm carbon or metalited resistor to terminal "D" of RF unit nearest the side of the tuner (extreme left hand terminal viewing rear of chassis).

4.03 Set tuning control for pointer to calibrate at the equivalent of half way between channels 300 and 301.

4.04 Apply 108 MC signal.

4.05 Set converter and antenna trimmers at minimum capacity.

4.06 Adjust oscillator trimmer by tuning from maximum capacity to first signal that is heard, and peak for maximum output.

4.07 Adjust antenna and converter trimmers from maximum output.

4.08 Set tuning controls so dial pointer calibrates at the equivalent of half way between channels 200 and 201.

4.09 Apply 88 MC signal.

4.10 Adjust oscillator slug to maximum output.

4.11 Repeat operations 4.03 to 4.10 inclusive.

NOTE: The degree of adjustment required in the tuning of the oscillator slug will determine the number of times operations 4.03 to 4.10 must be repeated until no further gain in sensitivity is obtained.

4.12 Carefully tune across the entire FM band for the observance of dead or weak spots that may be a function of improper alignment or defective compoents. This can be determined by carefully noting the degree of receiver noise, that is, high noise generally is accompanied by good sensitivity.

4.13 Signal input of 18 uV should produce approximately 3 volts AVC as measured with a voltohmyst.

4.14 With no signal input to antenna the tuning eye should have the same balanced appearance as it had following operation 1.02. If this is not the case, it usually indicates inaccurate alignment of IF system.

5.00 AM IF ALIGNMENT

5.01 Equipment required: From Section 2.00 use items 2.01, 2.03, and 2.08.

5.02 Set band switch in broadcast position and other controls as in Section 1.03.

5.03 Connect oscilloscope to high potential side of volume control.

5.04 Connect 455 KC sweep generator to the grid of the second AM IF tube through a .1 MFD condenser.

5.05 Align diode transformer for symmetrical conventional IF pattern.

5.06 Connect signal generator to grid of first IF tube.

5.07 Align second IF transformer.

5.08 Connect signal generator to converter grid.

5.09 Align first IF transformer.

NOTE: The resulting overall pattern shall be symmetrical and slightly flat topped.

5.10 Signal input of 2700 uV should produce approximately 3 volts AVC as measured with a voltohmyst.

6.00 BROADCAST BAND RF ALIGNMENT

6.01 Equipment required: From Section 2.00 use items 2.04, 2.06, 2.07, and 2.08.

6.02 Place antenna loop switch in antenna position.

6.03 Connect RF signal generator to either terminal "D" through 200 MF mica capacitor.

6.04 Set dial pointer to 1500 KC.

6.05 With 1500 KC signal align oscillator, converter, and antenna trimmers for maximum output.

6.06 Set dial pointer at 600 KC.

6.07 Align oscillator padder, converter and antenna slugs for maximum output. Do not adjust the coil slug in broadcast oscillator coil.

6.08 Repeat operations 6.04 to 6.07 inclusive until no further increase in sensitivity is obtained.

6.09 Check dial calibration at several frequencies. If calibration is not reasonably accurate it will be necessary to make an adjustment of the inductance slug.

WARNING: After any adjustment of the oscillator inductance slug it will be necessary to repeat operations 6.04 to 6.07 inclusive.

6.10 Signal input of 35 uV at 1000 KC should produce approximately 3 volts AVC as measured with a voltohmyst.

6.11 Switch antenna loop switch to loop position.

6.12 Connect dummy loop to terminal L-1 and L-2, and signal generator to antenna connection of dummy loop.

6.13 Set dial pointer to 1500 KC.

6.14 With 1500 KC signal align the loop trimmer for maximum output.

6.15 Check sensitivity at 600 and 1500 KC.

7.00 SHORT WAVE RF ALIGNMENT

7.01 Equipment required: From Section 2.00 use items 2.04, 2.06, 2.07, and 2.08.

7.02 Set band switch in short wave position and other controls as in Section 1.03.

7.03 Connect RF signal generator to either terminal "D" through a 400 ohm resistor.

7.04 Set dial pointer to 15 MC. Adjust oscillator, converter, and antenna trimmers for maximum output.

WARNING: On the short wave band the oscillator is operating on the low frequency side of the RF signal. Therefore, to avoid error in setting oscillator frequency, first set oscillator trimmer to maximum capacity, then slowly turn trimmer until first signal is heard.

7.05 Set dial pointer to 9.5 MC.

7.06 Adjust oscillator, converter, and antenna slugs for maximum output.

7.07 Repeat Sections 7.04 to 7.06 inclusive, until no further gain in sensitivity is obtained.

7.08 With signal input of 90 microvolts at 15 MC should produce approximately 3 volts AVC as measured with voltohmyst.

Upon completion of all alignment the oscillator padder should be sealed with a touch of glyptal on the adjustment screw and Ambroid or similar cement applied to all coil slugs to prevent their changing adjustment.

MODELS CAPEHART, FARNSWORTH TELEV. & RADIO CORP.
PANAMUSE N SERIES

TABULATION FOR AM ALIGNMENT

10.00-10.04 Same as 1.00-1.04.

11.00 EQUIPMENT REQUIRED

11.01 Voltohmyst.

11.02 R.F signal generator range 450 KC to 108 mc.

11.03 Insulated screw-driver.

12.00 FM IF ALIGNMENT

12.01 Equipment required: From Section 11.00 use items numbers 11.01, 11.02, and 11.03.

12.02 Set bandswitch in FM position and other controls as in section 10.03.

12.03 Connect voltohmyst from ground to pin #3 on 6H6 ratio detector.

12.04 Connect signal generator in series with a .1 MFD capacitor between grid and ground of 3rd. FM IF tube (Pin 4) and set generator to 10.7.

12.05 Disconnect 4 mfd. condenser (1 lead is sufficienct from detector circuit and place 10,000 ohm resistor across primary of the fourth or discriminator transformer. Resistor shall be left connected until operation calling for its removal.

12.06 Tune secondary and primary slugs for maximum voltage.

12.07 Connect generator in series with a .1 mfd. capacitor to grid of 2nd FM IF tube.

12.08 Place a 2200 ohm resistor across secondary of 3rd FM IF transformer.

12.09 Tune primary slug for maximum voltage.

12.10 Remove 2200 ohm resistor from secondary (and place across primary of same transformer).

12.11 Tune secondary slug for maximum output.

12.12 Remove 2200 ohm resistor from primary of 3rd FM IF transformer and place across secondary of 2nd FM IF transformer.

12.13 Connect generator, in series with a .1 mfd. capacitor to grid of 1st FM IF tube.

12.14 Tune primary slug for maximum voltage.

12.15 Remove resistor from 2nd IF transformer secondary and place across primary.

12.16 Tune secondary for maximum voltage.

12.17 Connect generator to grid of FM converter tube through a 10,000 ohm resistor and .1 mfd. condenser in series or loosely couple to the grid by placing the generator lead near the grid lead.

12.18 Remove resistor from 2nd IF transformer primary and place it across secondary of 1st IF transformer.

12.19 Tune primary slug for maximum voltage.

12.20 Remove resistor from secondary and place it across the primary.

12.21 Tune secondary for maximum voltage.

12.22 Move voltmeter to audio output lead on 4th FM IF transformer. This is a shielded lead.

12.23 Remove the 10,000 ohm resistor from the discriminator primary that was installed in item 12.05. Tune secondary of 4th FM IF transformer for zero voltage. Slight returning of the primary may be necessary after the secondary is tuned.

12.24 Tuning of the primary is done by slightly detuning signal generator to obtain a readable output then tuning slug for maximum. This operation and that of 12.23 must be repeated several times to obtain final accurate alignment.

12.25 The FM IF system is now aligned. Detuning the signal generator equal amounts each side of 10.7 mc should produce equal deflections of opposite polarity on the voltmeter. If the deflections are not equal (+10% or less) the alignment is not correct and the discriminator requires re-alignment.

13.00 FM RF ALIGNMENT

Follows exactly that given in sections 4.01 to 4.14.

14.00 ALIGNMENT OF THE A-M BANDS

Equipment required: Same as section 11.

CAUTION: Care must be taken when aligning the short wave band, for the adjustment of the shunt trimmer affects the adjustment of the oscillator coil slug.

At the high frequency end of the band it is possible to peak the oscillator trimmer, and to peak the slug at the low frequency end at the image; so in the alignment instructions we have indicated the fundamental frequency and the correct oscillator setting for the image so that by resetting the signal generator it is possible to see if the alignment is correctly made. In each case the image is found at a frequency 910 Kc. higher than the fundamental.

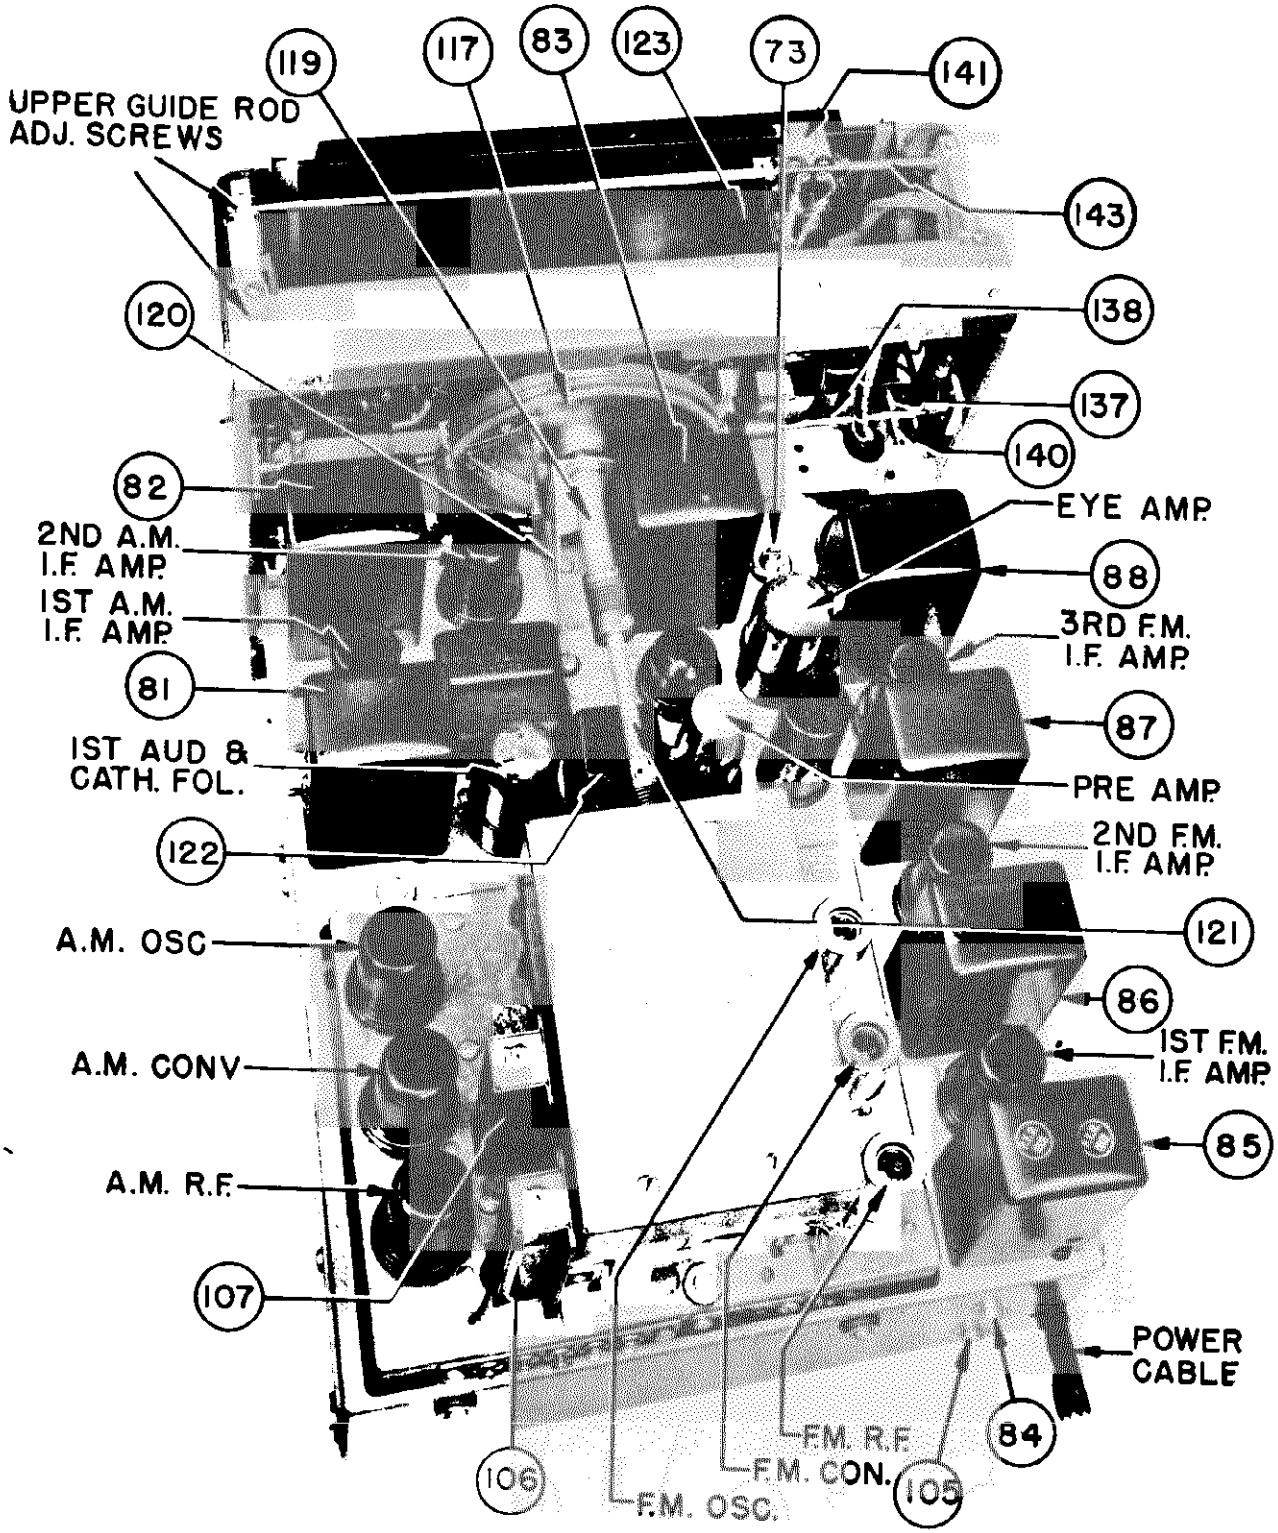
MODELS CAPEHART, PANAMUSE N SERIES

FARNSWORTH TELEV. & RADIO CORP.



MAINTENANCE OF THE TUNER

SECTION 11

This section of the Maintenance Manual is purposed, in part, to acquaint the service man with the chronological status of the tuner. The automobile industry effects certain minor modifications to their product from time to time. In like manner, circuit developments, the result of a continuous program of searching for means of improving the instrument, lead to the incorporation of modifications as enumerated below.

In addition, herein are presented the solutions to maintenance problems which the service man may encounter, which solutions will assist him in the efficient servicing of the N-series tuner. The material is listed by subject headings which will quickly permit access to the information:

1. Capehart N-series tuner code markings.
2. High hum level.
3. Tone reproduction
   a. Increasing the high frequency response.
   b. Increasing the bass response.
   c. Increasing the range of the treble control.
   d. Tone reproduction—model 413N and NC
3. Tone reproduction—general.
   a. Increasing the high frequency response.
   b. Increasing the bass response.
   c. Increasing the range of the treble control.
   d. Tone reproduction—model 413N and NC instruments.
4. Dial drive adjustments.
5. Control knobs; eccentric, loose, how to remove.
6. Dial-glass plate.
7. Microphonics.

1. CAPEHART N SERIES TUNER CODE MARKINGS

Certain "N" series receivers are coded by "circle markings" to indicate electrical circuit modifications. These markings are located on top of the first FM IF transformer (BLACK PAINTED CAN ON REAR OF CHASSIS TO THE EXTREME RIGHT WHEN VIEWING REAR OF CHASSIS) and are in the form of red circles approximately one-half inch in diameter enclosing the initials F.T.R. and tester's number.

Following is a listing of the significance of these markings, whereby you may identify any chassis:

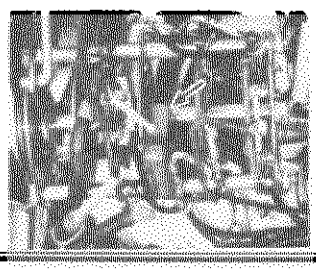
A. NO CODE MARKS

These tuners do not incorporate any of the modifications which are below-listed.

B. ONE CIRCLE

Indicates the change to a modified discriminator transformer in production which increases sensitivity and noise reduction.

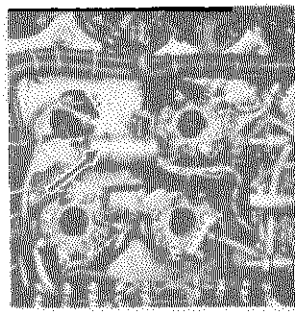
(a) *De-Emphasis Condenser*



For tuners coming under classifications (A) and (B) above, we recommend the addition of a .001 mfd. de-emphasis condenser. In FM transmission, the high modulation frequencies are pre-emphasized (their amplitude made greater). Heretofore, non-uniformity between stations caused some to evidence, in the receiver, apparent distortion—too much high-frequency response. Now, with greater uniformity in pre-emphasis, we can arrive at a more suitable overall amount of de-emphasis.

The de-emphasis condenser should be connected from the band switch side of the 47,000 ohm resistor which connects from the output of the discriminator to the auxiliary band switch, being mounted on the front wafer of the auxiliary band switch. Connection is made from the above-mentioned point to ground.

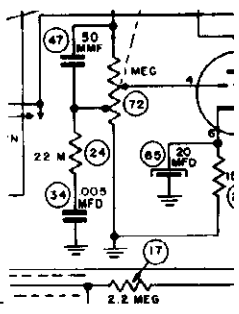
(b) *Tuning Eye Time Constant*



The action of the "eye" may be slowed-down by a longer time constant in its control circuit. This is accomplished by substituting a .1 mfd. condenser for the .01 mfd. unit connecting from pin # 4 of the eye amplifier to ground. A 200 volt condenser is satisfactory.

(a) and (b) are not essential unless the customer desires a change but if the tuner is being serviced, it is suggested that these easily-performed modifications be made.

C. TWO OR THREE CIRCLES



(a) These chassis may have resistor-capacitor values, from volume control tap to ground, of 220,000 ohms and .003 mfd., in which case the bass-boosting effects (at low volume levels) of the tap are not great. A .005 condenser and 22,000 ohm resistor will increase the bass-boost effects.

(b) These circles also indicate a change in the connection of the 50 mfd condenser associated with the single volume control circuit. Connection is changed from (1) between top of control and moving arm to (2) between top of control and fixed tap. This increases the bass response of the tuner at low volume levels.

D. FOUR CIRCLES—Tuners with 4 circles contain the above modifications.

E. ONE SQUARE—This signifies the tuner which incorporates a dual volume control as shown on the schematic, page 12. It also embodies all of the modifications listed in this portion of the manual.

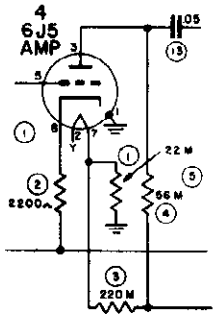
2. HIGH HUM LEVEL

a. With external jumper, connect the 2 chassis together to check the ground connection in the audio cable.

MODELS CAPEHART, FARNSWORTH TELEV. & RADIO CORP.
PANAMUSE N SERIES

b. Many tubes recently produced have heaters contaminated with the Barium-Strongium oxide emissive material, causing emission from heater to cathode if the cathode is positive with respect to the heater. This is a condition over which we have no control and we may only

(a) Substitute 6J5 or/and 6L6 tubes until those which have no such contamination are found or (b) Place the heaters at a positive potential with respect to cathode by:



1. Remove 6J5 (also 6L6 in N-2) heaters from ground. Also remove power transformer heater winding from ground.

2. Re-wire that side of the heater supply, using pin #6 (which is empty) as tie-down points, leaving both sides of the heater off ground.

3. Connect a 220,000 ohm and a 22,000 ohm resistor, in series, from +B to ground, the 22,000 ohm unit being placed at the ground end of the combination.

4. Connect the junction of the resistors to whichever side of the heaters results in the least hum.

This divider network places an approximate positive 30 volt potential upon the heaters.

All tuners in current production incorporate this feature.

3. TONE REPRODUCTION

The tonal reproduction of radio-combination instruments is occasionally commented upon by customers to be not in agreement with their personal preferences.

The human ear and the appreciation of musical rendition is a variable requiring some lee-way in tonal reproduction—thus tone-control adjustments, "treble" and "bass."

Should the customer desire a modification of the characteristics of his instrument, certain circuit re-arrangements may be made to effect the desired change. It is not recommended that such changes be done to sets whose tonal characteristics fulfill the individual's personal preferences.

Below are listed means of effecting a change in the receiver to accomplish increased high or low-frequency response and greater control-range of the treble control.

A. *Increasing the high-frequency response.*

If the instrument appears to lack high-frequency response

(a) Check the value of the capacitor in the pick up equalizer circuit. This component is mounted in the small shield can directly under the coupling shaft to the variable condenser. It should have a value of .0001 mfd. shunted with a 1.5 megohm resistor.

B. *Increasing the Bass Response*

(a) The resistor-capacitor combinations of part 1C should be checked.

C. *Increasing Range of Treble Control*

If comments are received regarding insufficient maximum treble control, the effect of this control may be increased as follows:

(a) Remove the shielded lead from terminal # 5, also remove bus wire jumper between terminals 1 and 5 of the 6SN7GT first audio tube.

(b) Connect the shielded lead to pin # 1 and install a 22,000 ohm half-watt resistor between pins 1 and 5. This makes each step of the treble control more pronounced and aids in minimizing record surface noise.

NOTE: Tuners "code marked" 3 or 4 circles incorporate this modification.

D. *Tone Reproduction Model 413N and NC Instruments*

The changes listed below are for purposes of rendering the reproduction more in keeping with the average ear and the personal preference of the listener. They are over-and-above the previous modifications and should be applied, if the 413N instrument is to be modified, after the pertinent previous changes have been made.

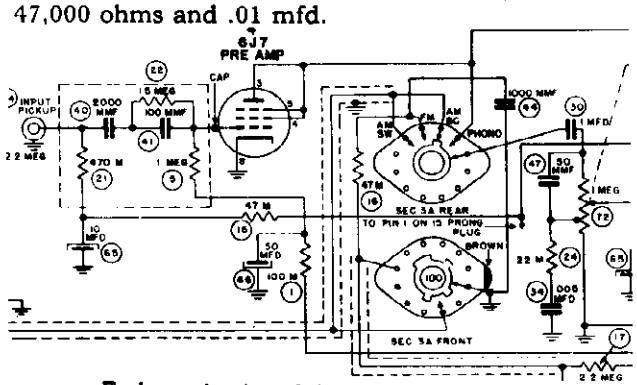
This applies to chassis with a 2, 3 or 4 code mark now in the field.

1. Change the grid resistor of the 6J7 phono preamp tube from 1 megohm to 470,000 ohms.

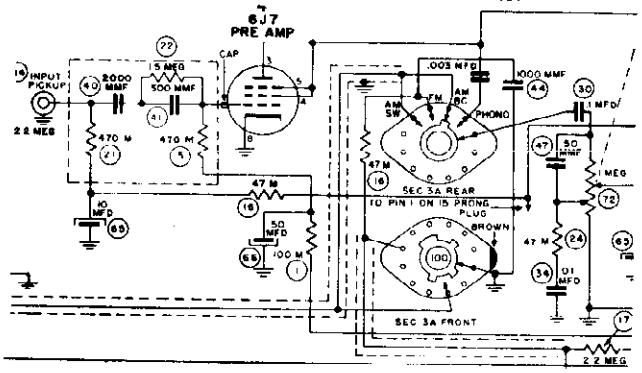
2. Change the condenser in series with the 6J7 preamp tube grid from 100 mfd. to 500 mfd. This is the condenser which has a 1.5 megohm resistor in shunt with it. This resistor should remain in the circuit.

3. Insert a .003 mfd. mica condenser in the connection between the plate of the 6J7 preamp tube and the band switch.

4. Change the series resistor-condenser connected from volume control tap to ground, to 47,000 ohms and .01 mfd.



Early production of the "N" Series tuner



Modifications of Section D, above (413N and NC instruments only)

We pass on to you below the solution to several service problems which have been experienced in the field, anticipating that they may effect a saving of time and more efficient servicing on your part.

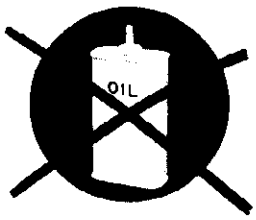
4. "N" TUNER—DIAL DRIVE ADJUSTMENTS

If dial slippage is experienced:

A. Clutch slipping. Tighten the drive clutch as tight as possible.

B. "Sticking" light boxes. The traveling light box may be sticking, causing dial slippage. This may be due to (a) lubricant on rods, (b) bent rods, (c) rough rods, (d) misalignment of rods.

(a) *The rods must be free of all lubricants.* Lubrication, momentarily helpful, causes gum to form at the light-box mounting, resulting in "sticking." Clean well with carbon tetrachloride.



(b) Bent rods must be accurately straightened or replaced.

(c) Rough portions of the rod surface should be cleaned with crocus cloth until perfectly smooth.

C. Old type of endless belt. If this belt has stretched, the newer-type may be installed by:

(a) Remove the center mounting bolt for the center resistor strip toward the FM IF section of the receiver.

(b) Remove band switch rod. Remove the program switch and lay back out of the way. (No wires need be disconnected.)

(c) Remove all parts of the idler pulley assembly and discard.

(d) Replace the drive pulley and split-gear assembly with the later type which is similar to the old type but has wider belt groove. Be sure that there is some tension on the split gear springs to avoid backlash.

(e) Remove the upper dial bracket to allow free access to the drive down.

(f) With a small rat tail file, file down the square shoulder on the drive drum at the cable cross over point. This is done to allow more space for the 2 ends of the drive cable to cross without binding. Also, dress down the ends of the drive cable channels.

(g) Install new drive cable, winding 1½ turns about the drive pulley.

(h) In reinstalling program switch, be sure that it is properly indexed with band switch.

5. DIAL GLASS PLATE

Paint scratched. This is due to the light-box assembly contacting the painted surface. Adjust the horizontal positioning of the light box for optical focus of the projected line of light, so that (1) focus is maintained throughout the entire path of travel, (2) front of light-box assembly does not at any point touch the scale. The clamps which hold the glass rod in place may be clipped back necessary.

Touch-up paint may be obtained at automobil service stations.

6. CONTROL KNOBS—ECCENTRIC—LOOSE—HOW TO REMOVE

A. *Knobs eccentric (wobbly motion) o loose.*

This is caused by pinching together the 2 halve of the split-shaft end. One half-section become bent toward the axis of the shaft to a greater de gree than does the other. Re-form the split por tions of the shaft so that they are symmetrical wit respect to the axis of the shaft.

B. *To Remove Control Knobs*

Loop a heavy cord behind the knob, bringin out the two ends at opposite sides of the knot Pull both ends firmly. If the cord (both ends) i brought out on one side only, there will be a tend ency to cause the difficulty of 6A, above.

7. MICROPHONICS AND FEEDBACK

A. Microphonic tubes.

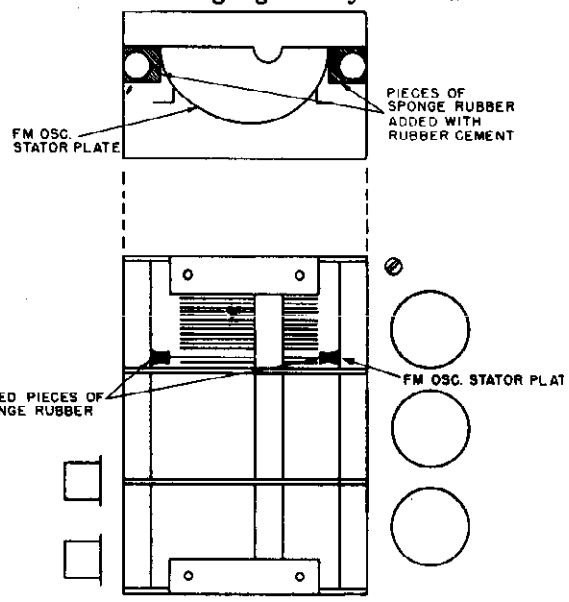
B. Check the variable condenser stator plate to ascertain whether they are loose. If so, apply collodial cement to the clamp which holds th stator plates to the insulating material.

C. "Twin lead" to antenna binding posts ma stapled to cabinet in taunt condition, whereby feed back is introduced mechanically. Re-staple the twin lead, leaving somewhat free and loose.

D. On FM microphonics and howl may b caused by the lead from stator plate to sub-chassi assembly being taunt. Re-solder with less tensio in the flat ribbon lead.

NOTE: Oscillator trimmer may have to be re adjusted.

E. If howl on the FM position persists, th following may alleviate the condition: Sponge rub ber bits added as shown in sketch. Rubbers mus be trimmed so that they will not touch rotor plate when the condenser gang is fully-meshed.



MODELS CAPEHART, FARNSWORTH TELEV. & RADIO CORP.
PANAMUSE N SERIES

REMOTE SPEAKER INSTALLATIONS

SECTION 12

No provision has been made, in the design of the instrument, for the use of one or more extension speakers.

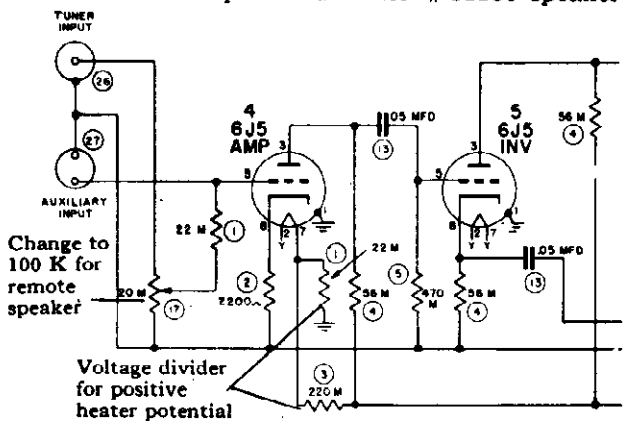
In the event that a customer desires a remote-speaker installation, we do not recommend that another speaker be connected either in series or in parallel with the cabinet speaker unit. Such an installation may be had by the use of an added amplifier unit which may be connected, in parallel with the cabinet amplifier, across the output of the tuner.

The added amplifier must have its original gain control, a 20,000 ohm unit, replaced by a control of 100,000 ohms. Connection may then be made, through a shielded lead of the low-capacity type, into the extra input jack on the cabinet amplifier chassis. Should it be so desired, the 100,000 ohm auxiliary amplifier gain control may be remotely-connected, for ready accessibility, to its amplifier circuit by individually-shielded leads of the low-capacity type. No shielding is necessary over the wires which connect amplifier to speaker.

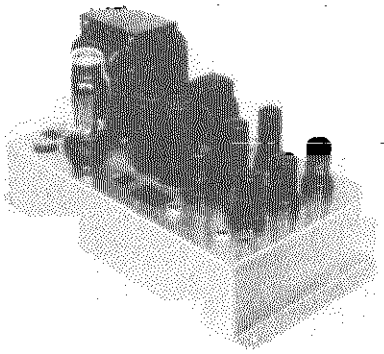
If the remotely-located speaker installation is to display characteristics identical to those of the cabinet speaker-amplifier, the remote components must be identical to those of the cabinet; an N-1 amplifier and #81143 speaker for 400N-series instruments, an N-2 amplifier and #81152 speaker for 100N-series instruments. Proper speaker enclosures must be provided. The #81166 speaker housing should be constructed of at least 1-inch plywood, wholly enclosed, lined with an acoustic absorbent such as hair-felt. Its volume is not less than $2\frac{1}{2}$, nor more than 4 cubic feet.

Should slightly lesser fidelity be permissable in the remote speaker at reduced cost, an N-3 amplifier may be employed as driver unit for the remote speaker. This amplifier provides an output power of 12 watts in an impedance of 8 ohms for driving the #81152 or #81149 speaker.

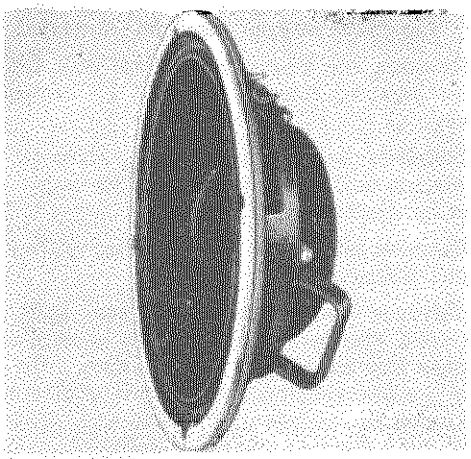
Enclosure for the 12" and 15" speakers, #81149 and 81152 respectively is after the usual fashion for cone-type speakers—it is not to be fully enclosed as is the #81143 unit.



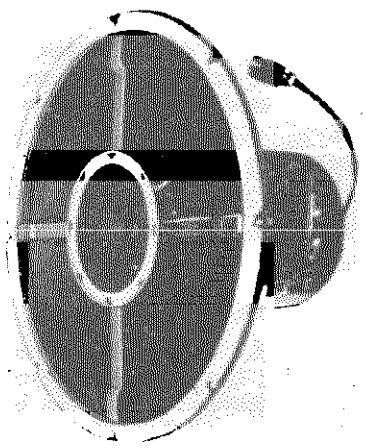
Circuit change necessary to the remote-speaker amplifier.



N3 amplifier giving 12 watts power output in 8 ohms.



No. 81166 speaker used in 400N model instruments, to be used with the N1 amplifiers. 4 ohms impedance.



No. 81152 (15"), No. 81149 (12") speakers for use with N2 or N3 amplifiers. 8 ohms impedance.

51	25273	1500 mmf. Hi-"K" Ceramic
52	25290	50 mmf. Ceramic
53	25293	500 mmf. Silver Button Mica Capacitor
54	25303	20 mmf. Ceramic
55	25145	100 mmf. Ceramic
57	25329	30 mmf. Ceramic
58	25406	80 mmf. Ceramic
59	25375	50 mmf. Ceramic N750
60	26231	5-20 mmf. Ceramic Trimmer
61	25221	1.5-7 mmf. Ceramic Trimmer
62	26111	65-175 mmf. Padder
65	25050	10 Mfd., 10 Mfd. 450 Volts; 20 Mfd. 25 Volts Electrolytic
66	25313	50 Mfd. 25 Volt Electrolytic
67	25270	4 Mfd. 100 Volt Electrolytic
72	78147	Dual Volume Control
73	78111	10M Ohm Potentiometer (tuning eye balance)
75	09308	BC Antenna Coil
76	09309	SW Antenna Coil
77	38705	Loop Loading Coil
78	09306	BC Converter Coil
79	09307	SW Converter Coil
81	38653	1st AM IF Transformer
82	38653	2nd AM IF Transformer
83	38654	3rd AM IF Transformer
84	80030	Phono Input Jack
85	38655	1st FM IF Transformer
86	38655	2nd FM IF Transformer
87	38655	3rd FM IF Transformer
88	38803	4th FM IF Transformer
89	38661	R. F. Choke
90	09304	BC Oscillator Coil
91	09305	SW Oscillator Coil
92	38752	FM Oscillator Coil
93	26230	Gang Condenser
94	90201	Antenna Loop Selector Switch
95	90206	Antenna Band Switch Wafer
96	90203	Band Switch Wafer (Osc., Conv. and R. F. Grid)
97	90204	Band Switch Wafer (Osc. and R. F. Plate)
98	90208	Aux. Band Switch Tuning Eye Wafer
99	90210	Aux. Band Switch B-plus Wafer
100	90209	Aux. Band Switch Audio Wafer
101	78114	Treble Control
102	78114	Bass Control
103	22149	Tuner and Amplifier Connecting Cable and Connector
104	90219	Phono-radio Switch
105	80030	Audio Output Jack
106		FM Antenna R. L. Line (for reference only, not stocked)
107		FM Converter R. F. Line (for reference only, not stocked)
	78112	Single Element Volume Control
110	90211	Band Switch Shaft and Detent assembly
111	55192	Band Switch Connecting Shaft
112	11277	Flexible Coupling Assembly
113	07455	Split Gear and Pulley Assembly
114	55183	Aux. Band Switch Connecting Rod
115	55158	Small Pinion Gear (Band Switch Drive)
116	55159	Pinion Gear, Tuning Shaft
117	15159	Tuning Drum, and Shaft Assembly
118	58348	Arm for Aux. Band Switch
119	55174	Tuning Drive Bushing
120	58326	Mtg. Bracket for Tuning Drum
121	55191	Connecting Shaft (tuning drive)
122	13565	Pre Amplifier Phono Input Assembly (100N and 413N)
123	13732	Dial Light Box Assembly (100N and 413N)
124	59332	Dial Cord Pulley
125	04026	Dial Light Shield Finishing Assembly (100N and 413N)
126	59439	Plastic Background (left)
127	13730	Plastic Pointer Crank and Clip Assembly
128	07453	Bass and Volume Control Pointer Assembly
129	58350	Eye Tube Support Plate (100N)
130	62134	Rubber Tube for Eye Tube
131	15168	Phono Switch Shaft and Lever Assembly
132	07450	Treble and Band Switch Pointer Assembly
133	59438	Plastic Background (right)
134	31326	Dial Scale (100N and 413N)
135	36501	"C" Washer (order #41089 "C" washer kit of 12 washers @ .40)
136	55160	Tuning Shaft
137	64382	Compression Spring
138	55118	Bottom Guide Bar (100N and 413N)
139	13731	Plastic Pointer Pinion and Clip Assembly
140	2000-071	#3-48 x 1" lg. R.H.M.S. (lower guide rod adj. screw)
141	2012-101	Dial Pointer Calibration Adj. Screw

FARNSWORTH TELEV. & RADIO CORP. MODELS CAPEHART, PANAMUSE N SERIE

Ref. No.	Part No.	Description
142	90207	Aux. Band Switch Frame
143	55119	Upper Guide Rod
	07456	Dial Drive Cord
	07629	Drive Cord Assembly
	07623	Light Box Roller Bracket Assembly
	55190	Stud for Dial Drive Cord Pulley
	54141	Glass Rod Station Pointer
	54161	Spacer, Ceramic Trimmer Mtg.
	58282	Mtg. Bracket for Glass Rod
	58335	Miniature Tube Shield
	64392	Hair Pin Retainer Spring, Cord Pulley
	80319	Miniature Tube Socket
	2000-115	#4-40 x 5/8 lg. R.H.M.S.
	2022-023	Pin for Pinion Gear

Part No.	Ref. No.	Description
	2041-141	#8-32 x 1/8" lg. Allen Cup Pt. Set Screw
	2041-143	#8-32 x 1/4" lg. Allen Cup Pt. Set Screw
	2041-147	#8-32 x 1/2" lg. Allen Cup Pt. Set Screw
	04027	Dial Light Shield Finishing Assembly
	07481	Dial Drive Cord
	13733	Dial Light Box Assembly
	13734	Preamplifier phono input assembly
	31331	Dial Scale
	55119	Guide Rod
	55228	Adjustable Guide Bar
	58282	Glass Rod Station Pointer Strap
	58441	Eye Tube Support

N1 AMPLIFIER PARTS

1	77266	22M Ohms
2	77264	2200 Ohms
3	77216	220M Ohms
4	77329	56M Ohms

13	25134	.05 Mfd., 600 Volt
14	25315	20 Mfd., 20 Mfd., 20 Mfd., 250 Volts
15	25297	20 Mfd., 20 Mfd., 20 Mfd., 20 Mfd., 450 Volts
17	78122	20M Ohm Potentiometer
18	78117	20 Ohm Potentiometer
19	78116	5M Ohm Potentiometer
20	94203	Bias Power Transformer
21	94124	Power Transformer
22	94202	Audio Drive Transformer
23	94157	Output Transformer
24	94161	Filter Choke
25	90215	Relay (power line control)
26	80334	Tuner Input Connector
27	80364	Auxiliary Input Connector
28	80331	6-pin Jones Connector
29	80089	15-pin Jones Connector
30	80332	4-pin Jones Connector
31	48006	5 Ampere Fuse
32	48015	1 Ampere Delayed Action Fuse
33	80336	Male Connector (A.C. line)
	80335	Fuse Receptacle
	80081	Molded Octal Socket
	80300	Molded Octal Socket (4-prong)

N2 AMPLIFIER PARTS

1	77266	22M Ohms
2	77264	2200 Ohms
3	77329	56M Ohms
4	77217	470M Ohms
5	77268	330M Ohms
6	77216	220M Ohms
7	77267	33M Ohms
8	77334	250 Ohms, Wire Wound, 5 Watt
9	77257	33 Ohms
10	77262	1000 Ohms
11	77350	5500 Ohms, Wire Wound, 30 Watts
12	77210	3300 Ohms
13	78122	20M Ohms Potentiometer
14	25209	.01 Mfd. (metal cased)
15	25314	.05 Mfd.
16	25083	.01 Mfd., 600 Volt
18	25269	50 Mfd., 25 Volt Electrolytic
19	25297	20 Mfd., 20 Mfd., 20 Mfd., 20 Mfd. 450 Volt
20	94125	Power Transformer
21	94161	Filter Choke
22	94158	Output Transformer
23	90215	Relay (power line control)
24	80334	Tuner Input Connector
25	80364	Auxiliary Input Connector
26	80336	A. C. Male Connector
27	48006	5 Amp. Fuse
28	48015	1 Amp. Delayed Action Fuse
29	80331	6-pin Jones Connector
30	80089	15-pin Jones Connector
31	80332	4-pin Jones Connector
	80081	Octal Socket
	80335	Fuse Receptacle

26	80336	Male Connector (A.C.)
27	48006	5 Amp. Fuse
28	80331	6-Pin Jones Plug
29	80089	15 Pin Jones Plug
30	80332	4-Pin Jones Plug
31	90215	Relay (Power Line Control)
	80335	Fuse Receptacle
	80081	Octal Socket

MODELS CAPEHART, PANAMUSE N SERIES

FARNSWORTH TELEV. & RADIO CORP.

CAPEHART CABINET SPECIFICATIONS

SECTION 15

Model No.	Cabinet	Crated Dimensions	Shipping Weight
414N	Chippendale	45¼ x 44½ x 24½	330 lb.
413N	Chippendale	39⅜ x 45½ x 24½	330 lb.
406N	Adam	26¾ x 46 x 47	331 lb.

Model No.	Cabinet	Dimensions Crated	Shipping Weight
114N2	Early Georgian	42½ x 25½ x 42¼	298 lb.
112N2	George II	42½ x 25½ x 41¾	286 lb.

Subtract 1¾" for cabinet dimensions.

PANAMUSE CABINET SPECIFICATIONS

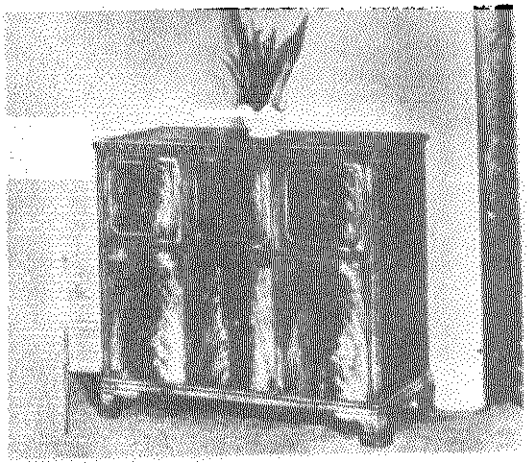
SECTION 15

Model	Cabinet	Crated Dimensions	Shipping Weight
19N3	Sheraton	37½ x 38½ x 23¾	197 lb.
21N2	Chippendale	43⅓ x 24¼ x 39¾	300 lb.

Model	Cabinet	Crated Dimensions	Shipping Weight
25N2	Sheraton Upright	40¼ x 37¾ x 24¼	219 lb.
26N2	Modern	40½ x 24 x 37¾	236 lbs.

Subtract 1¾" for cabinet dimensions.

"Sheraton Upright" 25N2



"Chippendale" 21N2

PANAMUSE "N" SERIES CABINET PARTS LIST AND CORRECTION SHEET

26N2

Delete the following parts:

13219 Basic glides
56538 Hinge (Soss type)
37376 Lid lift and stay arm mechanism R.H.
37374 Lid lift and stay arm mechanism L.H.

Change part number 67485 Hinge concealed type, etc., to part number 37485 Hinge concealed type, etc.

Add the following parts:

H-255-1 Cabinet and packing (Bisque)
H-255-2 Cabinet and packing (Cordovan)
67459 Bisque phono lid } Order in matched
67460 Bisque radio lid } sets only
67501 Bisque R.H. speaker door } Order in matched
67502 Bisque L.H. speaker door } sets only
67553 Cordovan phono lid } Order in matched
67554 Cordovan radio lid } sets only
67499 Cord. R.H. speaker door } Order in matched
67500 Cord. L.H. speaker door } sets only
37479 Cabinet glides ¾" nickel plated (4 req.)
37438 Stay arm 13¾" phono compartment
13188 Lid lift mechanism radio side
13189 Lid lift mechanism phono side

25N2

Add:

37479 Cabinet glides ¾" nickel plated (4 req.)
37475 Door catch, bullet type (3 req.)

CLARIFICATION OF TUNER PARTS LIST

Part number 07456 Dial drive cord is the pointer drive cord.

Part number 07629 Drive cord assy. is the variable condenser drive cord assy.

Part number 07481 Dial drive cord should be deleted from the Panamuse tuner parts list as it is the Pointer drive cord for the vertical dial 400 series tuner.

Part number 13733 Dial light box assy. should be deleted as this is used only on the vertical dial 400 series tuner.

21N2

Delete the following parts:

H-255-1 Cabinet and packing (Bisque)
H-255-2 Cabinet and packing (Cordovan)
37374 Stay arm and lid lift mechanism L.H.

Add the following:

13189 Lid lift mechanism phono compartment
37438 Stay arm 13¾" phono compartment
37479 Cabinet glides, ¾" nickel plated (4 req.)

The radio door and speaker doors are grain matched to the stationary front panels of the cabinet and are therefore not supplied separately.

19N3

Delete:

37497 Cabinet glides ¾" nickel plated (4 req.)

Add:

37479 Cabinet glides ¾" nickel plated (4 req.)

All parts on the "N3 Panamuse cabinet parts list—miscellaneous" are common to the N2 Panamuse cabinet except part number 81149 speaker for N3 series Panamuse.

NOTE: 81149 consists of 12" bass speaker and 6" treble speaker assembly for N3 Panamuse.

Add to this list:

81150 12" bass speaker only for N3 Panamuse
81151 6" treble speaker only for N2 and N3 Panamuse
81152 Bass and treble speaker assembly for N2 Panamuse
81182 15" bass speaker only for N2 Panamuse

Part number 13734 preamplifier phono input assy., should be deleted as it is used only on 400 series tuners.

Part number 31331 Dial Scale should be deleted as this is the dial scale for the vertical dial 400 series only tuner.

Part number 55119 Guide rod should be deleted as it is used only on vertical Dial 400 series tuner.

Part number 55228 Adjustable guide bar should be deleted as it is used only on vertical dial 400 series tuner.

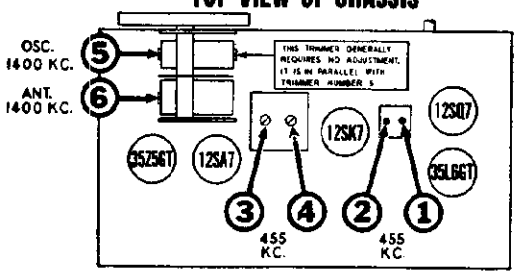
40	118921	Lamp dial (Mazda No. 47) 6-8 V. 150 Ma.
MISCELLANEOUS PARTS		
	505165	"C" washer—for tuning shaft
	506228	Cabinet
	114955	Clip—retainer on end of dial cord
	506230	Clip—retains cabinet back to chassis
	500497	Clip—retains cabinet back to cabinet
	117057	Cord—dial drive (4 ft. required)
	506216	Dial scale
	506218	Diffuser—light
	506215	Knob
	506217	Pointer
	119087	Ring for dial cord
	170162	Screw—#8-32 x ⅜" retains chassis
	506207	Shaft—tuning
	506211	Socket—dial light (with leads)
	116990	Socket—octal base
	506220	Socket—octal (rectifier)

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna (on cabinet back) from cabinet—allow loop to remain attached to chassis.
2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is incorrectly, release pointer clip on dial cord and reposition pointer.
3. Couple the signal generator to the receiver by connecting its output to several turns of wire formed in a circular shape so that it may be placed adjacent and parallel to the receiver loop antenna.
4. Connect an output meter across the speaker voice coil or from the plate of the 35L6GT tube to B— through a 0.1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	SIGNAL GENERATOR CONNECTION	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
None	Connect directly to coupling turn as instructed in Step 3 above.	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
None	Connect directly to coupling turn as instructed in Step 3 above.	1400 KC	1400 KC	5	Broadcast Oscillator	Adjust for maximum output.
None	Connect directly to coupling turn as instructed in Step 3 above.	1400 KC	Tune to 1400 KC generator signal	6	Broadcast Antenna	Adjust for maximum output.

TOP VIEW OF CHASSIS

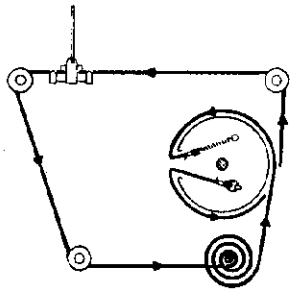


TRIMMER LOCATIONS

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum counter - clockwise position and use following parts:

114955 Clip on end of cord
117057 Cord (4 feet)
119087 Ring for dial cord
161384 Tension Spring

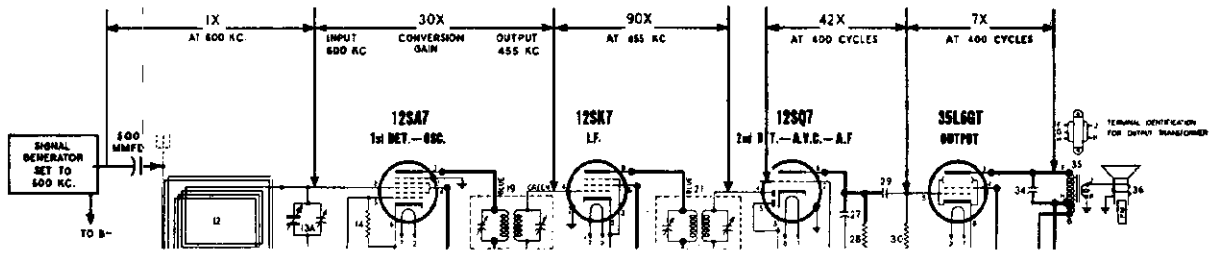


STAGE GAIN MEASUREMENT PROCEDURE

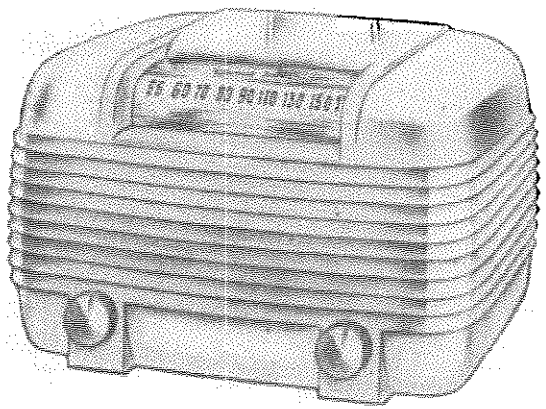
REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal "C" of the oscillator coil and connect the positive battery lead to B— in receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, torelance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

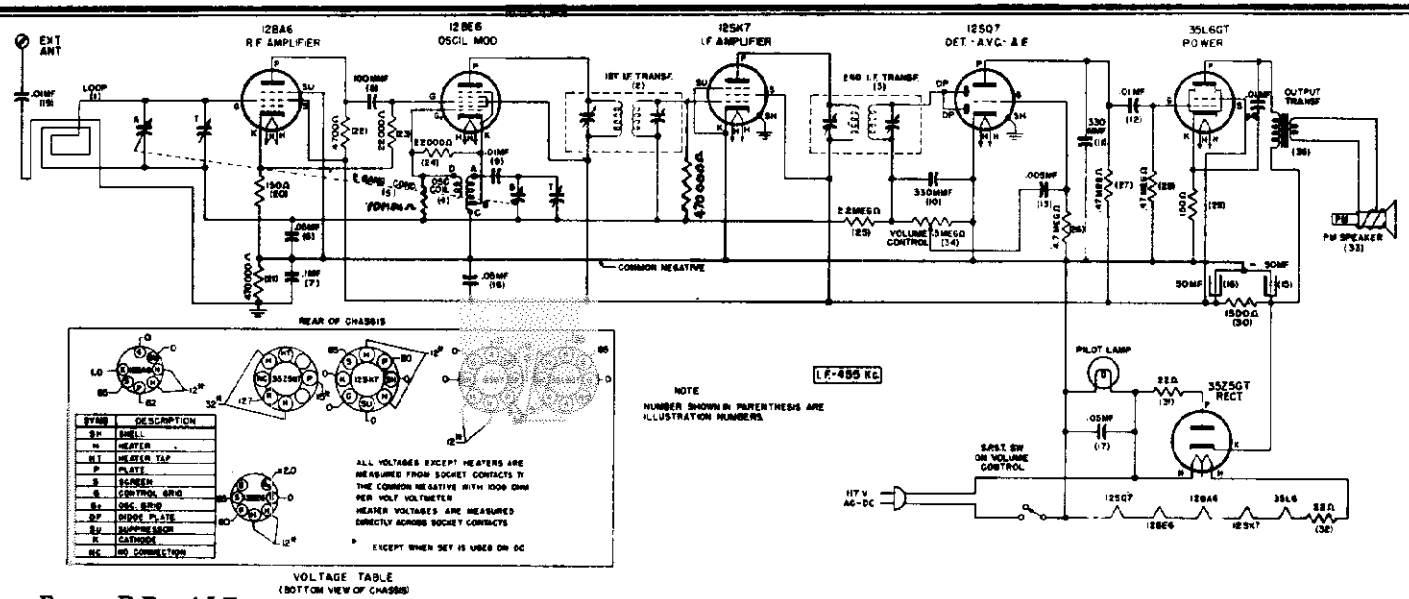


SPECIFICATIONS

CABINET DIMENSIONS	10-5/8" x 7-1/16" x 6-21/32"
WEIGHT	6 pounds 8 ounces
POWER SUPPLY	105 to 125 volts AC-DC
FREQUENCY RANGE	540 to 1600 KC.
I. F. FREQUENCY	455 KC.
SPEAKER	4 inch P-M Dynamic
VOICE COIL IMPEDANCE	3.2 ohms
POWER OUTPUT	Undistorted — 0.8 watts Maximum — 1.2 watts

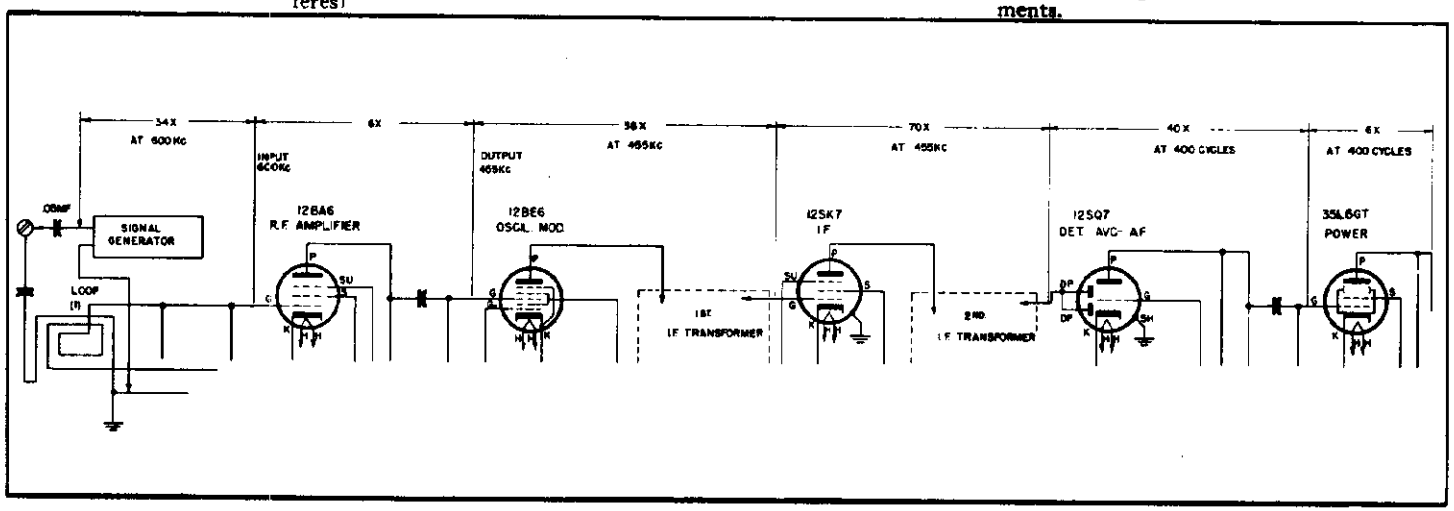
TUBE COMPLEMENT

12SA7	1st Det. — Osc.
12SK7	I. F. Amplifier
12SQ7	2nd Det. — A.V.C. — 1st A.F.
35L6GT	Power output



Be sure R-F and I-F stages are accurately aligned before measuring gain. R-F gains can be measured with a "channel" type instrument containing a tuned and calibrated R-F amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC signal with 400 cycle modulation (use nearby frequency if local station interferes)
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
3. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly $\frac{1}{16}$" from edge of dial plate. If dial needle does not have this position, move to correct one.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD condenser	High side to rear stator plates of tuning condenser. Low side to B minus.	Adjust each of the second I-F transformer trimmers for maximum output—then adjust each of the first I-F trimmers for maximum output.
2	Minimum Capacity	Exactly 1620 K. C.	.00025 MFD condenser	Antenna terminal. Receiver chassis.	Adjust 1620 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Approx. 1400 K. C.	.00025 MFD. condenser	Antenna terminal. Receiver chassis.	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

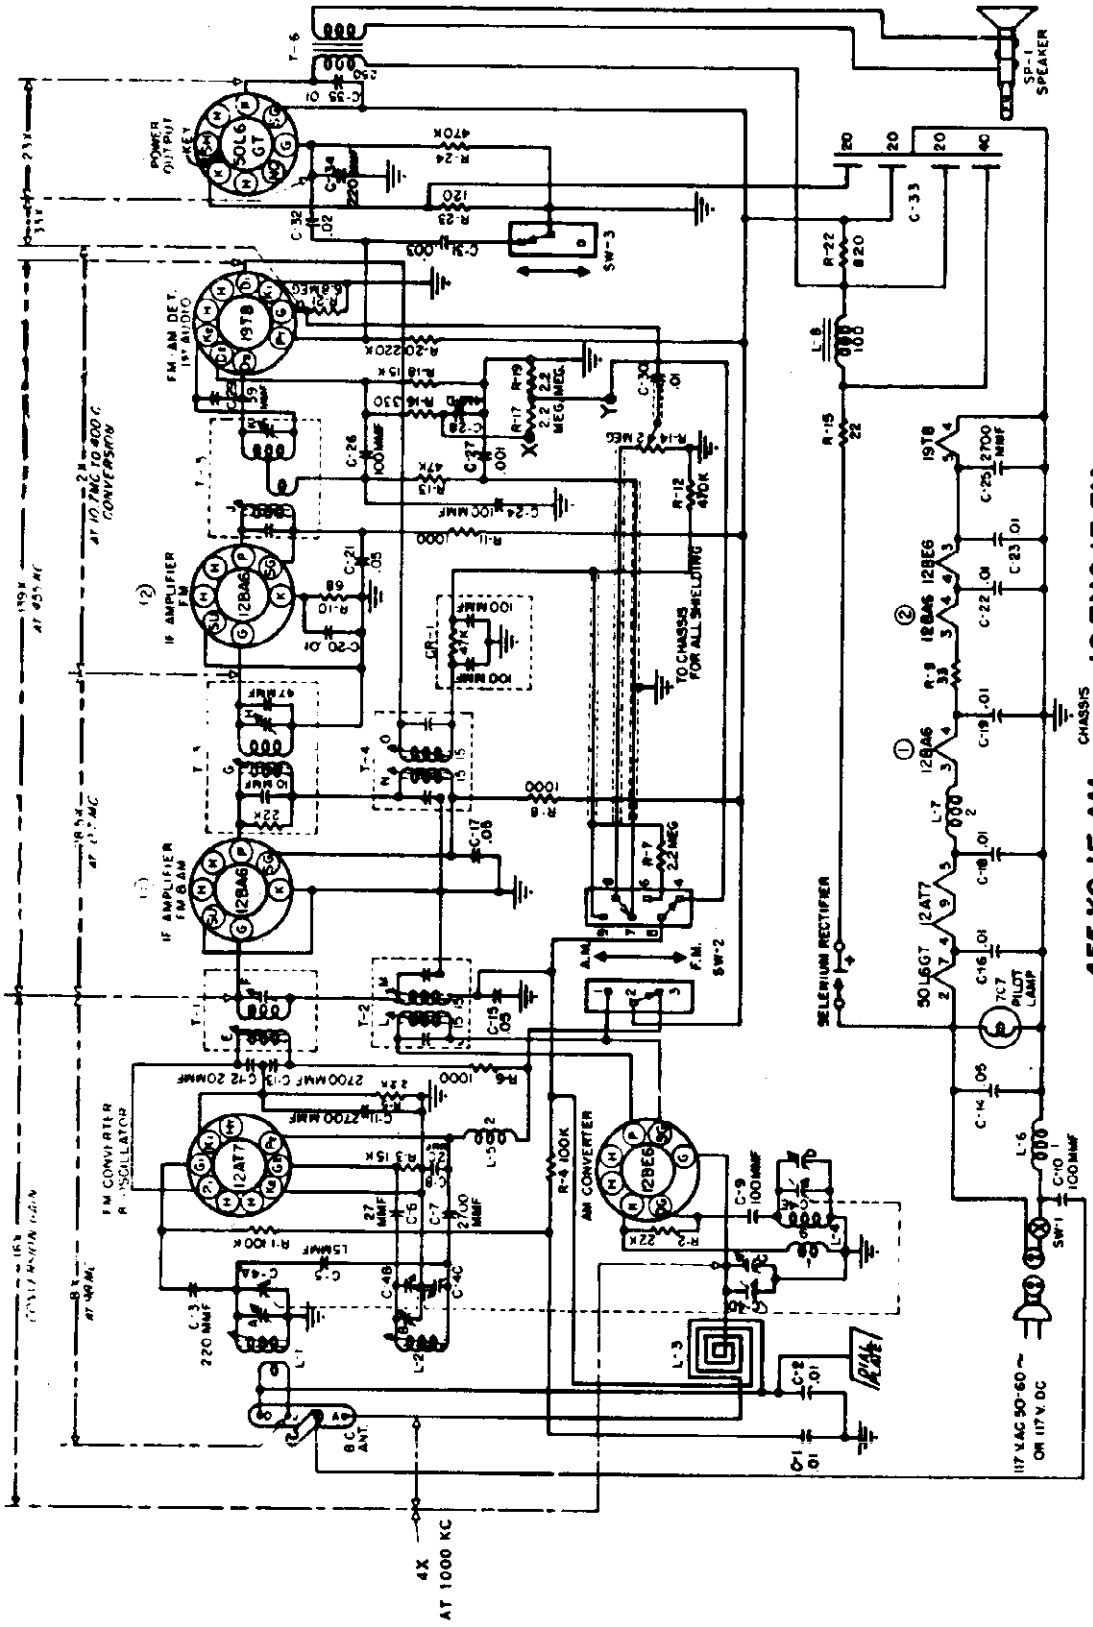
MODEL 4-A-12
THE NARRATOR



MODEL 4-A-12, THE NARRATOR

THE FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

The chassis and loop should remain in their normal position in the cabinet when making loop adjustment. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, slide the pointer along the dial cord to correct position.

Connect an output meter across the speaker voice coil. Connect the ground side of signal generator to B—. Set the volume control at maximum volume position and use a weak signal from the signal generator.

CAUTION: The chassis of this receiver is connected directly to one side of the line. Use an isolation transformer between the 117-volt AC line and AC input to the radio to avoid shock.

Step No.	Band Switch Position	SIGNAL GENERATOR Frequency	SIGNAL GENERATOR Type of Modulation	Dummy Antenna	Connect High Side of Signal Generator to	Radio Dial Setting	Trimmer Letter	Trimmer Description	Type of Adjustment
1	AM	455 kc	30% AM	0.1 mfd. Condenser	12BE6 Grid Pin No. 7	Any position where it does not affect the signal.	N - O L - M	2nd IF 1st IF	Adjust for maximum output, then repeat adjustment.
2	AM	1620 kc	30% AM	0.1 mfd. Condenser	12BE6 Grid Pin No. 7	Gang condenser completely out of mesh.	D	Oscillator	Adjust for maximum output.
3	AM	1400 kc	30% AM	RMA Loop		Tuned to 1400 kc generator signal.	C	Loop Antenna	Adjust for maximum output.
4	FM	10.7 mc	CW	0.1 mfd. Condenser	12BA6 Driver Grid Pin No. 1	High frequency end.	J	Ratio Detector Primary	Adjust for maximum AVC between Point X on wiring diagram and chassis, using Electronic Voltmeter. (See Note 1.)
5	FM	10.7 mc	CW	0.1 mfd. Condenser	12BA6 Driver Grid Pin No. 1	High frequency end.	K	Ratio Detector Secondary	See Note 1. Adjust for zero position (using Electronic Voltmeter) from point "Y" on the wiring diagram to the top of the volume control.
6	FM	10.7 mc	CW	0.1 mfd.	12AT7 Grid Pin No. 7	High frequency end.	G - H E - F	2nd IF 1st IF	Adjust for maximum AVC. (See Note 1.)
7	FM	108.5 mc	30% FM	300 ohm Carbon resistor	Antenna Terminal J with jumper disconnected.	High frequency end.	B	FM Oscillator	Adjust for maximum output. (See Note 2.)
8	FM	87.5 mc	30% FM	300 ohm Carbon resistor	Antenna Terminal J with jumper disconnected.	Low frequency end.	L_2	FM Oscillator	Adjust for maximum output. (See Note 2.)
9	FM	108 mc	30% FM	300 ohm Carbon resistor	Antenna Terminal J with jumper disconnected.	Tuned to 108 mc generator signal.	A	FM Antenna	Adjust for maximum output. (See Note 2.)
10	FM	87 mc	30% FM	300 ohm Carbon resistor	Antenna Terminal J with jumper disconnected.	Tune to 87 mc generator signal.	L_1	FM Antenna	Adjust for maximum output. (See Note 2.)
11	Repeat operations 9 and 10 if an appreciable change is made in the adjustment of L_1.								

NOTE 1—Adjust input voltage to give approximately 4 volts AVC before final adjustment is made. For steps 4 and 6—Voltmeter common lead to chassis. For step 5—Voltmeter common lead to point "Y" on wiring diagram. The desired zero position is at the point where the meter indicates a polarity change from plus to minus or vice versa.

NOTE 2—For all tests requiring an FM signal, the generator output (22.5 kc deviation, 400 cycles) must be adjusted to give approximately 50 milliwatts receiver output before final adjustments are made.

SOCKET VOLTAGES: Measured with voltmeter having sensitivity of 1000 ohms per volt. Tone control in treble position. Volume on full with no signal. 117 volt, 60 cycle AC power input. All voltages measured from chassis (B-) to points indicated. Voltage measurements are positive DC unless otherwise indicated.

SOCKET VOLTAGES

MODEL 4-A-12 THE FIRESTONE TIRE & RUBBER CO.

STAGE GAIN DATA

Be sure RF and IF stages are accurately aligned before measuring gain. RF gains can be measured with a "channel" type instrument containing a tuned and calibrated RF amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe the following precautions:

1. For all gain measurements, use 1000 KC signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. Be sure radio is carefully tuned to generator signal. (Use weak signal for sharp tuning.)
3. When using a "channel" type instrument, carefully tune it for maximum output at the desired frequency before making measurements.

Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain masurements.

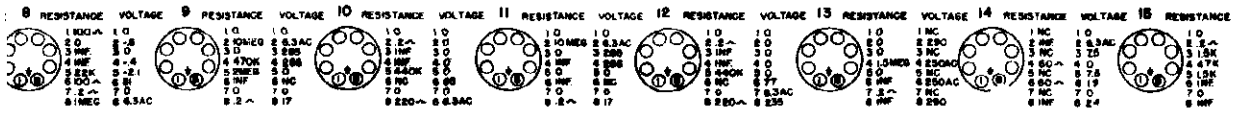
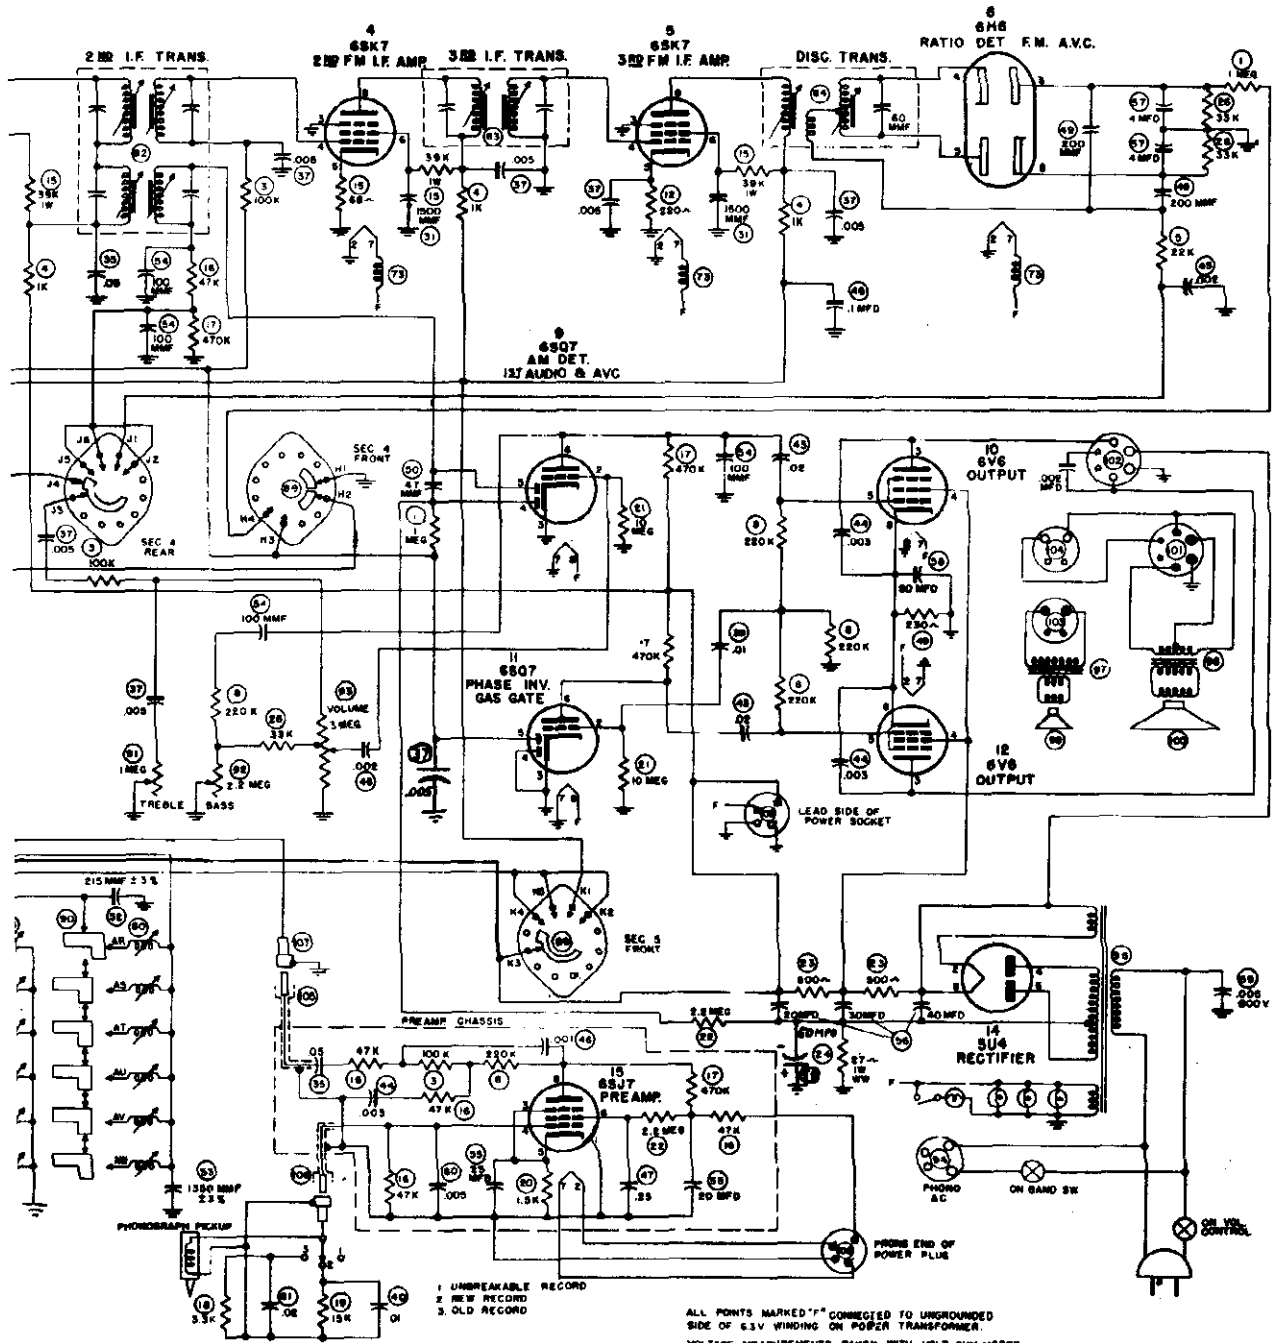
MODEL 4-A-15



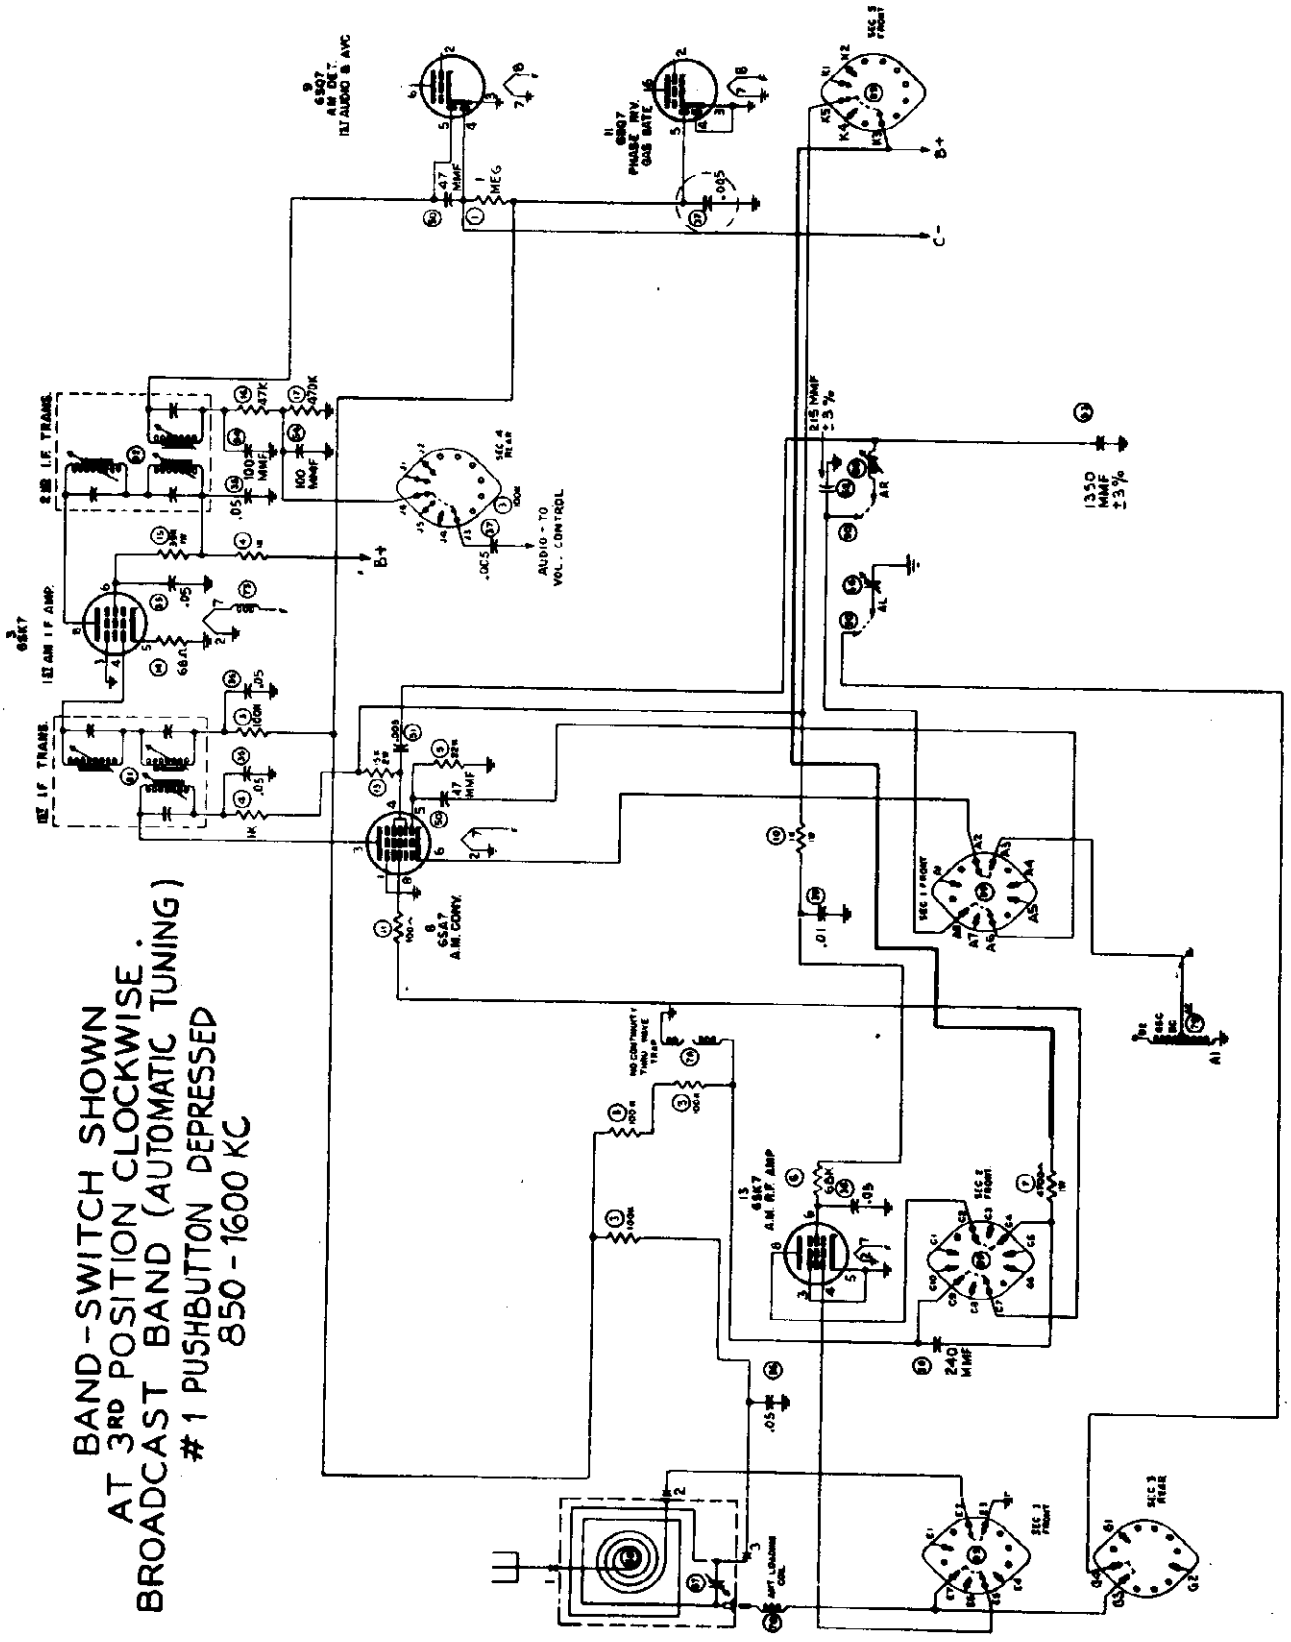


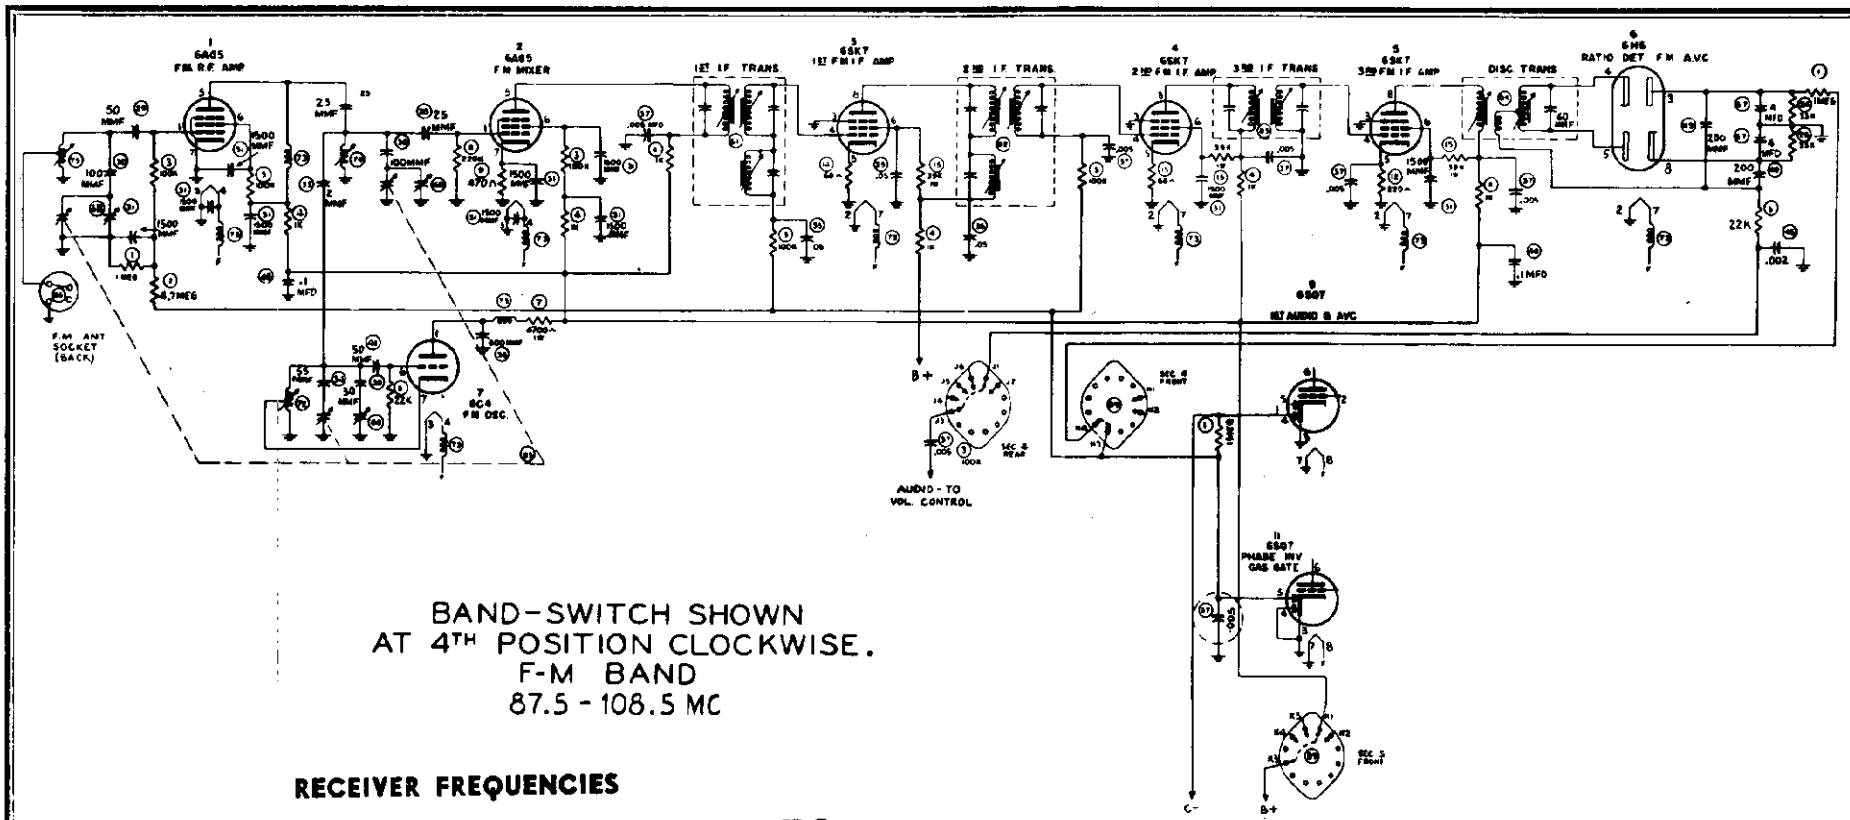
ALL POINTS MARKED "F" CONNECTED TO UNGROUNDED SIDE OF 6.3 V WINDING ON POWER TRANSFORMER.

VOLTAGE MEASUREMENTS TAKEN WITH VOLT-OHM-METER, NO SIGNAL, A.V.C. INOPERATIVE.

BAND SWITCH SHOWN IN EXTREME COUNTER-CLOCKWISE (PHONO) POSITION. 1 PHONO, 2 AM MANUAL, 3 AM PUSH BUTTON, 4 FM, 5 SHORT WAVE

MODEL 4-A-15 THE FIRESTONE TIRE & RUBBER CO.





BAND-SWITCH SHOWN
AT 4TH POSITION CLOCKWISE.
F-M BAND
87.5 - 108.5 MC

RECEIVER FREQUENCIES

Broadcast Band	540 to 1620 K.C.
Short-Wave Band	9.4 to 15.4 M.C.
Frequency Modulation Band	87.5 to 108.5 M.C.
Intermediate Frequency—AM Bands	455 K.C.
FM Bands	10.7 M.C.

POWER AND VOLTAGE REQUIREMENTS

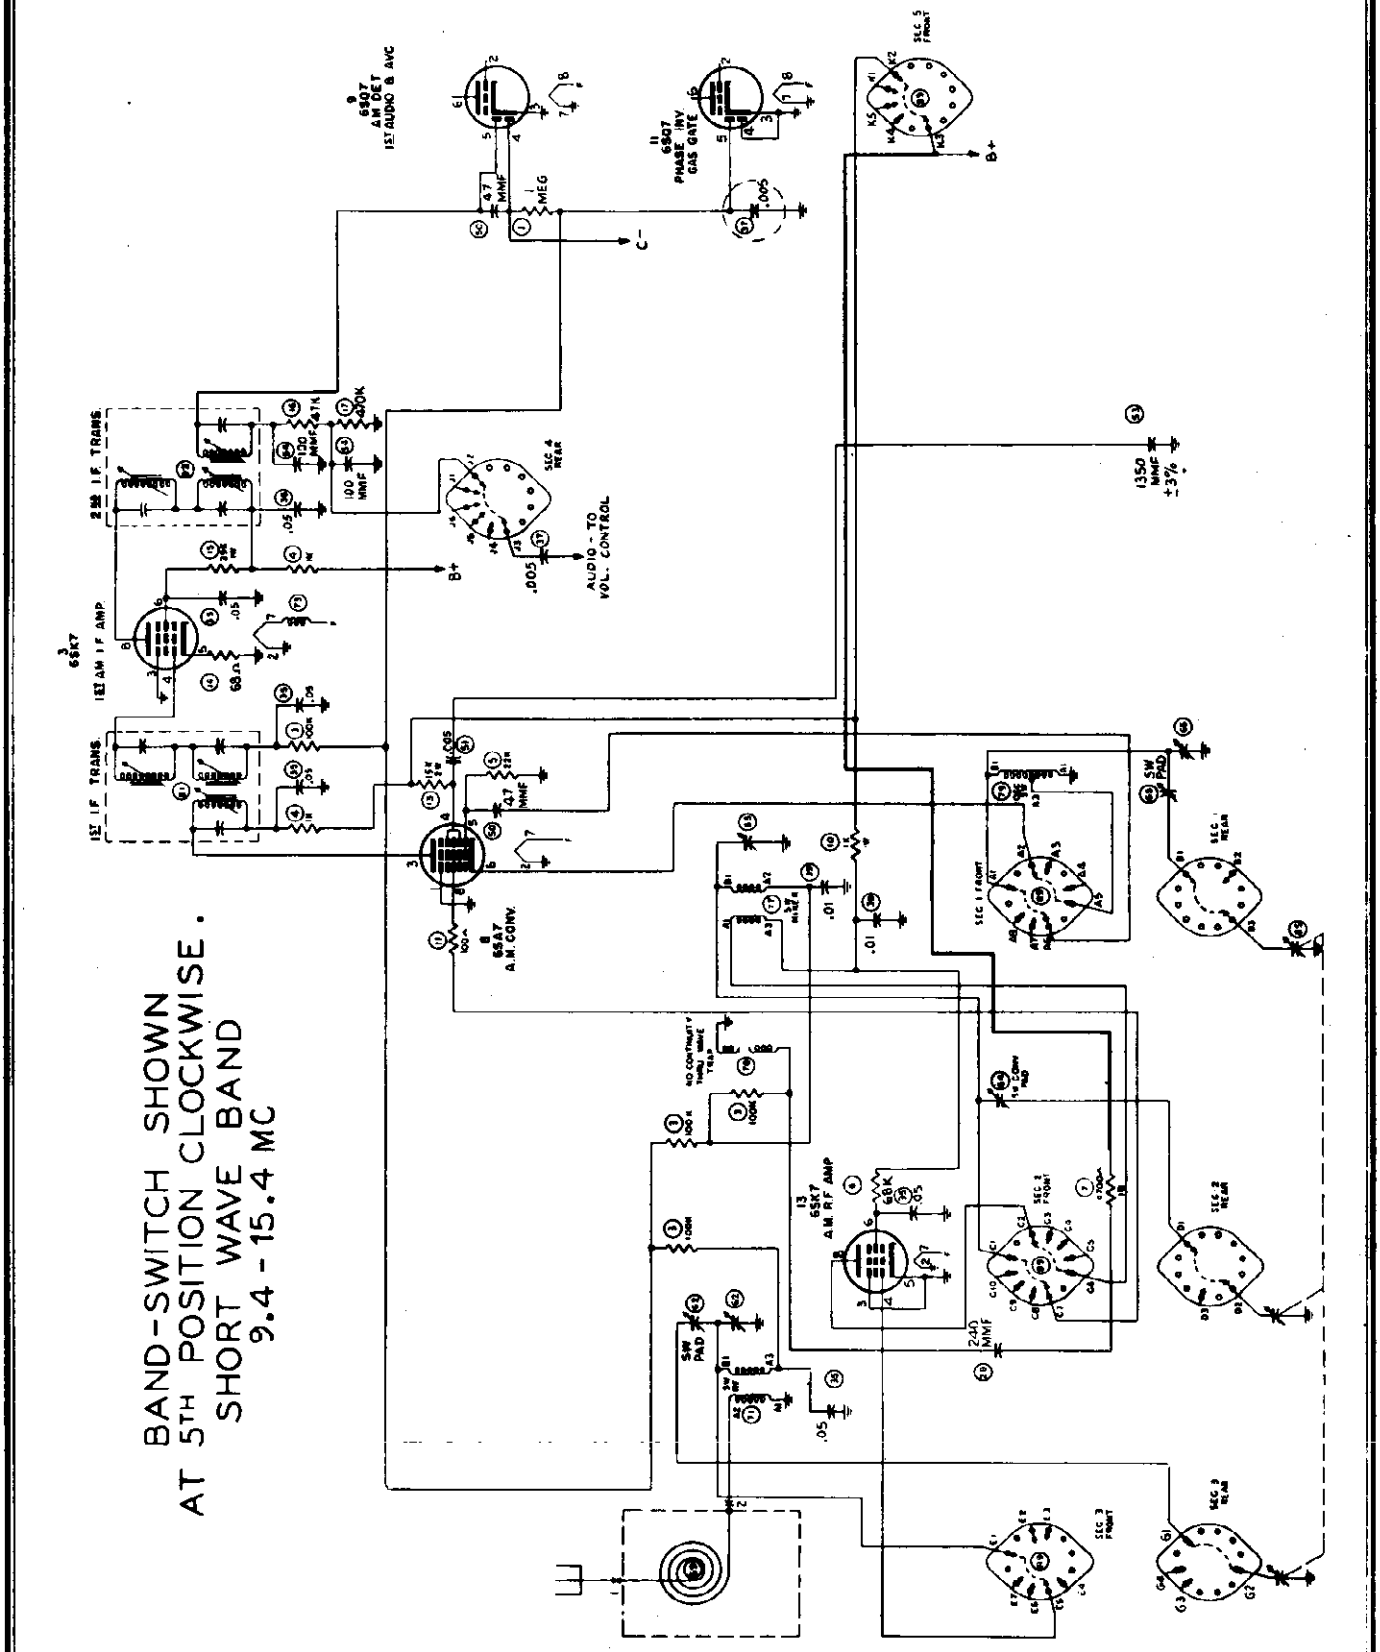
Power Consumption—120 Watts at 117 Volts, 60 Cycles
Voltage—105-125 Volts at 60 Cycles per Second
50 Cycle Operation With Modification
To The Record Changer

AMPLIFIER SPEAKER SYSTEM

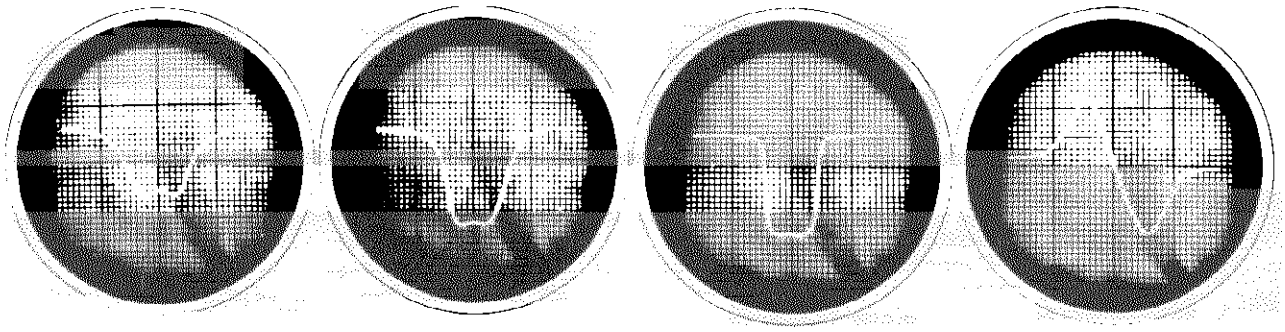
Power Output	15 Watts
Voice Coil Impedance, each speaker	3.2 Ohms
Speakers	12 inch and 6 inch

MODEL 4-A-15

THE FIRESTONE TIRE & RUBBER CO.



Oscilloscope Alignment—FM Band



(1) (2) (3) (4)

These curves were obtained under ideal conditions and show curves to be expected. They should be duplicated as nearly as practicable.

FM IF ALIGNMENT

1. Equipment required: Oscilloscope, 10.7 MC sweep generator, voltomyst, and RF signal generator.
2. Set band switch in FM position.
3. Make connection from vertical deflection amplifier of oscilloscope to pin #3 of 6H6 discriminator tube. Make certain that the 4MFD electrolytic condenser is disconnected from this same circuit. It is necessary that the lead to the oscilloscope be shielded, of low total capacity, and connection to receiver isolated by means of a 1 meg. resistor.
4. Connect sweep generator to last FM IF grid through a .1 MFD coupling capacitor.
5. Load primary of discriminator transformer with resistor of approximately 3900 ohms. Back out secondary slug (top slug) as far as it will turn. Align primary (bottom slug) to obtain curve similar to figure 1. This does not constitute a final alignment of discriminator, but is a convenient expedient to assist in IF alignment.
6. Shift connection of sweep signal generator to the grid of the second FM IF tube.
   NOTE: As alignment moves from stage to stage, reduce input instead of reducing oscilloscope gain.
7. Align third FM IF transformer for a symmetrical flat top pattern. (Fig. 2).
8. Shift signal generator to the grid of the first IF tube.
9. Align second IF transformer in same manner as described in Section 7.
   Note that the width of the nose of the curve is the same as before, but the sides have become steeper, as in Fig. 3.
10. Connect the signal generator to the grid of the converter tube grid in series with 10,000 ohm resistor and a .1MFD capacitor, or loosely couple by stray capacity of an insulated wire.
11. Align first FM IF transformer in the same manner as in Section 7.
    Note that the sides of the curve have further steepened, but that the nose of the curve has retained approximately the same width as in Fig. 3.
12. Connect 4 MFD electrolytic capacitor that was previously disconnected, and take off load resistor on discriminator primary.
13. Connect oscilloscope to audio output terminal of discriminator. There are several points where contact can be made and can be identified as the circuit connected to the terminal on the terminal board (nearest the discriminator transformer) to which the shielded lead is connected.
14. With sweep signal input to converter grid, align discriminator transformer for conventional discriminator pattern, as in Fig. 4.
15. Connect signal generator to converter tube grid through .1MFD capacitor. An unmodulated signal input of 65 microvolts at 10.7 MC should develop .55 volt rise on the AVC line with voltohmyst connected to AVC line through 1 megohm resistor.

Alternate FM IF Alignment Procedure

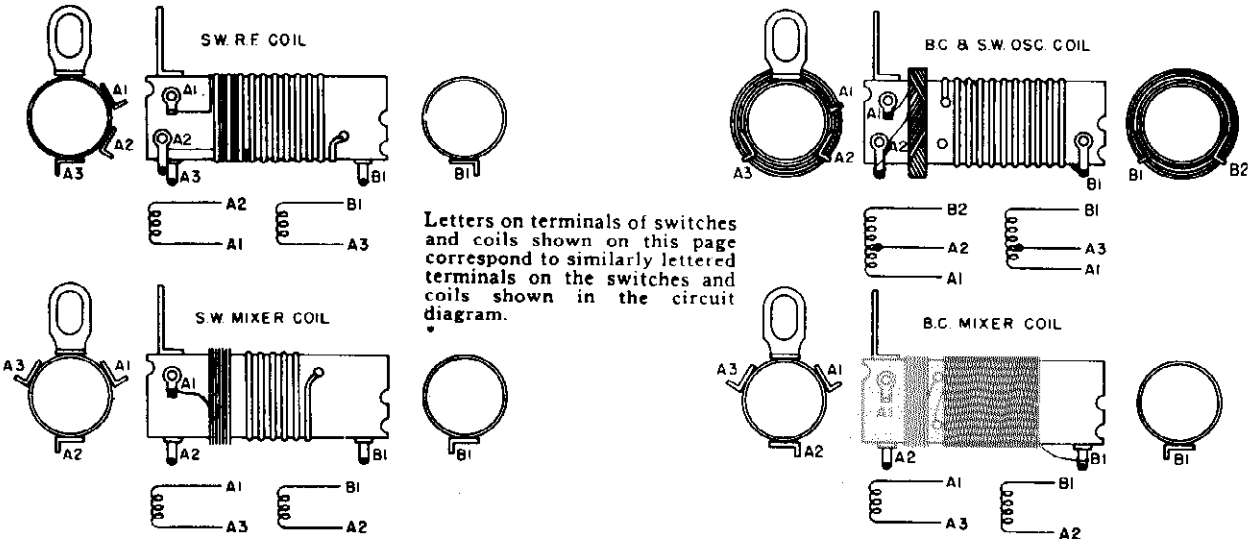
1. Connect voltohmyst or high resistance voltmeter on AVC line (Pin 3 on 6H6 socket) through 1 meg. resistor. Connect AM signal generator, set at 10.7 MC, to grid on 6SK7 which feeds diode transformer. Connect output meter on voice coil of speaker.
2. Turn bottom slug (nearest the chassis) of disc. transformer out as far as possible.
3. Tune top slug of disc. transformer for maximum output (negative voltage) on the volt meter.
4. Connect generator to grid of second IF amplifier.
5. Detune slug of 3rd IF transformer under chassis by turning out as far as possible
6. Tune top slug for maximum voltage, next tune bottom slug for maximum voltage. In each step do not use an input greater than necessary to give three volts AVC.
7. Connect signal generator to grid of first IF amplifier.
8. Detune bottom FM slug (nearest corner of can) by turning out as far as possible.

9. Tune top slug (nearest corner of can) for maximum voltage, next tune bottom slug for maximum voltage.
10. Connect signal generator to 6AG5 converter grid and tune first IF transformer as above.
11. With generator still hooked to 6AG5 grid and modulated with 400 cycles, about 200 microvolts input, adjust slug next to chassis on disc. transformer for minimum output voltage on output meter which is on voice coil.

FM RF Alignment

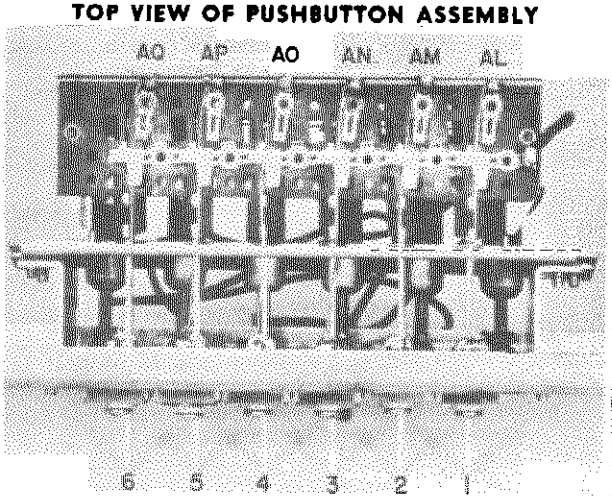
1. Equipment Required:
   a. RF Signal Generator. Range 88 to 108 MC.
   b. Output Meter.
   c. Insulated Screw Driver.
2. Connect RF signal generator in series with 330 ohm carbon resistor to "high" side of FM antenna socket. Connect output meter across voice coil of speaker.
3. Set tuning control for pointer to calibrate at 108.
4. Apply 108 MC Signal.
5. Set converter and antenna trimmers at minimum capacity.
6. Adjust oscillator trimmer by tuning from maximum capacity to first signal that is heard, and peak for maximum output.
7. Adjust antenna and converter trimmers for maximum output.
8. Set tuning controls so dial pointer calibrates at 88 MC.
9. Apply 88 MC signal.
10. Adjust oscillator, converter, and antenna slugs to maximum output.
11. Repeat operations 3 to 10 inclusive.
    NOTE: The degree of adjustment required in the tuning of the oscillator slug will determine the number of times operations 3 to 10 must be repeated until no further gain in sensivity is obtained.
12. Carefully tune across the entire FM band for the observance of the dead or weak spots that may be a resultant of improper alignment or defective components. This can be determined by carefully noting the degree of receiver noise, that is, high noise generally is accompanied by good sensitivity.

RF, OSCILLATOR AND MIXER COILS

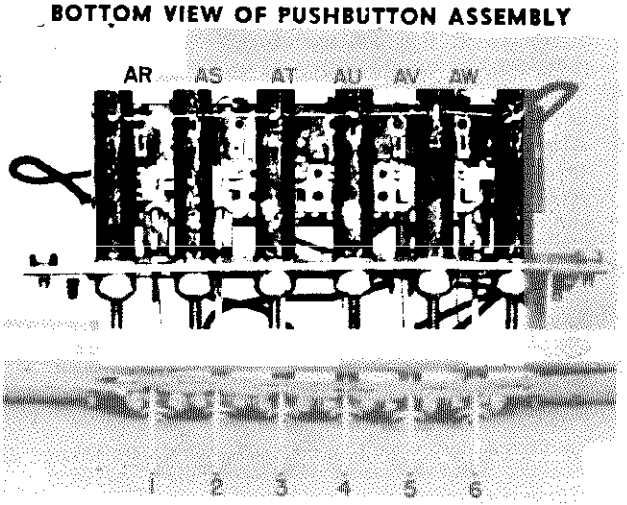


Letters on terminals of switches and coils shown on this page correspond to similarly lettered terminals on the switches and coils shown in the circuit diagram.

TOP VIEW OF PUSHBUTTON ASSEMBLY



BOTTOM VIEW OF PUSHBUTTON ASSEMBLY



Alignment of AM Bands

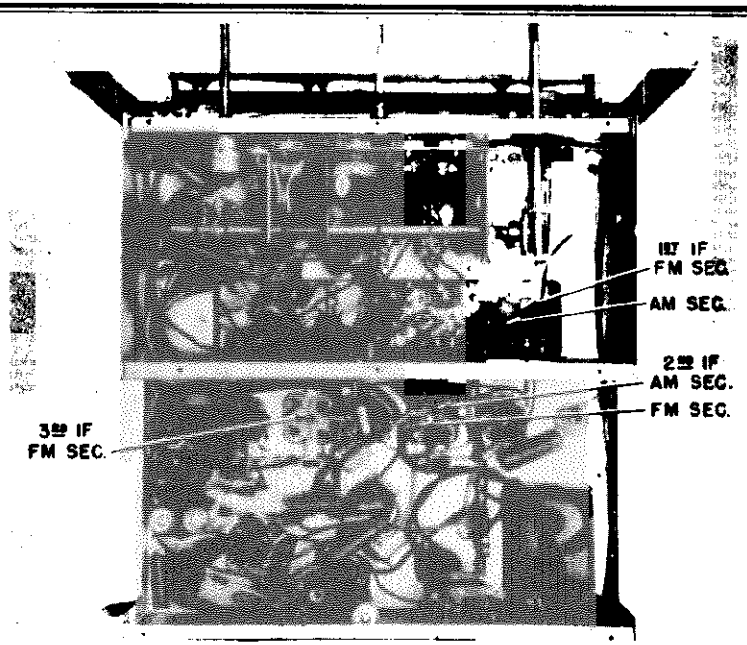
EQUIPMENT REQUIRED

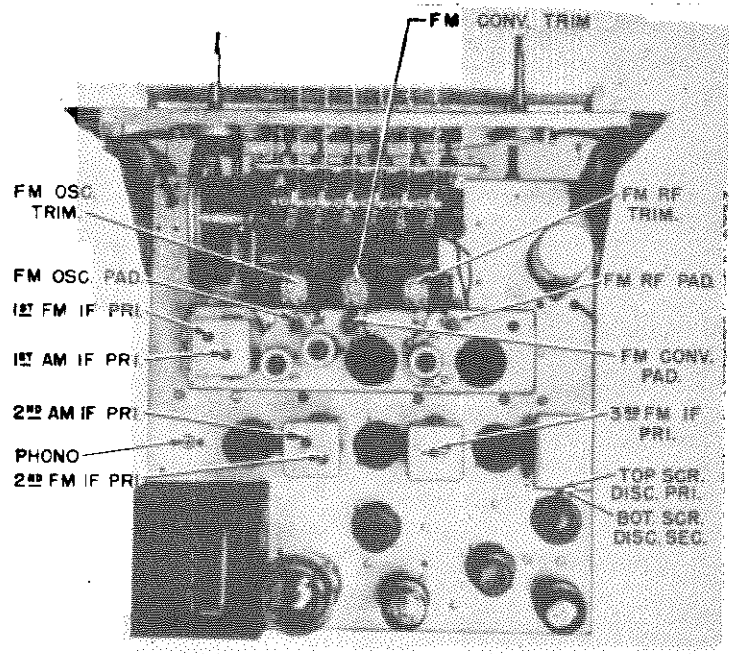
A calibrated signal generator having fundamental frequencies from 455 Kc to 16 MC. In addition to the signal generator a crystal calibrator is a great convenience.

The indicating device for showing correct alignment may be a high resistance A.C. voltmeter, a vacuum tube voltmeter or a Cathode Ray oscilloscope.

The A.C. voltmeter can be used either across the voice coil of the loud speaker or if the meter range is high enough, from the plate to plate in the output stage (don't forget a condenser (O.1 Mfd.) to keep the D.C. out of the meter).

Special care must be employed when aligning the short wave band, for the adjustment of the shunt trimmer affects the adjustment of the series pad. At the high frequency end of the band it is possible to peak the oscillator trimmer (and the pad at the low frequency end) at the image so in the alignment instructions we have indicated the fundamental frequency and the correct oscillator setting for the image so by resetting the signal generator it is possible to see if the alignment is correctly made. In each case, the image is found at a frequency 910 Kc. higher than the fundamental.





Trimmers are accessible by removing top radio panel, eliminating necessity of chassis removal from cabinet

MODEL 4-A-15 THE FIRESTONE TIRE & RUBBER CO.

TABULATION FOR AM ALIGNMENT

STEPS	CONNECT GENERATOR		SET GENERATOR AT	SET GANG AT	ADJUST	TO OBTAIN
1	Set Tone and Volume Controls at Maximum					
2	Through .1 Mfd.	Grid Conv. tube	455 Kc	Quiet Point	2nd. I.F. A.M. Slugs	MAXIMUM OUTPUT
3					1st. I.F. A.M. Slugs	
4	Through .1 Mfd.	RF of GANG	1500 Kc	1500 Kc	BC Osc. Trimmer	
5					BC R.F. Trimmer	
6			600 Kc	600 Kc	Osc. Padder *	
7		Check dial calibration at several frequencies. If not reasonably correct, adjust oscillator padder. See Note †				
8	#	Ext. Ant. Binding Post	1500 Kc	1500 Kc	Loop Trimmer	

#Through RMA dummy antenna.
* This adjustment should be made while gang is rocked.

SHORT WAVE RF

9	Place Band Switch in Short Wave position.					
10	Through 400 ohm resistor	External Antenna	15 MC	15 MC	SW Osc. * Trimmer	MAXIMUM OUTPUT
11					SW R.F. Trimmer	
12					SW Ant. Trimmer	
13			9.4 MC	9.4 MC	SW Osc. † Padder	
14					SW R.F. Padder	
15					SW Ant. Padder	
16	Recheck Steps 10 to 15 inclusive.					

* Set oscillator trimmer to maximum capacity, then slowly loosen trimmer until 2nd signal is heard. Check for proper alignment of OSC trimmer by tuning set to approximately 14.1 MC at which point or image signal should appear.
† After any adjustment of oscillator padder, repeat steps 4, 5 and 6.

MODEL 4-A-26
THE NEWSCASTI

ALIGNMENT PROCEDURE

1. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on dial cord and reposition pointer.
2. Remove chassis from cabinet by taking out two screws which hold chassis to bottom of cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on Page 6 for convenient B— location).
3. Connect ground lead of signal generator to B— through a 0.25 Mfd. condenser.
4. Connect output meter across speaker voice coil (terminals at back of speaker) or from plate of type 50L6GT tube to B— through a 0.1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

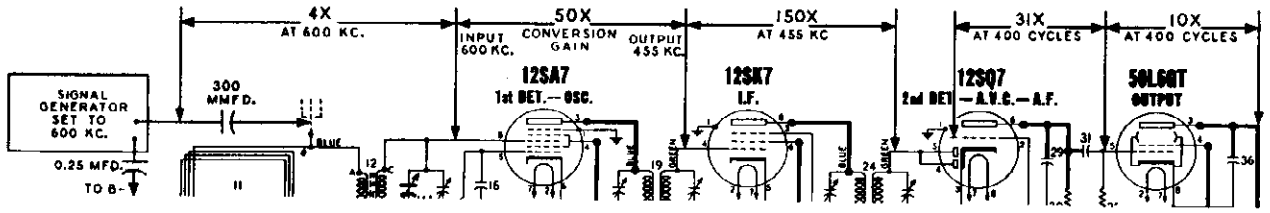
STAGE GAIN MEASUREMENT PROCEDURE

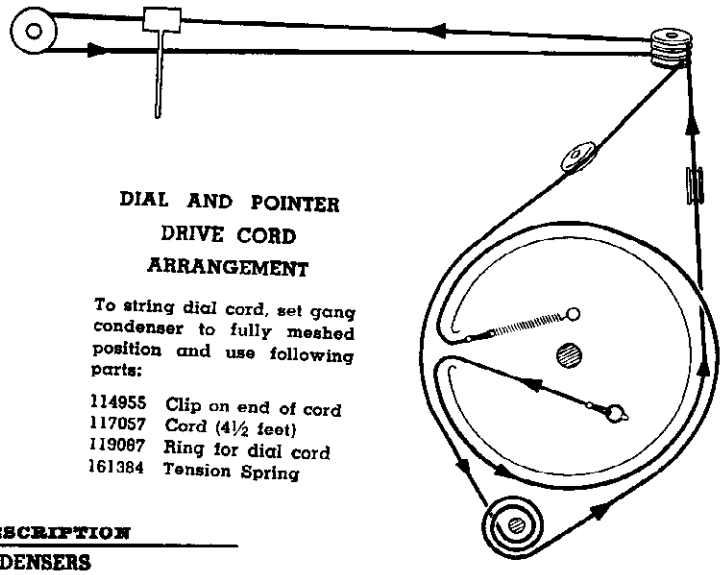
REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given on page 4.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to the A.V.C. lead at terminal "D" of antenna coil and then connect positive battery lead to B— in the receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (4½ feet)
119087 Ring for dial cord
161384 Tension Spring

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet (do not remove loop of wire stapled to cabinet). Wind one turn of insulated wire around frame of antenna so as to provide a means of coupling it to the signal generator. Space chassis approximately same distance from loop as when installed in cabinet. Connect plug on loop antenna cable to socket at rear of chassis. Brown lead in antenna cable (which was connected to loop of wire stapled to cabinet) should now be connected to one end of new coupling turn on frame of loop.
2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect output meter across speaker voice coil.
4. Connect the ground lead of the signal generator to the receiver chassis.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.
6. Push in the manual button and leave it in that position throughout the alignment procedure.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Trimmer on rear section of gang	455 KC	"A" Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
500 MMFD. Condenser	Coupling turn on Loop Frame	1500 KC	"A" Broadcast (counter-clockwise)	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output

SETTING-UP THE PUSH BUTTONS

1. Set Band Switch to "A" position and allow set to operate 15 minutes before making any adjustments.
2. Note two rows of adjusting screws on back of radio chassis which are visible and accessible through top opening in cabinet back (entire cabinet back may be removed if desired by taking out screws around the sides). Each vertical pair of adjusting screws is used to tune-in a station for one of the push-buttons. A label under the row of screws specifies the frequency or tuning range that each screw will cover.
3. Select five powerful nearby stations and obtain their frequencies from your local newspaper. Be sure that the frequency of each station falls within the frequency range of the adjusting screw which will be used to tune-in that station.
4. Before disturbing adjusting screws, return to front of radio and push in "MANUAL" button. Then tune-in the lowest frequency station in the group of 5 that you selected. Listen to the program so that you can identify it later.
5. Now push in the first button **on the left.** Return to rear of radio and use vertical pair of adjusting screws **on extreme right** to tune-in the same station. Adjust bottom screw first until desired station is heard. If station is not heard, change setting of top screw to a position where the slight static noise or rushing sound is the loudest. Then try adjusting bottom screw again; repeat this procedure until desired station is found. After locating station, carefully set bottom screw for deepest tone and top screw for maximum volume.
6. The set-up of the first push-button is now complete. Proceed to set-up remaining buttons by first tuning-in station manually to identify program, then push in desired button and use appropriate pair of adjusting screws to tune-in the same station. The pair of adjusting screws associated with a particular button are located directly behind that button.
7. A set of station call-letter tabs will be found in the envelope containing the operating instructions. Use these tabs to label the push-buttons.

FREQUENCY RANGES:

Standard Broadcast Band	540-1725 KC.

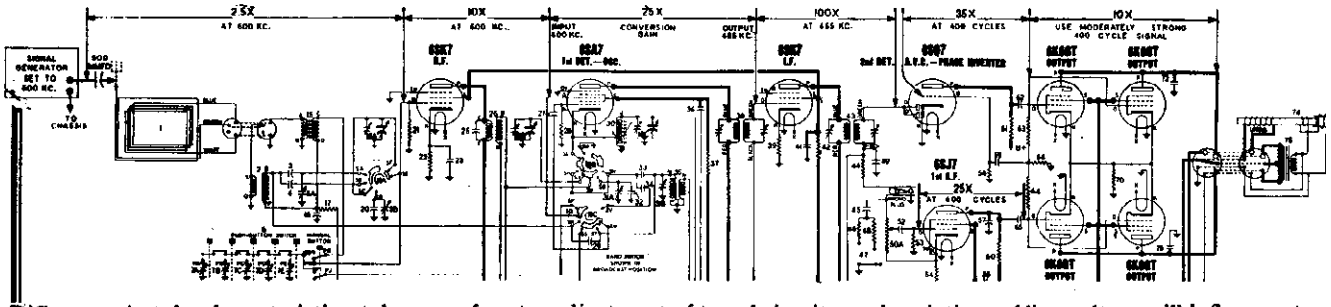
THE FIRESTONE TIRE & RUBBER CO. MODEL 4-A-3

APPROXIMATE STAGE GAIN DATA

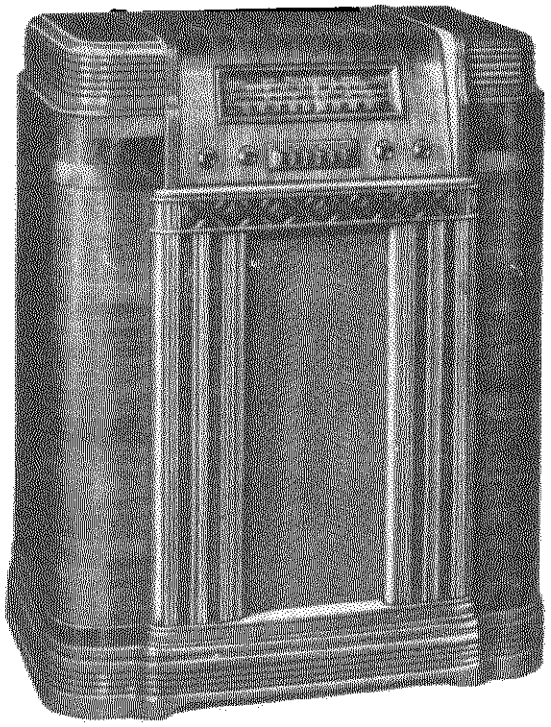
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instru ment containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observ following precautions:

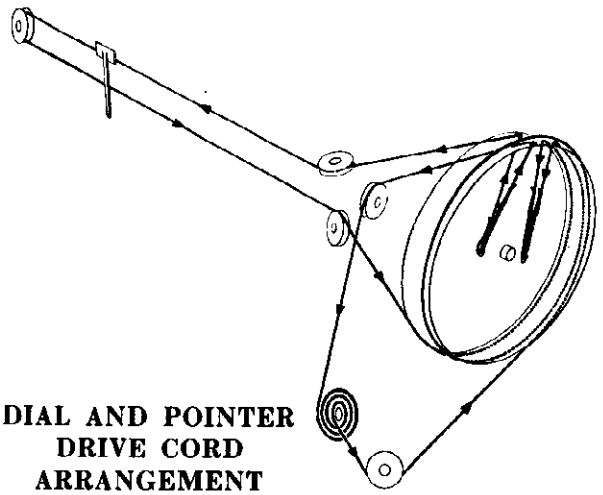
1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead at lug "P" of S.W. Antenna Coil and positive terminal to chassis. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using "channel" type in strument carefull tune it for maxi mum output at de sired frequenc before makin measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias i order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stag gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your tes equipment. These factors may create considerable variation in gain measurements.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177	Tension Spring
114955	Clip on end of cord
119087	Ring for dial cord
117057	Cord (9 feet)
	Pointer drive 5 feet
	Gang drive 4 feet

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to repl the speaker or output transformer, it is important to maintain a definite phase relationship in this feedback circuit. If the connections the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, system will become regenerative instead of degenerative. Under such conditions audio oscillation may result. If that occurs, oscillat may be prevented by reversing the connections to the primary of the output transformer.

ALIGNMENT PROCEDURE

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

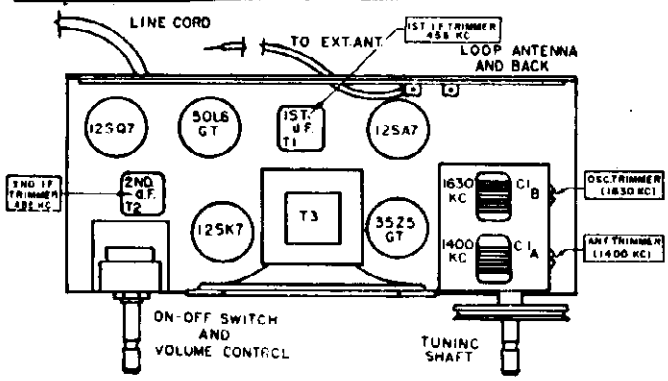
For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third. Before starting alignment:

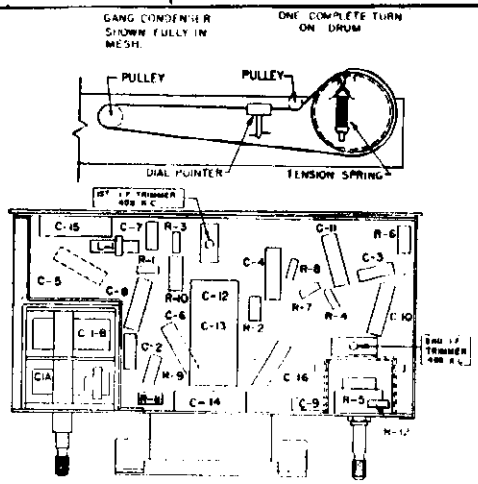
(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh at which point the dial pointer must be exactly even with the last mark at the low frequency end of the dial calibration If dial pointer is incorrectly set, release pointer clip on dial cord and reposition pointer.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

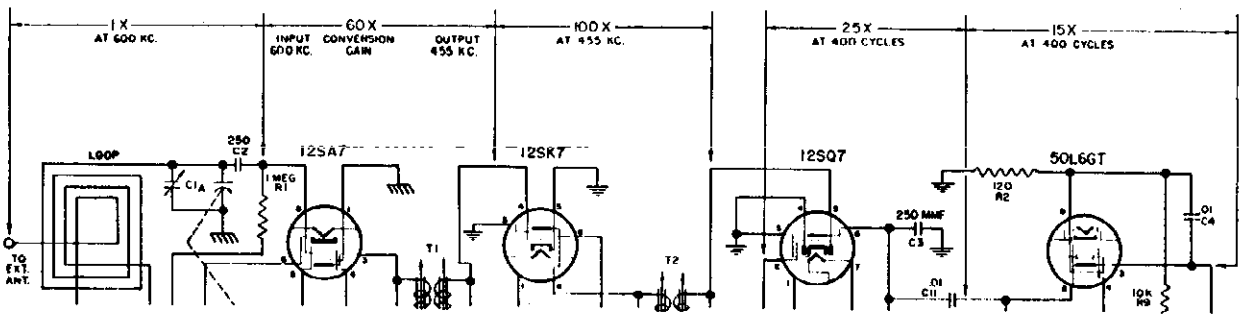
Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	Minimum capacity (fully open)	455 K.C.	.1 MFD. condenser	High side to grid of tuning condenser. Low side to common negative. (through .25 MFD. Cond.)	Adjust each trimmer on the second I. F. transformer for maximum output—then adjust each trimmer on the first I. F. transformer for maximum output.
2	Minimum capacity (fully open)	Exactly 1630 K.C.	.00025 MFD. condenser	Receiver antenna lead. common negative	Adjust 1630 K.C. oscillator trimmer for maximum output.
3	Approx. 1400 K.C.	Approx. 1400 K.C.	.00025 MFD. condenser	Receiver antenna lead. common negative	While rocking gang condenser adjust 1400 K.C. antenna trimmer for maximum output.





Before proceeding with stage measurements be sure the receiver is properly aligned. R.F. gains can be measured by a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe the following precautions:

1. For all gain measurements connect the "high" side of a signal generator to the antenna lead through a .00025 mica condenser. The ground side of the signal generator should be connected to common negative. Use a 600 KC signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
3. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



Stage gain measurements can be influenced by the normal manufacturers tolerances allowed in parts, differences in individual tube characteristics, the adjustment of the tuned circuits and variations in line voltage. Careful tuning of the receiver as well as experience in using your test equipment will determine the accuracy of the measurements taken. Due to all of these factors, the stage gains shown in the above diagram are approximate values rather than absolute as it is possible to introduce many variations in these measurements.

MODELS 4-A-62, 4-A-63

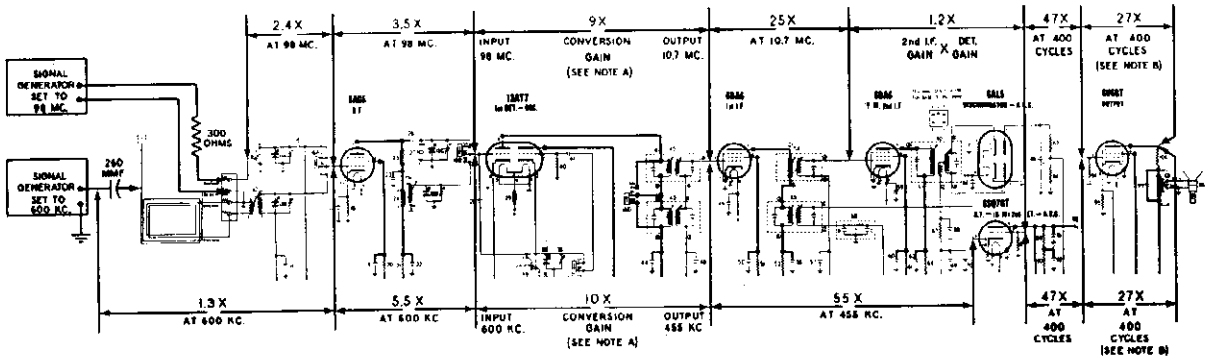
THE FIRESTONE TIRE & RUBBER CO.

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of most of the stages of this receiver can be measured with an A.C. Vacuum Tube Voltmeter of the high frequency type. An AM (600 KC.) as well as an FM (98 MC.) signal source is required. For gain measurements in the FM antenna—FM converter—FM 1st I.F. stages, a microvolt calibrated FM signal generator should preferably be used.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. (400 cycle modulation) and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. (400 cycle modulation with 22½ KC. deviation) and then carefully tune radio receiver to this signal by using a D.C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin No. 7 of 6AL5 tube and chassis. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of —3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. system. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to both A.V.C. supply lines by effecting a common connection to terminal 4 of 2nd FM-I.F. transformer and terminal 2 of 1st AM-I.F. transformer. Then connect the positive battery lead to the receiver chassis.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.



NOTE A: Short oscillator grid (pin 2 of 12AT7) to ground when measuring input voltage at signal grid (pin 7) of 12AT7 tube.

NOTE B: Measured with input voltage of 0.3.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

4-A-63

BROADCAST BAND —"AM"—ALIGNMENT PROCEDURE

1. Disconnect leads from FM-AM aerial terminal strip (labeled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.

2. Stand chassis on one edge so that all trimmers are accessible.

3. Loop aerial leads (on cabinet) do not have to be connected to terminal strip on chassis while I. F. stages are being aligned. Before starting alignment of Ant., R.F., and Osc. stages, reconnect all four aerial leads to chassis—do not attempt to use extension leads; place chassis as close as required to cabinet so that connections may be made dire aerial terminal strip at back.

4. With the gang condenser fully meshed, dial pointer sh be in the position indicated by the last division below 5 the dial. If it is set incorrectly, hold tuning shaft steady reposition pointer.

5. Connect an output meter across speaker voice coil, or plate of 6V6GT tube to chassis through a 0.1 Mfd. conde

6. Connect ground lead of signal generator to the rec chassis.

7. Set volume control at maximum volume position and u weak signal from the signal generator.

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE
(USING A VACUUM TUBE VOLTMETER AND AM SIGNAL GENERATOR)

INSTRUMENTS: Although it is preferable to use an FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventional AM generator and vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer.

IMPORTANT: When using an AM signal generator, it should be capable of producing fundamental frequencies of 10.7 MC and 88 to 108 MC — avoid using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which are dependent upon third, fourth or fifth harmonics for output frequencies of 88 to 108 MC will generally produce undesirable spurious beat signals with the local oscillator in the receiver and alignment will be exceedingly difficult.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on the preceding page).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required. However, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by a V-T voltmeter connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. Set band switch to the FM (extreme counter-clockwise) position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	VACUUM TUBE VOLTMETER CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang see illustration on page 9 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to pin No. 7 of the 6AL5 tube.	Any position where it does not affect the signal.	11	Discriminator Primary	Adjust these trimmers for maximum meter reading the output voltage will be of negative polarity.
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Same as above	Same as above	Connect common (or ground) terminal of V-T voltmeter to the junction of resistors 87 and 88 in the discriminator circuit. D.C. probe lead of meter is then connected to junction of resistor No. 67 (18,000 ohms) and condenser No. 70 (.003 MFD.) which are in the discriminator output circuit. ——— Set meter for operation on its lowest D.C. voltage range.	Same as above	10	Discriminator Secondary	Note that as trimmer No. 10 is rotated a point will be found where voltmeter will swing from a positive to a negative reading or vice versa. Correct setting of trimmer No. 10 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable care must be exercised to set the trimmer for a zero meter indication.
Recheck adjustment of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain the specified output indication.						
Connect generator "high" side in series with a 300 ohm carbon resistor to end terminal marked "FM" on strip at back of chassis. Generator ground lead must connect to next terminal marked "GND".	**106 MC** AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to Pin No. 7 of the 6AL5 tube.	106 MC	16	Oscillator Trimmer	Set trimmer No. 16 to receive 106 MC. signal as indicated by maximum meter reading. **IMPORTANT:** It will be noted that there are two different settings of trimmer No. 16 at which the 106 MC. signal will be received always select the trimmer setting which is nearest to the low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	17	R.F. Trimmer	Adjust trimmer No. 17 for maximum meter reading.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum meter reading.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.

Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condsenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner as outlined above for the oscillator stage.

MODELS 4-A-6
4-A-63

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE
(USING AN OSCILLOSCOPE AND FM "SWEEP" GENERATOR)

INSTRUMENTS: Alignment of the FM circuits in this receiver can be most conveniently accomplished with an FM signal generator. When using this type generator, the output indicator must be an oscilloscope.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on page 8).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. (If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.)
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required, however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by an oscilloscope connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. **Set band switch to the FM (extreme counter-clockwise) position.**
7. Set tone control to fully counter-clockwise position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	OSCILLOSCOPE CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang (see illustration on page 8 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** FM signal should preferably be modulated ±400 KC.	Connect vertical amplifier "high" lead to function of resistor No. 67 (18000 ohms) and condenser No. 70 (.003 Mfd.) which are in discriminator output circuit. Connect scope ground lead to receiver chassis. Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope.	Any position where it does not affect the signal.	10	Discriminator Secondary	Before attempting to adjust trimmer No. 10, se trimmers No. 11, 12, 13, 14 and No. 15 for approx mately maximum sound output from the speake (output meter not required). This is done t obtain sufficient signal for an oscilloscope pa tern of desirable amplitude when making th following discriminator trimmer adjustment. Adjust setting of trimmer No. 10 until a patter similar to that shown in Fig. 2 appears on th screen. If pattern does not remain stationary ope ate sweep frequency control on 'scope and als "sync" control until desired result is obtainec Correct setting of trimmer No. 10 is obtained whe crossover point "B" (Fig. 2) is centrally locate in both the horizontal and vertical directions; i addition that portion of the curve between "A and "C" should be as linear (straight) as possible
Same as above	Same as above	Same as above	Same as above	11	Discriminator Primary	Adjust these trimmers for maximum amplitud and steepness of that portion of the pattern be tween "A" and "C" (see Fig. 2).
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Recheck adjustments of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain correct cross-over point or symmetry of pattern.						
Connect generator "high" side in series with a 300 ohm carbon resistor to end terminal marked "FM" on strip at back of chassis. **Generator ground lead** must connect to next terminal marked "GND".	**106 MC** FM signal should preferably be modulated ±400 KC.	Same as above	**106 MC**	16	Oscillator Trimmer	Adjust trimmer No. 16 to obtain the symmetrica pattern shown in Fig. 2. Correct setting of trim mer No. 16 is obtained when cross-over point i pattern is centrally located. **IMPORTANT:** It will be noted that there are tw different settings of trimmer No. 16 at which th desired 'scope pattern can be obtained—alway select the trimmer setting which is nearest to th low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	17	R.F. Trimmer	Adjust trimmer No. 17 for maximum amplitude o pattern.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum amplitude o pattern.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maxi mum amplitude of pattern.

Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner.

MODELS 4-A-62, 4-A-63

THE FIRESTONE TIRE & RUBBER CO.

SOCKET VOLTAGES

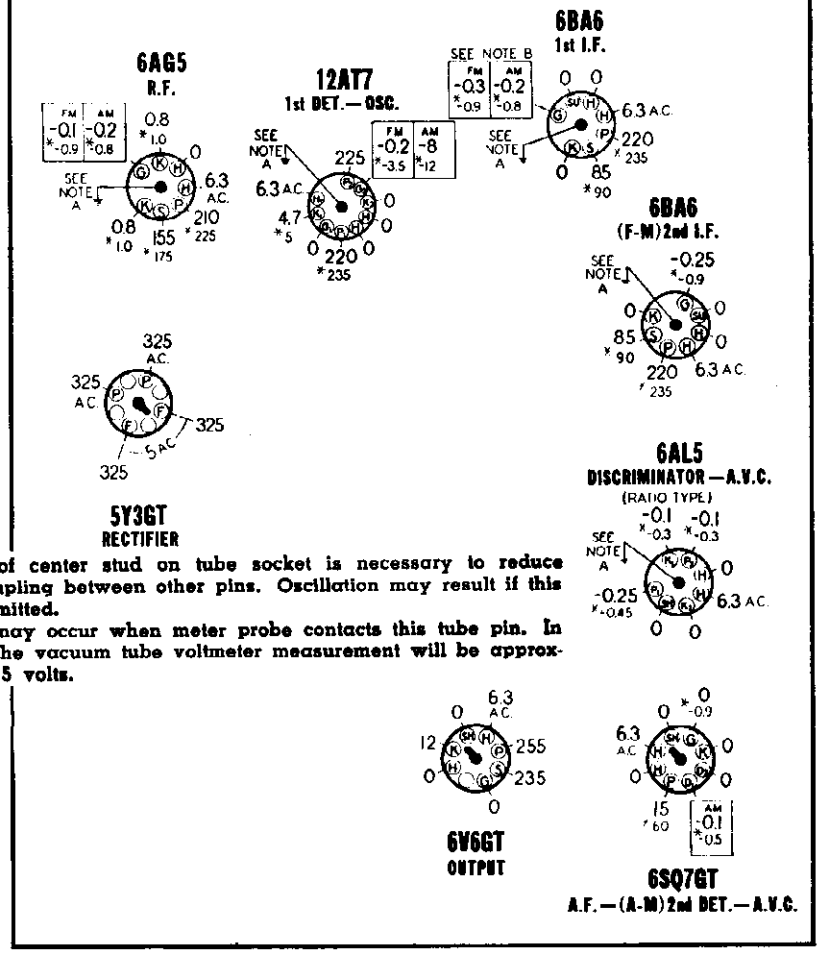
Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

ALL MEASUREMENTS MADE WITH BAND SWITCH IN "FM" POSITION UNLESS OTHERWISE INDICATED
DIAL TUNED TO 88MC. FOR "FM" MEASUREMENTS
DIAL TUNED TO 540KC. FOR "AM" MEASUREMENTS
VOLUME CONTROL SET TO MINIMUM WITH NO SIGNAL
GROUND ALL ANTENNA TERMINALS

BOTTOM VIEW OF CHASSIS

117 VOLT 60 CYCLE A.C. POWER SUPPLY USED FOR THESE MEASUREMENTS.

ALL VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND CHASSIS.



NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

NOTE B: Oscillation may occur when meter probe contacts this tube pin. In that event, the vacuum tube voltmeter measurement will be approximately —4.5 volts.

P-48X34	Dual .5 mf. Generator Condenser

DIAL AND DRIVE ASSEMBLY

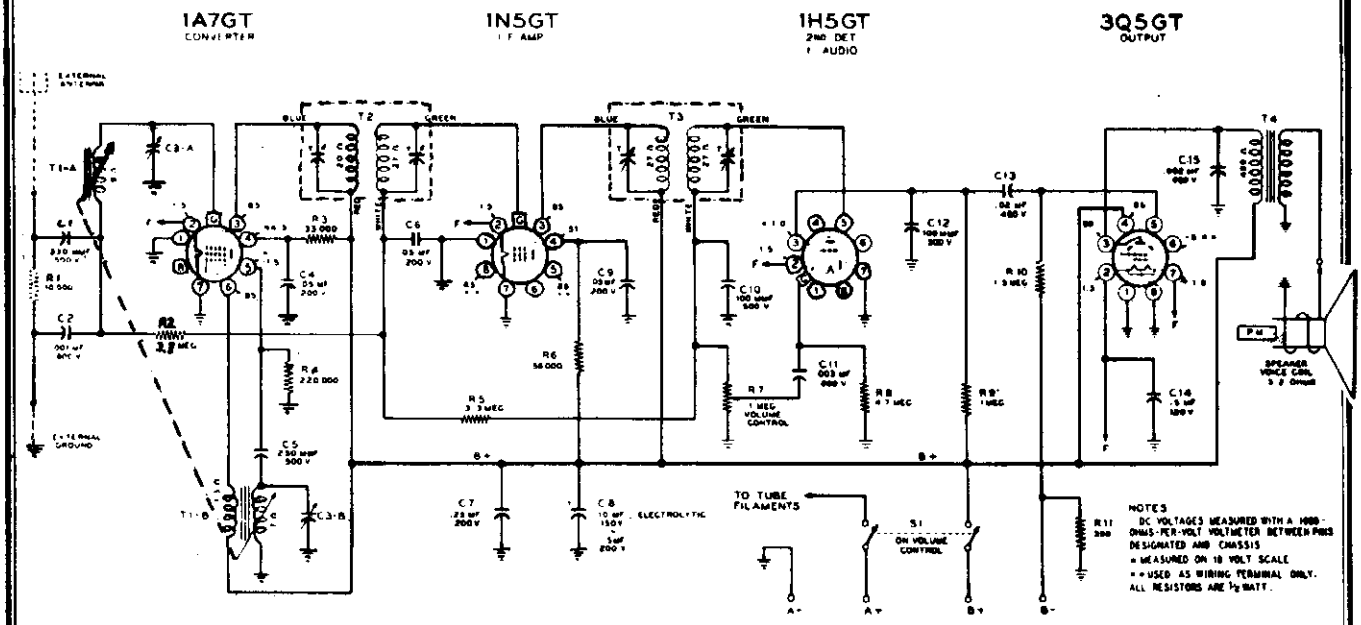
DIAL ASSEMBLY

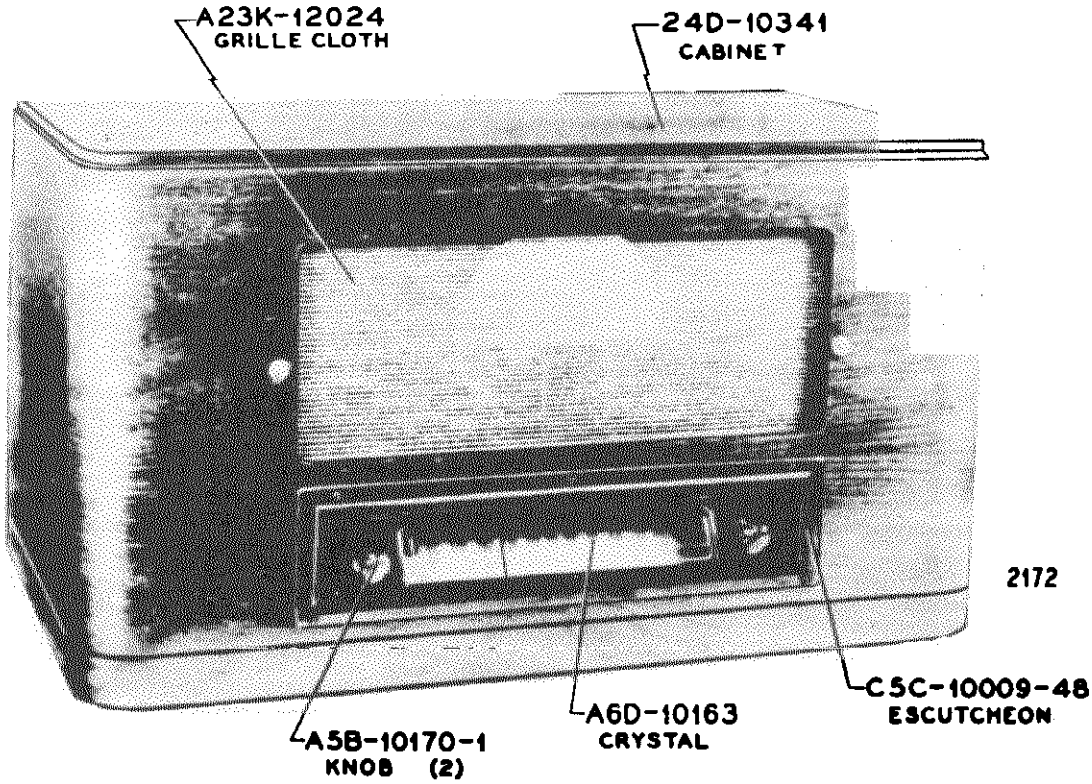
Part No.	Description
Specify Name and Model of Radio	Dial Assembly Complete with Dial Glass; Dial Plate; Dial Cardboard; Small Pointers; Reflectors; Small Pointer Cords, Springs, Pulleys and Collars; and Band Indicator Assembly less Large Station Pointer and Micrometer Pointer.
See above	Dial Glass Only
P-25A125	Dial Assembly Mounting Plate, Includes Small Pointer Shafts and Pulleys, and Band Indicator Assembly
P-25X297	Dial Assembly Support Brackets (Attached to Gang Condenser)
P-15X59	Large Station Pointer
P-15X60	Micrometer Pointer
P-16X57	Small Volume or Tone Control Pointer
P-9X16	Dial Cardboard
P-11X41	Fibre Strip (At Bottom of Dial Glass)
P-41X12	Dial Lamp Reflectors (At each side of Dial Plate)
P-7A37	Dial Lamp Sockets and Clips
P-7A32	Dial Lamps
P-29X20	10" Black Cord for Small Pointers Brass Collars with Set Screws for Securing Small Pointer Cords to Shafts
P-28X44	Tension Springs for Small Pointer Cords
P-26X229	Small Pointer Shafts and Pulleys
P-17X15	Glass Crystal (Mounted in Escutcheon Plate)
P-28X58	Crystal Retaining Ring

DRIVE ASSEMBLY

P-5A34	Planetary Assembly Complete with Hex Nut and Lockwasher (This is the unit mounted at the front of the chassis base. It is integral with the tuning shaft)
P-10X14	Black Tuning Drive Cord Only
P-28X49	Tension Spring for Tuning Drive Cord
P-25X269	Drive Assembly Bracket Only (Mounted on Gang Condenser)
P-25X283	Rear Mounting Foot for Gang Condenser
P-24X239	Drive Drum Assembly Complete with Gears, Micrometer and Main Pointer Shaft
P-28X84	Spreader Spring for Rotary Gear (Part of Above Assembly)
P-28X83	Spreader Spring for Stationary Gear (Part of Above Assembly)

MODEL 43-6321 GAMBLE-SKOGMO, INC.





GAMBLE-SKOGMO, INC. MODEL 43-632

ALIGNMENT PROCEDURE

Output meter across 3.2-ohm output load.

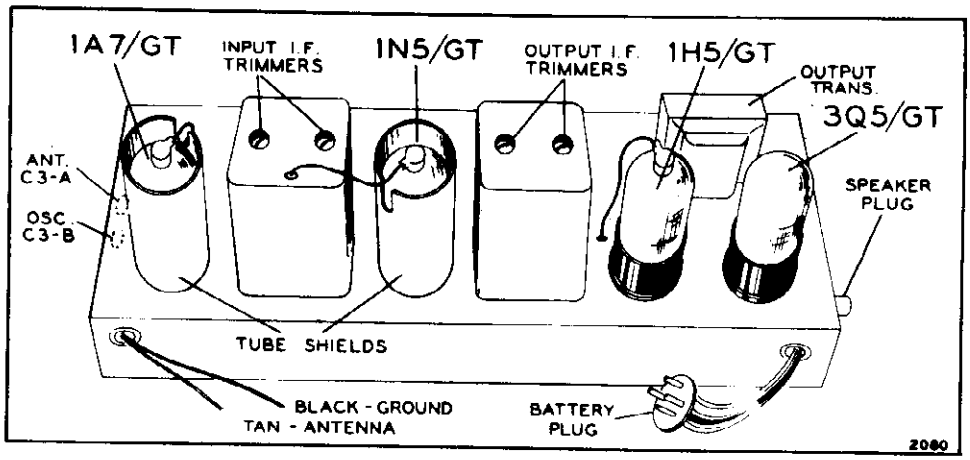
Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

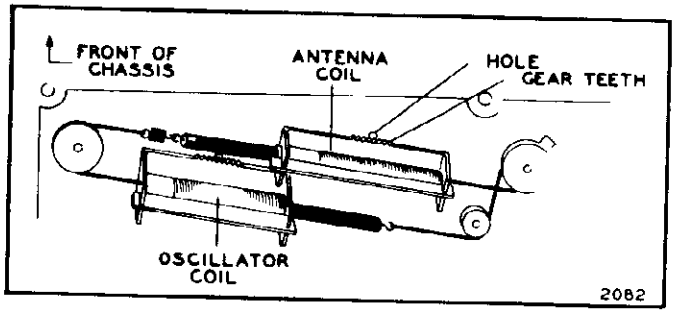
Volume control at maximum for all adjustments.

Connect ground post of signal generator to radio chassis.

FREQUENCY	SIGNAL GENERATOR DUMMY ANTENNA	CONNECTION TO RADIO	TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT (in order shown)
455 kc	.1 mf	Grid (top cap) of 1A7GT	Iron cores all the way out	Trimmers on output and input I.F.
1720 kc	.1 mf	Grid (top cap) of 1A7GT	Iron cores all the way out	Oscillator trimmer C3-B
1720 kc	200 mmf	Antenna lead	Iron cores all the way out	Antenna trimmer C3-A
1400 kc	200 mmf	Antenna lead	Turn dial to 1400 kc	Adjust position of antenna coil (see coil view)

This adjustment and the previous adjustment are interlocking: therefore repeat the two adjustments alternately for best results.





SPECIFICATIONS

4 Tube Superheterodyne

Power Output.....160 mw. undistorted, 250 mw. maximum
Selectivity.....48 kc. broad at 1,000 times signal at 1,000 kc.
Antenna.....External only. Also external ground.
Intermediate Frequency.....455 kc.
Speaker.....5 in. P.M., 1.5 oz., magnet, voice coil imp. 3.2 ohr
Tuning.....Two permeability-tuned circui
Sensitivity.....20 mv. avg. for 50 mw. outp
Frequency Range.....535 to 1,720 k
Power Supply.....A battery 1.5 v. 250 ma., B battery 90 v. 14 m

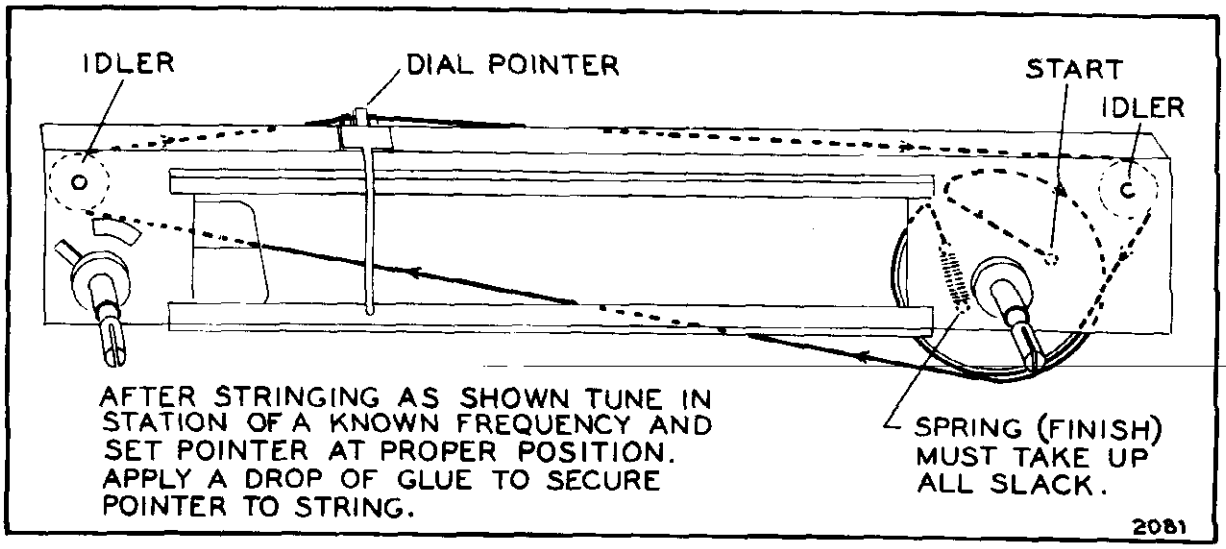
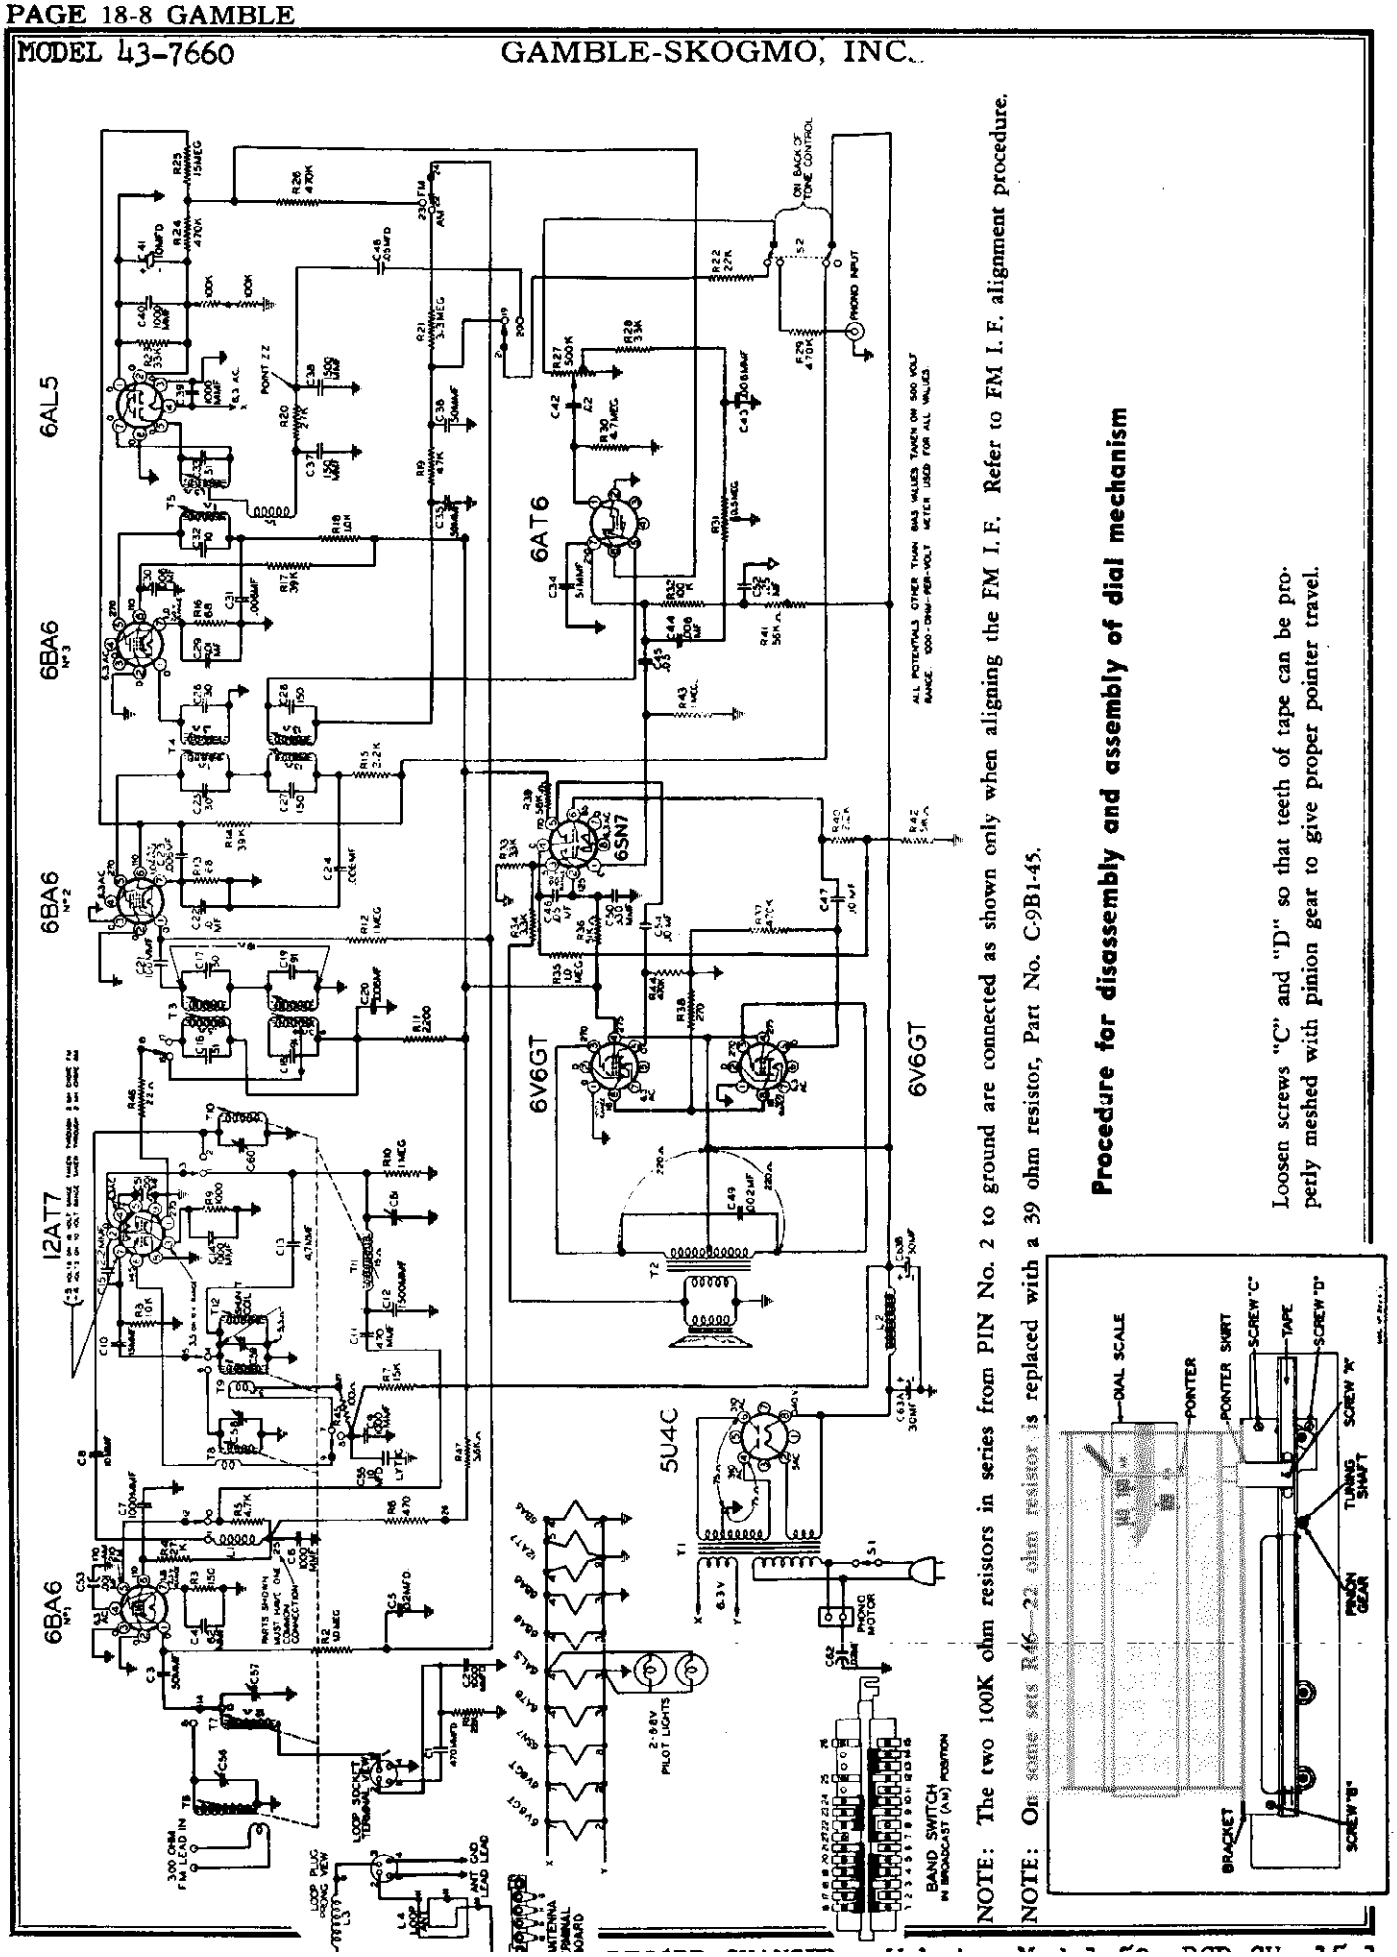
	A-49A-11324	Spring for dial pointer drive cord

DRIVE CORD REPLACEMENT



MODEL 43-7660 GAMBLE-SKOGMO, INC.



NOTE: The two 100K ohm resistors in series from PIN No. 2 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: On some sets R46 22 ohm resistor is replaced with a 39 ohm resistor, Part No. C-9B1-45.

Procedure for disassembly and assembly of dial mechanism

Loosen screws "C" and "D" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE—The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Resonance should be about 3 volts
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4 10.7 m.c. windings See top and bottom views	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3 See top and bottom views	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL Input signals should b adjusted to give approximately volts. The ratio detector is oper ating at a resonable level at thi point and will give the truest in dication of correct alignment wit the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out.

For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, howeve will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generat and connect to one screw. Connect cold side of generator other screw.

MODEL 43-7660

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of suppling the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

AM-I.F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

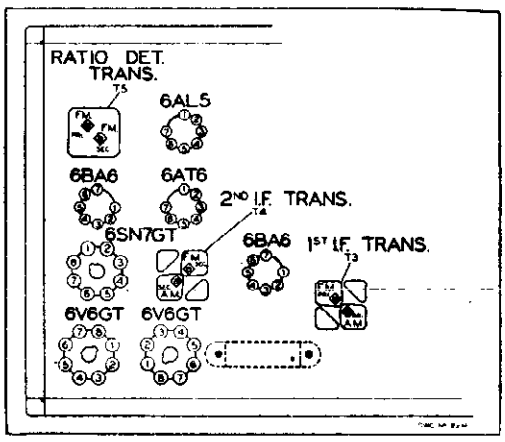
SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings See top and bottom views	Maximum output Should be ½ watt
455Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

BROADCAST BAND-R.F. ALIGNMENT

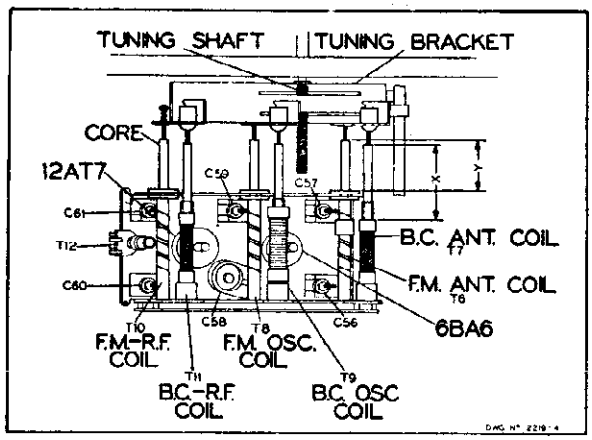
Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C59 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T12 for maximum ½ watt
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C57 and C61 for max. ½ watt. See note

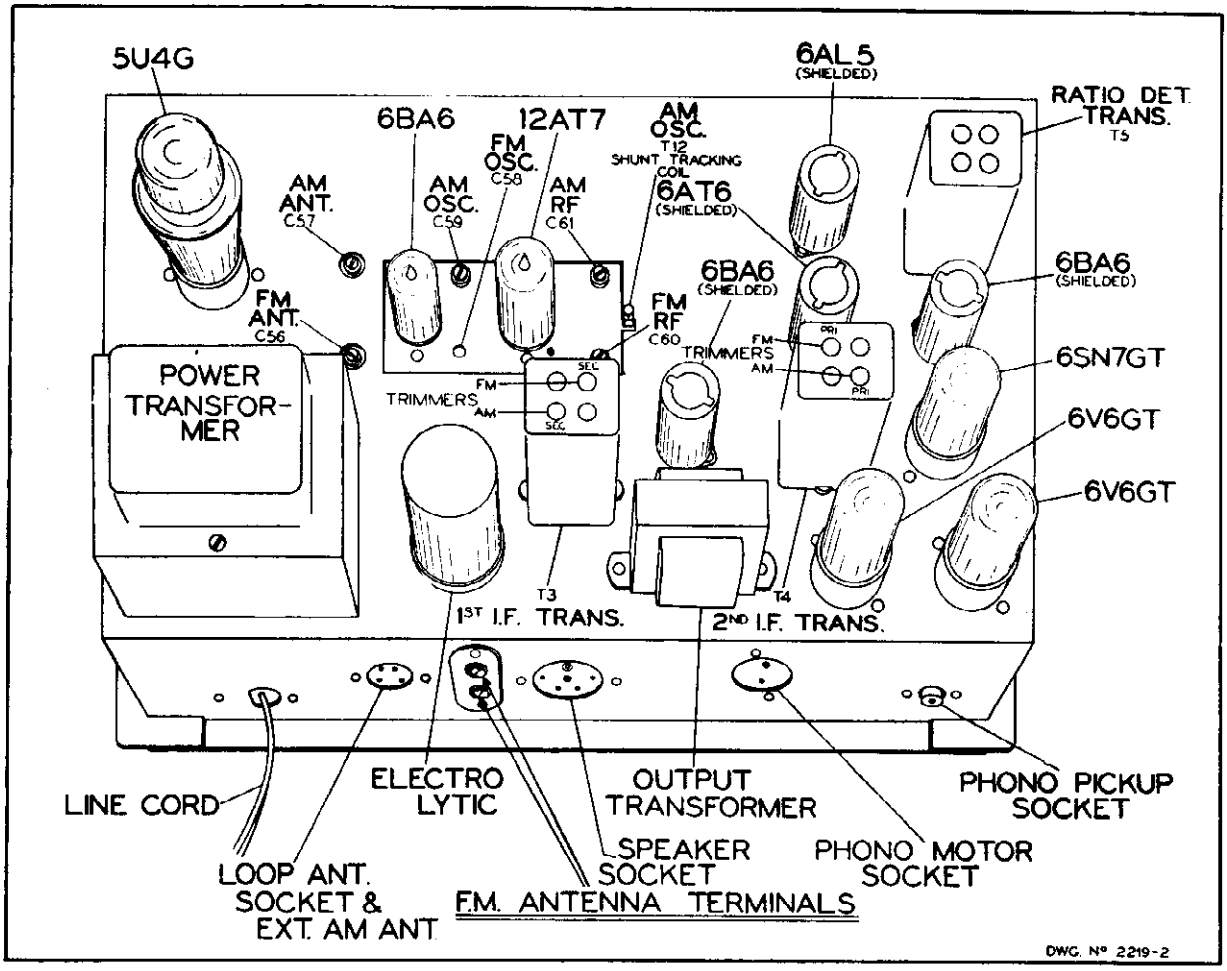
NOTE: Re-check first two adjustments after this adjustment because of inter-locking effects.



TUNER ADJUSTMENT

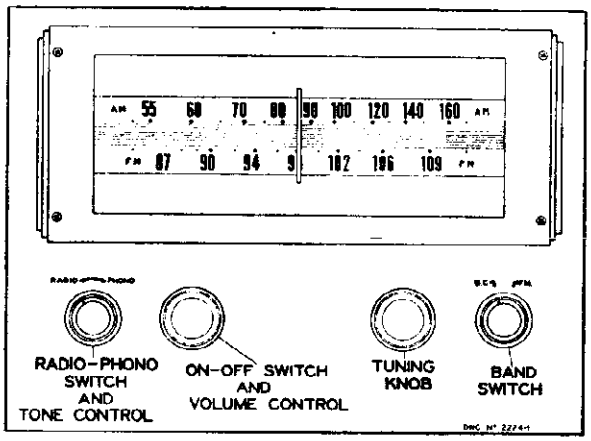


With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.



Chassis—top view

GENERAL DESCRIPTION— This is a 2-band, nine tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I. F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with 300 ohm lead-in. Both antennas may be connected to the radio at the same time.



Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.

Frequency Range.....Broadcast Band—535 to 1620 kc.
FM—Band 88 to 108 mc.

Intermediate Freq......AM-455 kc; FM-10.7 mc.

Selectivity.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc.
I.F. FM-180 kc. broad at 2 times down.
I.F. FM-320 kc. broad at 10 times down.

AM Sensitivity.....(For .5 watt output with external antenna)—3 microvolts average.

FM Sensitivity.....(For .5 watt output)—10 microvolts average.

Power Output.....8 watts, 10% distortion. 10 watts maximum.

MODEL 43-7660 GAMBLE-SKOGMO, INC.

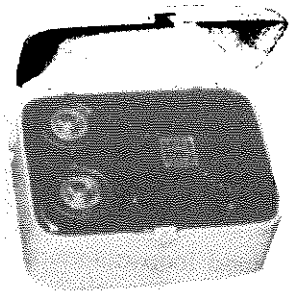
I.F. = 455 KC.
ALL RESISTORS 1/8 WATT AND ALL PAPER CAPACITORS 150 VOLTS UNLESS OTHER WISE MARKED.
K = KILOHMS

① 1.468 LOOP ANTENNA
② 2.215 2 GANG VARIABLE CONDENSER
③ 1.470 OSCILLATOR COIL
④ 1.412-3 1 ST. I.F. TRANSFORMER
⑤ 1.413-3 2 ND I.F TRANSFORMER
⑥ 8.201-6 VOLUME CONTROL & SWITCH
⑦ 30.317 SPEAKER WITH TRANSFORMER
⑧ 5.417 OR 5.426 8 MFD, 100 V. ELEC. CAPACITOR



TUNING RANGE: Broadcast 540 to 1650 Kilocycles (180 to 555 meters).
DIAL SCALE: The dial scale is calibrated in kilocycles. Example: Read "60" as 600 Kc.

TUBES: The tubes used and their functions are as follows:

1R5 Converter	1S5 Detector, AVC and Audio Amp.
1L4 I.F. Amplifier	3S4 Power Amplifier

For the placement of these tubes, see the diagram showing tube layout.

BATTERY VOLTAGE: This personal receiver is designed for operation from three self contained 1½ volt "A" batteries and a 67½ volt "B" battery.

BATTERY REQUIREMENTS: The following batteries are required:

QUANTITY	TYPE	MANUFACTURER
3	1½ volt "A"	Eveready size "D", Burgess No. 2, Ray-O-Vac size "D" or equivalent.
1	67½ volt "B"	Eveready #467, Burgess Type XXD, Ray-O-Vac Type 4367 or equivalent.

ALIGNMENT: (Receiver removed from cabinet.) Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

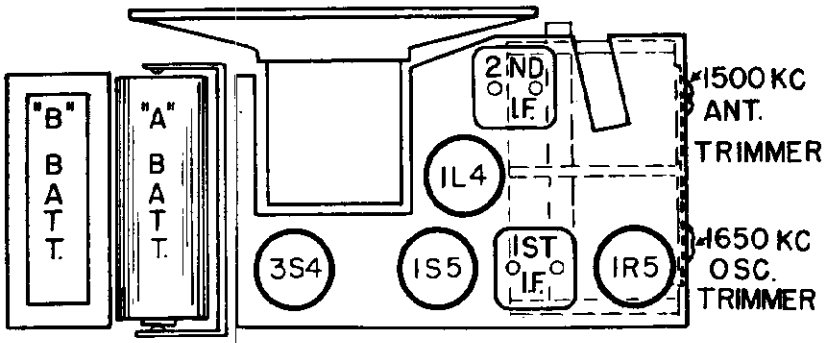
(1) Set the signal generator to 455KC and connect to the Stator Lug or green wire (front section) of Variable Capacitor. Connect the signal generator ground lead to the chassis. Connect a suitable output meter across the speaker voice coil connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position (minimum capacity). Remove P.K. screws holding loop in place and move loop away from I.F. transformers.

(2) Adjust the trimmers located at the top of the first and second I.F. Transformers for maximum output, as indicated on the output meter. Replace the loop in its original position.

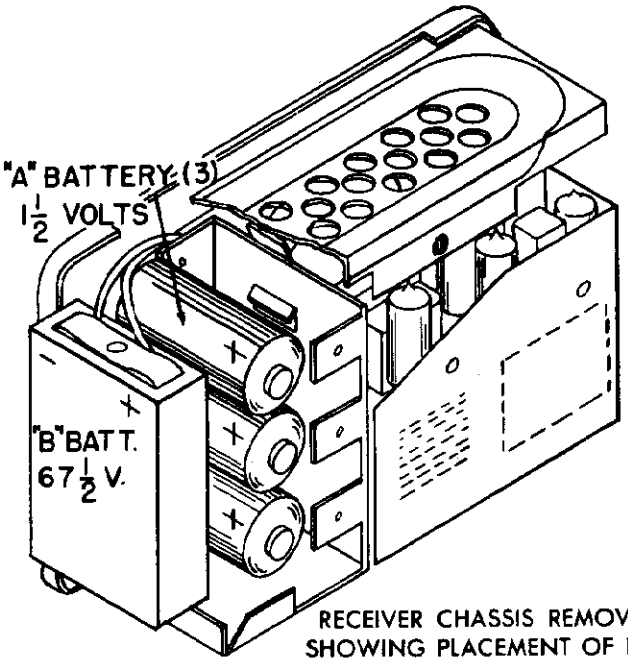
(3) Loosely couple the signal generator lead to the loop and set to 1650 KC.

(4) With the Variable Capacitor set at minimum capacity, tune in the 1650 KC signal by means of the oscillator trimmer on the Variable Capacitor (Rear Section).

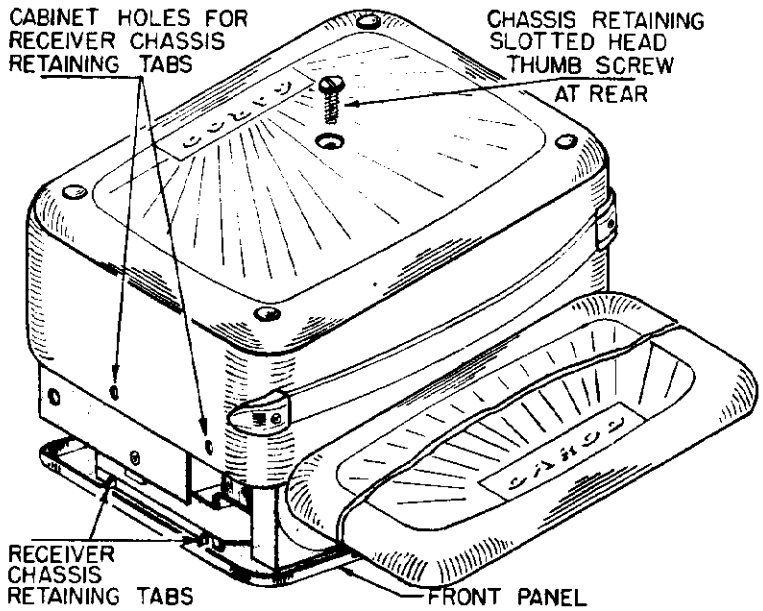
(5) Set the signal generator to 1500 KC and turn the tuning control until this frequency is heard. Adjust the antenna trimmer on the Variable Capacitor (front section) for maximum output. No other adjustments are necessary.



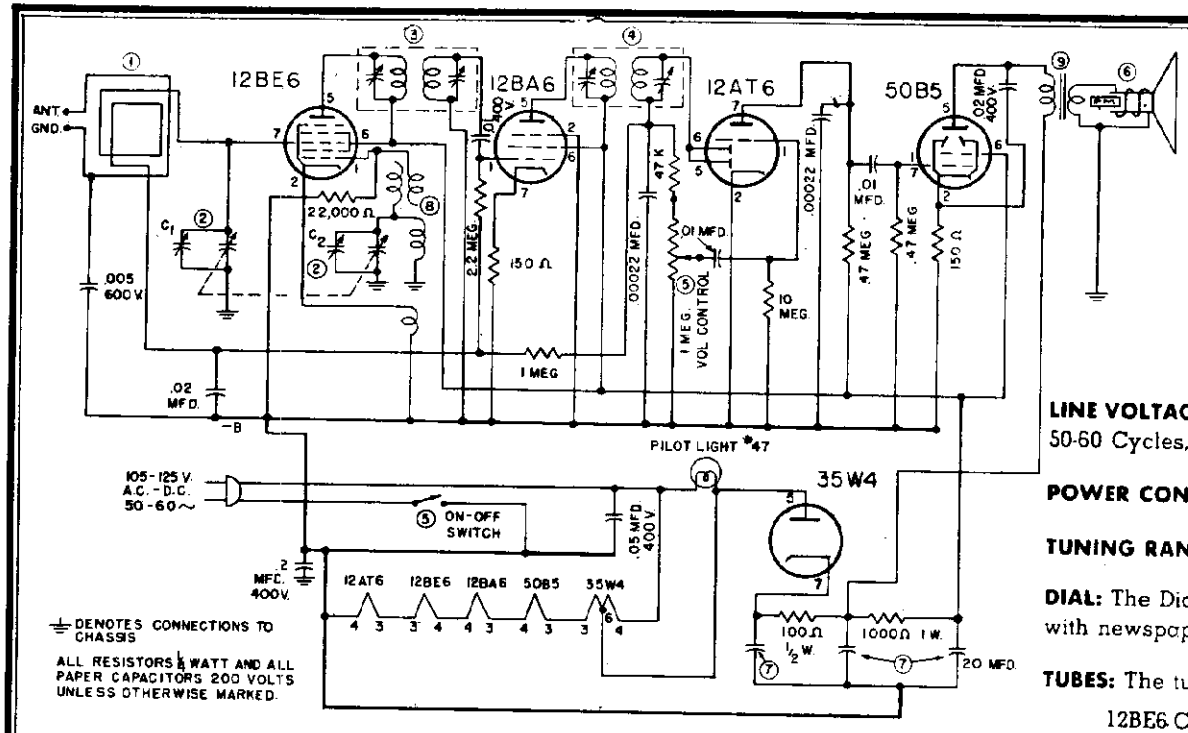
TUBE AND TRIMMER LOCATION DIAGRAM



RECEIVER CHASSIS REMOVED FROM CABINET SHOWING PLACEMENT OF BATTERIES



RECEIVER CHASSIS PARTIALLY RELEASED FROM CABINET FOR BATTERY INSTALLATION



① 1.464 LOOP ANTENNA
② 2.213 2 GANG VARIABLE COND.

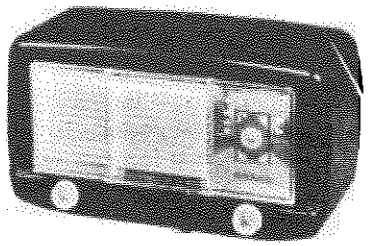
④ 1.409 2ND I.F. TRANSFORMER
⑨ 9.200 OUTPUT TRANSFORMER
⑤ 8.200-1 VOLUME CONTROL & SWITCH
⑥ 30.300 P.M. SPEAKER
⑦ 5.415-1 ELECTROLYTIC CAP. 40-40-20 MFD.
⑧ 1.402-1 OSCILLATOR COIL



LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC).

POWER CONSUMPTION: 30 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

DIAL: The Dial Scale is calibrated in Kilocycles times 10 to correspond with newspaper or periodical listings.

TUBES: The tubes used, and their functions, are as follows:

12BE6 Converter	12AT6 Detector, Avc and Audio Amp.
12BA6 I.F. Amplifier	50B5 Beam Power Amplifier
	35W4 Rectifier

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.

ALIGNMENT CHART

(Follow Sequence as Indicated)

CIRCUIT ALIGNED	STEP	RCVR. DIAL POINTER	SIGNAL GENERATOR FREQUENCY	SIGNAL GENERATOR CONNECTIONS	METER	METER CONNECTIONS	TRIMMER OR CORE ADJ.	PROCEDURE
B.C. I.F.	1	1650 KC. B.C. Band	455 KC. 30% Mod.	Through .1 MFD CAP. TO GRID of 6BE6.	A.C. Output Meter	Across voice coil	Cores on top and bottom of 1st and 2nd I.F. trans.	Adjust for maximum output
F-M I.F.	2	108.5 MC. F-M Band	10.7 MC. unmod.	Through .01 MFD. Cap. to grid of 12AT7.	D.C. VTVM	From Pin 1 limiter grid and ground	Top and bottom cores of 1st, 2nd and 3rd I.F. Trans. F-M	Same as step 1
F-M I.F.	3							Repeat step 2
F-M Disc.	4	108.5 MC. F-M Band	10.7 MC. unmod.	Same as step 2	D.C. VTVM	From junction of 100K disc. load resistor point "A" and ground	Bottom core of 10.7 MC Disc. Trans.	Same as step 1
F-M Disc.	5	108.5 MC. F-M Band	10.7 MC. unmod.	Same as step 2	D.C. VTVM	From Pin 3 6T8 and ground	Top core of 10.7 Mc Disc. Trans.	Adjust for zero between positive and negative meter reading
F-M Osc. (high) Freq. end)	6	108.5 MC. F-M Band	108.5 MC. unmod.	Through balanced 300 ohm dummy ant. to D1, D2 and ground terminals	D.C. VTVM	From Pin 1 limiter grid and ground	C3	Same as step 1
F-M Osc. (low freq. end)	7	87.5 MC. Band 1	87.5 MC. unmod.	Same as #6	D.C. VTVM	Same as #6	Oscillator coil core L3	Same as step 1
F-M Osc.	8	REPEAT STEPS 6 AND 7 AS NECESSARY						
F-M R.F. Circuit	9	105 MC. Band 1	105 MC. unmod.	Same as #6	D.C. VTVM	Same as #6	C4	Same as step 1
	10	90 MC. Band 1	90 MC. unmod.	Same as #6	D.C. VTVM	Same as #6	R.F. coil core L2	Same as step 1
F-M ANT. Circuit	11	105 MC.	105 MC.	Same as #6	D.C. VTVM	Same as #6	C5	Same as step 1
	12	90 MC. Band 1	90 MC. unmod.	Same as #6	VTVM D.C.	Same as #6	Antenna coil core L1	Same as step 1
B.C. Osc.	13	1650 KC. Band 2	1650 KC. 30% mod.	Through loop, or coupled to receiver loop by a 2 or 3 turn loop.	Output meter	Across voice coil	C2	Same as step 1
B.C.R.F.	14	1500 KC. Band 2	1500 KC. 30% mod.	Same as #13	Output meter	Across voice coil	C1	Same as step 1

During the alignment procedure all adjustments should be made under the following conditions:

(A) Line voltage set at 117 volts A.C.

(B) Volume control at maximum position.

(C) Tone control set at extreme left position (Treble).

(D) Minimum input from the signal generator. This procedure should be adhered to, otherwise adjustments will be broad, due to the action of the automatic volume control.

Refer to the trimmer and tube location diagram below for trimmer and core location. Follow the sequence in the alignment chart for proper alignment procedure.

LINE VOLTAGE: This receiver is designed for operation on 105-125 volts, 50-60 cycles, either Alternating or Direct Current (AC-DC) or 220-240 Volts when changed as indicated on the schematic diagram (rear page).

POWER CONSUMPTION: 30 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 Meters). Short Wave: 5.7 to 18.5 Megacycles (16 to 53 Meters).

DIAL: The dial scale is calibrated in Kilocycles times 10 for the Broadcast Band, and in Megacycles for the Short Wave Band.

TUBES: The tubes used, and their functions, are as follows:

6BJ6 R. F. Amplifier	12AT6 Detector, Avc and Audio Amp.
12BE6 Converter	50B5 Beam Power Amplifier
6BJ6 I. F. Amplifier	35W4 Rectifier

For the placement of these tubes, see the diagram showing tube layout on the back page of this folder.

CONTROLS: Four control knobs are provided on the front of the cabinet. From left to right they are as follows:

(A) On-Off Switch and Volume Control: This control combines the line On-Off Switch and Volume Control.

(B) Tone Control: When turned to the right (clockwise) a deep bass effect is produced, while rotation to the left (counter-clockwise) produces a more brilliant treble tone. Various shadings between the extremes may be obtained at intermediate settings of the control.

(C) Band Selector Switch: This two-position control selects the frequency band to be used. The extreme left hand position selects the "Short Wave" band and the extreme right hand position selects the "Broadcast" band.

(D) Tuning Control: This control is coupled to the tuning capacitor through a reduction drive and serves to select the desired broadcast or short-wave station along the slide-rule dial, the frequency of which is indicated by the dial pointer.

ALIGNMENT:

Re-alignment of this receiver should not be attempted unless all other possible causes have been thoroughly investigated. An accurately calibrated signal generator, which will cover the necessary bands, and an output meter for indicating the effect of adjustments are required.

During the alignment procedure described below, all adjustments should be made under the following conditions (refer to trimmer and tube location diagram, rear page, for trimmer locations):

(a) Line voltage as indicated on page one of this folder.
(b) Volume control at maximum.
(c) Tone control at extreme left hand position (treble).
(d) Minimum input from signal generator. This procedure should be adhered to, otherwise adjustments will be broad, due to the action of the automatic volume control.

BROADCAST (Band Switch in extreme right position)

I. F. Adjustment:

(1) Set the signal generator to 455 KC and connect to the stator lug on the front section of the Variable Capacitor through a .1 MFD. capacitor. Connect the signal generator ground lead to the chassis. Connect a suitable output meter across the speaker voice coil connections. Turn the Variable Capacitor to the extreme clockwise position (minimum capacity).

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the output meter.

BC. R. F. Adjustment: It is desirable to align this band on the loop.

(1) Couple the signal generator to the receiver loop by means of a two or three turn loop 8" in diameter.

(2) With the Variable Capacitor set at the extreme clockwise position (minimum capacity), tune in the 1650 KC signal by means of the broadcast oscillator trimmer (C1).

(3) Set the signal generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the antenna trimmer (C5) and R. F. trimmer (C3) for maximum output.

(4) Set the signal generator to 600 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the broadcast oscillator padder capacitor (C2) for maximum response while "rocking" the variable capacitor. Repeat the last three steps until no further improvement can be made.

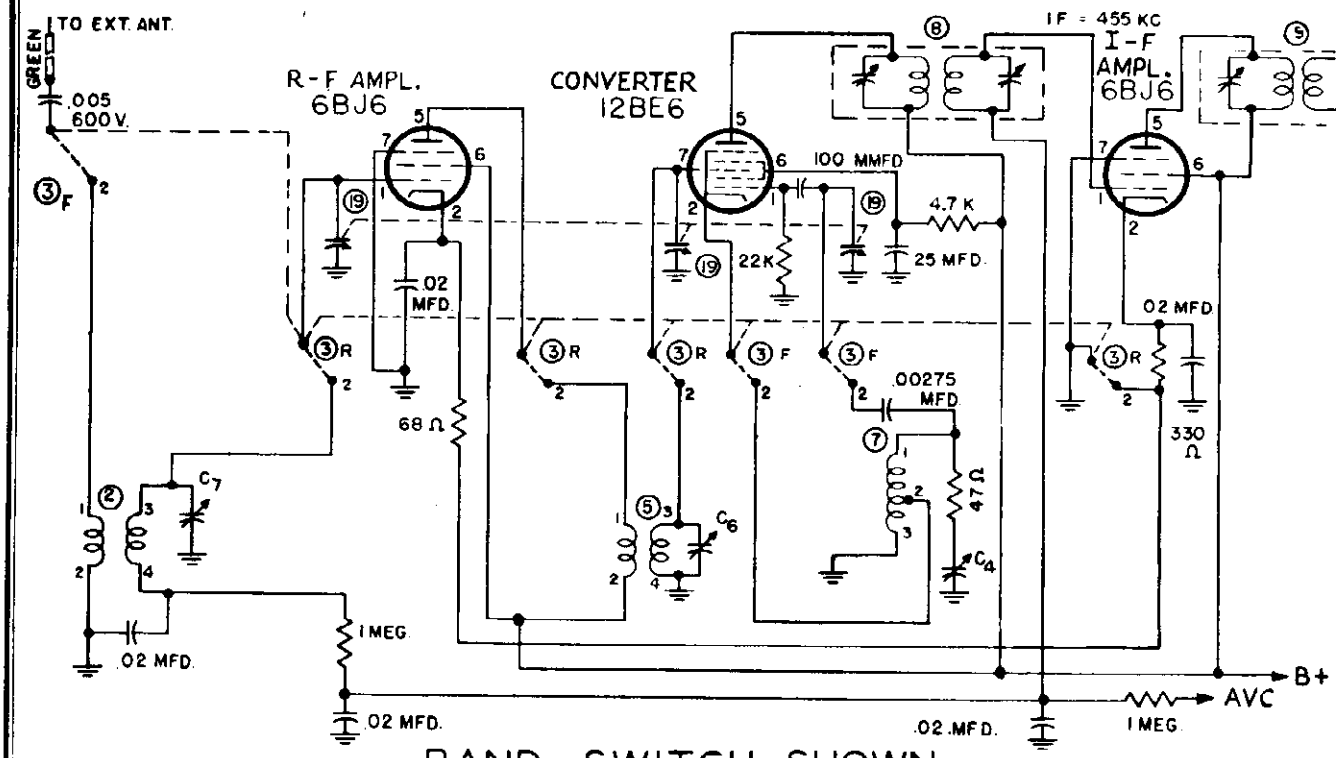
SHORT WAVE (Band Switch set to extreme left hand position)

(1) Connect the signal generator through a standard short wave dummy antenna or a 400 ohm resistor to the antenna (green wire) and the ground lead of the signal generator to the chassis of the receiver. Set the signal generator to 18.5 MC.

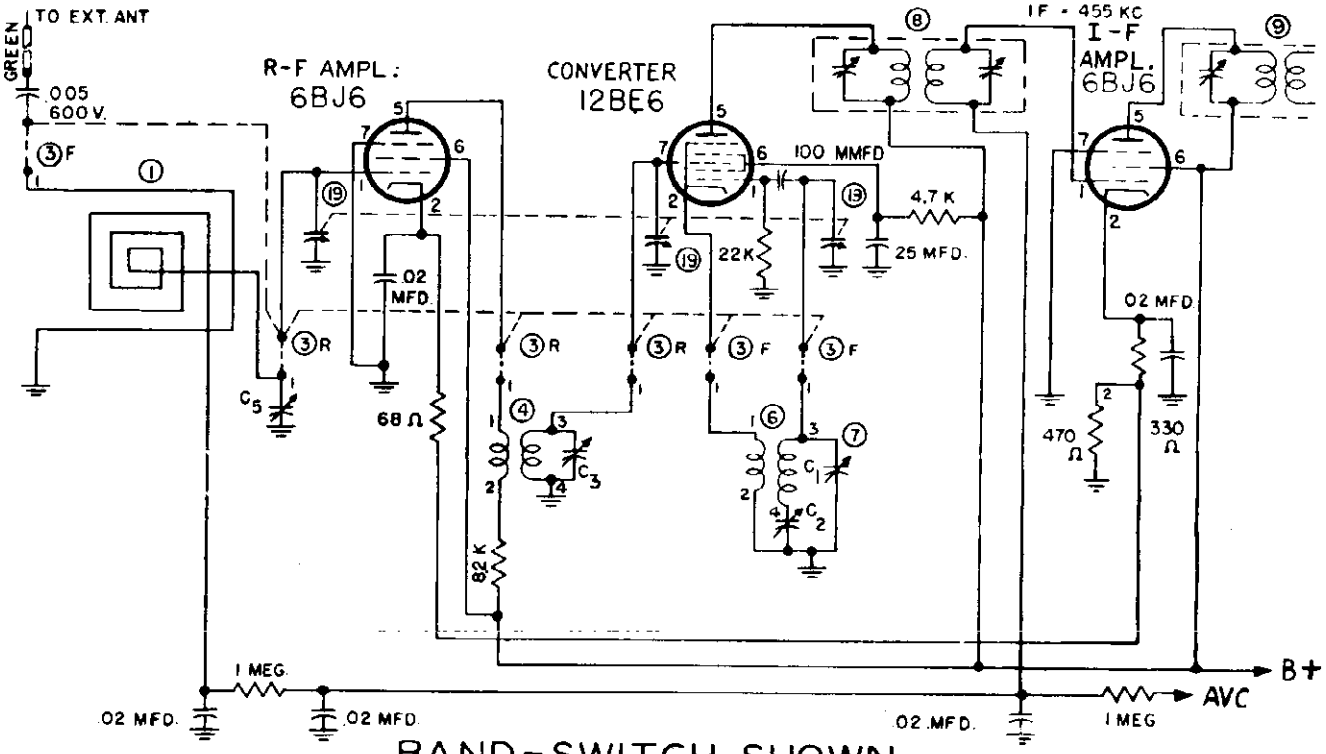
(2) With the Variable Capacitor set at the extreme clockwise position (minimum capacity), tune in the 18.5 MC signal by means of the S. W. oscillator trimmer (C4).

(3) Set the signal generator to 16 MC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the antenna trimmer (C7) and R. F. trimmer (C6) for maximum output while rocking the variable capacitor from left to right. No other adjustments are necessary.

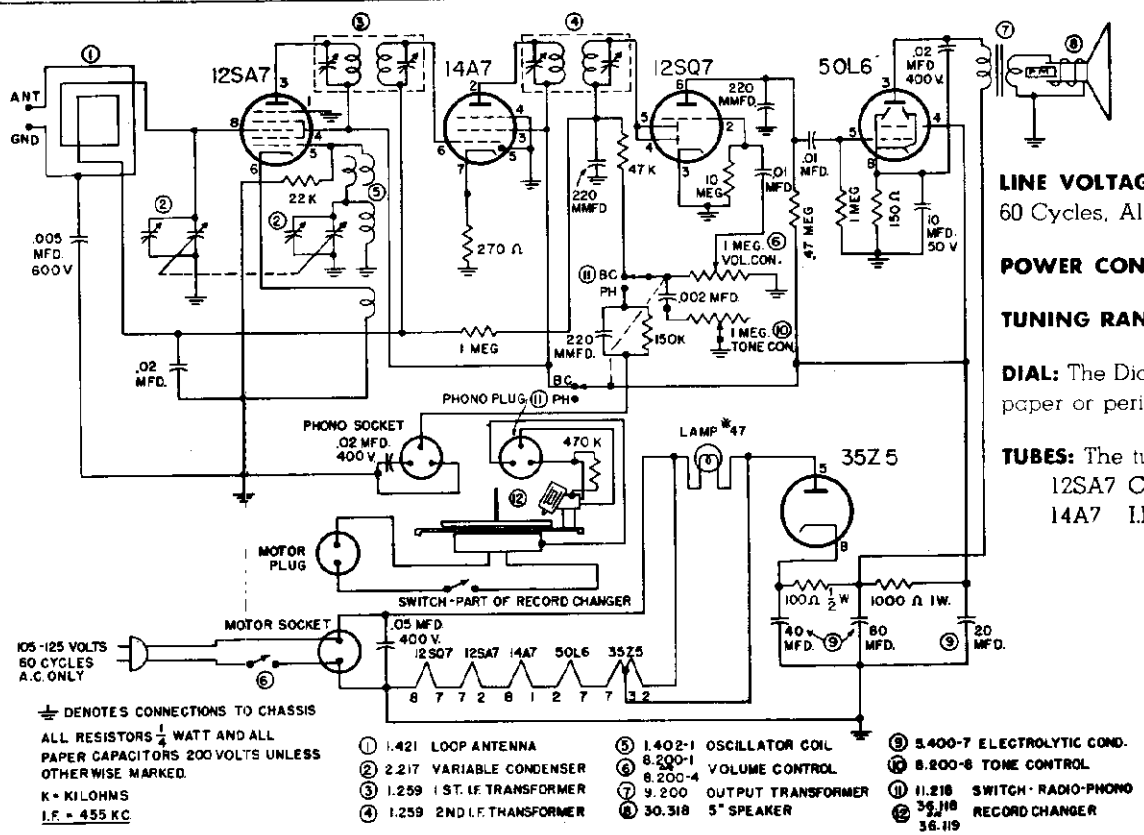
GAROD RADIO CORP. MODEL 62



BAND-SWITCH SHOWN
AT 1ST POSITION.
SHORT WAVE BAND.
5.7 - 18.5 MC



BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE.
BROADCAST BAND
540 - 1650 KC



LINE VOLTAGE: This unit is designed for operation on 105-125 Volts, 60 Cycles, Alternating Current (AC) only.

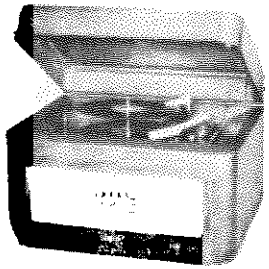
POWER CONSUMPTION: 45 Watts.

TUNING RANGE: Broadcast 540 to 1650 Kilocycles (180 to 555 meters).

DIAL: The Dial Scale is calibrated in Kilocycles, corresponding to newspaper or periodical listings. Example: Read 60 as 600 KC.

TUBES: The tubes used, and their functions are as follows:

12SA7 Converter — 12SQ7 Detector, AVC and Audio Amp
14A7 I.F. Amplifier — 50L6 Beam Power Amplifier
35Z5GT Rectifier



ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I.F. Transformers for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) Wtih the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.

Charging Cable Details

REPLACEMENT PARTS LIST

CAT. NO.	SYMBOL	DESCRIPTION
		SPECIALIZED REPLACEMENT PARTS
RJX-012		CORD—6-foot cord assembly, connecting radio receiver to socket on automobile dashboard
RJX-013		BRACKET ASSEMBLY—Socket assembly, consisting of connecting leads, socket, clamp, and flexible resistor
RRW-017		RESISTOR—3 ohm, 5 w., flexible resistor

GENERAL INFORMATION

The Model LM-1A charging cable may be used with General Electric receivers using a 2-volt rechargeable battery unit. It provides a convenient means of charging the radio battery directly from your automobile battery when the 115-volt house current is not available, such as when traveling or camping.

With a fully charged automobile battery, it is normally unnecessary to run the engine of your car while charging the radio battery. However, operating the automobile engine during part of the charging cycle will hasten the charging process.

The cable is supplied in two sections as shown in the illustration. The short section is permanently installed to the underside of the automobile dashboard and connects the longer cable to the 6-volt automobile battery at the ammeter or fuse block. The leads connected to the shorter cable must not be cut nor lengthened. The longer cable connects the receiver to the end of the short cable to which receptacle "B" is attached.

INSTALLATION

1. Determine the polarity of the car battery. If the positive battery terminal is connected to the frame of the car, the black lead of the short cable should be connected to the ammeter terminal.

CAUTION: *If the positive terminal of the automobile battery is grounded, avoid contact between the metal of the receiver case and the metal of the car.*

If the negative terminal is connected to the frame of the car, the colored lead or the lead with the flexible resistor should be connected to the ammeter terminal.

(***NOTE:*** Connection may be made to either terminal of the ammeter. If this connection is made to the battery side of the ammeter, the ammeter will not indicate discharge while the radio battery is being charged.)

2. The remaining terminal on the short cable must be securely fastened to the car dashboard or frame of the car.

3. Fasten the male plug B to the underside of the dashboard so that it is convenient to insert plug A of the remainder of the charging cable.

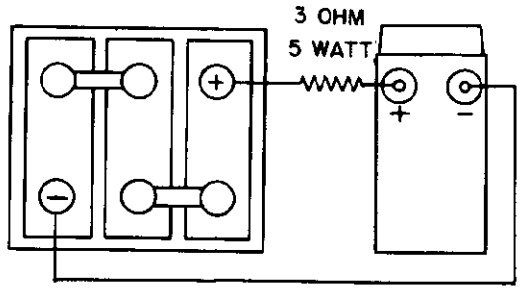
HOW TO CHARGE THE RADIO BATTERY

1. Open the rear door of the radio. Two prongs will be found mounted on the chassis near the tuning capacitor. Plug "C" of the charging cable should be pressed fully on these prongs with the larger prong fitting into the larger hole of the plug.

2. Insert plug "A" into the receptacle "B" which is installed on the dashboard.

3. With the receiver switched to the CHARGE position, a completely discharged battery will in most cases be fully charged within 20 hours. After the red ball in the radio battery has risen, checks should be made every two hours to determine the degree of charge. When both indicator balls are visible, the charging should be discontinued.

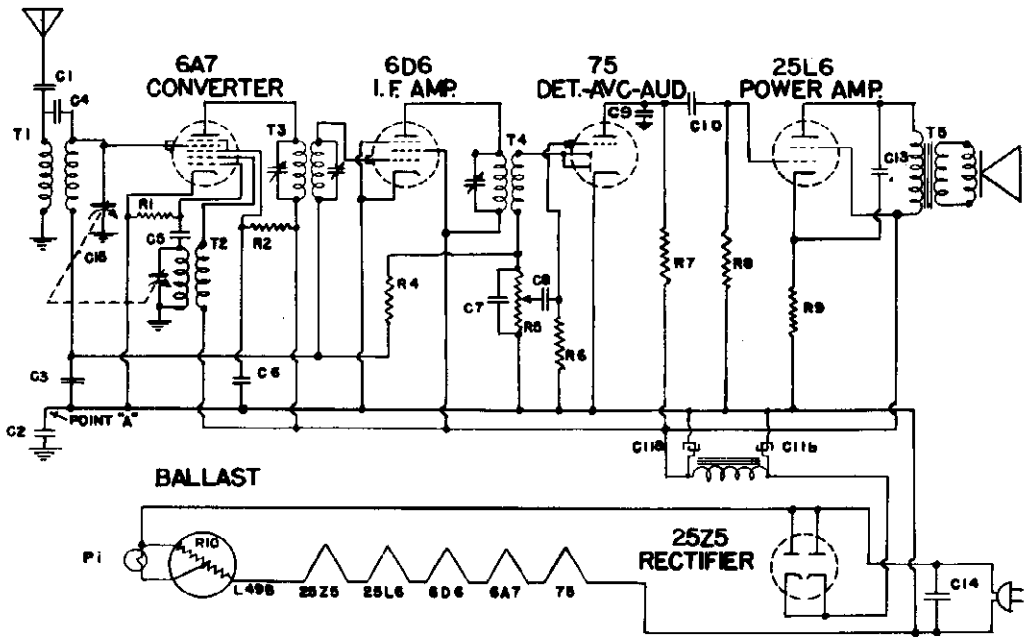
4. If the receiver is switched to the ON position, it can be operated while the battery is being charged. However, since the receiver will be consuming power at about the same rate as the radio battery is being charged, little or no improvement in the condition of the radio battery will result.



IMPORTANT: TERMINALS OF LIKE POLARITY MUST BE CONNECTED TOGETHER.

Basic Charging Circuit

MODELS GD-510, GD-511, GD-512, GD-512W, GD-512X, GD-513 GENERAL ELECTRIC CO.



GENERAL INFORMATION

Models GD-510 and GD-513 are five-tube AC-DC superheterodyne receivers employing five General Electric Pre-Tested Tubes plus a ballast tube. One side of the power line is connected directly to the chassis ground in either receiver; therefore, caution should be exercised in servicing.

Models GD-511, GD-512, GD-512W, and GD-512X, are five-tube AC-DC superheterodyne receivers, employing five General Electric Pre-Tested Tubes plus a ballast tube. These models are fully approved by Underwriters' Laboratories.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.—456 kc.....Broadcast—1500 kc

The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Set the volume control for maximum.

Set test oscillator to 456 kc and apply signal to the control grid of the 6A7 tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A7. Keep the test oscillator output as low as possible to give a readable output. Adjust all three I.F. trimmers for maximum output.

R.F. Alignment

Set test oscillator to 1500 kc and connect one output lead to the receiver chassis† and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust the oscillator trimmer (C-15) and antenna trimmer (C-16) for a maximum output.

† **Precaution**—In Models GD-510 and GD-513, one side of the power supply is connected to the chassis. Do not connect chassis to any external ground. If the signal generator is AC operated, connect a .05 mfd. capacitor in series with the ground side before connecting it to the receiver chassis.

NOTE:

C2 USED ON MODELS GD-511, 512, 512W, 512X ONLY. ON MODELS GD-510 AND GD-513 POINT "A" IS CONNECTED TO CHASSIS.

VOLTAGE CHART

Tube No.	6A7	6D6	75	25L6	25Z5
Plate to −B Volts	90	90	55*	75	120 AC
Screen to −B Volts	40	90	..	90	..
Cathode to −B Volts	0	0	0	7	135
Filament Volts	6.3	6.3	6.3	25	25

Voltage measured when volume control is set to minimum.

Line Voltage—120 AC. No signal input.

* Measured on 500-volt scale.

On DC, voltages should read approximately 10 per cent lower.

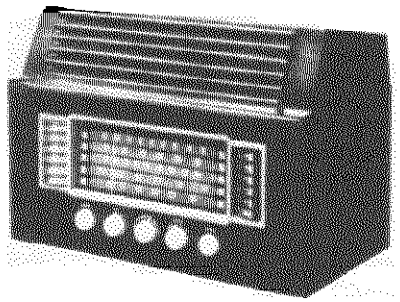
MODEL X-415 GENERAL ELECTRIC CO.



SPECIFICATIONS

CABINET:

Model	X415
Material	Wood
Color	Mahogany
Height	14½ in.
Width	20 in.
Depth	12⅛ in.

ELECTRICAL RATING (INPUT):

50–60 Cycles Nominal Voltage	105 Watts Range in Volts
110	103–117
125	117–133
150	140–160
200	185–213
225	213–234
245	234–260

OPERATING FREQUENCIES:

Standard Band	540 to 1600 kc
Short Wave 1	9.4 to 9.9 mc
Short Wave 2	11.6 to 12.1 mc
Frequency Modulation 1	42 to 50 mc
Frequency Modulation 2	88 to 108 mc
AM I-F Frequency	455 kc
FM I-F Frequency	10.7 mc

POWER OUTPUT (117 volts line):

Undistorted	4.0 watts
Maximum	5.5 watts

LOUDSPEAKER:

Type	Alnico PM
Size	8 inches
Voice Coil Impedance (400 cps)	3.5 ohms

ANTENNA INPUTS:

Broadcast and Shortwave—conventional antenna
FM—300-ohm input for folded dipole

TUBE COMPLEMENT:

R-F Amplifier	6AK5
Converter	6AK5
Oscillator	6AK5
1st I-F Amplifier	6SG7
2nd I-F Amplifier	6SV7
FM Limiter—AM Detector	6SH7
Discriminator—1st A-F Amplifier	6AQ7-GT
Power Amplifier	6V6GT
Rectifier	5Y3GT
Dial Lamp (2)	G-E No. 44

GENERAL INFORMATION

THE TUNING SYSTEM

The "r-f end" of the receiver is unusual in a number of respects. Variable inductance tuning is employed instead of using a conventional tuning capacitor. This design makes possible two distinct advantages. First, it provides a high efficiency FM circuit in the 88 to 108 megacycle range which would not be possible with the more conventional methods of tuning. Second, it provides stable short-wave spread-bands which tune as easily as the broadcast band. Other advantages are also obtained but the two mentioned above are the most important.

Tuning is accomplished by an "elevator" which consists of a rigid plastic horizontal plate raised and lowered by means of a windlass controlled by the tuning knob at the panel. From this plate are suspended three powdered iron cores which tune the broadcast r-f, converter, and oscillator coils; and three tuning "vanes" which tune three low-inductance circuits. These latter circuits are employed in both FM bands and both short wave bands, with the exception of the antenna circuit for the shortwave spread bands when a broad tuned antenna coil is used and the r-f guillotine tuner is switched out. They are called "guillotine" tuners because of their appearance.

FACTS ABOUT "GUILLOTINE" TUNING

The "guillotine" tuners are designed primarily for the 88–108 megacycle FM band where special technique is needed to realize high gain and circuit stability. Ordinary coils, tuned by a variable capacitor are inefficient at these frequencies, first, because of the low inductances required to reach these frequencies when a variable tuning capacitor is employed and, second, because shunt capacity reduces the gain of the amplifier circuit; shunt capacity must be kept very low. Another disadvantage of standard tuning arrangements at these frequencies is that common coupling is obtained through the shaft of a ganged tuning capacitor unless insulated single sections are used (cumbersome and costly). Common coupling of this type tends to cause oscillation or general instability and precludes high gain per stage. The guillotines make possible short leads, completely isolated sections, stable tuning, high Q circuits, low shunt capacity, and location of each tuner in the best physical and electrical position in the assembly. Furthermore, since the shunt capacity is small and the inductance is consequently at its highest corresponding value, the additional unavoidable inductance introduced in the wiring, bandswitch, etc., produces a minimum of circuit losses and unbalance.

The guillotine tuner consists of a heavy, silver-plated, two-turn square coil, rigidly supported between two plastic posts. A flat, solid vane slides up and down between the two turns. It is guided in grooves in the plastic posts so that it passes between the two sections of the coil without touching them. The posts are so moulded and the coil so constructed that the whole assembly is held rigidly at a predetermined spacing. The tuning vane is raised and lowered by the tuning elevator. When the elevator is all the way up (set tuned to lowest frequency), the vane is completely above the coil which then acts as a simple two-turn coil. As the set is tuned toward the higher frequencies, the vane moves downward into the field of the coil until, finally, it is all the way in. The vane reduces the inductance of the coil through two principles. First, it acts as a shorted turn, and thus reduces inductance directly; second, it provides a barrier between the two turns of the coil which reduces the mutual coupling and thus also reduces inductance.

The tuners described above are identified as T2, T4, and T5, on the schematic diagram.

FM BANDS

Guillotine tuners T2, T5, and T4 are used as the tuned circuits for the r-f amplifier, converter, and local oscillator respectively, in both FM bands. In the higher frequency band, the tuner is used with only a small shunt trimmer for adjusting distributed capacity. In the lower band, a higher value shunt trimmer is used to reduce the frequency. The layout of band switch, tuners, and tube sockets is arranged to give the shortest possible leads when the FM bands are in use. The lead length in the other bands is not nearly so critical.

SHORT WAVE SPREAD-BANDS

Bandspread tuning in the short wave bands is obtained in the converter and oscillator circuits by inserting the guillotine tuners in series with a higher inductance so that the two inductances together form the "L" part of the short wave tuned circuit. The small percentage change in inductance obtained in the tuner provides smooth, wide, and stable tuning. The "C" part of the tuned circuit consists primarily of a shunt trimmer. Switching from one short wave band to the other is accomplished by selecting a different shunt trimmer.

The converter grid circuit, as an example, includes L7 and T5 in series in both the SW1 and SW2 bands. Tuner T5 is in the ground end of the circuit and the signal is fed into the grid end through C10. The shunt tuning capacity is either C56 or C57, depending upon which of the two short wave bands is used. Additional oscillator coupling capacitors, C72 or C73, are also added to compensate for the lower coupling through C67 when the higher shunt capacitors are in the circuit.

In the r-f stage, a section of the antenna tracking coil is used as the grid circuit. It is tuned for resonance by a shunt capacitor (C54 and C55) and a shunt inductance (L20). Because a tuned circuit of this type is inherently broad, tuning through the relatively narrow spread-band offers little advantage and is not done.

STANDARD BROADCAST BAND

When manual tuning is employed (Band Switch in STD position), the receiver employs an r-f stage, a converter, and an oscillator, all of which are tuned by iron slugs suspended from the tuning elevator. In the automatic position (Band Switch in the AUTO position), the r-f stage is not used. Instead, a separate antenna coil is used which couples the antenna directly into the converter. A separate coil is used in order to make the tuning circuit independent of the dial tuning mechanism so that it may be tuned by trimmers in the push-button assembly.

Switching from manual to automatic tuning is accomplished in the oscillator by using an oscillator coil which is tuned by a separate shunt inductance. In manual tuning, the inductance is one which is tuned by the tuning elevator. In automatic tuning, a fixed shunt capacity (C76) plus one of a series of push-button selected coils tunes the oscillator.

I-F AMPLIFIER

The i-f amplifier consists of a composite 455 kc and 10.7 mc circuit. The electrical changes required to transfer between AM and FM service are made by the **Band Switch. When t** switch is in either the **FM1** or **FM2** position, the amplifi operates at 10.7 megacycles and delivers the i-f signal into FM discriminator circuit. When the switch is in any of t other positions, the amplifier operates at 455 kc. Scre voltage is removed from the tube which acted as an F limiter and this tube then acts as an AM diode detect Thus, the AM audio signal appears across R16 while the F audio signal appears across R22. A section of the Band Swit switches the audio input circuit from one to the other. T AVC bus is also shorted out for FM.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter similar measuring devices may be used to check circuit pe formance and isolate trouble. The gain values listed may ha tolerances of 20%. Readings taken with low signal so th AVC is not effective.

(1) *R-F and I-F Stage Gains*

Signal applied through IRE dummy antenna:

Antenna post to V1 grid	4	@	1000 k
Antenna post to V1 grid	2	@	9.6 n
Antenna post to V1 grid	2	@	11.8 n

Signal applied through 300-ohms, including signal generator impedance:

Dipole terminals to V1 grid	1.5	@	45 n
Dipole terminals to V1 grid	2	@	98 n

These checks with oscillator tube (V3) removed:

V1 grid to V2 grid	13	@	1000 k
V1 grid to V2 grid	6	@	9.6 n
V1 grid to V2 grid	9	@	11.8 n
V1 grid to V2 grid	13	@	45 n
V1 grid to V2 grid	10	@	98 n

These checks with oscillator tube (V3) removed:

V2 grid to V4 grid	23	@	455 k
V2 grid to V4 grid	37	@	10.7 n

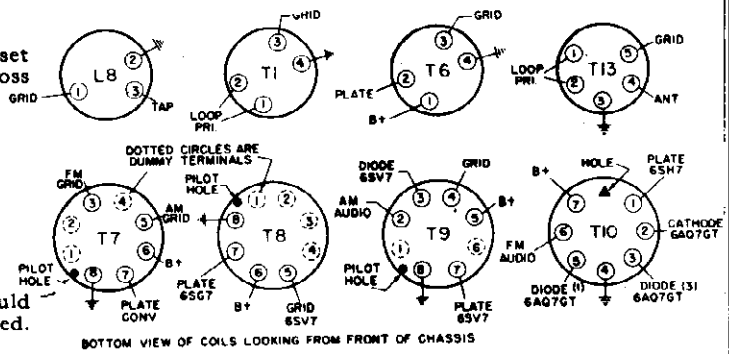

Figure 3—Terminal Identification of Coil Assemblies (Numbers correspond with schematic

REPLACEMENT OF DRIVE CORDS

Dial Stringing

Push the tuning elevator all the way down and string the dial as shown in Figure 1. This illustration shows the stringing as viewed from behind the dial scale, as you would see it when working on it. The number and arrows indicate the progression of the dial cord from start to finish. The procedure will be easier if pulley C is by-passed until the rest of the work is finished after which the cord can be pulled tight over that pulley. During the procedure, locate the two brass eyelets so that they fall between pulleys A and B. When finished, crimp the eyelets on the cord in the proper positions to act as minimum and maximum stops for the tuning mechanism and clip the pointer on the cable half-way between the eyelets.

Separate detail drawings are given to show the three different methods of attaching the ends of the cord. The arrangement with the standard helical spring was used in some earlier production receivers. If the cord and spring are to be replaced, the Type 1 spring should be used. It fits the same drum and is an improved type. The Type 2 spring should be used with the later type of drum (with two tabs). When stringing the mechanism with either the Type 1 or Type 2 spring, load the spring by pulling the hook over the projection at the other end of the spring, string the dial and, as a final step, release the hook so that it pulls up the slack in the dial cord.

Elevator Stringing

The step-by-step procedure for stringing the elevator windlass is shown in Figure 2. (The view is from the rear of the mechanism.) This is done with the elevator up. Start by inserting the metallic cord in the slot as shown in 1. Then loop the left-hand free end over (2) and solder it to the lug provided at the bottom of the vertical shaft (3). The other free end is then given two turns around the pulley, first on one side of the first half turn (4-5) and then on the other side (6-7). In making these two loops, the free end of the cord passes on *this* side of the end which is already secured. Similarly, in view 2, the end which is to be secured to the bottom of the shaft, passes on *this* side of the right-hand free end of the cord. Observe these relationships. Finally, after completing the seven steps shown, pull the upper end of the cord through the hole in the top of the elevator mechanism and solder it to the spring provided.

Concluding Comments

After replacing the dial cord or the elevator cord, it may be found that some correction in relative positioning is needed. This can be done by loosening the set screws in the large drive pulley directly behind the dial scale and re-positioning it on the shaft. The object, of course, is to permit the tuning control to drive the elevator through its full tuning range. Slight errors in final setting are not serious since leeway is provided in the location of the dial pointer itself.

WIRING OF BAND SWITCH

In order to facilitate repair, replacement, and circuit tracing, a table and diagrams are supplied with reference to the connections made in the band switch. If used properly, these will be of invaluable aid. The remarks which follow are intended to clarify the make-up of the tables and diagrams—read them carefully before using the table.

The table is broken down into six parts, one for each switch wafer. Section 1 is nearest the front and section 6 is the rearmost wafer.

Individual lugs on each wafer are numbered from 1 to 12, depending upon their position on the wafer. The method of numbering is illustrated in Fig. 5. In determining the number, turn the chassis upside down and look from the front toward the rear of the chassis. Thus, lugs 1 and 12 are the ones which are at the bottom when the set is in its normal position; lugs 3 and 4 are on the side with the broadcast band coils; and lugs 9 and 10 are on the side with the 6AK5 tubes. The numbering refers to lugs whether they be on the front or rear of the wafer.

Fig. 4 shows the physical location of various components and terminals to which reference is made in the table.

In those cases where a component symbol number is given in column two, instead of a wire, that component is connected by its own lead wire directly to the switch lug and the connection of the *other* end of the component is given in the last column.

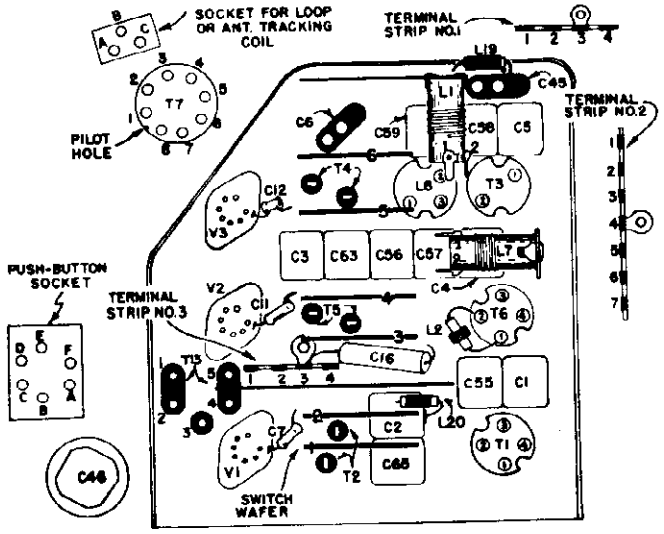

Figure 4—Physical Location of Components Listed in Band Switch Wiring Table

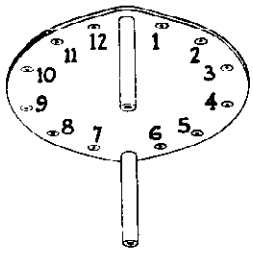

Figure 5—Identification of Switch Lugs —Set Inverted and Viewed from Panel

WIRING OF BAND SWITCH

(Wire length given from end to end before stripping)

SECTION 1

At this lug—	—connect this—	—the other end of which is connected to this—

10	a. Capacitor C73 b. Insulated wire, 2½" lg.	Section 5, lug 12 Trimmer C57, front terminal
12	Bus with spaghetti, 2½" lg.	Coil L7, terminal 1

SECTION 5

At this lug—	—connect this—	—the other end of which is connected to this—
1	a. Bus with spaghetti, 1¾" lg. b. Resistor R33	Coil L1, terminal 1 Section 5, lug 4
2	a. Insulated wire, 3" lg. b. Insulated wire, 1¾"	Coil L8, terminal 1 Section 6, lug 4
4	See Section 5, lug 1b	
5	Bus with spaghetti, 3" lg.	Coil L1, terminal 2
6	a. Bus with spaghetti, 3" lg. b. Bus with spaghetti, 1½" lg.	Capacitor C45, left-hand termina Section 5, lug 10
7**	Short bare bus	Tuner T4, left-hand terminal*
8	Capacitor C12	Tube socket V3, pin 1
9	Insulated wire, 4" lg.	Trimmer C5, lug nearer T3
10	a. See Section 5, lug 6b b. Capacitor C41	Section 6, lug 6
11	a. Insulated wire, 3¾" lg. b. See Section 4, lug 9a	Trimmer C59, lug nearer front
12	a. Insulated wire, 3½" lg. b. See Section 4, lug 10a	Trimmer C58, lug nearer front

SECTION 6

At this lug—	—connect this—	—the other end of which is connected to this—
1	Insulated wire, 4½" lg.	I-F transformer T7, terminal 8
2	Bus with spaghetti, 1½" lg.	Coil L1, terminal 2
4	See Section 5, lug 2b	
5	Insulated wire, 12" lg.	Push-button socket, terminal A
6	a. Bus with spaghetti, 2" lg. b. Capacitor C75 c. See section 5, lug 10b	Trimmer C45, center terminal Ground at C59
7	Short bare bus	Trimmer C6, center terminal
8	Bare bus, 1" lg.	Tube socket V3, pin 7
9	Insulated wire, 2¼" lg.	I-F transformer T7, terminal 5
10	Insulated wire, 2¾" lg.	I-F transformer T7, terminal 3
12	Insulated wire, 3½" lg.	Coil L8, terminal 3

* Looking from front, chassis inverted.
** Double lug (front and rear) soldered together

MODEL X-415 GENERAL ELECTRIC CO.

ALIGNMENT

EQUIPMENT REQUIRED:

1. Test Oscillator with tone modulation. (See Table.)
2. D-C Voltmeter or Microammeter. (See notes 2 and 3.)
3. A-C Voltmeter, 2-volts. (See note 6.)
4. Insulated hex wrench, ¼". (See steps 1, 10, 13.)
5. .01 MF Paper Capacitor. (See steps 1 to 5.)
6. 400-ohm, ½ watt resistor. (See steps 16 to 21.)
7. 200 mmf. mica capacitor. (See steps 22 to 28.)

Important detailed instructions and references in connection with the alignment table which follows are keyed in by means of column 7, headed "See Note." The notes are included in numerical order after the table. They are important—refer to them carefully.

Step	Signal Generator Frequency	Signal Input Point	Band Switch	Dial Setting	Adjust	See Note	Remarks
				F-M I-F ALIGNMENT			
1	10.7 mc	6SH7 grid thru .01 mf	FM1	.....	C49 for zero**	1, 2	Adjust C49 for *zero* meter reading. Apply 1 volt signal input.
2	See last column	6SH7 grid thru .01 mf	FM1	.....	Signal Generator	1, 2	Detune signal generator to point of *maximum* meter reading.
3	As in step 2	6SG7 grid thru .01 mf	FM1	.....	Peak C48	1, 2	
4	10.7 mc	6SV7 grid thru .01 mf	FM1	.....	Peak C28	1, 3	6AQ7GT tube removed from its socket.
5	10.7 mc	6SG7 grid thru .01 mf	FM1	.....	Peak C26	1, 3	6AQ7GT tube removed from its socket.
6	10.7 mc	Conv. grid directly	FM1	.....	Peak C24 & L10	1, 3, 4	6AQ7GT tube removed from its socket.
				AM I-F ALIGNMENT			
7	455 kc	Conv. grid directly	STD	.....	Peak C86 & C61	5, 6

25	1500 kc	Antenna via 200 mmf	STD	1500 kc—1.4 to 1.5 in.*	Osc. coil T3 iron slug	5, 6, 7, 9	T3 iron slug is the rear one on the left side. Adjust for peak.
26	1000 kc	Antenna via 200 mmf	STD	For max. output	Conv. coil T6 iron-slug	5, 6, 9	T6 iron slug is the center one on the left side. Adjust for peak.
27	1000 kc	Antenna via 200 mmf	STD	Do not change	R-F coil T1 iron slug	5, 6, 9	T1 iron slug is the front one on the left side. Adjust for peak.
28	580 kc	Antenna via 200 mmf	STD	For max. output	Peak L8	5, 6, 8	Peak L8 while rocking dial.
29							Repeat steps 22 to 28.

* Important! See Note 7.
** Use insulated hex wrench, ¼".

Notes in Connection with Alignment Table

1. Use *unmodulated* signal.
2. Connect 20,000-ohm-per-volt meter from junction of R21 and C29 to chassis. Use ten-volt scale. (Steps 1-3.)
3. Connect 20,000-ohm-per-volt meter from grid pin 4 of 6SH7 to chassis with a 200,000-ohm resistor in series. The resistor must be connected directly to the grid so that capacity loading will be negligible and so that the meter is isolated from the i-f signal voltage. Keep signal generator output down so that the meter indicates not more than one volt at the grid (5 micro-amperes through 200,000-ohms). (Alignment steps 4 to 6, 10 to 15.)
4. Connect signal generator directly to the converter grid at some convenient point. The generator lead must be shielded up to this connection so that not more than 1/16 inch of exposed lead exists. Ground the shield solidly by clamping it firmly to the chassis or a shield as close to the connection as possible. (Steps 6-9.)
5. Use 400-cycle modulation. (Steps 7 to 9, 16 to 28.)
6. Connect a standard output meter across speaker voice coil. Turn volume control fully on. Keep signal generator output down so that the meter indicates not than ½ watt output (2 volts) during alignment. (7 to 9, 16 to 28.)
7. If dial scale is not available, index pointer as fol Turn pointer to right-hand limit of travel. Mar dial back plate at a reference edge of the pointer s Then set pointer by turning dial knob until the cated dimension exists between the reference edg the mark.
8. "Rocking" consists of adjusting the indicated adj while turning the dial a small amount back and through peak output. The object is to find the r mum peak. Rocking is necessary and is permi only when interlocking circuits are being adjuste
9. The main tuning iron slugs are suspended from th side of the tuning "elevator." They are individ adjustable by loosening the locknut and turning the porting screw into which the suspending wire is sold
10. *Two* oscillator settings will give response. The h frequency response point is the correct one; the ot the image. If in doubt, start with the trimmer s loosened completely and adjust for the *first* respo

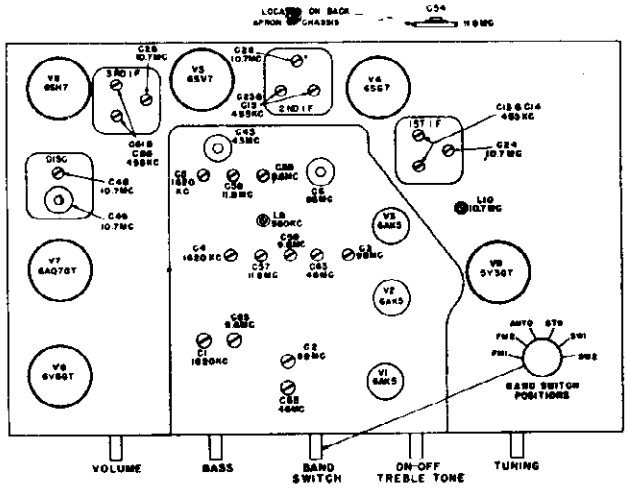

Figure 7—Location of Tubes and Adjusters

PHONO CONNECTION

A phono jack is located at the right on the re the chassis and a plug to fit this jack is provided the receiver. This plug may be connected to the of any crystal pick-up of a record player. The rec will now reproduce record recordings.

If the record player uses the General Electric tronic pick-up, RPX-010, a phono pre-amplifier be used for which a power receptacle is provide the receiver chassis. The pick-up, RPX-010, is nected to the input jack of the pre-amplifier an output cable of the pre-amplifier is then connect the phono jack on the receiver chassis.

RDB-001		PUSH BUTTON—Black push button used at bottom of strip only
RDB-004		PUSH BUTTON Black push-buttons used in upper five positions only
RDC-019		CORD Hoist cord 6½" long
RDC-021		CORD—Dial drive cord
RDE-016		ESCUTCHEON—For dial scale and push-buttons
RDG-003		BACK PLATE—Large metal panel plate
RDK-004		KNOB Black knob, plain
RDK-032		KNOB—Black control knob with pointer
RDO-001		ESCUTCHEON ORNAMENT—Left-hand plastic escutcheon ornament
RDP-016		POINTER—Dial pointer and slide
RDP-022		POINTER—Dial pointer
RDS-018		SCALE—Tuning dial scale
REX-002		CORE—Iron core with glass tubing for broadcast antenna, r f, and oscillator coils
RHC-007		PIN—Hairpin cotter for securing shaft through push-buttons
RHC-009		PIN Hairpin cotter for idler wheel
RHC-010		SPRING CLIP—Holds FM coil assembly
RHE-001		EYELET For connecting FM coil links
RHM-016		CLIP—Mounting clip for L1 and L7
RHM-024		LINK—Hoist link holding end of hoist cord
RHM-025		RING—Retaining ring for flywheel
RHM-026		COIL LINK—Rectangular coil link for assembling FM coils T2 and T5
RHM-027		COIL LINK—Rectangular coil link for assembling FM coil, T4
RII-001		POST—Mycalex posts for assembling all FM coils
RJC-001		CONTACT PIN—For speaker connection
RJJ-004		RECEPTACLE Pre-amp. and push-button receptacle
RJP-004		PLUG Phono input plug
RJP-005		PLUG—Plug for push-button cable
RJP-010		SOCKET Phono input jack
RJS-003		SOCKET—Octal socket for V5, V6, and V7
RJS-012		PLATE—For mounting electrolytic
RJS-027		SOCKET—Dial light socket
RJS-030		SOCKET—Octal socket for V4, V8, and V9
RJS-044		TUBE SOCKET—Tube socket for V1, V2, and V3
RJS-051		RECEPTACLE—3 pin receptacle for antenna tracking coil
RLA-009	T1	COIL—Broadcast band antenna coil
RLA-011	L6	COIL—FM antenna choke coil

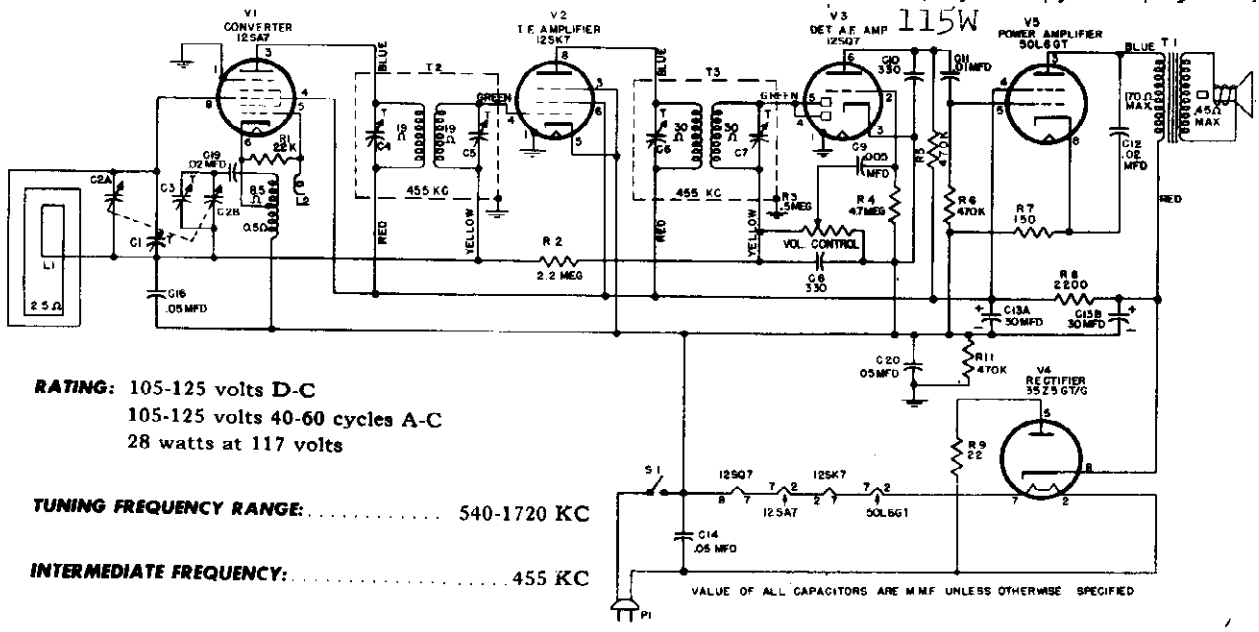
115W



RATING: 105-125 volts D-C
105-125 volts 40-60 cycles A-C
28 watts at 117 volts

TUNING FREQUENCY RANGE: ..... 540-1720 KC

INTERMEDIATE FREQUENCY: ..... 455 KC

ALIGNMENT PROCEDURE

ALIGNMENT FREQUENCIES

I-F ..... 455 KC
R-F ..... 1720 and 1500 KC

The location of all trimmers is shown in Fig. 1.

I-F ALIGNMENT

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit. Apply signal to the converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st I-F transformer cans.

R-F ALIGNMENT

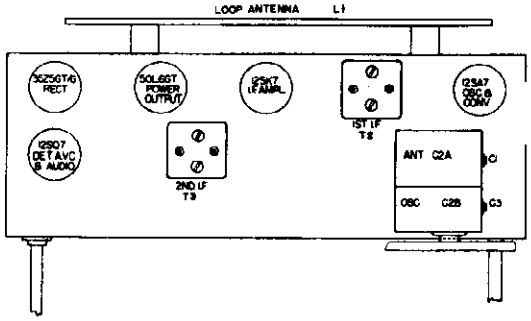
Apply the R-F alignment signals through a standard IRE dummy antenna to the primary on the loop. With the gang condenser wide open, align the oscillator trimmer (C3) to 1720 KC. Change the generator signal to 1500 KC, tune the receiver to the signal and peak the antenna trimmer (C1) for maximum output.

PRECAUTION

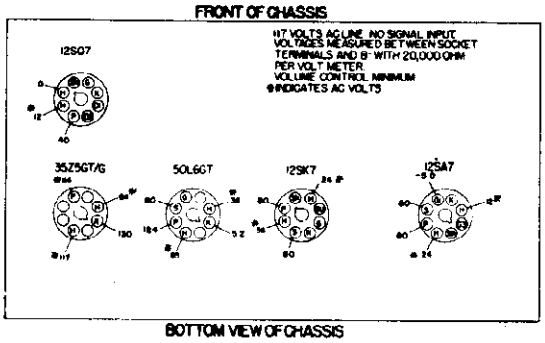
If the signal generator is A-C operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as A-C through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

LOUDSPEAKER "ALNICO V" MAGNET DYNAMIC

Outside Cone Diameter ..... 4 in.
Voice Coil Impedance (400 cyc) ..... 3.2 ohms



Tube and Trimmer Location



Socket Voltage Diagram

GENERAL INFORMATION

These models are 5-tube (including rectifier) superheterodyne receivers in distinctively styled brown plastic and white urea cabinets. These receivers incorporate built-in antenna, automatic volume control, oversize permanent magnet speaker and beam power output.

ALIGNMENT PROCEDURE

ALIGNMENT FREQUENCIES:

I-F	455 KC
R-F	1725 and 1500 KC

I-F ALIGNMENT:

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 kc and keep oscillator output down so that meter reads 1/2 watt output or less. Apply signal to the converter grid (pin 8 of 12SA7) through a .05 mfd. capacitor and align progressively the trimmer capacitors in the second and first i-f transformer.

R-F ALIGNMENT:

Apply the r-f alignment signals through a standard IRE dummy antenna to the receiver antenna post. With the tuning condenser completely open, align the oscillator trimmer (C3) to 1725 kc. Tune the signal generator to 1500 kc and tune the receiver for maximum signal output, then peak antenna trimmer (C1) while rocking the generator.

PRECAUTION:

If the signal generator is a-c operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as a-c through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

SPECIFICATIONS

Rating	105-125 v. DC, 105-125 v. 25-60 CPS AC, 28 watts
Tuning Range	540-1725 KC

GENERAL INFORMATION

Model 113 is a five-tube (including rectifier) AC-DC superheterodyne broadcast receiver in a distinctly styled cabinet. This receiver incorporates automatic volume control, attached antenna, permanent magnet "Alnico V" speaker, and beam power output.

ALIGNMENT PROCEDURE

ALIGNMENT FREQUENCIES:

I-F . . . . . 455 kc
R-F . . . . . 1725 kc and 1500 kc
The location of all trimmers is shown in Figure 1.

I-F ALIGNMENT:

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 kc and keep the oscillator output as low as a readable meter reading will permit. Apply signal to the converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st i-f transformer cans.

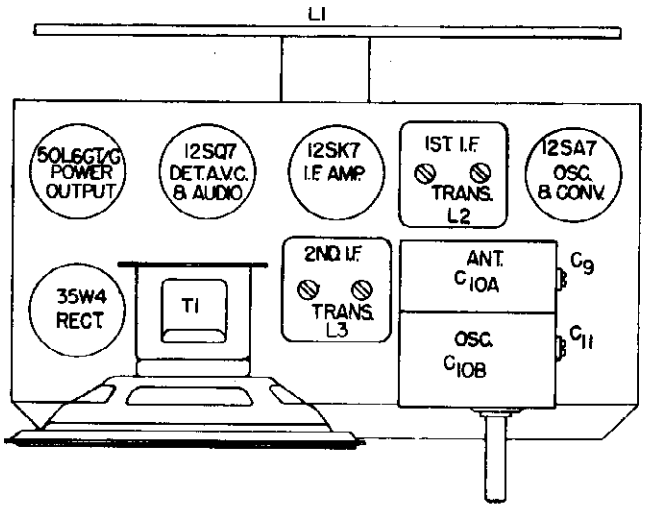

Fig. 1. Tube and Trimmer Location

R-F ALIGNMENT:

Apply the r-f alignment signals through a standard IRE dummy antenna to C9. With the gang condenser wide open, align the oscillator trimmer (C11) to 1725 kc. Change the generator signal to 1500 kc, tune the receiver to the signal, and peak antenna trimmer (C9) for maximum output.

PRECAUTION:

If the signal generator is a-c operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as a-c through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

GENERAL ELECTRIC CO.

ELECTRICAL RATING (INPUT)

Voltage	105-125 volts a-c or d-c
Frequency on a-c	25 to 60 cycles
Wattage	45 watts

OPERATING FREQUENCIES

Broadcast Band	540-1600 kilocycles
I-F Amplifier	455 kilocycles

POWER OUTPUT (117 VOLTS LINE)

Undistorted	1.2 watts
Maximum	1.5 watts

LOUDSPEAKER

Type	Alnico P.M.
Outside Cone Diameter	5¼ in.
Voice Coil Impedance (400 cycles)	3.5 ohms

TUBE COMPLEMENT

R.F. Amplifier	Type 12SG7
Oscillator-Converter	Type 12SA7
I.F. Amplifier	Type 12SK7
Detector-Audio	Type 12SQ7
Power Output	Type 35L6GT
Rectifier	Type 35Z5GT/G
Pilot Lamp	G-E, Type C7, 115-volt, 10-watt, clear, candelabra screw base

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES

R-F	1500 kilocycles
I-F	455 kilocycles

EQUIPMENT REQUIRED

1. Test oscillator with audio tone modulation
2. A.C. output meter, 1½ volts full scale
3. 0.05 mf paper capacitor
4. 50 mmf mica capacitor
5. Insulated screwdriver

PROCEDURE—GENERAL

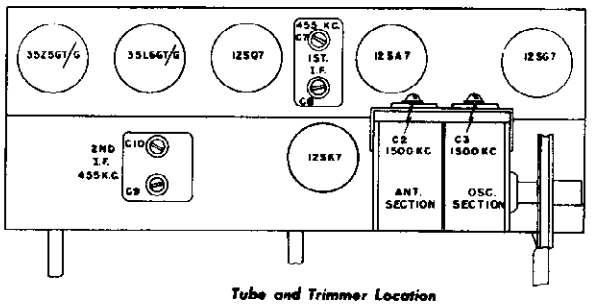
1. Turn dial scale pointer as far counterclockwise as possible. The pointer should coincide with the first marking at the left of the scale. If it doesn't, remove chassis and slip pointer on shaft until the pointer is under reference mark when chassis is bolted in place.

2. For i-f and r-f alignments, the output meter is connected across the loudspeaker voice coil terminals.

3. Keep radio volume control at maximum and attenuate test oscillator signal output so that the output meter reading never exceeds 1½ volts.

4. The chassis must be removed from the cabinet during I-F alignment. For R-F alignment bolt the chassis in the cabinet securely.

5. Connect the capacitor as listed in column 2, between the output "High Side" of test oscillator and the point of input specified.



Tube and Trimmer Location

ALIGNMENT CHART

Step	Connect Test Oscillator to	Test Osc. Setting	Pointer Setting on Radio	Adjustment for Maximum Output
1	12SK7 grid in series with 0.05 mf cap.	455 kc	1500 kc	2nd I-F Trans. Trimmers
2	12SA7 grid in series with 0.05 mf cap.	455 kc	1500 kc	1st and 2nd I-F Trans. Trimmers
3	Ant. Post in series with 50 mmf	1500 kc	1500 kc	C3 (Osc.)
4	Ant. Post in series with 50 mmf	1500 kc	1500 kc	C2 (R-F)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20 per cent. Readings taken with low signal input so that AVC is not effective.

(1) R-F Stage Gains.

Antenna post to 12SG7 grid	4 at 1000 kc
12SG7 grid to 12SA7 grid	8 at 1000 kc
12SA7 grid to 12SK7 grid	30 at 455 kc
12SK7 grid to 12SQ7 diode plate	57 at 455 kc

(2) Audio Gain.
0.12 volt at 400 cycles across volume control (R8) with control set at maximum will give approximately ½-watt output across speaker voice coil.

(3) Oscillator Grid Bias.
D-C voltage developed across the oscillator grid leak (R3). Averages 7.7 volts at 1000 kc.

(4) Socket Pin Voltages.
Figure 4 shows voltages from all tube pins to B- unless otherwise specified. Voltage readings much lower than those specified may help localize defective components or tubes.

(I1).....Mazda #47, 6–8 v.

MODELS 210, 211, 212

GENERAL ELECTRIC CO.

GENERAL

Models 210, 211 and 212 are alike except for cabinets. Model 210 is a mahogany-colored plastic cabinet. Model 211 is an ivory plastic cabinet, while 212 is a wood cabinet.

These models are designed to operate either from built-in antennas or from an external AM antenna or FM dipole antenna. On AM it is merely necessary to connect an external antenna to the terminal screw marked "Antenna." On FM, to operate the receiver from the built-in power line antenna, it is necessary to connect the green wire coming out the back of the cabinet back, to the right-hand terminal screw of the antenna terminal strip.

For operation from a 300-ohm FM dipole (G. E. Cat. No. UKA-006 or UKR-006), remove this green wire from the terminal and connect the 300-ohm transmission line (G. E. Cat. No. UWT-002) to the terminals marked "DIPOLE."

On AM operation, the set operates as a five-tube set with the signal being fed directly into the converter grid.

On FM, the set uses a reflex circuit, the Armstrong type discriminator and a special limiter circuit.

In the reflex circuit, V1 (6BJ6) acts both as an r-f amplifier and as the 1st i-f amplifier. The r-f signal is fed into the grid of V1 through the secondary of T1. It is amplified by V1 and tuned at the converter grid by L10, C1B and trimmer C11. In the converter, the r-f is changed to 10.7 mc i-f, and fed into the primary of T1 and again inserted into the grid of V1, which now acts as an i-f amplifier. The i-f signal is fed from the plate of V1 through choke L3 into the second i-f transformer. L1 and C38 form a 10.7 mc wave trap to eliminate any i-f signal from the antenna circuit to prevent interference. C2 and L2 are designed to peak at 98 mc with strays to increase the FM r-f sensitivity. At the FM r-f frequencies, the capacitor C42 offers little series impedance to the r-f signal. L3 and C7 form a high-pass filter to pass the FM r-f signal into the converter grid and to shunt the FM i-f frequency into the primary of the second FM i-f transformer.

It should be noted that the FM oscillator coil L12 is a section of 300-ohm line shorted at one end to form a one-turn loop. C16 and C17 are tapped in at each side of the shorted end.

L6 and C22 in the cathode circuit of the limiter tube are series tuned to 10.7 mc. This effectively grounds the cathode for IF. The presence of R12, however, provides a highly degenerative condition for any amplitude modulation applied to the limiter grid. The cathode bias developed by R12 is approximately 50 volts, which makes it necessary to insert onto the grid of V4 from B+ 50 volts through R11.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by a vacuum tube voltmeter or similar measuring device may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of ±20%. Readings should be taken with low signal voltage so that AVC is not effective.

1. R-F AND I-F STAGE GAINS

Signal applied through IRE dummy antenna:

Antenna Post to V2 Grid	4.0 at 1000 kc
V2 Grid to V3 Grid	38 at 455 kc
Dipole Terminals to V1 Grid	1.3 at 98 mc
V1 to V2 Grid	8.0 at 98 mc
V2 to V1 Grid	1.6 at 10.7 mc
V1 to V3 Grid	22 at 10.7 mc
V3 to V4 Grid	26 at 10.7 mc

2. AUDIO GAIN

.09 volts at 400 cps across volume control with volume control set at maximum will give approximately ½ watt output across the speaker voice coil.

3. OSCILLATOR GRID BIAS

D-c voltage developed across R6:
4.8 volts at 1000 kc.
2.2 volts at 98 mc.

4. SOCKET PIN VOLTAGES

Figure 3 shows typical tube pin voltages. All readings should be made from the pins to ground, unless otherwise indicated.

5. HUM MEASUREMENT

Hum measured across the voice coil of the speaker with volume control at minimum and Band switch on AM should not exceed 10 millivolts.

On FM, ground limiter grid and measure hum across voice coil with volume control at maximum. Hum should not exceed 20 millivolts.

ANTENNA:

AM	Loop antenna, or outside antenna
FM	Power cord antenna, or 300-ohm FM dipole antenna

ALIGNMENT

Two methods of alignment are given: (1) The regular meter alignment as previously used; and (2) Visual alignment, which allows for more precision in aligning the i-f transformers and particularly the discriminator alignment where it is necessary that the negative and positive half cycles of the output wave have equal amplitude and symmetry.

EQUIPMENT REQUIRED FOR METER ALIGNMENT:

1. Test oscillator with tone modulation.
2. 20,000 ohm-per-volt voltmeter or microammeter.
3. A-c voltmeter, 2 volts.
4. .01 mfd., paper capacitor.
5. 200,000 ohm resistor, ½ watt.

EQUIPMENT REQUIRED FOR VISUAL ALIGNMENT:

1. General Electric YGS-3 AM and FM signal generator, or equivalent.
2. General Electric CRO-5A oscilloscope, or equivalent.
3. 200,000 ohms ½ watt resistor.
4. 20,000 ohm-per-volt meter.
5. .01 mfd paper capacitor.
6. 8 to 10 mfd Pyranol capacitor.

NOTES IN CONNECTION WITH VISUAL ALIGNMENT TABLE:

1. Connect vertical plates of scope to the limiter cathode (pin 2 or 7 of V4) through 200,000-ohm resistor and ground. Connect an 8 to 10 mfd. pyranol capacitor between junction of C21 and R11 and ground.

2. Connect vertical plates of scope to junction of R18 and C29 (FM audio).

3. Connect vertical plates of scope at junction of R15 and C27 (AM audio).

4. Use a 60-cycle, amplitude-modulated signal.

5. In some cases tuning of the converter grid will cause "pulling in" of the oscillator and will change the oscillator frequency. After centering the response curve, if peaking of C11 causes the curve to move off the screen, it is necessary to recalibrate the oscillator as in Step 9.

6. The termination impedance of the signal generator should be 300 ohms to properly match the FM imput impedance of this receiver.

7. To align the 1st i-f transformer (T1), it is necessary to disconnect the copper strap from the 12BE6 at the tube pin connection. After aligning T1, resolder the copper strap to pin 7 of the 12BE6.

8. To position the dial pointer, close the gang condenser completely and place the dial pointer on the shaft such that it is parallel to the chassis.

9. For alignment of the AM oscillator and r-f trimmers, the signal should be inductively coupled to the loop antenna by connecting a four-turn, six-inch diameter loop of bell wire to the signal generator terminals, and then locate this loop about one foot from the radio loop antenna. To prevent possible errors in peak readings, the position of the loop with respect to the radio loop antenna should not be changed during any one set of adjustments.

NOTES IN CONNECTION WITH METER ALIGNMENT CHART:

1. Use unmodulated signal.

2. Connect a 20,000 ohm-per-volt meter from junction of C29 and R18 to chassis. Use ten-volt scale.

3. Connect a 20,000 ohm-per-volt meter from cathode of limiter (pin 2 or 7 of V4) to junction of C21 and R11 in series with 200,000-ohm resistor. The resistor should be connected directly to the cathode to minimize capacity loading and to isolate the i-f signal voltage from the meter. Keep signal generator level down so that meter indicates not more than one volt at the cathode (5 microamps through 200,000 ohms).

4. Use 400-cycle modulation.

5. Connect a standard output meter across speaker voice coil. Turn volume control full on. Keep signal generator output down so that meter indicates not more than ½ watt.

6. For alignment of the AM oscillator and r-f trimmers, the signal should be inductively coupled to the loop antenna by connecting a four-turn, six-inch diameter loop of bell wire to the signal generator terminals, and then locate the loop about one foot from the radio loop antenna. To prevent possible errors in peak readings, the position of the loop with respect to the radio loop antenna should not be changed during any one set of adjustments.

7. To align the first FM i-f transformer (T1), it is necessary to disconnect the copper strap from the tube grid connection (pin 7 of 12BE6). Resolder the strap after T1 is aligned.

8. The AM r-f alignment should be made before the FM r-f alignment. With the gang condenser fully closed or meshed, the dial pointer should be parallel to the top of the chassis.

9. Termination impedance of the signal generator should be 300 ohms.

ALIGNMENT CHARTS

STEP	SIGNAL GENERATOR FREQUENCY	SIGNAL INPUT POINT	BAND SWITCH SETTING	DIAL SETTING	ADJUST	SEE NOTE

VOLTAGES READ FROM POINT SHOWN TO CHASSIS WITH 1000 OHM PER VOLT METER

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED:

1. Test oscillator with audio tone modulation.
2. A-C output meter, 2½ volts full scale.
3. Insulated screwdriver.
4. .1 mf. paper capacitor.
5. Two 30 mmf. mica capacitors.
6. Jeweler's vise (for core adjustment).

PROCEDURE—GENERAL:

1. The alignment procedure is given in the Alignment Chart, Table I.

2. Alignment Chart, Table II, will be used *only* when a tuning core or coil has been replaced.

3. Figure 9 is the schematic circuit of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with the signal generator leads when aligning the r-f section of the receiver.

4. Reference is made to Figures 10 and 11 for trimmer locations.

5. Connect output meter across voice coil.

6. Make all adjustments with volume control on full, tone control in clockwise (treble) position.

7. Keep signal generator output reduced as much as possible for about half-scale output meter reading.

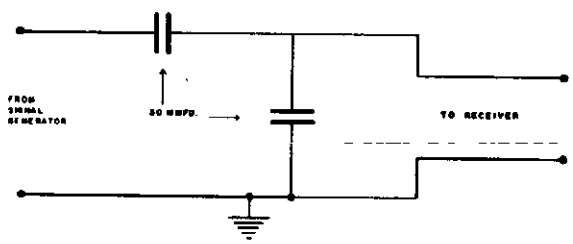
ALIGNMENT CHART, TABLE I

Step	Connect Signal Generator to	Signal Generator Setting	Dial Setting	Adjust for Maximum
	I-F ALIGNMENT			
1	†Grid (pin 6) 7A7	265 kc	*535 kc	2nd. I-F, T2, Trimmers A and B
2	†Grid (pin 6) 7B8	265 kc	*535 kc	1st. I-F, T1, Trimmers C and D
3	Repeat 1 and 2 for accuracy			
	R-F ALIGNMENT			
4	‡Antenna socket	1400 kc	**1400 kc	Oscillator trimmer C10
5	‡Antenna socket	1400 kc	**1400 kc	Converter trimmer C7, R-F trimmer C3

† Low side of signal generator to chassis, high side in series with .1 mf. paper capacitor.
‡ Signal generator through dummy antenna.
* R-F gang closed.
** Receiver in manual position.

NOTES IN CONNECTION WITH ALIGNMENT TABLE I

1. If dial calibration is off after completing alignment, a correction can be made by a screw adjustment of the eccentric cam that actuates the tail of the dial scale pointer. This can correct the pointer for position and travel.



Dummy Antenna

2. After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 kc.

ALIGNMENT CHART II

For Core or Coil Replacement Only

Step	Signal Generator Setting	Dial Setting	Remarks
1	1675 kc	*1600 kc	Screw Ant., R-F, converter, and oscillator cores out of their coils
2	1675 kc	*1600 kc	Adjust oscillator trimmer C10 at 1675 kc
3	1675 kc	*1600 kc	Adjust converter trimmer C7, R-F trimmer C3, and antenna trimmer C1 for maximum
4			Replace cores to their approximate original positions
5	1400 kc	1400 kc	Adjust oscillator core to scale at 1400 kc
6	1400 kc	1400 kc	Adjust antenna core, RF core, and converter core for maximum
7	600 kc	**600 kc	"Rock-in" shunt oscillator coil for maximum
8	Recheck step 6 at 1400 kc		
9	1200 kc	1200 kc	Check receiver for calibration and gain
10	Repeat steps 5, 6, 7, and 8		If receiver is off calibration or weak

* Maximum high frequency end of dial.
** "Rocking" consists of adjusting the indicated adjuster while turning the dial a small amount back-and-forth through peak output. The object is to find the maximum peak.

NOTES IN CONNECTION WITH ALIGNMENT TABLE II

1. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 kc, the mechanical stop for the tuner cross-arm should be bent to limit the frequency coverage to 1605 kc.

2. After all adjustments have been made, glue core screws with speaker cement.

3. After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 kc.

PERMEABILITY TUNING UNIT

The permeability tuning unit is a sub-assembly of the receiver. It contains the antenna and r-f coil assembly, and the oscillator and converter coil assembly. A solenoid which is energized by the six volts of the car battery is operated by the station selector bar or button and the foot control. This solenoid is mounted between the slug-tuned coil assemblies and functions to operate a cross arm assembly, pulling it from left to right or to a rest position from any one of the six turret stops. This actuates the drive of a ratchet gear to effect a change in tuning (see page 2, paragraph under Automatic Tuning Adjustments). The rest of the tuning unit is made up of the tuning control shaft, gears, ratchets, springs, cams, and brackets to complete the assembly.

This unit is covered more thoroughly under separate service data publication ER-S-231. In it are instructions for changing the ratchet gear and solenoid. It also contains all service data and a parts list on the Auto Radio Permeability Tuning Unit.

MODEL 230
KAISER-FRAZER

GENERAL ELECTRIC CO.

Cat. No.	Symbol	Description
DIAL AND TUNING MECHANISM ASSEMBLY		
RDB-012		BUTTON—Station selector button (Kaiser)
RDE-025		ESCUTCHEON—Dial scale escutcheon
RDM-002		FLAG—Indicator flag and window assembly (Frazer)
RDM-003		FLAG—Indicator flag and window assembly (Kaiser)
RDP-030		POINTER Dial pointer assembly (Kaiser)
RDP-031		POINTER Dial pointer assembly (Frazer)
RDS-041		SCALE—Dial scale (Frazer)
RDS-042		SCALE—Dial scale (Kaiser)
REI-007		CORE—Adjusting spring and core
RHH-005		RING—Turret screw lock ring
RJP-016		PLUG—Solenoid end plug and bracket assembly
RJS-067		SOCKET—Dial light socket and wire assembly
RLS-001	L6	COIL—Tuning solenoid and terminal assembly
RMD-001		Disc—Indexing disc
RMG-006		GEAR Ratchet gear
RML-011		LEVER—Mounting plate and lever assembly
RMM-026		ARM—Cross arm assembly
RMR-003		RATCHET—Ratchet and bracket assembly
RMS-084		SPRING Gear indexing spring
RMS-085		SPRING Cross arm return spring
RMS-086		SPRING Cam lever spring
RMS-087		SPRING Ratchet gear return spring
RMS-088		SPRING Lever spring
RMS-089		SPRING Kick-off spring
RMS-090		SPRING Tuning shaft spring
RMS-091		SPRING—Solenoid switch spring
RMS-092		SPRING—Solenoid switch contact spring
RMU-024		SHAFT—Tuning shaft and gear assembly (Kaiser)
RMU-025		SHAFT—Tuning shaft and gear assembly (Frazer)
RMX-085		ASSEMBLY Turret assembly
UDL-005	S3	LAMP Dial light bulb
CHASSIS COMPONENTS		
RAP-003		PLATE—Speaker mounting plate
RCE-049	C20, 21, 22	CAPACITOR—10 mfd., 300 v.; 20 mfd., 350 v., dry electrolytic
RCN-007	C24	CAPACITOR—.008 mfd., 1600 v., paper
RCN-008	C9	CAPACITOR—350 mmf., compensator
RCU-279	C6	CAPACITOR—250 mmf., mica
	C17	CAPACITOR 250 mmf., mica
RCY-025	C3	TRIMMER R-f trimmer, 50 mmf.
RCY-026	C7	TRIMMER—Detector trimmer, 50 mmf.
RCY-027	C10	TRIMMER—Oscillator trimmer, 50 mmf.
RCY-028	C1	TRIMMER—Antenna trimmer, 250 mmf.
RDW-003		WINDOW—Dial window
REF-002	S4	FUSE—10 amp. line fuse
REM-002	C25, 26	DISC—Spark plate disc
REV-002	V1	VIBRATOR—Nonsynchronous vibrator
RHW-005		WASHER Vibrator cushion washer
RJS-068		SOCKET Foot switch cable plug socket
RJS-069		SOCKET Loktal tube socket
RJS-070		SOCKET Antenna connector and bracket assembly
RJS-071		SOCKET Vibrator socket
RLC-048	L7	COIL Oscillator series coil
RLC-049	L8	COIL Oscillator shunt coil
RLI-026	L10	CHOKE Vibrator hash choke
RLI-027	L1	CHOKE Antenna motor noise choke
RLI-028	L9	CHOKE Motor noise choke
*RNM-027	L2, 3	COILS—Antenna and r-f coil (right hand assembly)
*RNM-028	L4, 5	COILS—Oscillator and converter coil (left hand assembly)
ROE-001	SP1	SPEAKER 6 in. x 9 in. oval dynamic speaker (field coil not replaceable)
ROG-001		GASKET Speaker gasket
ROX-001		CONE Cone and voice coil assembly
RRC-047	R19, R20, S2	CONTROL 250,000 volume control, 1.5 meg-ohm tone control and power switch (Kaiser)
RRC-048	R2	POTENTIOMETER 800 ohm, sensitivity control

Cat. No.	Symbol	Description
CHASSIS COMPONENTS (Cont'd)		
RRC-049	R19, R20, S2	CONTROL—250,000 ohm, vol. control, 1.5 meg. tone control and power switch (Frazer)

SPECIFICATIONS

CABINET:

Material	Steel
Height	5¼ inches
Depth	13⅛ inches
Width	9⅞ inches

CONTROLS:

On-Off Switch and Volume
Tone
Manual Tuning
Pushbuttons for Tuning (6)

ELECTRICAL RATINGS:

Voltage	6.6 volts d-c
Current	8.5 amperes

FUSE:

S.F.E. (2)	14 amperes

OPERATING FREQUENCIES:

Broadcast Band	540–1605 kc
I-F Amplifier	265 kc

SENSITIVITY:

7 microvolts for one watt output (at band ends)
6 microvolts for one watt output (at points other than band ends)

POWER OUTPUT:

(Measured at voice coil)

Undistorted	7.25 watts
Maximum	8.25 watts

VIBRATOR:

Nonsynchronous	6 volts

LOUDSPEAKER:

Oval, PM	6 x 9 inches

TUBE COMPLEMENT:

(V1) R-F Amplifier	6SK7
(V2) Oscillator-Converter	7B8
(V3) I-F Amplifier	6SK7
(V4) Detector and Audio Amplifier	6SQ7
(V5) Audio Phase Inverter	6J5
(V6) Power Output	6V6GT
(V7) Power Output	6V6GT
(V8) Rectifier	6X5GT
(I1, I2) Pilot Lamps	Mazda No. 55

GENERAL INFORMATION

The 1949 Kaiser-Frazer auto radio is an eight tube superheterodyne receiver employing pushbutton tuning.

OFF-ON SWITCH AND VOLUME CONTROL

The power lead of the radio is connected to the accessory post of the ignition switch and the radio cannot be turned on without the ignition key. When the key is turned to the right, the engine may be started in the usual manner and the radio can be operated. To operate the radio when the engine is not running, turn the ignition switch key to the left.

To turn the radio on, turn the Volume Control knob to the right until a click is heard. After approximately 20 seconds, the radio tubes will reach their operating temperature, permitting operation of the radio. To increase volume, rotate this control knob further to the right. To turn the radio off, rotate the volume control knob completely to the left until a click is heard, indicating the radio is turned off.

Note: In addition to the radio ON and OFF switch, the di lights are also controlled by the Instrument Panel Control. T illuminate radio dial scale at night, the control, which also co trols the brilliance of the dial lights and auto instrument pan lights to various degrees, must be advanced as desired.

MANUAL TUNING

Manual tuning is accomplished by rotating the Tuning Contr knob, which drives the tuning mechanism and dial point through a reduction drive to the desired station frequency indicated by the pointer on the dial scale. The dial is marked i numbers to which a zero must be added to correspond to th frequency numbers of the stations, as listed in radio progra schedules. Accurate tuning of the station is necessary for optimu quality of reproduction.

PUSHBUTTON TUNING

Instantaneous tuning of any one of the six preselected statio may be accomplished by fully depressing the pushbutton for th desired station. After depressing the pushbutton, the radio wi become tuned to the selected station and the pushbutton wi return to its normal position upon release.

TONE CONTROL

The Tone Control knob is located directly behind the Volum Control knob. Rotating the control to the right or left will chang the tone of receiver reproduction. Turning the control to th right will emphasize the treble tones, while turning it to the le will emphasize the bass tones. The treble position is useful i overcoming wind noise, etc., when driving; while the bass positio brings out the full mellow tones of musical programs. With th tone control set midway, the full tonal range is obtained.

PUSHBUTTON TUNING ADJUSTMENTS

There are six pushbutton positions which are available fo setting up six desired stations for instantaneous tuning. Proce to adjust as follows:

1. Release the retaining spring beneath the bottom surfac of the pearl-colored pushbutton cover by pushing it to the le with the finger tip. The cover is now free and may be remove from its shaft, exposing the knurled adjustment screw.

2. With the fingers, loosen the long screw, by a few turns o its knurled head, in the counterclockwise direction.

3. Tune in the desired station for pushbutton tuning b operating the Manual Tuning Control knob. Accurate tuning o the station is necessary for optimum quality of reproduction.

4. Depress the exposed pushbutton plunger screw fully an then release and immediately tighten screw in a clockwis direction.

5. Replace the pearl-colored pushbutton cover with th spring on the under surface of the cover, by merely slipping i over the exposed pushbutton mechanism until the spring cove lock automatically snaps in place.

The five steps above complete the procedure for adjustment o one pushbutton-controlled preselected station. Repeat the pro cedure for each of the remaining pushbutton positions or any on pushbutton position which may be changed to a new statio setting when so desired. Any pushbutton may be set up or oper ated on any station without regard to frequency or sequence.

RADIO INSTALLATION

Reference is made to the Installation Details shown in Figure 1 and 2. The necessary mounting hardware for radio installatio and, also, the radio control knobs and interference eliminatio components are found packaged in a cardboard box inside th radio shipping carton. The step-by-step procedure for installatio is given as follows:

1. Install the antenna. Complete instructions are packe with each antenna kit. Dress the antenna lead-in cable up an over the auto instrument panel wires to the center of the instru ment panel.

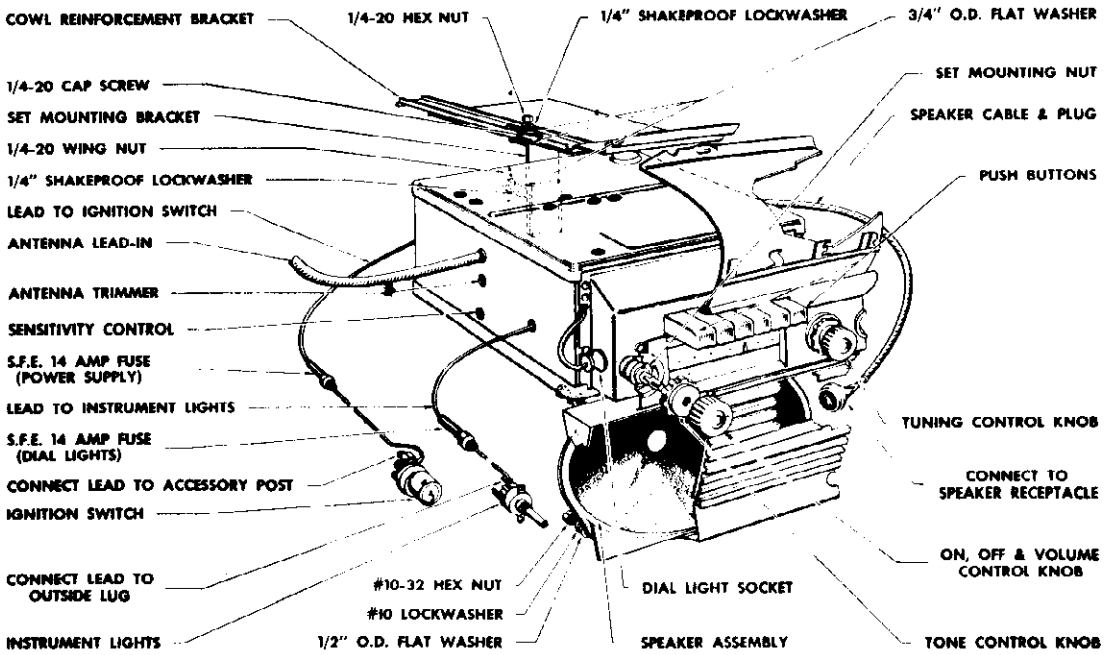

Fig. 1. Installation Details, Kaiser

2. Remove the radio opening cover plate from the auto instrument panel. The plate is held in place by speed nuts.

3. Fit the Set Mounting Bracket over the stud at the rear of the radio so that the serrated surfaces mesh, and place a ¾" O.D. flatwasher, ¼" shakeproof lockwasher, and the wing nut onto the stud and over the assembly in the order mentioned and as shown in Figures 1 and 2.

4. Lift open the auto engine compartment hood and place the Cowl Reinforcement Bracket above the cowl with its slotted opening over the hole provided for the ¼-20 Cap Screw used to fasten set mounting bracket to the automobile's cowl.

5. Carefully place radio into position from beneath and behind the auto instrument panel, so that the volume and tuning control shafts come through the panel openings provided. It may be necessary to enlist the aid of a helper in this step, since the radio must be supported while the cap screw with its first ¾" O.D. flatwasher is placed through the set mounting bracket hole, cowl, and cowl reinforcement bracket. Apply the ¾" O.D. flatwasher, ¼" shakeproof lockwasher, and ¼-20 Hex Nut. With radio and set mounting bracket in position, and the assembly pushed as far forward as set mounting bushings at control shafts will allow; tighten the hex nut.

6. With the ¼-20 wing nut (securing set mounting bracket to rear of radio) loosened a bit, raise or lower rear of radio to align the volume and tuning control shafts squarely with their respective holes in the auto instrument panel. Tighten wing nut securely.

7. Thread set mounting nuts over the volume and tuning control shafts. Using the special Spanner Wrench provided in the installation kit, tighten nuts securely.

8. Install the tone control knob on its shaft followed by the volume control knob. These knobs are the "press on" type and are merely pushed onto the shaft. Place the tuning control knob over the tuning control shaft and tighten set screw to flat of shaft.

9. Fit the radio speaker assembly over the four mounting studs with the speaker receptacle facing to the right. Place the ½" O.D. flatwasher, No. 10 lockwasher, and No. 10-32 hex nut over each stud in the order named and as shown in the illustrations. Tighten the four hex nuts securely.

10. Connect speaker cable and plug to speaker receptacle.

11. Connect antenna lead-in into its receptacle.

12. Connect the lead shown going to the ignition switch located on the auto instrument panel, to the longer accessory terminal post.

13. Connect the lead shown going to the automobile instrument light control to the load side terminal of the control.

14. Turn on the radio and allow it to operate for approximately 15 minutes to reach normal operating temperature. Tune in a weak station near 12 on the dial scale. With a small screwdriver, adjust the Antenna Trimmer until the station is heard the clearest. This setting will be optimum when adjusted for minimum noise level on station used for test. This adjustment should be made with the antenna extended to its normal operating position.

INTERFERENCE ELIMINATION

IMPORTANT: Use the utmost care in the following operations to insure freedom from motor noise. Be certain that good ground contacts are made between the interference condenser mountings and the car body. If necessary, clean away paint or dirt with emery paper. Tighten all nuts and bolts securely.

1. Remove the voltage regulator mounting screw and under this screw mount the Voltage Regulator Condenser, as shown in Figure 3. Connect the condenser lead wire under the battery terminal screw of the regulator marked "BATT."

2. Remove the high tension coil wire cable from the ignition distributor. Remove the wire cable end clip and fit cable to screw end of distributor suppressor. Screw suppressor onto cable so that screw bites into end of cable and contacts wires at its center. The distributor suppressor, in turn, is inserted into the center jack of the distributor so that the unit is now connected in series with the high tension wire lead and distributor. See Figure 4.

3. Mount the Ignition Coil Condenser under the ignition coil bracket bolt and connect its wire lead to the battery terminal of the coil as shown in Figure 4.

4. Install the Generator Condenser under the ground screw on the auto battery motor generator, as shown in Figure 5. Connect its wire lead to the generator armature post.

5. Install the two auto motor compartment hood bonding springs, one on each side of car, as shown in Figure 6.

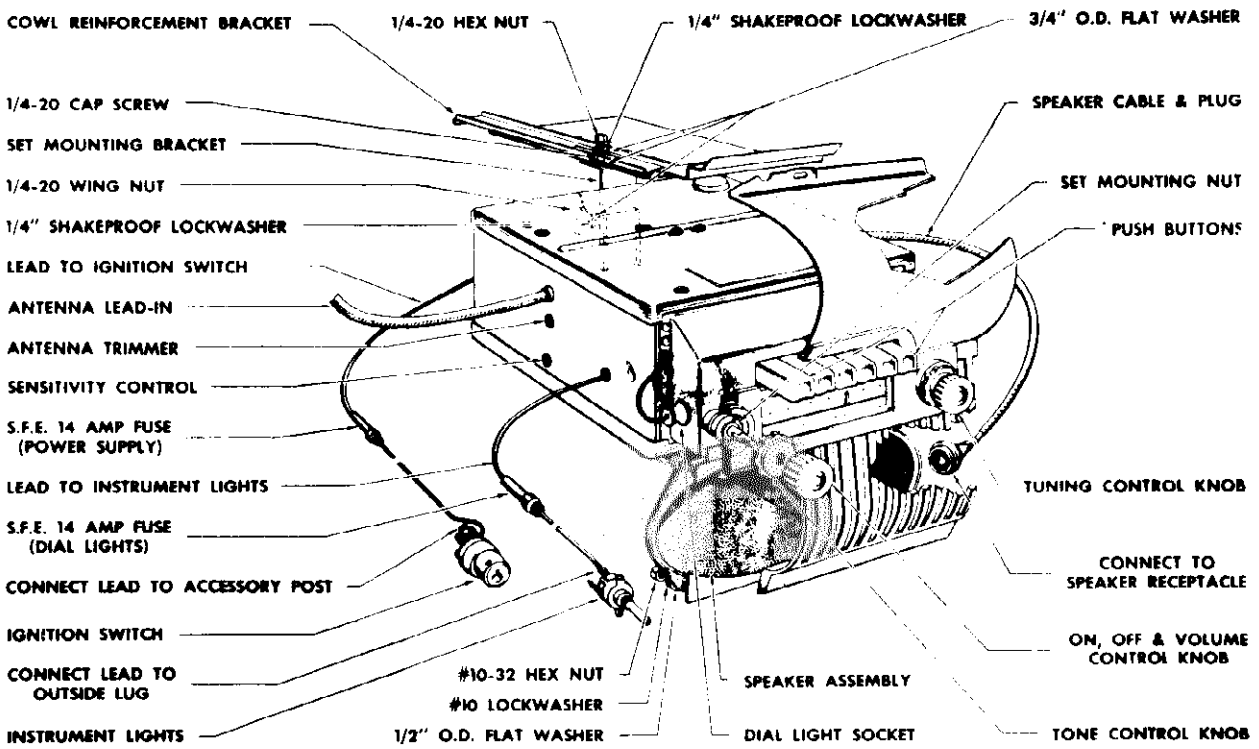

Fig. 2. Installation Details, Frazer

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED:

1. Test oscillator with audio tone modulation.
2. A-C output meter, 2½ volts full scale.
3. Insulated screwdriver.
4. .1 mf. paper capacitor.
5. Two 30 mmf. mica capacitors.
6. Jeweler's pin vise (for core adjustment).

PROCEDURE—GENERAL:

1. The alignment procedure is given in the Alignment Chart, Table I.

2. Alignment Chart, Table II, will be used *only* when a tuning core or coil has been replaced.

3. Figure 7 is the schematic circuit of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with the signal generator leads when aligning the r-f section of the receiver.

4. Reference is made to Figures 8 and 9 for trimmer locations.

5. Connect output meter across voice coil.

6. Make all adjustments with volume control on full, tone control in clockwise (treble) position.

7. Keep signal generator output reduced as much as possible for about half-scale output meter reading.

ALIGNMENT CHART, TABLE I

Step	Connect Signal Generator to:	Signal Generator Setting	Dial Setting	Adjust for Maximum
	I-F ALIGNMENT			
1	†Grid (Pin 6) 6SK7 (V3) I-F	265 kc	*1605 kc	2nd I-F, T2, Trimmer C35 and C34
2	†Grid (Pin 6) 7B8 (V2) conv.	265 kc	*1605 kc	1st I-F, T1, Trimme C33 and C32
3	Repeat Steps 1 and 2 for accuracy			
	R-F ALIGNMENT			
4	‡Antenna socket	1400 kc	1400 kc	Oscillator trimmer C
5	‡Antenna socket	1400 kc	1400 kc	Converter trimmer C R-F trimmer C3

† Low side of signal generator to chassis, high side in series with mf paper capacitor.
‡ Signal generator through dummy antenna.
* R-F cores fully withdrawn from tuner.

NOTES IN CONNECTION WITH ALIGNMENT TABLE I

After reinstalling the receiver in the car, allow it to opera for approximately 15 minutes to reach normal operating ten perature. Extend antenna to maximum. Check the antenn trimmer alignment on a weak station at approximately 1200 k Adjust trimmer for minimum noise level on station used for tes

MODEL 233
KAISER-FRAZER

GENERAL ELECTRIC CO.

GENERAL SERVICE

Where symptoms are manifested by intermittent operation, check all cables and their connections for breaks, loose or dirty contacts, chafing, grounding, and probable short circuits.

Static noise, varying in speed as the auto motor is accelerated, indicates ignition interference. Check parts and installation of distributor and ignition coil noise suppression units. Also, make certain the car motor compartment hood is bonded efficiently with two bonding springs provided.

Interference noise in the form of a ripple, varying in frequency with motor acceleration, is caused by the auto battery generator. Cures are also outlined here in section headed "Interference Elimination," regarding the generator noise condenser and voltage regulator condenser.

For other services where the trouble is in the receiver chassis, for r-f and i-f alignment, tube changes, etc., the receiver will be taken out of the car.

TAKING RECEIVER OUT OF CAR

To take the receiver out for servicing, consult the installation detail drawings of Figures 1 and 2 while following the outlined procedure below.

1. Disconnect the following leads and cables: speaker cable and plug at speaker receptacle, antenna lead at antenna receptacle, lead to ignition switch at switch accessory post, and lead to instrument lights at the load side terminal of the instrument light control.

2. Remove the volume, tone, and tuning control knobs. The volume and tone control knobs are the push-on type so that they are merely pulled off, while the tuning control knob must first be made free by loosening the No. 6-32 Allen Headless setscrew holding it fast at the flat section of its shaft.

3. Remove the special mounting nuts from the volume and tuning control shaft bushings, using the special spanner wrench supplied in the original receiver installation kits.

4. Remove the hex nut, washers, and cap screw from the mounting at the cowl. It may be necessary to enlist the aid of a helper in this step so that while one operator removes the screw the other can support the receiver, finally moving it away from the instrument panel to clear the control shafts. The receiver will then be free from its mounting and may be removed from the car.

5. To take out the speaker, remove the hex nut, lockwasher, and flatwasher from each of the four speaker mounting studs. The speaker is now free of the mounting and can be removed from the instrument panel.

ALIGNMENT CHART II

For Core or Coil Replacement Only

Step	Signal Generator Setting	Dial Setting	Remarks
1	1675 kc	*1600 kc	Screw Ant., R-F, converter, and oscillator cores out of their coils
2	1675 kc	*1600 kc	Adjust oscillator trimmer C10 at 1675 kc
3	1675 kc	*1600 kc	Adjust converter trimmer C7, R-F trimmer C3, and antenna trimmer C1 for maximum
4			Replace cores to their approximate original positions
5	1400 kc	1400 kc	Adjust oscillator core, L5, to scale at 1400 kc
6	1400 kc	1400 kc	Adjust converter, RF core, and antenna core (L4, 3, and 2 respectively), for maximum
7	600 kc	**600 kc	"Rock-in" shunt oscillator coil, L7, for maximum
8	Recheck step 6 at 1400 kc		
9	1200 kc	1200 kc	Check receiver for calibration and gain
10	Repeat steps 5, 6, 7, and 8		If receiver is off calibration or weak

* Maximum high frequency end of dial.

** "Rocking" consists of adjusting the indicated adjuster while turning the dial a small amount back-and-forth through peak output. The object is to find the maximum peak.

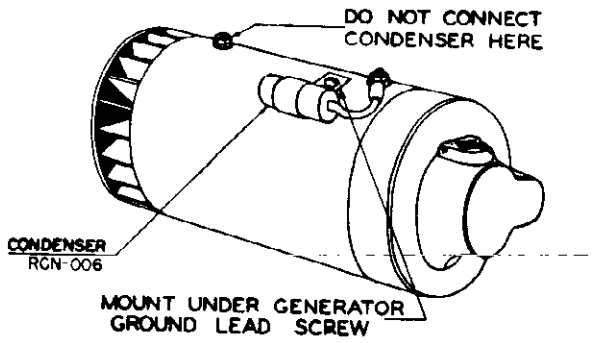

Fig. 5. Generator Noise Condenser

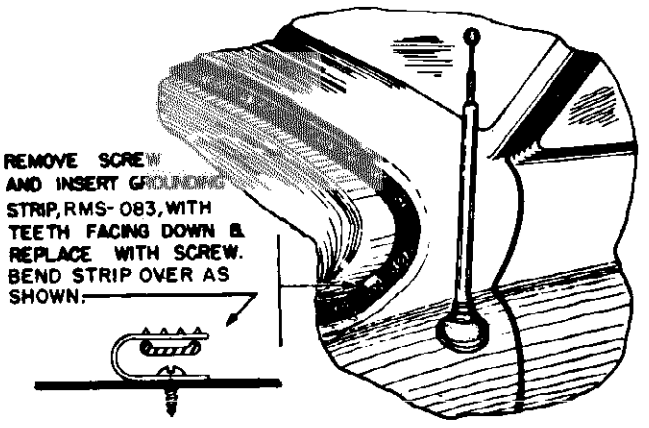

Fig. 6. Hood Bonding

NOTES IN CONNECTION WITH ALIGNMENT TABLE II

1. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 kc, the screw stop for the tuner core-bar should be adjusted to limit the frequency coverage to 1605 kc.

2. After all adjustments have been made, glue core screws with speaker cement.

3. After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 kc. Adjust trimmer for minimum noise level on station used for test.

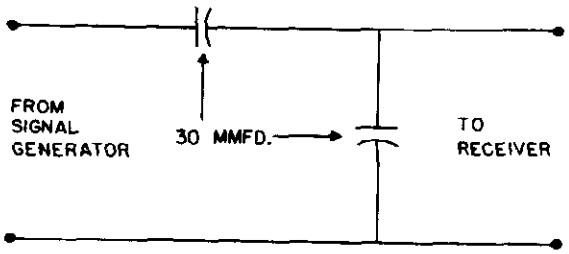

Fig. 7. Dummy Antenna

STAGE GAINS AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum tube voltmeter to check circuit performance and to locate stages which are not operating properly. The gain values listed may have a tolerance of 10%.

1. *R-F STAGE GAIN*

Antenna Post to 6SK7 (V1) Grid.....9.5 at 1000 KC
6SK7 (V1) Grid to 7B8 (V2) Grid.....8.5 at 1000 KC

2. *CONVERSION GAIN (1000 TO 265 KC)*

7B8 (V2) Grid to 6SK7 (V3) Grid.....17 at 1000 KC

3. *I-F GAIN*

6SK7 (V3) Grid to 6SQ7 (V4) Diode Plate.....15 at 265 KC

4. *AUDIO GAIN*

The power output across the speaker voice coil should be approximately one watt (1.89 volts) with not more than 70 millivolts at 400 cycles input across volume control R19. Volume control must be fully on (clockwise) and tone control in maximum treble (clockwise) position.

5. *OSCILLATOR GRID BIAS*

The d-c voltage developed across the oscillator grid leak R5 should be approximately -9 volts as measured by a vacuum tube voltmeter.

6. *SOCKET PIN VOLTAGES*

Socket pin voltages (Figure 10) may have a tolerance of 10%. All voltages are based upon a power supply input of 6.6 volts at the receiver terminals.

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES

R-F—1500 KC
I-F—455 KC

EQUIPMENT REQUIRED

1. Test Oscillator with Tone Modulation.
2. A-C Output Meter, 1½ volts full scale.
3. .05 Paper Condenser.
4. Insulated Screwdriver.
5. 200 $\mu\mu$f. Mica Condenser.

ALIGNMENT PROCEDURE—GENERAL

The alignment procedure is given in table form. All i-f and r-f alignments may be made with the chassis removed from the cabinet. All adjustments are accessible from the bottom of the cabinet when the chassis is installed. The location of the i-f and r-f adjustments is shown in Figure 4.

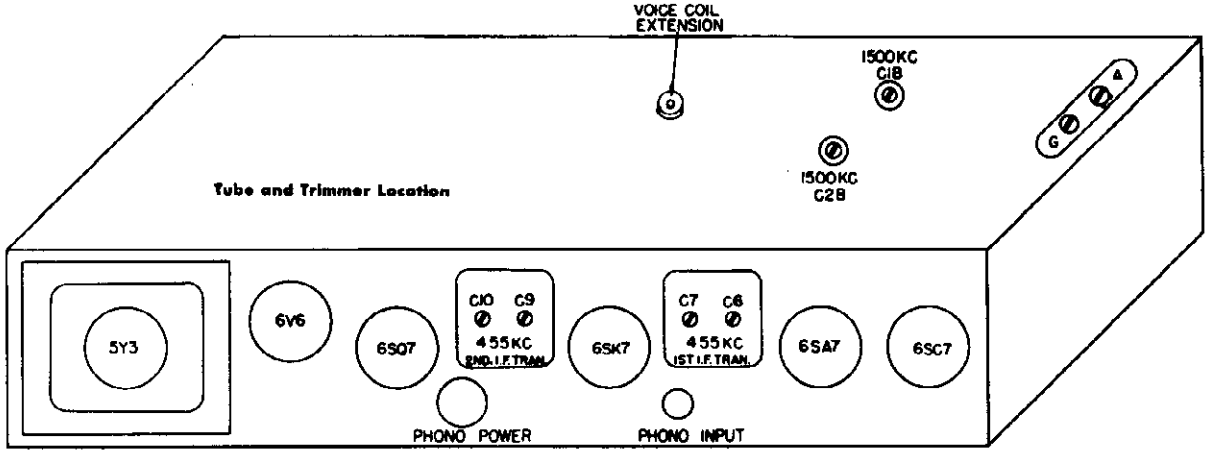
For calibration, the position of the pointer should be established prior to r-f alignment as follows. If no dial scale is available or if the chassis is removed from the cabinet, turn the tuning control knob fully counterclockwise (gang condenser closed) and secure the pointer to the dial string at some arbitrary position near the left end of the dial scale or pointer travel. Mark the pointer position on the backplate or note its position with reference to the number scale stamped on the backplate. Proceed with the alignment as indicated in the alignment chart and mark the pointer position for 1500 kc. The distance between the original reference mark and the 1500 kc mark should be $5\frac{1}{8}$ inches for dial calibration. After installation of the chassis in the cabinet, the tuning control is turned extreme counterclockwise and the pointer slid and secured to the string at the extreme left rectangular dial calibration mark on the scale. The pointer is accessible through the hole in the backplate.

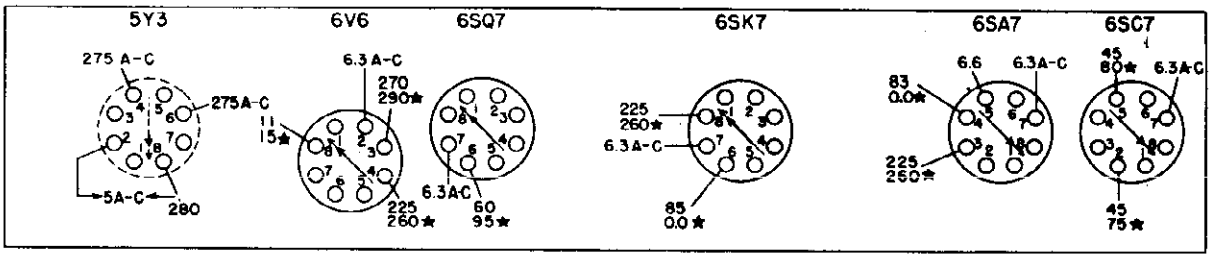
The output meter should be connected across the loudspeaker voice coil terminal. A voice coil terminal is accessible at an insulated rivet in the bottom of the chassis. The low side of the test oscillator output should be connected to the chassis ground; the high side of the test oscillator output should be connected as indicated in the alignment chart. During the entire alignment procedure, the volume control should be at its maximum position. The test oscillator output should be attenuated so that the output meter reading doesn't exceed $1\frac{1}{4}$ volts.

ALIGNMENT CHART

Step	Connect Test-Osc. To:	Test-Osc. Setting	Pointer Setting on Radio	Adj. for Max. Output
1	6SK7 pin No. 4 in series with .05 mf. paper capacitor	455 kc	1600 kc	2nd I-F Trans. Trimmers C9-C10
2	6SA7 pin No. 8 in series with .05 mf. paper capacitor	455 kc	1600 kc	1st and 2nd I-F Trans. C6, C7, C9, and C10
3	Antenna post in series with 200 mmf. capacitor.	1500 kc	*1500 kc	Oscillator Trimmer C2B
4	Antenna post in series with 200 mmf. capacitor.	1500 kc	1500 kc	R-F Trimmer C1B
5	Recheck Steps 3 and 4.			

* 1500 kc is $5\frac{1}{8}$ inches from extreme low frequency pointer position. (See alignment procedure.)





BOTTOM VIEW OF CHASSIS

Socket Voltage Diagram

CONDITIONS OF TEST
VALUES OBTAINED WITH 20000 OHMS PER VOLT METER
READINGS ARE BETWEEN PIN AND CHASSIS WITH A LINE VOLTAGE OF 117 VOLTS
VOLUME CONTROL MINIMUM
NO SIGNAL INPUT
★ VALUES OBTAINED WITH RADIO-PHONO SWITCH IN PHONO POSITION
ALL READINGS TAKEN WITH RADIO-PHONO SWITCH IN RADIO POSITION UNLESS OTHERWISE INDICATED

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum tube voltmeter to check circuit performance and to locate stages which are not operating properly. The gain values listed may have a tolerance of 20%.

1. R-F Stage Gain.

Antenna post to 6SA7 grid	5 at 1000 kc
6SA7 grid to 6SK7 grid	50 at 455 kc
6SK7 grid to 6SQ7 diode plate	70 at 455 kc

2. Audio Gain.

The power output across the speaker voice coil should be approximately ½ watt with .05 volts at 400 cps applied between the high side of the volume control and ground. Approximately .008 volts at 400 cps should be applied to the phonograph input for ½ watt output across the speaker voice coil.

3. Oscillator Grid Bias.

The d-c voltage developed across the oscillator grid leak R2 should be approximately 6.6 volts at 1000 kc.

4. Socket Pin Voltages.

Socket pin voltages greatly different than those shown in Figure 1 indicate defective components or tubes. It should be noted that a considerable difference in voltage exists at some voltage check points depending on the position of the radio-phono switch.

(V2) Oscillator-Converter 6BE6
(V3) 1st I-F Amplifier 6BA6
(V4) 2nd I-F Amplifier 6AU6
(V5) FM Limiter 6AU6
(V6) AM Detector, FM Discriminator, and 1st Audio Amplifier 6S8GT
(V7) Audio Output 25L6GT
(V8) Rectifier 25Z6GT
I1 and I2 . . . . . Mazda No. 47

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of ±20%. Readings should be taken with low signal voltage so that AVC is not effective.

1. *R-F AND I-F STAGE GAINS*

Signal applied through IRE dummy antenna:

Antenna Post to V1 Grid	3.5 at 1000 kc
Dipole Terminals to V1 Grid	1.0 at 98 mc
V1 Grid to V2 Grid	24 at 1000 kc
V1 Grid to V2 Grid	7.5 at 98 mc
V2 Grid to V3 Grid	21 at 455 kc
V2 Grid to V3 Grid	4.0 at 10.7 mc
V3 Grid to V4 Grid	1.75 at 455 kc
V3 Grid to V4 Grid	22 at 10.7 mc
V4 Grid to V5 Grid	16 at 10.7 mc

2. *AUDIO GAIN*

.08 volts at 400 cps across volume control with control set at maximum will give approximately ½ watt output across the speaker voice coil.

3. *OSCILLATOR GRID BIAS*

D-c Voltage Developed Across R5:
8.0 volts at 1000 kc
3.0 volts at 98 mc

4. *SOCKET PIN VOLTAGES*

Figure 3 shows typical tube pin voltages. All readings should be made from the pins to ground unless otherwise indicated.

ALIGNMENT

Two methods of aligning the i-f transformers and the discriminator are given here, (1) the regular meter alignment method as previously used on AM sets, and (2) the visual alignment which allows for much more precision in aligning the i-f transformers and, particularly, the discriminator where you can check the output wave shape for distortion, oscillations, and to see that the negative and positive half cycles of the wave have equal amplitude and are symmetrical.

EQUIPMENT REQUIRED FOR METER ALIGNMENT:

1. Test Oscillator with tone modulation.
2. D-C Voltmeter or Microammeter.
3. A-C Voltmeter, 2 volts.
4. .01 mf. paper capacitor.
5. ½ watt resistor of required resistance (note 9).
6. 200 mmf. mica capacitor.

EQUIPMENT REQUIRED FOR VISUAL ALIGNMENT:

1. General Electric YGS-3 AM and FM signal generator, or equivalent.
2. General Electric CRO-5A oscilloscope, or equivalent.
3. 330,000 ohm resistor, ½ watt.
4. 20,000 ohm per volt meter.

NOTES IN CONNECTION WITH METER ALIGNMENT:

1. Use unmodulated signal.
2. Connect 20,000 ohm-per-volt meter from junction of R29 and C55.
3. Connect 20,000 ohm-per-volt meter from grid pin 1 of (V5) 6AU6 limiter to chassis with a 200,000-ohm resistor in series. The resistor must be connected directly to the grid to minimize capacity loading and to isolate the meter from the i-f voltage. Keep signal generator output down so that meter indicates not more than one volt at the grid (5 microamperes through 200,000 ohms) (Alignment Steps 7 through 13).
4. Use 400-cycle modulation (Steps 1, 2, 3, 15, 16, 17, and 18).
5. Connect a standard output meter across speaker voice coil. Turn volume control full on. Keep signal generator output down so that meter indicates not more than ½ watt output (2 volts) during alignment.
6. Two oscillator settings will give response. The higher frequency response is the correct one; the other is the image response. If in doubt, start with the trimmer screw loosened completely and adjust for the first response.
7. For alignment of the standard band oscillator and r-f trimmers, the input signal should be inductively coupled to the radio loop antenna by connecting a 4-turn, 6-inch diameter loop of bell wire across the signal generator terminals, and then locate the loop about one foot from the radio loop antenna to prevent possible errors in peak readings. The position of the loop in respect to the radio loop antenna should not be changed during any one set of adjustments. Steps 15, 16, 17 and 18.
8. The lead from the signal generator must be kept as short as possible and it must be kept away from later stages to prevent regeneration. The signal may also be fed in to the tube pin connection from the top of the chassis to prevent regeneration.
9. A dummy antenna is a resistor in series with the hot lead of the signal generator. The resistance of the resistor plus the termination impedance of the signal generator should equal 300 ohms.
10. If a dial scale is not available, index the dial pointer as follows: turn the pointer to the left hand limit of travel and mark the dial plate at a reference edge of the pointer slide. Then set the pointer by turning the dial knob until the indicated dimension exists between the reference edge and the mark.

NOTES IN CONNECTION WITH VISUAL ALIGNMENT TABLE

1. Use FM signal modulated at 60 cps ±300 kc.
2. Connect vertical plates of scope to the limiter grid (pin 1 of V5/6AU6) through 200,000 ohm resistor.
3. Connect vertical plates of scope to the junction of R29 and C55 (FM audio) through 200,000 ohms.
4. Connect vertical plates of scope at junction of R13 and C28 (AM audio output) through 200,000 ohms.
5. Use FM signal modulated at 60 cps ±20 kc.
6. Use a 60 cycle amplitude modulated signal.
7. If a dial scale is not available, index the dial pointer as follows: Turn the pointer to the left-hand limit of travel and mark the dial plate at a reference edge of the pointer slide. Then set the pointer by turning dial knob until the indicated dimension exists between the reference edge and the mark.
8. Two oscillator settings will give a response. The higher frequency response is the correct one, the other response is the image. If in doubt, start with the trimmer screw loosened completely and adjust for the *first* response.
9. In some cases tuning of the converter grid will cause "pulling" of oscillator which will change the oscillator frequency. After centering the response curve on the scope, if peaking of L4 causes the response curve to move off of the screen it is necessary to realign the oscillator for calibration.
10. A dummy antenna is a resistor in series with the hot lead of the signal generator. The resistance of the resistor plus the termination impedance of the signal generator should equal 300 ohms.
11. The lead from the generator must be kept short as possible and away from later stages to prevent regeneration. The signal can also be fed into the tube pin connection from the top of the chassis to prevent regeneration.

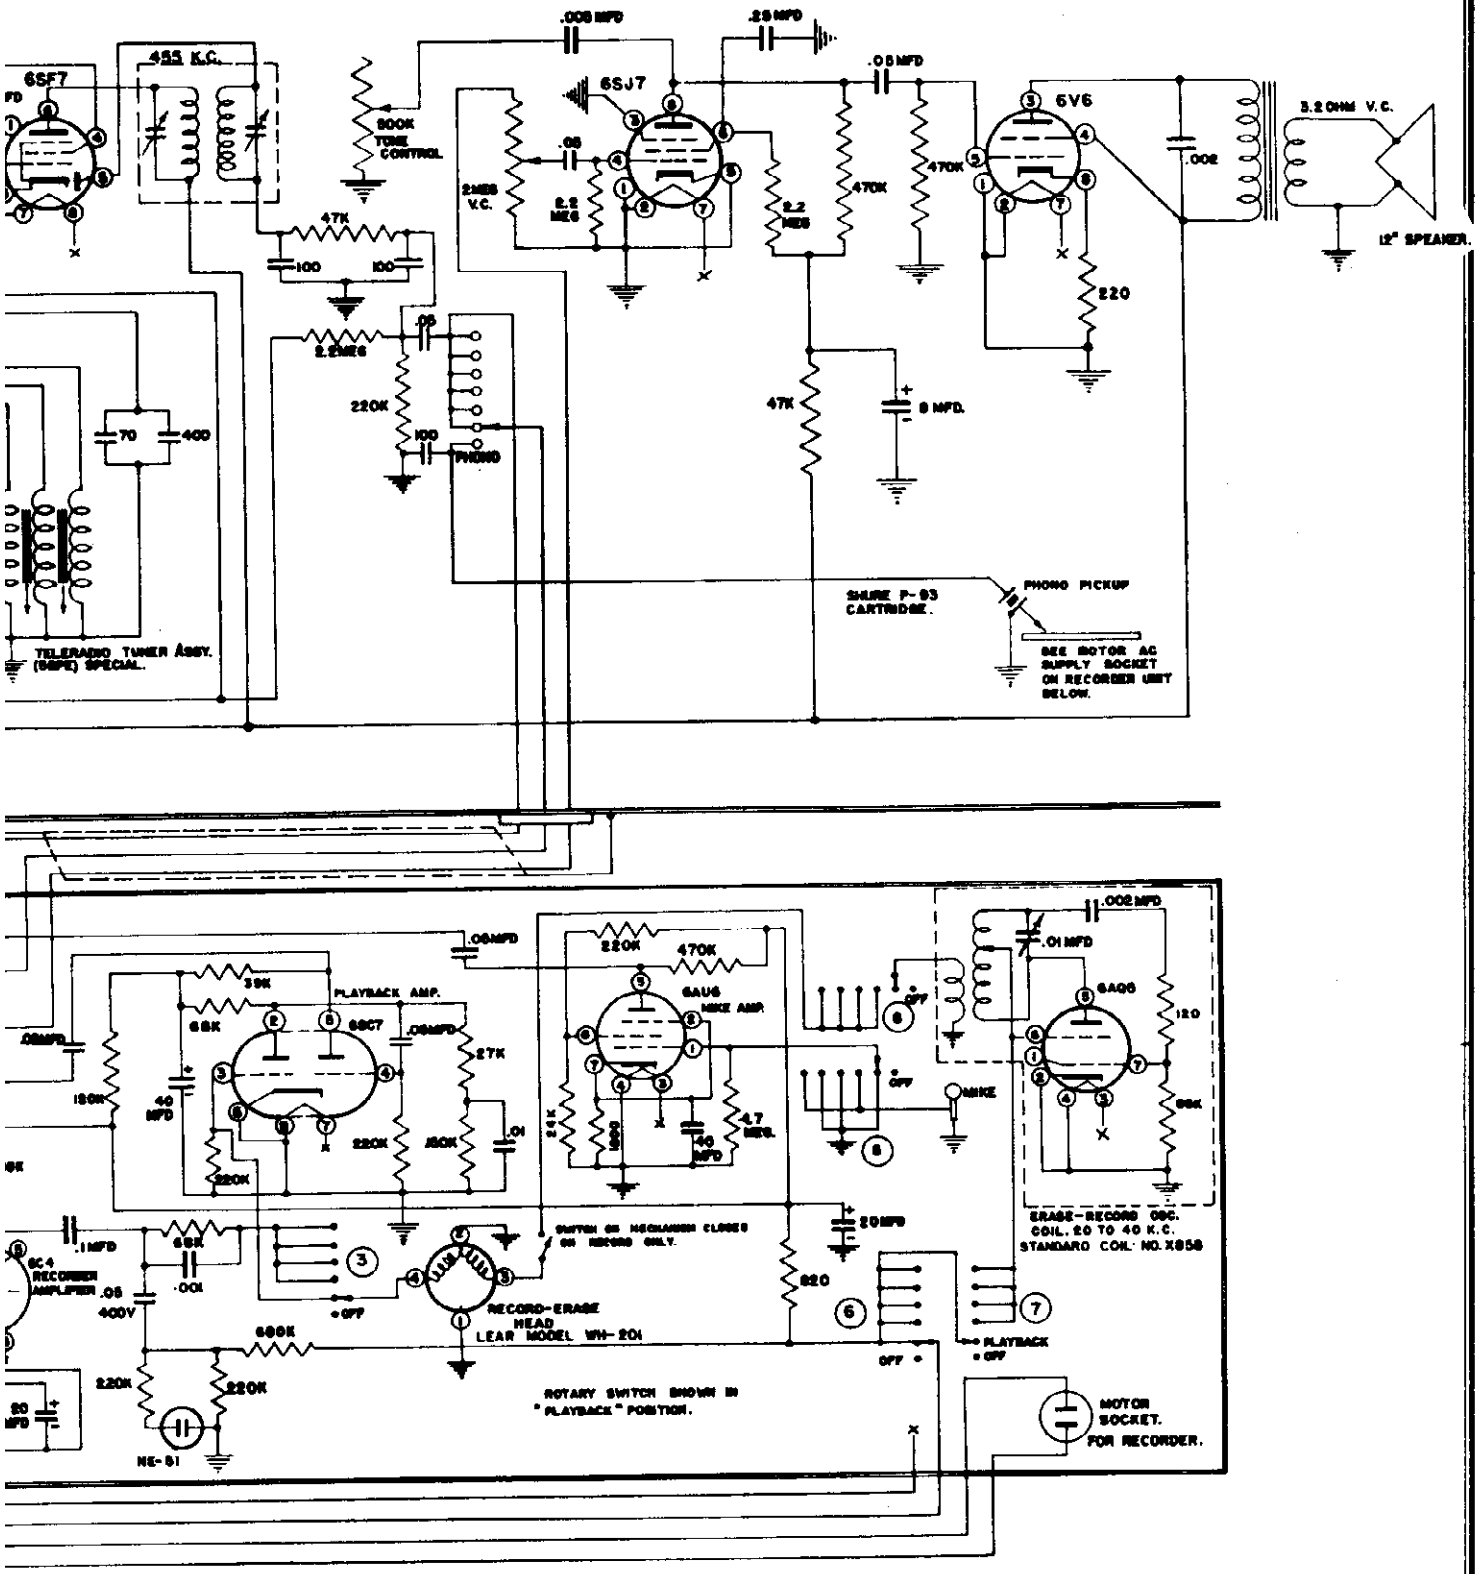
NOTE: A CRESCENT TOOL AND DIE, WIRE TRANSPORT SYSTEM IS USED IN THIS MODEL AND IS USABLE ONLY ON THE POWER SOURCE NOTED.

FOR 50 CYCLE OPERATION, A 50 CYCLE MOTOR IS REQUIRED. AND INFORMATION PERTINENT TO THE CHANGING REQUIRED, CAN BE OBTAINED FROM:
CRESCENT TOOL AND DIE CO
4140 BELMONT AVE.
CHICAGO, ILLINOIS.

1 FEED A MODULATED 455KC SIGNAL INTO LOOP PLUG TERMINALS, ALIGN I.F. TRANS. FOR MAXIMUM, NEGATIVE AVC VOLTAGE AS INDICATED AT TEST POINT X.
2 ADJUST TRAP TRIMMER C3 FOR MINIMUM VOLTAGE AT TEST POINT X.
3 MAKE CERTAIN POINTER IS LINED UP WITH TRIANGLE ON DIAL AT LEFT END OF POINTER TRAVEL.
4 TURN TUNING KNOB UNTIL POINTER IS AT 1500KC. CONNECT OUTPUT OF SIGNAL GENERATOR TO A TWO TURN LOOP AND RADIATE A MOD. 1500KC SIGNAL INTO THE RECVR LOOP FROM AT LEAST 12".
5 ADJUST OSC. TRIMMER C7 UNTIL SIGNAL IS HEARD.
6 ADJUST C2 AND C4 FOR MAXIMUM AVC VOLTAGE
7 SET POINTER AND GENERATOR AT 600KC AND ADJUST C8 PAD UNTIL SIGNAL IS HEARD.
8 ROCK GANG AND C8 FOR MAX AVC VOLTAGE.
9 RECHECK 1500KC. ALIGNMENT.

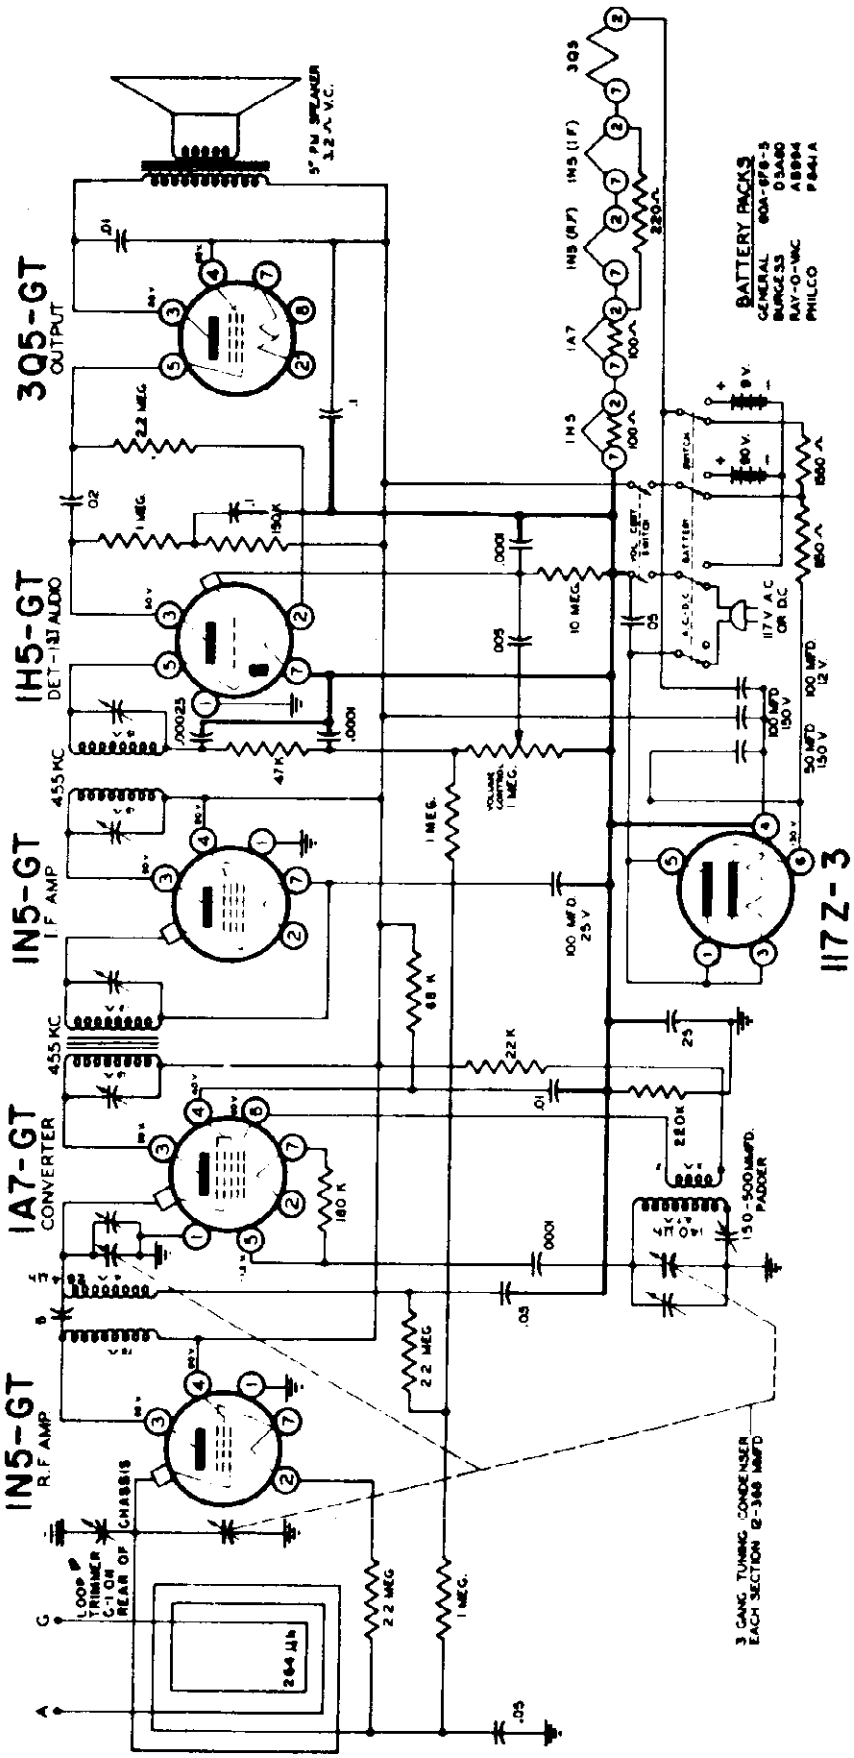
GILFILLAN BROS., INC.

MODEL 68-48



MODELS 68B, 68D

GILFILLAN BROS., INC.



ALIGNMENT INSTRUCTIONS

1. REMOVE CHASSIS, BATTERY AND LOOP FROM CABINET AND PLACE IN SAME RELATIVE POSITION AS IF SET WERE IN CABINET. LOOP MUST BE CLOSE TO BACK OF CHASSIS TO OBTAIN PROPER ALIGNMENT.
2. CONNECT SIGNAL GENERATOR LEADS TO EXTERNAL LOOP AS IN STEP 3. CONNECT AUDIO OUTPUT METER ACROSS VOICE COIL TERMINALS. DO NOT EXCEED .3 VOLT READING ON METER. ADJUST POINTER TO HORIZONTAL POSITION WITH GANG CLOSED.

STEP	TUNE TEST OSCILLATOR TO	TUNE RADIO DIAL TO	ADJUST TRIMMERS FOR MAXIMUM OUTPUT READING
1	455 KC	1500 KC	I F TRANSFORMERS
2	1400 KC	1400 KC	OSC., R.F., ANT.
3	600 KC	600 KC	PADDER CONDENSER

3. IN SOME CASES IT IS IMPOSSIBLE TO OBTAIN SUFFICIENT ATTENUATION OF THE GENERATOR SIGNAL FOR ACCURATE ALIGNMENT. IN SUCH CASES THE GENERATOR SHOULD BE CONNECTED TO AN AUXILIARY LOOP PLACED A FOOT OR SO FROM THE RECEIVER LOOP.

ALIGNMENT PROCEDURE

Connect output meter across the voice coil.

Connect the signal generator to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

The output of the signal generator should be just sufficien to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers for maximum output in the following order: C9, C8, C7, C6. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1600 kc and adjust the oscillator trimmer C3 for maximum output.

Set the signal generator and receiver to 1400 kc and adjust the antenna trimmer C4 for maximum output.

Set the signal generator and receiver to 1600 kc and readju oscillator trimmer C3 for maximum output.

ALIGNMENT DATA

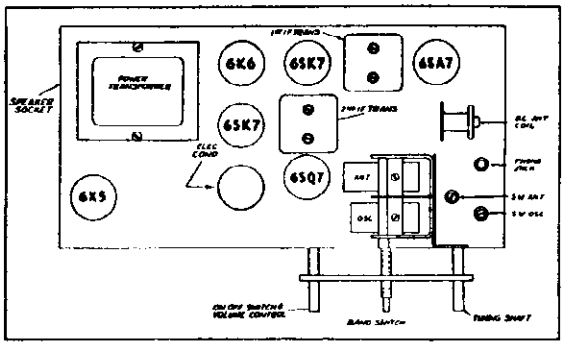

Fig. 2—Top View of Chassis

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal.

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 1400, 1630 and 9500 kc., and an output meter to be connected across the primary or secondary of the output transformer. All alignments should be made with the volume control in the maximum position, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT

Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. Align all I. F. trimmers to peak or maximum reading on the output meter.

B.C. AND S.W. BAND ALIGNMENT

Disconnect loop leads and set the band switch to the broadcast position. Adjust signal generator to 1630 K.C. and connect thru a .0002 mfd. mica condenser to the green loop lead. Set the gang condenser to minimum capacity and adjust the B.C. oscillator trimmer (see fig. 2) to receive this signal. Set the band switch to the short wave position, adjust the signal generator to exactly 9,500 K.C. and connect thru a 400 ohm resistor to the green loop lead. Set the dial pointer at 9.5 megacycles and carefully peak S.W. oscillator trimmer and then peak S.W. antenna trimmer. Re-install chassis in cabinet and connect loop leads. Set the band switch to the broadcast position. Adjust the signal generator to 1400 K.C. and connect the output to a shielded loop radiator and place this loop about two feet from the loop antenna. If no loop radiator is available the output of the signal generator should be connected to the green loop lead thru a .0002 mfd. mica condenser. Tune signal and carefully peak the B.C. antenna trimmer.

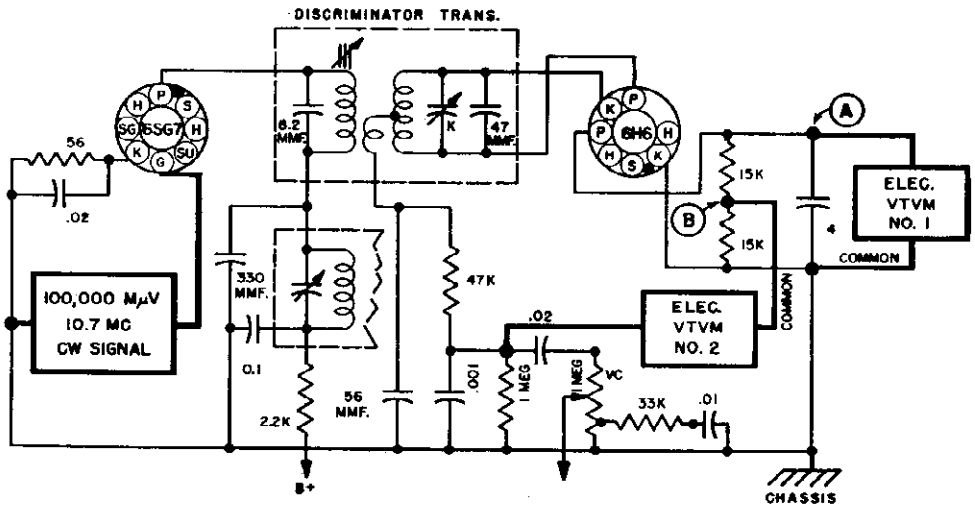
RATIO DETECTOR

Proper operation of the ratio detector stage is extremely important for best performance on the FM band of this receiver.

The performance of the ratio detector stage may be checked by closely following the procedure and diagram given below.



Wiring Diagram—Ratio Detector

1. After setting up the signal generator and VTVM, turn the trimmer adjustment screw "K" until tight. Turn the core adjustment "L" to maximum counterclockwise position. These two adjustments are on the top of the Ratio Detector transformer. (See Trimmer Location diagram.)

2. Now turn adjustment "L" clockwise until VTVM in No. 1 position indicates maximum voltage. This maximum value should be from five to seven volts with input as indicated in above diagram. Then slowly turn adjustment "K" in a counterclockwise direction, observing VTVM in No. 2 position. It will approach a maximum value and then rapidly drop to zero. If adjustment "K" is turned beyond this point, VTVM in No. 2 position will indicate a polarity change. The proper adjustment of "K" is at the point where the VTVM indicates zero volts between the polarity change.

3. Shift the 10.7 mc. signal to 10.725 mc. (10.7 mc. +25 kc.). VTVM in No. 2 position should now indicate a plus .3 volts minimum.

4. Change the 10.725 mc. signal to 10.675 mc. (10.7 mc. —25 kc.). VTVM in No. 2 position should indicate a minus .3 volts minimum. STEPS 3 and 4 constitute a sensitivity check on the ratio detector transformer.

5. Place the polarity switch of VTVM in No. 2 position to "plus" position and observe VTVM as the frequency of the signal generator is increased above 10.7 mc. It should indicate an increasing positive voltage. Continue increasing the frequency until the meter indicates a peak and begins to decrease. Reduce the generator frequency slightly until the peak is obtained. Record the generator frequency.

6. Set the polarity switch of VTVM to "minus" position. Repeat STEP 5, reducing the generator frequency from 10.7 mc. instead of increasing. Record the generator frequency when VTVM in No. 2 position indicates a peak.

7. The difference between the generator frequencies noted in STEPS 5 and 6 is the "Static Band Width" of the Ratio Detector transformer. This should be approximately 220 kc.

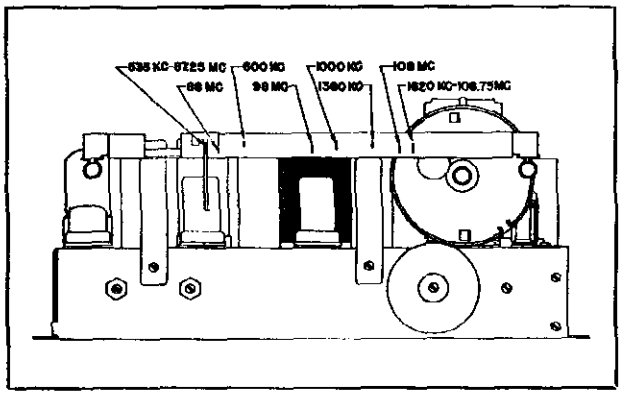
ALIGNMENT PROCEDURE

First determine if factory adjustments of the permeability tuner cores have been altered. This may be done by checking core positions against dimensions shown in tuner illustration. Broken wax seals on the core adjustments may also indicate altering. If the slug adjustments have been changed, it will be necessary to first adjust them in accordance with the dimensions given in tuner illustration before proceeding with alignment.

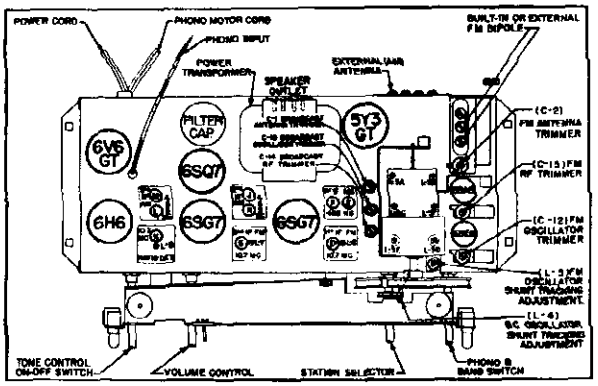
The following equipment is necessary to properly align this receiver:

1. AM signal generator with frequency coverage from 455 kc. to 1700 kc.
2. FM or CW signal generator covering the FM band from 87.25 mc. to 108.75 mc. and the 10.7 mc. frequency for FM IF alignment.
3. Vacuum Tube Voltmeter (VTVM).
4. Output meter—to match 4 ohms, 5 watts maximum.
5. Insulated alignment screwdriver.
6. Dummy antenna—0.1 mfd. capacitor, 300 ohm carbon resistor and inductive loop (fashioned from several turns of wire).

NOTE: Oscilloscope equipment not required if aligned according to the following procedure:
The accuracy of the AM RF and AM antenna slug adjustments may be determined by noting the trimmer adjustment at each end of the band when the oscillator is set for proper coverage. The proper setting of the AM or FM oscillator slugs is indicated by proper tracking of the receiver at the center of the respective band. The FM RF and FM antenna slugs must be adjusted to dimensions given in the permeability tuner illustration.



Calibration Points



Trimmer Location

Reference Notes to Alignment Chart on Following Page.

Note 1—If 1620 kc. signal is received lower in frequency than the 1620 kc. dial calibration, turn BC oscillator shunt tracking adjustment (L-4) outward. Retrack at 535 kc. (Step 2). If higher than the 1620 kc. dial calibration, screw adjustment inward and retrack at 535 kc. Repeat until 535 kc. and 1620 kc. signals coincide with their respective dial calibrations.

Note 2—Adjust input voltage to give approximately 5 volts AVC before final adjustment is made.

For STEPS 6 and 8A—Voltmeter "common" lead to chassis.

For STEP 7—Voltmeter "common" lead to point "B" on wiring diagram. The desired zero position is at the point where the meter indicates a polarity change from plus to minus or vice-versa.

Note 3—For all tests requiring an FM signal, the generator output (22.5 kc. deviation, 400 cycles) must be adjusted to give approximately one-half watt receiver output before final adjustments are made. Either STEP 8A or 8B may be used depending on equipment available.

Note 4—If 108.75 mc. signal is received lower in frequency than the 108.75 mc. dial calibration turn FM oscillator shunt tracking adjustment (L-5) outward. Retrack at 87.25 mc. (STEP 9) If higher than the 108.75 mc. dial calibration screw adjustment inward and retrack at 87.25 mc. Repeat until 87.25 mc. and 108.75 mc. signals coincide with their respective dial calibrations.

MODEL 92502 THE B. F. GOODRICH COMPANY

ALIGNING INSTRUCTIONS

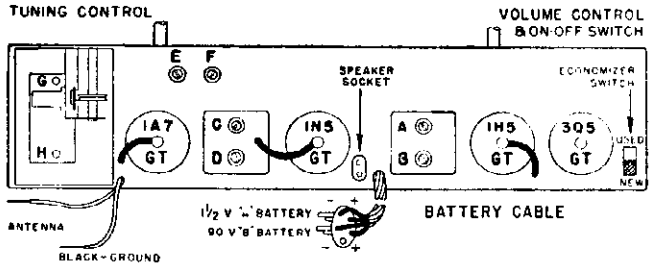
All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a signal generator as well as an output meter must be used.

POWER SUPPLY

This receiver is designed to operate on a single unit Ensign AB48, Ray-O-Vac No. AB-82, Burgess 17G-D60, Eveready 748, Bond 0528 or General 60DL-11L Battery. No other batteries are required as this battery is a combination 90 volt "B" battery and a 1½ volt "A" battery. The life of this battery is approximately 750 hours. The "A" and "B" sections are so proportioned that equal life may be expected from both. The "A" section will give satisfactory performance as low as 1.2 volts and the "B" section as low as 68 volts. This battery life may be expected with an average usage of several hours daily. If the reception becomes weak when the Economizer Switch is in the "USED" position, a new battery should be installed. A battery compartment is provided in the rear of the cabinet, and the battery cable simply plugs into the battery.

ALIGNMENT PROCEDURE

- IMPORTANT—Check to see that dial pointer reaches each end of dial scale when Station Selector Control is turned from one end to the other.
- Volume control—Maximum for all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead, when needed (see below).
- Connect output meter across voice coil of speaker.
- Allow chassis and signal generator to warm up for several minutes.



- Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as indicated in the chart below.

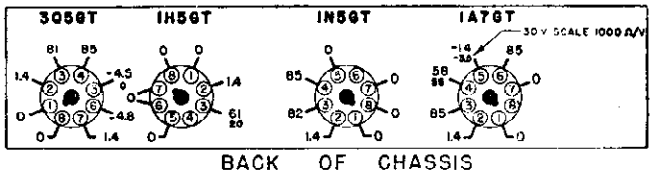
Band	Signal Generator Frequency	Dummy Antenna	Connection to Radio	Receiver Dial Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Type of Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	A-B—2nd I.F.	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	C-D—1st I.F.	Input I.F.	Adjust to maximum output
BROAD-CAST	1630 KC.	.0002 MFD.	Antenna Lead	High frequency end of dial	E—(See note below) F—(See note below)	Oscillator Antenna	Adjust to maximum output
	1300 KC.	.0002 MFD.	Antenna Lead	1300 KC.	G H	Oscillator Antenna	Adjust to maximum output

NOTE: Before adjusting trimmers "E" and "F", make sure that each iron core is 1⅜" or more outside of its coil form. If necessary, turn adjustments "G" and "H" to accomplish this.

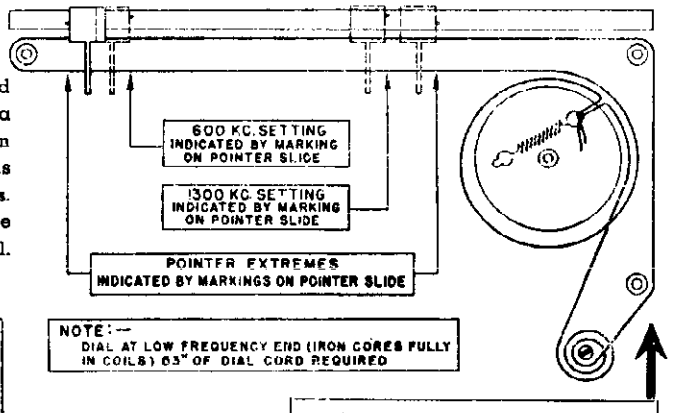
VOLTAGE DATA

All readings made between tube socket terminals and chassis. Voltages indicated have been obtained using a Vacuum Tube Voltmeter. A second voltage reading is shown made with a 1000 ohm-per-volt meter, when use of this instrument would result in appreciably lower readings. The voltages were measured using a fresh battery, volume control full on, dial at the high frequency end, and no signal.

VOLTAGE CHART BOTTOM VIEW



POINTER SETTINGS AND DIAL CORD STRINGING



NOTE:— DIAL AT LOW FREQUENCY END (IRON CORES FULLY IN COILS) 63" OF DIAL CORD REQUIRED

In later production, a dual pulley is used here. String dial cord around inside pulley only.

EQUIPMENT

SIGNAL GENERATOR capable of ranges indicated in the Alignment chart including a 400 cycle audio modulator.
OUTPUT METER capable of handling 3 watts of audio power.
ANTENNA DUMMY LOAD consisting of a 100 uuf condenser in series with the "hot" side of the signal generator bypassed with a 51 uuf condenser to ground on the load side of the series condenser.
LOOP DUMMY LOAD consisting of a 20 uh coil (¾" form, 1⅞" winding of #22 dcc wire) bypassed by a 150 uuf condenser to ground.
AUDIO SIGNAL GENERATOR capable of 1020 cps output.

ALIGNMENT CHART

Step Number	Connection of Sig. Generator Output to Receiver	Signal Gen. Frequency Setting	Band Switch Setting	Receiver Dial Setting	Adjust Slug, Padder, or Trimmer No.	Trimmer Description	Type of Adjustment
	I-F ADJUSTMENT						
1	Pin No. 7 of V-1 (12BE6)	455 kc	Broadcast ant.	1000 kc	1 & 4	Input IF	Maximum output
2

23	Dummy loop	380 kc	Beacon loop	380 kc	C-2	Beacon loop trimmer	Maximum output
24							Repeat steps 22 & 23 for maximum output
	FILTER VOICE ADJUSTMENT						
25	*Same as for r-f alignment; connect audio oscillator to external modulation terminals on sig. gen. and set at 1020 C.P.S. 30% modulation.	300 kc	Filter voice	300 kc	C-32	Range filter condenser	Minimum output of receiver

*This adjustment should be made with a 300 microvolt input. 1020 C.P.S. should be down approximately 18 db. from 400 C.P.S. level.

TRANSMITTER ADJUSTMENT

Equipment required: Antenna loading coil, part #51B885-2, Capacitor, 27 mmfd, mica, ±10%, Resistor, 6 ohm, 2 watt carbon, ±10%, RF ammeter, 0-1 amp., Alignment tool, part #74A208, Transmission line part #87B1613-1, Microphone T-17 or M1-1.
Series connect antenna loading coil to 27 mmfd capacitor, 6 ohm resistor and 0-1 RF ammeter to ground. Connect dummy antenna across transmission line with load coil to center conductor, plug transmission line into SO-1.
Connect a 12 volt battery to power cable, turn on set and allow a few minutes warm-up period. Plug in microphone to jack, J-1.
Set bandswitch to position No. 3 (Tower) and press microphone button.
Tune antenna loading coil slug for maximum current reading on RF meter. For 12 volts DC power source, antenna current should be in the vicinity of .7 amperes. Whistling or talking in to the microphone should cause the antenna current to rise approximately 20%. Do not hold the press-to-talk microphone button down for more than 10 seconds at a time until all tuning adjustments are completed.

MODEL CA-2 THE HALLICRAFTERS CO.

GENERAL: The Model CA-2 is a 7 tube Crystal controlled transmitter and a Superheterodyne receiver. The receiver incorporates two frequency ranges; 195 to 410 kc Beacon band and 540 to 1610 kc Broadcast band. The transmitter uses any one frequency range between 2 to 7 mc depending upon the crystal used—a 3105 kc crystal is provided.

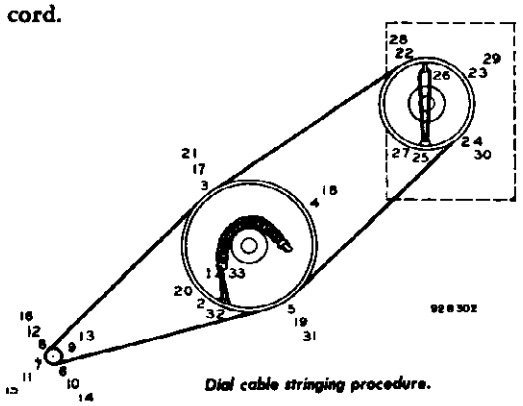
CORD CONNECTIONS: Consist of an audio and power cable, Antenna, and Direction finding loop antenna. All are located at the bottom of the set.

POWER SUPPLY DATA: Vibrator with rectifier, 12 volts DC, 13.75 volts nominal DC. Power drain is 3.5 amps on "Receive" and 5.3 amps on "Transmit."

TUBE COMPLIMENT AND FUNCTIONS: 12BE6 pentagrid converter, 12BA6 I.F. amplifier, 12AT6 detector, delayed AVC, and 1st audio, 6V6 output amplifier. The 12AT6 is used as a speech amplifier and the 6V6 as a Modulator when transmitting. The transmitter proper uses a 6J5 crystal oscillator and a 6V6 power amplifier.

HOW TO RESTRING DIAL CORDS

Cut a 30" length of 12 lb. test dial cord and tie one end to the tension spring on the pulley mounted on the hub of the bandswitch at position "1" on the diagram. Follow the numbers from "1" to "33," stretch the tension spring and tie cord securely. Cut off excess cord.



Dial cable stringing procedure.

TROUBLE SHOOTING CHART

SET IS DEAD

Cause	Remedy
Defective power cable	Repair or replace cable.
Battery connections disconnected.	Check and make the connections.
Defective master switch on plane.	Repair or replace switch.
Blown fuse	Replace fuse.

NO PLATE VOLTAGE

Dead rectifier tube	Replace tube.
Defective vibrator	Replace vibrator.
Open plate circuit	Check continuity of plate circuit and repair.

RECEIVER PERFORMS BUT TRANSMISSION IS DEAD

Cause	Remedy
Inoperative crystal	Check and replace if necessary.
Defective microphone switch	Check and replace or repair if possible.
Defective relay or relay contacts.	Check and repair or replace if necessary.
Antenna not tuned properly	Retune

FILAMENTS DO NOT LIGHT

Defective filament circuit	Check filament wiring and repair.

NOTE; Series parallel wiring on 6V6, 6X5 and 6J5 tubes.

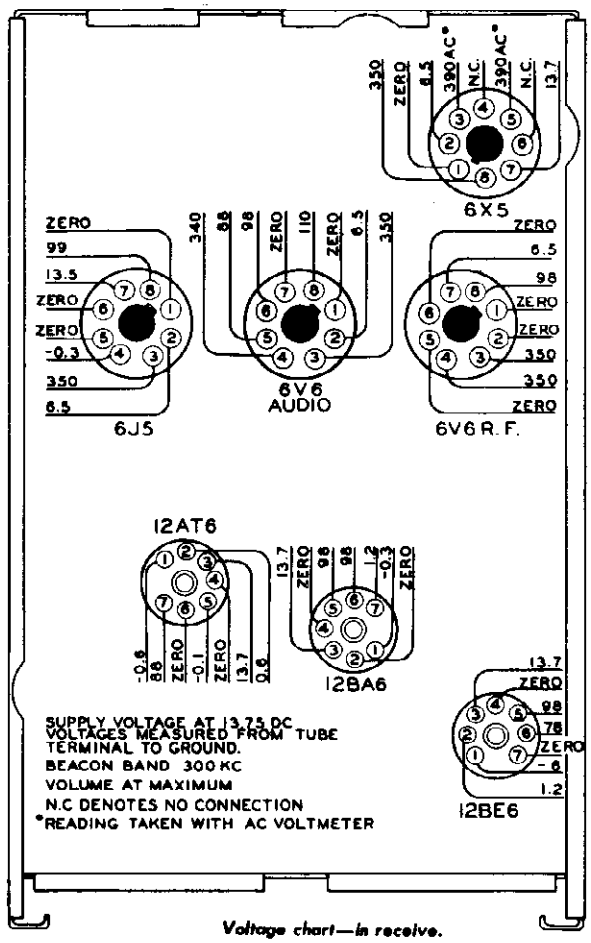
SYMPTON: Ignition Interference

ANALYSIS: Ignition noise is greatly reduced by inserting "damping" resistors in the grids of the oscillator mixer tube and a "limiting" resistor in the cathode circuit of the 2nd detector tube.

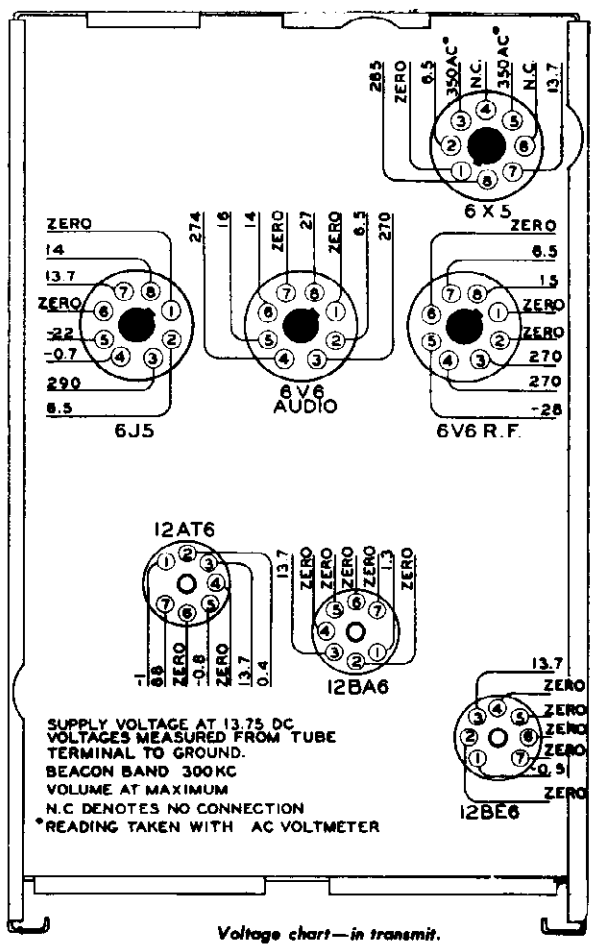
1. Install a 1500 ohm resistor in series with lead to pin no. 7 of V-1, 12BE6 tube. (R26)

2. Install a 1500 ohm resistor in series with lead to pin no. 1 of V-1, 12BE6 tube. (R27)

3. Install a 75 ohm resistor in series with lead to spark plate that is connected to pin no. 2 of socket, SO-4. (R28)



Voltage chart—in receive.



Voltage chart—in transmit.

THE HALLICRAFTERS CO.

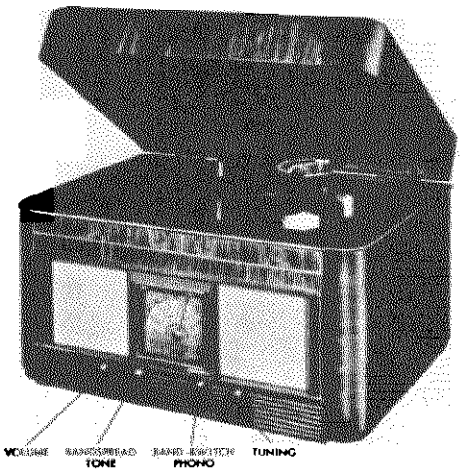
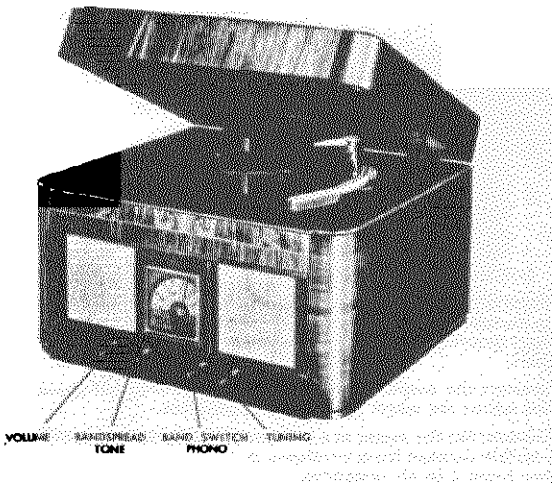
MODELS EC-306
EX-306



Model EX-306 Front view of receiver showing control locations.



Model EC-306 Front view of receiver showing control locations.

GENERAL: The EC-306 and EX-306 are six tube AC, table model radio-phonographs.

These receivers incorporate a superheterodyne circuit and are capable of receiving both domestic and short-wave recep tion in three bands as follows: Band #1, domestic broadcast, 540 kc 1625 kc (position 2). Band #2, short wave rang #1, 2.2 to 7.1 mc (position 3). Band #3, short wave range #2, 6.9 to 22 mc. (position 4).

Both models have built in antennas, plus provisions for external antenna and ground systems.

PHONOGRAPH: Position #1 on band switch is for "phono" operation. The record changer is of the automatic type an will handle either ten twelve inch or twelve ten inch records. Detailed Service instructions for the automatic changer are available on request. The EC-306 uses changer model 205 and the EX-306 uses changer model 204.

POWER SUPPLY DATA: Both receiver models are designed to operate from a line voltage of 105 to 125 volts AC 5(60 cycles with a power drain of 30 watts nominal. Power to the receivers is supplied through the line cord extendin from the rear of the cabinets.

TUBE TYPES AND FUNCTIONS: 12SA7GT/G-mixer-oscillator; 2-12SK7GT/G's as I-F amplifiers; 12SF7-Detecto AVC and First audio amplifier; 35L6GT/G-Audio power amplifier; 35Z5GT/G-Power rectifier.

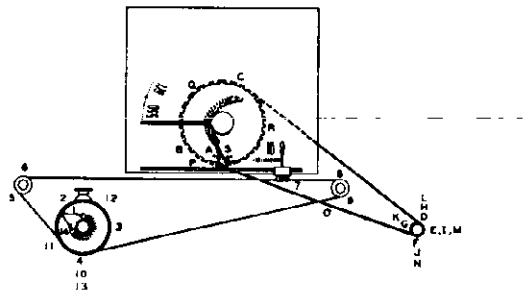
*Readings for 500 milliwatt constant output. Speaker disconnected and replaced with a 3.2 ohm load resistor. Signal fro generator modulated 30% at 400 cycles.

HOW TO RESTRING DIAL CORDS



Dial cable stringing procedure; main tuning is indicated by letters, and band spread tuning is indicated by numbers.

To restring the main tuning dial cord, cut a 25" length of 18 lb test dial cord and tie one end to the tension spring of the main tuning capacitor drive pulley at position "A" on the diagram. Following the letters "A" through "S", wind the cord on the pulley and knob drive shaft. At position "S", stretch the tension spring and tie the cord securely. Cut off the excess cord. Note that three turns are wound on the knob drive shaft.

To restring the bandspread tuning dial cord, cut a 30" length of the dial cord and follow the procedure as explained above, except start at position "1" on the diagram and proceed through position "14". Then turn knob pulley maximum clockwise, slide pointer to 100 and insert cord in clip on pointer. Note that the knob pulley has two turns.

MODELS EC-306, EX-306

THE HALLICRAFTERS CO.

ALIGNMENT INSTRUCTIONS

EQUIPMENT:

1. Signal Generator capable of ranges indicated in the ALIGNMENT CHART, including a 400 cycle audio modulator.
2. Output meter capable of handling 1 watt of audio power.
3. Standard RMA dummy antenna consisting of a 200 mmf condenser in series with a 20uh r-f choke, the choke being shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.
4. Non-metal screw-driver.

CONNECTIONS: Connect the Sig. Gen. "cold" lead to "G" on the antenna terminal strip except for i-f adjustments (see chart below); the "hot" lead is connected as indicated in the chart.

Connect the output meter across voice coil of the speaker and adjust the meter for 3 ohm impedance.

Caution: Set the meter at a sufficiently high range to prevent possible damage from overload. Band 3 must be aligned before band 2 in all instances.

CONTROL SETTINGS: After allowing about a ten minute warm up period, set the receiver's control as follows:

VOLUME control at full clockwise.

BANDSPREAD tuning control at "0", (min. cap.).

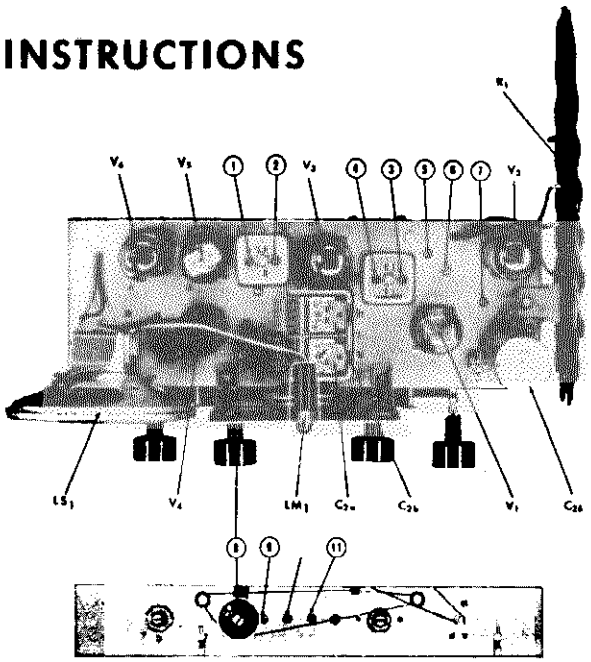


Fig. 6. Top and front views of the receiver showing tube locations and location of padder, trimmer and i-f adjustment points.

MODEL SX-43 THE HALLICRAFTERS CO.

ALIGNMENT PROCEDURE:

It will be necessary to remove the receiver chassis from the cabinet to make alignment adjustments on the i-f stages. The r-f stages receive final alignment through the holes in the bottom of the cabinet to compensate for the close proximity of the cabinet to the r-f coils. The chassis is held in the cabinet by seven screws along the edge of the flange of the front panel and by three screws through the bottom of the cabinet along the rear edge.

The standard RMA dummy antenna mentioned in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

The following control settings are to be set before alignment:

TONE Switch	- HIGH
STANDBY-RECEIVE	- RECEIVE
NOISE LIMITER	- OFF
VOLUME	- Max. gain
SENSITIVITY	- Max. sensitivity
Band Spread Dial	- High frequency stop

ALIGNMENT CHART

Step	*Dummy Antenna*	*Signal Generator Coupling*	*Signal Generator Frequency*	*Receiver Control Settings*	*Receiver Dial Setting*	*Adjust*	*Remarks*
1	None	Connect to center section (rear stator plates) of low capacity gang.	10.7 mc (No modulation)	BAND SEL.-5 REC. sw.-FM	General coverage dial at mid-scale	S1,S2, S3,S4, S5,S6, S7	Adjust for max. D.C. voltage as measured between pin #7 of the 6AL5 and ground with a V.T. voltmeter.
2	None	See step 1.	10.7 mc (No modulation)	See Step 1	See step 1.	S8	Adjust for zero D.C. voltage as measured between junction of R-50 and C-83 and ground with a V.T. voltmeter.
3	None	See step 1.	455 kc **	BAND SEL.-4 REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	See step 1.	S9,S10, S12,S13, S14	Adjust for max. audio output.
4	None	See step 1.	455 kc **	BAND SEL.-4 REC. sw.-AM-MVC SEL. sw.-CRYSTAL-BROAD	See step 1.	S11	Adjust for max. audio output.
5	None	See step 1.	455 kc **	BAND SEL.-4 REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	See step 1.	A	Adjust for max. audio output.
6	None	See step 1.	455 kc ** (No modulation)	BAND SEL.-4 REC. sw.-CW SEL. sw.-NORMAL-SHARP	See step 1.	CW PITCH control.	Remove CW PITCH control knob and set shaft for zero beat. Replace knob with zero at index line.
7	Repeat steps 1 & 2 for possible detunning during adjustments in steps 3, 4, and 5.						
8£	None	See step 1.	10.7 mc	BAND SEL.-5 REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	See step 1.	S15*	Tune slug S15 to high freq. side of 10.7 mc (11.155 mc). Tune for max. audio output.
9	Std. RMA dummy	To terminals A1 and A2 with jumper between A2 and GND.	1500 kc	BAND SEL.-1 REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	1500 kc	B*, C, D	Adjust for max. audio output.
			600 kc		600 kc	E*	
10	Std. RMA dummy	See step 9.	4.6 mc	BAND SEL.-2 REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	4.6 mc	F*, G, H	Adjust for max. audio output.
			2 mc		2 mc	S16*	
11	330-ohm carbon res.	See step 9.	14 mc ***	BAND SEL.-3 REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	14 mc	I*, J, K	Adjust for max. audio output.
			6 mc ***		6 mc	S17*, S18 S19	
12	330-ohm carbon res.	See step 9.	14 mc	BAND SEL.-3A REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	M.T. dial at 20M. band line. B.S. dial at 14 mc	L*	Adjust for calibration. Check band spread calibration and reset trimmer L if necessary. Increase trimmer cap. to decrease bandspread etc.

* Note - Calibration adjustment.

** Note - Set generator frequency to exact crystal freq. as follows: Turn on BFO and set CW PITCH for approx. 1000 cycles with signal generator set at approx. 455 kc. Set SELECTIVITY control at CRYSTAL-SHARP and tune signal generator for weakest of two response frequencies on either side of zero beat: adjust CRYSTAL PHASING control for complete null, retune signal generator for maximum output on opposite side of zero beat for the exact IF alignment frequency.

*** Note - Rock signal generator when making adjustments.

£ Note - Step 8. adjusts the 11.155 mc oscillator for the dual conversion char quired for AM reception on band 6. After aligning band 6 in step 15, tune to approx. 44.6 mc and pick up fourth harmonic of the oscillator. If the oscillator harmonic falls at approx. 51.3 mcs, the oscillator is oscillating at the low frequency side or image frequency and must be readjusted.

ALIGNMENT CHART —Continued

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Receiver Control Settings	Receiver Dial Setting	Adjust	Remarks
13	330-ohm carbon res.	See step 9.	14.2 mc ***	BAND SEL.-3A REC. sw.-AM-MVC SEL. sw.-NORMAL-SHARP	M.T. dial at 20 M. band index line. B.S. dial at 14.2 mc.	M, N	Adjust for max. audio output.

SPECIFICATIONS

TUNING RANGES:

Broadcast Band ..... 535 Kc to 1650 Kc
FM Band ..... 88 Mc to 108 Mc

INTERMEDIATE FREQUENCIES:

Broadcast Band ..... 455 Kc
FM Band ..... 10.7 Mc

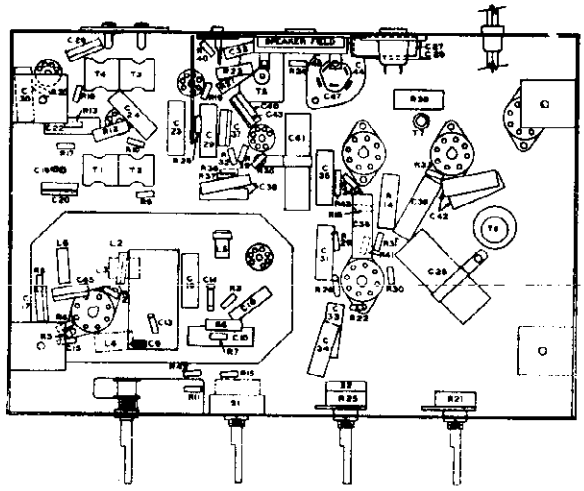
Power Supply ..... 115 V.A.C. 50-50 C.P.S.
Power Consumption (incl. phono.) ..... 110 watts
Undistorted Audio Output ..... 10 watts

NORMAL OPERATING VOLTAGES

The table below lists the normal operating voltages to be expected at the various tube socket terminals.

NORMAL OPERATING CURRENTS

5U4G Cathode Current ..... 95-100 Ma
6K6 Cathode Current (both tubes) ..... 55 Ma



Bottom of Chassis

MODELS B-508, B-509, B-510, CHASSIS 129

HOFFMAN RADIO CORP.

ALIGNMENT PROCEDURE

CAUTION: No alignment adjustments should be attempted without first thoroughly checking over all other possible causes of trouble such as defective tubes, resistors, and condensers. In order to align the receiver properly, remove the chassis from the cabinet and proceed as follows:

NOTE: IT IS PARTICULARLY IMPORTANT THAT AM ALIGNMENT BE DONE BEFORE FM ALIGNMENT. THIS IS TO AVOID POSSIBLE INTERACTION BETWEEN FM AND AM ADJUSTMENTS.

AM ALIGNMENT

I.F. ALIGNMENT:

1. Set tuning condenser on high frequency end of tuning range (minimum capacity).
2. Set band switch to AM position.
3. Turn receiver on and let it warm up for fifteen minutes or longer in order to minimize drift effects.
4. Connect output meter across speaker voice coil and set meter on lowest range, but not below 2.5 volt scale.
5. Connect output of signal generator to stator of C3 (see schematic diagram and chassis layout) through a .1 mfd. condenser; connect ground side of generator directly to chassis of receiver. Set signal generator on 455 Kc modulated.
6. Adjust I.F. slugs on T2 and T4 for maximum reading on the output meter. Keep the meter reading on the lower half of the scale.

(NOTE: The above mentioned slugs are located on the top and bottom of their respective I.F. cans. Keep the signal generator output low and the volume control on the receiver wide open during adjustment.)

R.F. ALIGNMENT:

After following the steps outlined above for I.F. alignment, proceed as follows:

1. Connect signal generator to ext. antenna connection of loop.
2. Set signal generator to 1650 Kc (modulated) and adjust oscillator trimmer (C8) to signal frequency. (Tuning gang should be at minimum capacity setting for this adjustment.)
3. Set signal generator to 1400 Kc (modulated). Tune signal in by rotating condenser gang until signal is heard. Adjust trimmer C7 for maximum reading on output meter. Keep signal generator output low so that meter reading is on lower half of scale.
4. Set signal generator to 600 Kc (modulated). Tune signal in until signal is heard. Bend antenna condenser plates (C1) for maximum output on 600 Kc as required.

FM ALIGNMENT

I.F. ALIGNMENT:

1. Set band switch in the FM position.
2. Set tuning condenser to high frequency end of tuning range (minimum capacity).
3. Solder a 5,000 ohm ½w. carbon resistor between terminals A and B of T1. Solder another 5,000 ohm ½w. carbon resistor between terminals D and C of transformer T3. DO NOT USE WIRE WOUND RESISTORS.
4. Connect the negative side of a 20,000 ohm/volt D.C. voltmeter or vacuum tube voltmeter to point "X" on diagram. Connect the positive side of meter to ground.
5. Connect output of signal generator directly to FM antenna input. Adjust signal generator to 10.7 Mc.
6. Adjust the tuning slugs on transformers T1 and T3 for maximum output. (Note: There are two slugs on each I.F. transformer, one on the top of the can and one on the bottom of the can under the chassis. tI is desirable to make this adjustment with an insulated alignment screw driver.) While making the above adjustments, keep the output of the signal generator low so that the D.C. reading on the meter is always between ½ volt and 1 volt.
7. Adjust the iron slug on the top only of T5 for maximum reading on the meter as outlined in step 6 above.
8. Remove meter lead from point "X" and connect to point "Y". Set meter to most sensitive D.C. voltage range.
9. Adjust the iron slug on the **bottom** only of T5 for a zero reading on the meter. It will be noted that as this slug is adjusted the meter will go from a positive indication to a negative indication. Proper adjustment is obtained when the meter is at the zero point between negative and positive swings of the meter.

(CAUTION. This adjustment **must** be made with an insulated alignment screw driver.)

NOTE: The above adjustments must be made in sequence and the operator should take particular care that the frequency setting on the signal generator is not touched during alignment. BE SURE THAT THE TWO 5,000 OHM RESISTORS ARE REMOVED FROM THE CIRCUIT AFTER I.F. ALIGNMENT IS COMPLETED. The above adjustments should be made on the basis of meter readings only and no attention should be paid to what is heard coming out of the speaker.

R.F. ALIGNMENT:

1. Set tuning condenser to 107 Mc on the dial.
2. Set band switch to FM position.
3. Connect DC voltmeter to point "X" as outlined above in step 4.
4. Connect output of signal generator to antenna terminals on receiver through 150-ohm resistors. One resistor should be connected in series with the "hot" side of the signal generator and the other resistor should be connected in series with the ground side of the generator. Set signal generator on 107 Mc.
5. Adjust oscillator trimmer C6 for maximum indication on meter, then adjust R.F. trimmer C5.
6. Set signal generator to 90 Mc.
7. Tune set by rotating gang condenser until meter reads maximum. Bend condenser gang plates to bring signal in and to match dial calibration.

CAUTION: The above adjustments should be made on the basis of meter readings only and no attention should be paid to what is heard coming out of the speaker.

ALIGNMENT PROCEDURE

CAUTION:

No alignment adjustments should be attempted without first thoroughly checking over all other possible causes of trouble such as defective tubes, resistors, and condensers. In order to align the receiver properly, remove the chassis from the cabinet and proceed as follows:

NOTE

IT IS PARTCULARLY IMPORTANT THAT AM ALIGNMENT BE DONE BEFORE FM ALIGNMENT. THIS IS TO AVOID POSSIBLE INTERACTION BETWEEN FM AND AM ADJUSTMENTS.

AM ALIGNMENT

I.F. ALIGNMENT:

1. Set tuning condenser on high frequency end of tuning range (minimum capacity).
2. Set band switch to AM position.
3. Depress Manual pushbutton.
4. Turn receiver on and let it warm up for fifteen minutes or longer in order to minimize drift effects.
5. Connect output meter across speaker voice coil and set meter on lowest range, but not below 2.5 volt scale
6. Connect output of signal generator to stator of C16 (see schematic diagram and chassis layout) through a .1 mfd. condenser; connect ground side of generator directly to chassis of receiver. Set signal generator on 455 Kc modulated.
7. Adjust I.F. trimmers on T2 and T3 for maximum reading on the output meter. Keep the meter reading on the lower half of the scale.

(NOTE: The above mentioned trimmers are on the top of their respective I.F. cans and are not to be confused with the iron core adjustments also coming out of the tops of the FM IF cans. Keep the signal generator output low and the volume control on the receiver wide open during adjustment.)

R.F. ALIGNMENT:

After following the steps outlined above for I.F. alignment, proceed as follows:

1. Connect signal generator to "hot" side of loop through a .1 mfd condenser and a 400 ohm resistor in series.
2. Set signal generator to 1650 Kc (modulated) and adjust oscillator trimmer (C26) to signal frequency. (Tuning gang should be at minimum capacity setting for this adjustment).
3. Set signal generator to 535 Kc. (Modulated) and adjust oscillator padder (C21) to signal frequency. (Gang should be at maximum capacity setting for this adjustment.
4. Repeat steps 2 and 3 to insure correct adjustment.
5. Set signal generator to 1400 Kc. (modulated). Tune signal in by rotating condenser gang until signal is heard. Adjust trimmers C8 and C13 for maximum reading on output meter. Keep signal generator output low so that meter reading is on lower half of scale.

FM ALIGNMENT

I.F. ALIGNMENT:

1. Set band switch in the FM po ition.
2. Set tuning condenser to high frequency end of tuning range (minimum capacity).
3. Solder a 5,000 ohm 1/2 w. carbon resistor between terminals A and B of T2. Solder another 5,000 ohm 1/2 w. carbon resistor between terminals D and E of transformer T3. DO NOT USE WIRE WOUND RESISTORS.
4. Connect the negative side of a 20,000 ohm/volt D.C. voltmeter or vacuum tube voltmeter to point "X" on diagram. Connect the positive side of meter to ground.
5. Connect output of signal generator directly to stator of C12. Adjust signal generator to 10.7 Mc.
6. Adjust the tuning slugs on transformers T2 and T3 for maximum output. (Note: There are two slugs on each I.F. transformer, one on the top of the can and one on the bottom of the can under the chassis. It is desirable to make this adjustment with an insulated alignment screw driver.) While making the above adjustments, keep the output of the signal generator low so that the D.C. reading on the meter is always between 1/2 volt and 1 volt.
7. Adjust the iron slug on the **top** only of T4 for maximum reading on the meter as outlined in step 6 above.
8. Remove meter lead from point "X" and connect to point "Y". Set meter to most sensitive D.C. voltage range.
9. Adjust the iron slug on the **bottom** only of T4 for a zero reading on the meter. It will be noted that as this slug is adjusted the meter will go from a positive indication to a negative indication. Proper adjustment is obtained when the meter is at the zero point between negative and positive swings of the meter. (CAUTION: This adjustment **must** be made with an insulated alignment screw driver).

NOTE

The above adjustments must be made in sequence and the operator should take particular care that the frequency setting on the signal generator is not touched during alignment. BE SURE THAT THE TWO 5,000 OHM RESISTORS ARE REMOVED FROM THE CIRCUIT AFTER I.F. ALIGNMENT IS COMPLETED. The above adjustments should be made on the basis of meter readings only and no attention should be paid to what is heard coming out of the speaker.

R.F. ALIGNMENT:

1. Set tuning condenser to 100 Mc on the dial.
2. Set band switch to FM position.
3. Connect DC voltmeter to point "X" as outlined above in step 4.
4. Connect output of signal generator to antenna terminals on receiver through 150-ohm carbon resistors. One resistor should be connected in series with the "hot" side of the signal generator and the other resistor should be connected in series with the ground side of the generator. Set signal generator on 100 Mc.
5. Adjust tuning slug on L6 for maximum indication on meter.
6. Set signal generator to 90 Mc.
7. Tune set by rotating gang condenser until meter reads maximum. Now adjust tuning slugs on L3 and L5 for maximum meter reading. While making the above adjustments keep the output on the signal generator low so that the meter reading is between 1/2 volt and 1 volt.
8. Set signal generator to 106 Mc.
9. Tune set by rotating gang condenser until meter reads maximum. Now adjust tubular trimmers C2 and C18 for maximum meter reading.
0. Repeat steps 6 through 9 inclusive twice for proper alignment.

CAUTION: The above adjustments should be made on the basis of meter readings only and no attention should be paid to what is heard coming out of the speaker.

PUSHBUTTON ADJUSTMENTS

The frequency ranges for the pushbuttons are given in figure 2. A layout of the pushbutton adjustments is shown in Figure 3. Note that in this figure, pushbutton number 1 is now to the extreme right, since the pushbutton assembly is being viewed from the rear. To make pushbutton adjustments, proceed as follows:

1. Turn the receiver on and let it warm up for fifteen minutes or longer in order to minimize drift effects.
2. Depress the DIAL pushbutton and tune in the station which is to be set on pushbutton number 1.
3. Now depress pushbutton number 1 and adjust tuning slug 1a and trimmer 1b (Figure 3) until the station is accurately tuned in again.

MODEL B502

4. Repeat the above procedure for the remaining pushbuttons.

NOTE: When making oscillator coil pushbutton adjustments, it is desirable that this adjustment be made from the high-frequency end (slug all the way out). The proper oscillator coil slug setting will then be reached before there is any possibility of tuning the oscillator to the low frequency side of the carrier.

HOFFMAN RADIO CORP.

WIRE RECORDER FOR MODELS C1006 and C1007

DESCRIPTION

The Hoffman WIRECORD consists of a wire recorder and associate amplifier. The amplifier is a special 6-tube (plus rectifier) AC-operated unit especially designed to work with the Webster wire recorder head.

TUBE COMPLEMENT

1st A.F. Amp	6SJ7
2nd A.F. Amp. and Aux. output Amp.	6SL7
3rd A.F. Amp. and Volume Indicator Amp.	6SL7
Output Amp.	6K6
Volume Indicator	6U5/6E5
Erase-Bias Oscillator	6V6
Rectifier	6X5
Frequency Response	40 CPS to 9000 CPS

NORMAL OPERATING CURRENTS (6X5 Cathode)

Standby Position	0 Ma.
Play Back Position	30 Ma.
Record Position (Motor off)	50 Ma.
Record Position (Motor on)	54 Ma.

TEST PROCEDURE

No special test procedure is required to service the amplifier unit of the Hoffman Wirecord If the amplifier fails to function properly, proceed as follows:

1. Check all tubes, preferably by replacing them one at a time with known good tubes.
2. Check all tube socket voltages and compare readings with the voltage table. Any appreciable discrepancy in voltage readings should be investigated by looking for shorted or leaky condensers, or defective resistors.
3. Whenever it is necessary to replace a resistor or a condenser in the amplifier, make certain that the replacemnt part has the proper resistance or capitance value, otherwise the amplifier may fail to perform as it should.

VOLUME INDICATOR ADJUSTMENT

The recording level on the wire must be maintained within definite limits in order to obtain good performance from the wire recorder. If the recording level is too high, a permanent record that is difficult to, erase will result. If the recording level is too low, the reproduction on playback will be noisy because of the low signal-to-noise ratio. To adjust the volume level indicator for correct indication of volume, proceed as follows:

1. Place switch in RECORD position.
2. Turn Radio volume and microphone volume controls to minimum volume (counterclockwise) position.
3. Rotate R20 (slot adjustment at rear of amplifier chassis) in a counterclockwise direction until the pattern on the indicator tube overlaps. If the indicator pattern cannot be made to overlap:
   a. Replace indicator tube.
   b. Replace 6SL7 tube used as 3rd Amp. and volume indicator amplifier.
   c. Make necessary voltage checks according to voltage chart.
4. If indicator tube pattern overlaps satisfactorily, back off on the adjustment of R20 until the tube pattern is as wide open as it will go. Then move the R20 adjustment until the pattern JUST BEGINS TO CLOSE. This is the final and correct adjustmen..

If the wire recorder is now operated so that volume peaks just close the pattern on the indicator tube, no trouble should be experienced in erasing the original material when using the wire for subsequent recordings.

NORMAL OPERATING VOLTAGES

The following table lists the normal operating voltages to be expected at the various tube socket terminals. For tube socket terminal locations, refer to bottom view of chassis.

Pin No.	1	2	3	4	5	6	7	8
6SJ7 1st Ampl.	0	0	5	0	5	17	6.3 AC	65
6SL7 2nd Ampl.	0	200	3.6	0	125	1.0	6.3 AC	0
6SL7 3rd Ampl.	0	160	2.4	0	50	2.0	6.3 AC	0
6K6 Output	0	0	230	245	0	0	6.3 AC	
6V6 Osc. #	0	0	250	250	—44	0	6.3 AC	0
6V6 Osc. ★	0	0	230	230	—37	—	—	0
6X5 Rectifier	0	6.3 AC •	260	—	260	—	0	300
6U5 Indicator	0	75	29	245	50	6.3 AC		

• Between Pins 2 and 8 on 6X5
Wire Recorder switch in "OFF" position
★ Wire Recorder switch in "RUN" position

All voltage readings are made with amplifier switch in record position.

SERVICE DATA

FEATURES

Large, easy to read, unbreakable lucite dial with band in use only being illuminated. Coverage: Broadcast Band 540 to 1650 KC. Short Wave Band 9. to 12.5 MC. Personalized Tuning Gang - 6 sections. Individual sections for short wav with oscillator section double spaced. Frequency Modulated Band 88-108 MC. using its own Tuner, I.F., Ratio Detector, and special Tuning Gang double spaced. High Q Antenn Coils. Very large Loop. Separate Power Pack. Output 13 watts - 8.5 watts undistorte Dual HOWARD built elliptical speakers. Webster Record Changer. Illuminated Selector Control. Five position illuminated Acousticolor Switch with pleasing treble and bass accentuation. Special Feature: Large storage space for records capable of holding th HOWARD Television Chassis 475-TV.

ANTENNA REQUIREMENTS: The HOWARD Model 481 Radio contains a very large loop aerial having exceptional pickup and in use upon the Broadcast Band. For the short wave band one end of this loop is disconnected and the loop then becomes the antenna. Also installed within the cabinet is a folded Dipole antenna for use upon the FM Band. Although the FM Band is the most sensitive built today, the successful operation of this Band depends on the signal strength of the transmitter and the efficiency of the anten connected to the Band. In localities a number of miles from the sending station, it i advisable that a good antenna be used. It must be remembered that a great many things influence FM reception: elevations, high buildings or hills will intercept the waves and reduce signal strength. Each installation presents a different problem, however i most cases the built-in antenna will provide sufficient signal strength to operate the FM Band. If the folded Dipole within the cabinet does not have sufficient pick-up, we recommend the erection of a DIPOLE ANTENNA mounted as high as possible and away from a obstructions. Use a 300 ohm twin lead-in wire and place the horizontal arms of the antenna flat side to the transmitter.

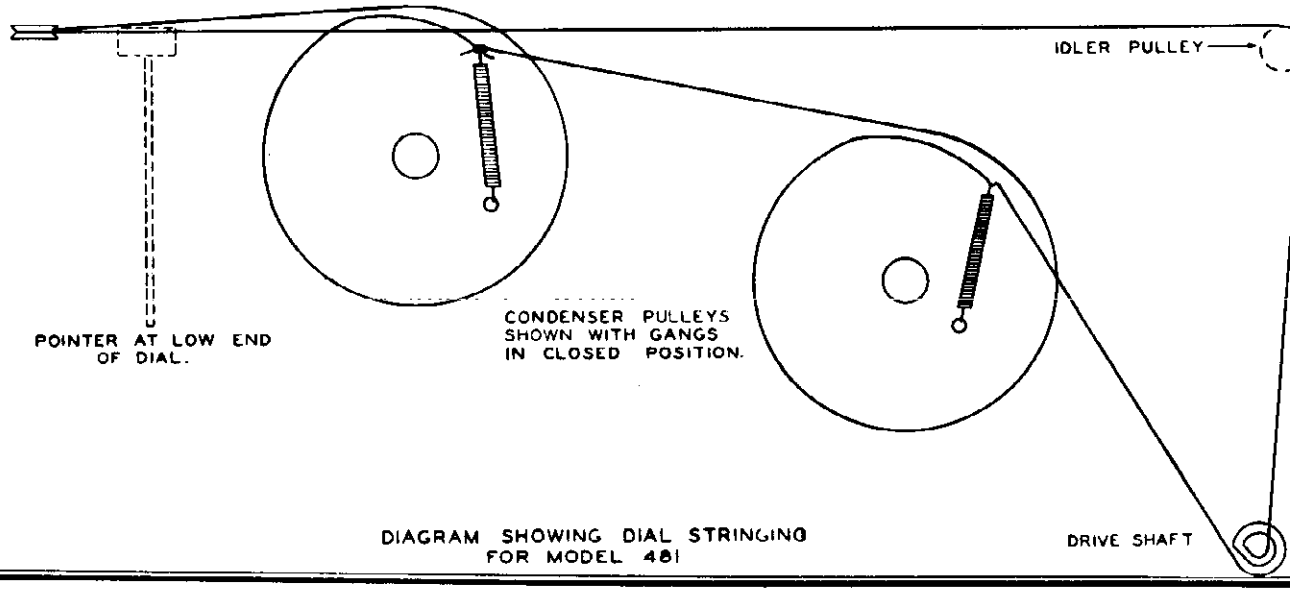

DIAGRAM SHOWING DIAL STRINGING FOR MODEL 481

MODELS 481M, 481B, 481C

HOWARD RADIO COMPANY

AM ALIGNMENT CHART

Do the following before alignment:

Remove condenser gang dust cover by taking out 4 P.K. sheet metal screws.
With both gangs closed, put the dial pointer on the last vertical line at the low frequency end of the calibrated dial scale.
Loop attached to chassis.
Volume Control on full.
Set pointer between broadcast stations at low frequency end of dial.
Tone control set at clockwise position (normal).
Band Switch at broadcast position.
Adjust all trimmers for maximum sensitivity.

See Dummy Gen. Chart	Sig. Gen. Connection	Gen. Freq.	Band Switch Position	Dial Setting	Order of Slug and Trimmer Adjustments	Trimmer or Slug Function	See Notes Below
2	Grid of 6SA7	455 K.C.	BC	Low End of BC	⑩ ⑪ ⑫ ⑬	I.F.	J
1	Generator Inductively Coupled to Loop	11.9 M.C.	SW	11.9 M.C.	⑰ ⑱ ⑲	SW	K & L
		Accurately set signal generator at one MC and check through short wave dial, harmonics to be one MC apart.					
1	Pin #4 6SK7	1400 K.C.	BC	1400 K.C.	⑭ ⑮	BC Osc. and R.F.	
1	Generator Inductively Coupled to Loop	1400 K.C.	BC	1400 K.C.	⑯	Loop	

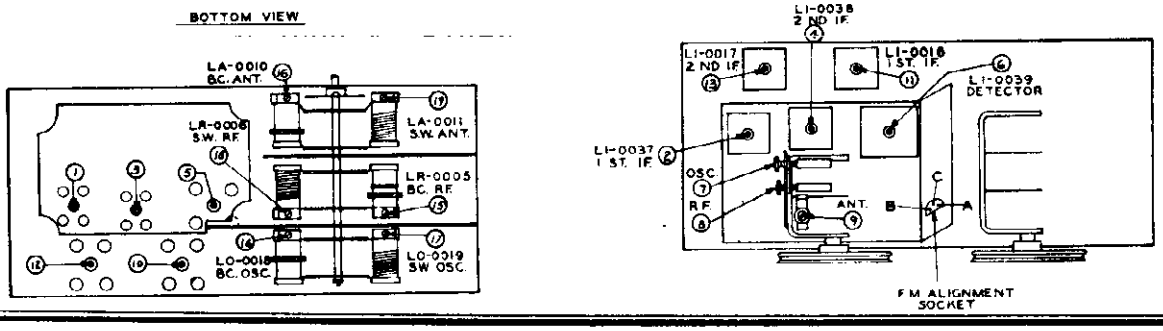
NOTE J. The I.F. adjustments are iron core slug tuning and it should not be necessary to move them very far in either direction from the factory setting since they are of a very stable nature.

NOTE K & L. Inductively couple signal generator to loop by wrapping one or two turns of wire around outside wire of loop and fasten one end to the high side of the signal generator. Rock gang while adjusting trimmers ⑱ and ⑲. In adjusting trimmer ⑰, be sure the image of the I.F. is at approximately 11. MC.

CAUTION: Do not knife gang unless absolutely necessary, and then with extreme care.

Replace gang dust cover before proceeding with FM alignment.

TRIMMER LOCATION CHARTS



HOWARD RADIO COMPANY

FM ALIGNMENT CHART

Set controls at indicated positions before following chart:

FM Dipole attached to chassis.
Volume control on full.
Set pointer between FM stations at low frequency end of dial.
Tone control in clockwise position.
Band Switch in FM position.
Adjust all trimmers for maximum sensitivity.

See Dummy Gen. Chart	Sig. Gen. Connection	Gen. Freq.	Band Switch Position	Dial Setting	Order of Slug and Trimmer Adjustments	Trimmer or Slug Function	See Notes Below
2	Point E on Circuit Diagram	10.7 MC	F.M.	Gang Closed	⑤	F.M. Det. Adj.	A & B
2	Point E on Circuit Diagram	10.7 MC	F.M.	Gang Closed	⑥ Adj. to zero voltage	F.M. Det.	C
2	Point D on Circuit Diagram	10.7 MC	F.M.	Gang Closed	①②③④	F.M.-I.F.	D
3	Ant. & Ground Socket on top F.M. Chassis	105 MC	F.M.	105	⑦⑧⑨	Osc. and R.F.-F.M.	E & F
3	Ant. & Ground Socket on top F.M. Chassis	90 MC	F.M.	90 MC		F.M.-R.F. Ind. Adj.	G H & I

A. Signal generator modulation off and turned up to about 100,000 microvolts.
B. Connect electronic voltmeter (equivalent to voltohmist) at point "B" of FM alignment socket as shown on the wiring diagram and turn slug (5) on trimmer location chart to extreme counter-clockwise position. Turn clockwise to lst peak and adjust to maximum. While making this adjustment, vary the output of the signal generator to a point which will give a reading of minus 2 volts.

C. Turn slug (6) to extreme counter-clockwise position. Connect electronic voltmeter to Point A of FM alignment socket and turn slug (6) until voltmeter is to zero voltage. Repeat adjustments given in Notes B & C until no further improvement can be made.

D. Connect voltmeter to Point B and generator at Point D. Adjust (1) (2) (3) (4), then retrim (5). Move voltmeter to Point A and recheck zero voltage. (Retrim if necessary.) These adjustments should be made with input signal necessary to produce approximately .7 volts at Point B.

E. Change generator dummy as shown on dummy antenna chart, Picture 3, and modulation on, and fasten generator to antenna socket on top of FM chassis.

F. Turn the first Detector or R.F. Trimmer 8 well to the left - almost open - so you will not have a locking condition and be able to locate the signal at 105 MC when turning Trimmer 7.

G. Should 90 M.C. signal not fall in at 90 M.C. on the dial, adjust F.M. oscillator coil to correct calibration. It is only necessary to press together or open the spacing on one turn of the coil to do so.
H. After adjusting oscillator coil for the correct calibration at 90 M.C., check the detector and antenna coil for proper tracking with the oscillator. If they do not track it will be necessary to adjust the detector and antenna coils for perfect tracking.
I. Repeat adjustments ⑦⑧⑨ until no further improvement can be made.

POWER SUPPLY -- (Standard Models) = 100-130 V. AC-DC CONSUMPTION 30 WATTS

SEE LABEL ON BACK OF CHASSIS

ANTENNA SYSTEM = Built-in loop on back of cabinet. Available connection for outside antenna from the back of the cabinet.

TUNING RANGE = 540-1600 KC and 6-18 MC.

I.F. - 455 KC | TYPE = Iron Core Tuned | POWER OUTPUT - (MAX.) 1.25W UPO .5 W.

TUNING SYSTEM = String Drive, Airplane Dial Full Vision.

SPEAKER = P.M. Size 5" | V.C.IMP. (400CPS) = 3.2 Ohms

IMPORTANT: To operate this receiver with voltages higher than 130 volts A.C. or D.C., it is necessary to use a voltage reducer cord.

5	Repeat operations 3 and 4							D
6	400 Ohm. Line	"A" Ant. Post	6 MC	A	6 MC	⑨⑩	Maximum	E
7	400 Ohm. Line	"A" Ant. Post	20 MC	B	20 MC	⑪⑫	Maximum	F
8	Accurately set signal generator at one MC and check through both short wave dials, harmonics to be one MC apart.							

NOTE A Important. Connect the signal generator to the antenna screw on the outside of the radio chassis and keep the metal of the chassis between the generator lead and the wave trap coil. Use your signal generator to a turned up powerful position and adjust the wave trap trimmer to null.

NOTE B Padding condenser adjustment for calibration at low frequency end of broadcast band.

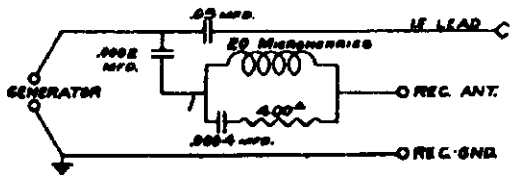
NOTE C Set dial at 1400 KC. Adjust oscillator and R.F. trimmer for maximum sensitivity.

NOTE D Check broadcast stations across dial for accuracy.

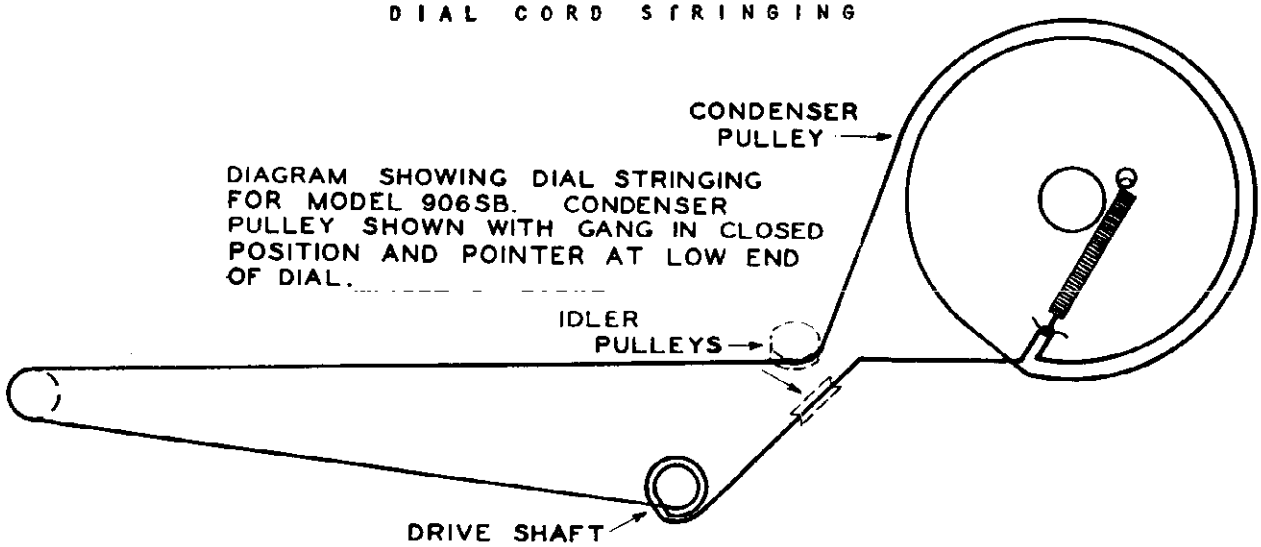
NOTE E True Signal at 6. Image at 5.

NOTE F True signal at 20. Image at 19.

RECOMMENDED DUMMY ANTENNA. Although the values as shown in above table for antenna load may be satisfactory, we urgently recommend the circuit as shown at the right to properly take care of the various frequencies to accomplish the correct alignment.



DIAL CORD STRINGING



"SOCKET VOLTAGE READINGS"

Voltage reading taken from ground with voltage at line set at 6 volts D.C. These readings were taken with a vacuum tube voltmeter of the VoltOhmyst Junior type. Amperage drain 3. Amps.

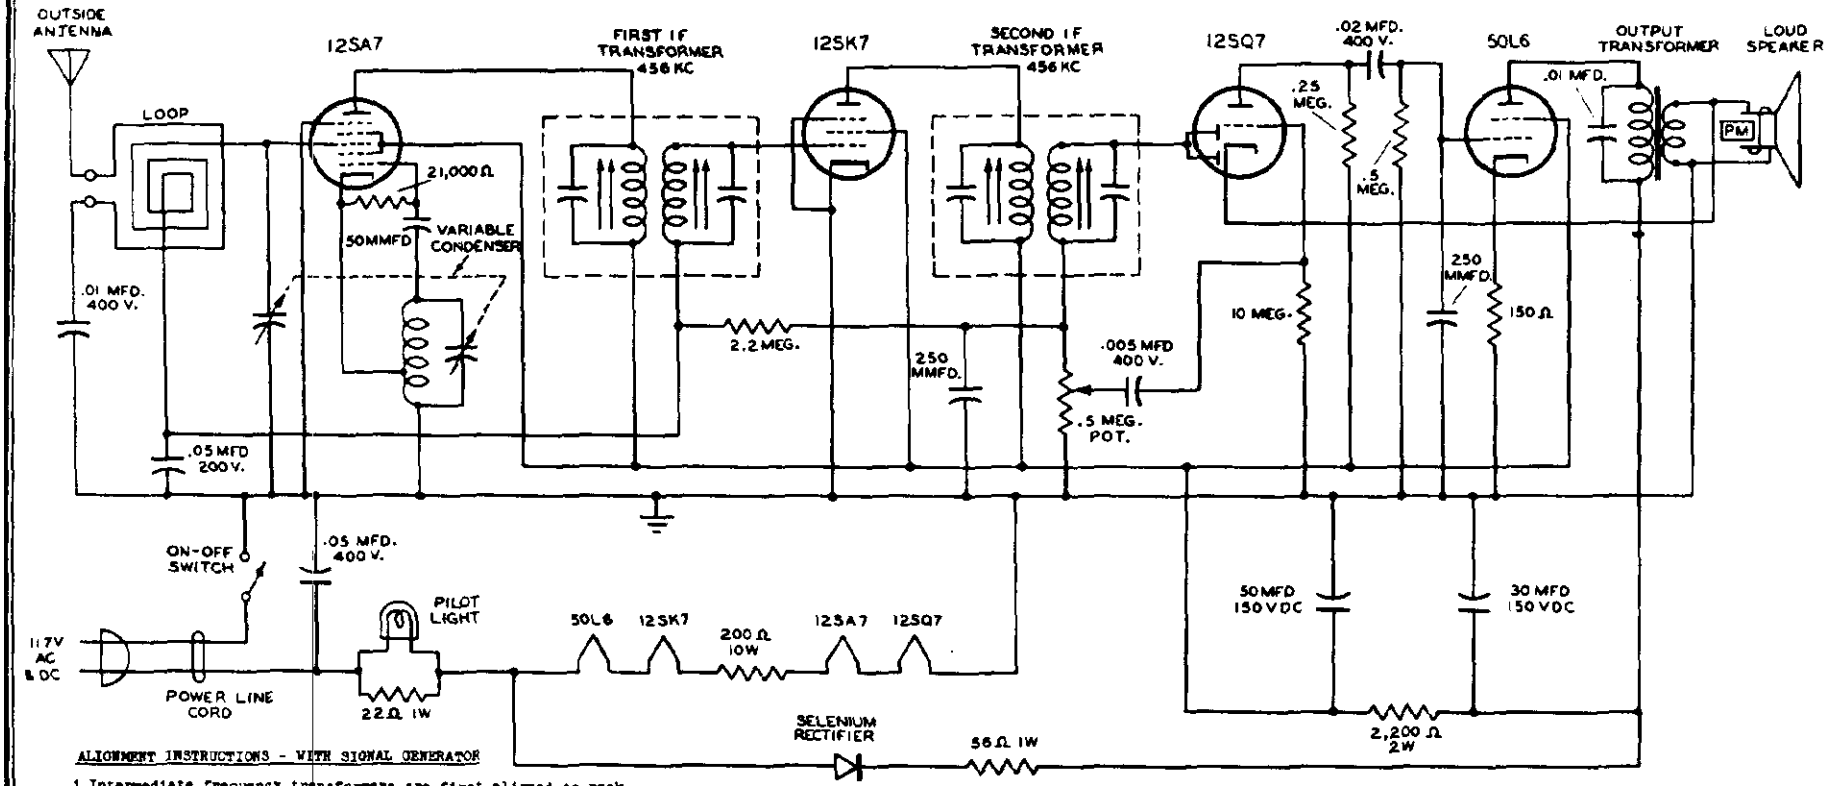
PR-0009	Ground Clip - Vib.
PR-0026	Battery Clip - Negative
PR-0027	Battery Clip - Positive



ALIGNMENT INSTRUCTIONS - WITH SIGNAL GENERATOR

1. Intermediate frequency transformers are first aligned to peak at 456 kilocycles. Set signal generator at 456 kilocycles. Connect Ground lead of signal generator to receiver chassis and the signal input lead from signal generator to the radio frequency section(large condenser plates) of the variable condenser or to the grid connections of 14A7 or 12SA7 tubes.

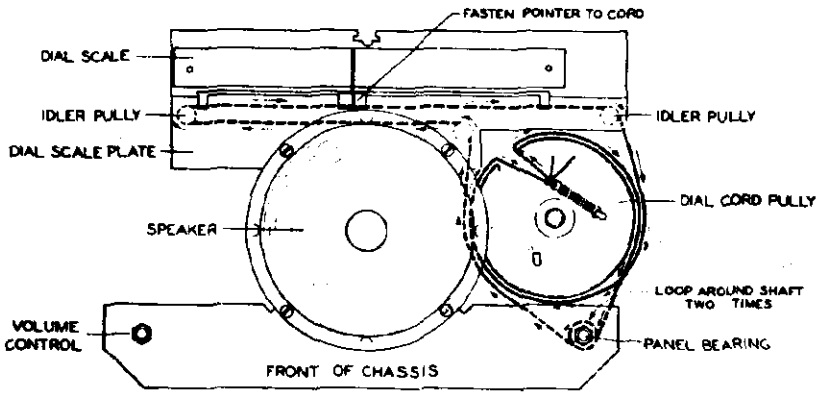
2. Have plates of variable condenser completely open (turn tuning knob as far to right as possible). Connect output meter to voice coil terminals of loud speaker, and tune for maximum signal volume.

3. Adjust both adjustment screws of second intermediate frequency transformer for maximum output signal over entire tuning range.

4. Repeat adjustments as in paragraph 82 above for first intermediate frequency transformer.

5. For radio frequency alignment adjustments, adjust signal generator to 1500 kilocycles, leaving input leads from signal generator to receiver same as in paragraph 50 above. Then set variable to 150 or 1500 kilocycles on dial scale. For maximum signal and most perfect alignment now adjust oscillator variable condenser section (small plates) trimmer condenser for strong 1500 kilocycle signal - without changing dial scale setting from 150. Then peak this 1500 kilocycle signal by slightly adjusting the radio frequency variable condenser (large plates) trimmer condenser.

6. Check the low end 55 dial position by adjusting signal generator to 550 kilocycles, which should result in good 550 kilocycle signal reception.



TROUBLE SHOOTING SUGGESTIONS

If receiver howls, oscillates or motorboats -

14	Condenser, paper - .05 mfd. 400 to 600 working volts	1
15	Condenser, variable - dual section with 1" dial cord pulley attached	1
16	Cord, Power Line (rubber covered for 110 volt Model 500K and fabric covered for 220 volt Model 500KE)	1
17	Grommets, Rubber (for shock mounting variable condenser)	3
18	Knobs, Plastic (for tuning and volume control adjustments)	2
19	Light, Pilot (#44 single bayonet, 6-8 volts at 150 milliamperes)	1
20	Lockwashers, Steel - #6 for 6-32 machine screws - used as follows: 2 for speaker to dial plate; 4 for I. F. transformer	6
21	Lockwashers, Steel - #8 for 8-32 machine screws - used as follows: 2 for speaker to chassis; 2 for loop to loop bracket	4
22	Lockwashers, Steel - 3/8" inside diameter-used as follows: 1 for potentiometer volume control; 1for panel bearing	2
23	Lockwasher, Steel - #4 for 4/40 screws - used as follows:- 2 for loop bracket to chassis; 8 for sockets; 2 for adeptor plate; 1 for selenium rectifier	13
24	Nuts, Steel - 4/40 hexagon - used same as 4/40 lockwashers	13
25	Nuts, Steel - 6-32 hexagon - used same as #6 lock-washers	6
26	Nuts,Steel - 8-32 hexagon - usedsame as #8 lock-washers plus 2 additional for speaker to dial plate	6
27	Nuts,Steel - 3/8" by 36 thread hexagon - used same as 3/8" lockwashers	2
28	Plate, Dial - for mounting dial scale and idler pulleys	1
29	Plate, Selenium Rectifier Adaptor - for mounting over socket hole and then for mounting selenium rectifier	1
30	Pointer, Dial Scale	1
31	Dial Scale	1
32	Potentiometer or Volume Control with power supply "on-off" switch - 500,000 ohms	1
33	Pulleys, Idler - for dial cable and dial scale pointer assembly - rivet to back of dial plate	3
34	Rectifier, Selenium	1
35	Relief, Grip Strain - 2 pieces - plastic - for securing power line cord through rear of chassis to relieve strain on soldered connections when power supply cord is plugged in to power supply outlets	1
36	Resistor, Carbon 22 ohms 1 watt - (red-black color code)	1
37	Resistor, Carbon 56 ohms 1 watt - (green-blue-black color code)	1
38	Resistor, Carbon 150 ohms 1 watt - (brown-green color code)	1
39	Resistor, Carbon 200 ohms 10 watt - not color coded - usually marked with resistance value - has hole through center. This resistor is connected in filament circuit of tubes (from No. 3 of 12SA7 tube to No. 4 of 12SK7 tube) and is the PROTECTIVE FILAMENT CIRCUIT RESISTOR preventing current surge through filaments thus decreasing or eliminating tube burnouts and accordingly increasing tube life.	1
40	Resistor, Carbon - 2200 ohms 2 watts (red-red-red color code)	1
41	Resistor, Carbon - 21,000 ohms ½ watt (red-brown-orange color code)	1
42	Resistor, Carbon - 220,000 ohms ½ watt (red-red-yellow color code)	1
43	Resistor, Carbon - 470,000 ohms ½ watt (yellow-purple-yellow color code)	1
44	Resistor, Carbon - 2.2 megohms ½ watt (red-red-green color code)	1
45	Resistor, Carbon - 10 megohms ½ watt (brown-black-blue color code)	1
46	Rivets - shoulder - for attaching idler pulleys to back of dial plate	3
47	Rivets - Low oval head - for riveting dial scale to dial scale plate	2
48	Screws, Machine Steel - 4/40 x 3/8 binding head - used as follows:-8 for sockets; 2 for adaptor plate; 2 for loop brackst to base	12
49	Screws, Machine Steel - 6/32 by 3/4 inches long binding head - use as follows: 2 for loudspeaker to dial scale plate; 3 for mounting variable condenser	5
50	Screws, Machine Steel - 4/40 by 1½inches long - binding head - for mounting selenium rectifier.	1
51	Screws, Self-tapping steel - No. 6 by 3/4 inches long-binding head - for fastening chassis into cabinet	3
52	Screws, Machine Steel - 8/32 by ½ inches long - binding head - for loop to loop bracket.	4
53	Sockets, Octal-wafer	4
54	Socket, Pilot Light, with leads attached	1
55	Spacers, Steel - ½ inch diameter by 3/8 inch long with clearance hole for 6/32 machine screw - use for mounting variable condenser.	3.
56	Speaker, Permanent Magnet - 5 inch with attached output transformer	1
57	Spring, Dial Cable - for keeping tension in dial cable	1
58	Strip, Terminal - 4 lug with insulated mounting lug	2
59	Transformers, Intermediate Frequency - (Air) condenser tuned 456KC	2
60	Tube, Octal - 12SA7 - pentagrid converter	1
61	Tube, Octal - 12SK7 - triple-grid super-control amplifier	1
62	Tube, Octal - 12SQ7 - duplex-diode high-mu triode	1
63	Tube, Octal - 50L6 - beam power amplifier	1
64	Tubing, Insulating (Spaghetti) small - red - for insulating connections to 200 ohm resistor - pieces 1 inch long	2 pieces
65	Tubing, Insulating (Spaghetti) large - yellow - for insulating selenium rectifier connections - pieces 1 inch long	2 pieces
66	Washers, Felt - for under knobs on panel bearing and potentiometer (volume control)	2
67	Washer, Fibre - 1/2 inch diameter by 1/8 inch thick with 3/16" center hole - for spacing selenium rectifier	1
68	Washers, Metal - 3/8 inch diameter with No. 5 clearance hole - used as follows:- 6 for variable condenser; 2 for dial scale rivets	8
69	Washers, Ripple - metal ½ inch diameter with No.6 clearance hole - for use with item No. 49 self-tapping screws to fasten chassis into cabinet	3

ALL VOLTAGE AND RESISTANCE MEASUREMENTS MADE WITH RESPECT TO CHASSIS GROUND. AND WITH A LINE VOLTAGE 116 V.A.C.

ALIGNMENT PROCEDURE

Connect output meter across Voice Coil.

Connect the signal generator to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers for maximum output in the following order: L6, L5, L4, L3. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1600 kc and adjust the oscillator trimmer C4A for maximum output.

Set the signal generator and receiver to 1400 kc and adjust the antenna trimmer C3A for maximum output.

Set the signal generator and receiver to 1400 kc and readjust oscillator trimmer C3A for maximum output.

Alignment Procedure

IF ALIGNMENT

Remove chassis from cabinet. Connect an output meter across the voice coil. Connect the signal generator to the standard Hazeltine loop, Model 1150 and couple it loosely to the receiver loop.

Set the signal generator to 455 KC and fully mesn the receiver tuning capacitor. Keep the receiver volume control at maximum and the output of the signal generator sufficient to give a readable deflection on the output meter. Adjust for maximum IF trimmers, C8, C7, C6, C5.

RF OSC ADJUSTMENT

Keeping the same setup as used for the IF Alignment, set the signal generator and receiver to 1600 KC and adjust oscillator trimmer C2 for maximum output.

Set the signal generator and receiver to 1400 KC and adjust RF trimmer C4 for maximum output.

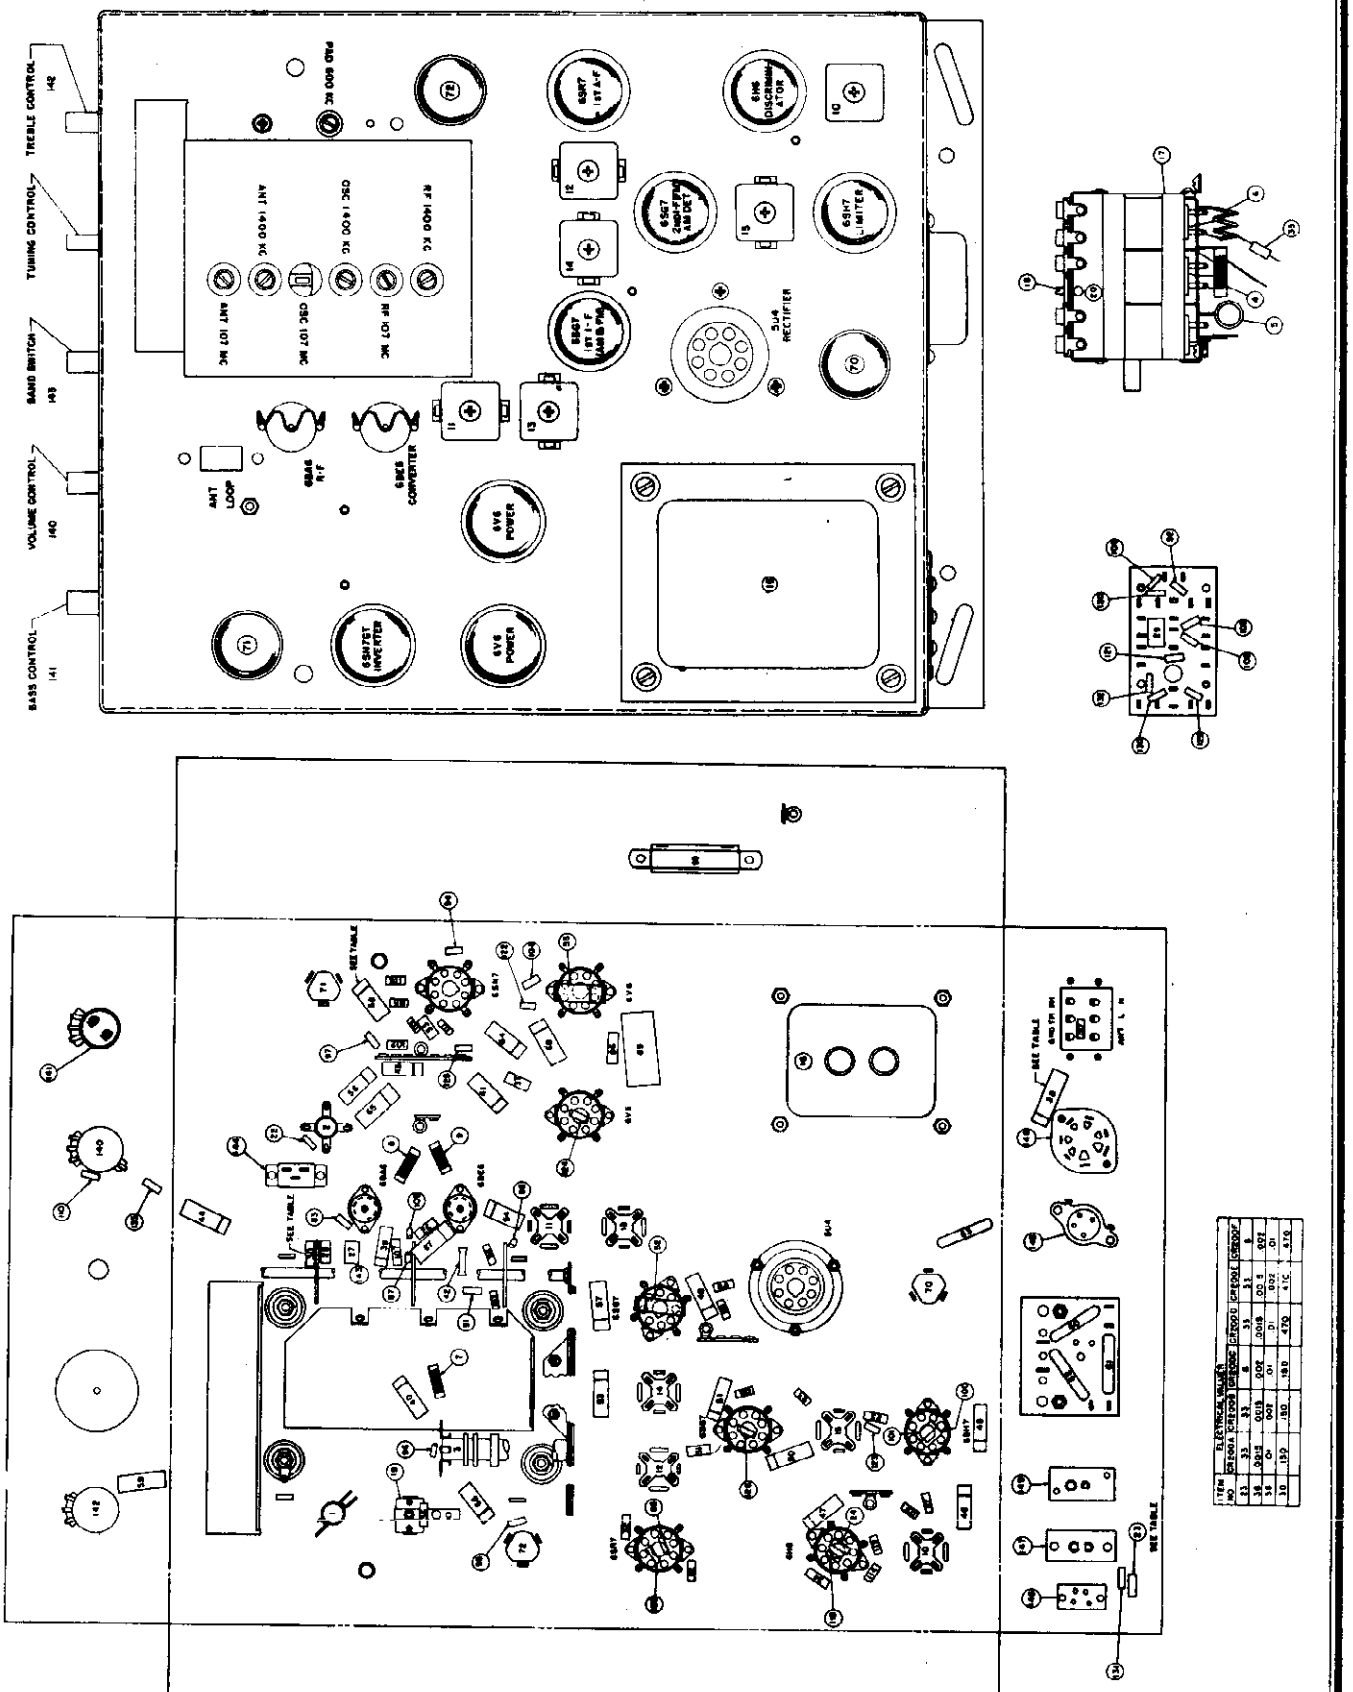
MODELS CR-200 SERIES

THE MAGNAVOX CO.



ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of greater than 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

AM ALIGNMENT

I-F ALIGNMENT

1. Set volume, treble, and bass controls to maximum. Set Band Switch to Broadcast position, and dial pointer to 1000 kc.

2. Tune the signal generator to EXACTLY 455 kc.

3. Connect output of modulated signal generator to the signal grid of the 6BE6 (pin 7) through a .01 mfd. capacitor and signal generator ground to radio chassis.

4. AM and FM i-f transformers on this model are separate and can be identified on the chassis layout diagram Figure 3.

5. Connect output meter across voice coil of speaker and adjust the i-f transformers for peak output as indicated on the output meter.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 40 kc. sweep to signal grid of 6BE6 (pin 7) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 150,000 ohm diode load resistor. Align for best possible peak and symmetry.

R-F ALIGNMENT

1. Connect signal generator through .00025 mfd. capacitor to antenna and ground terminals on antenna terminal strip on rear of chassis. Be sure "Ant-loop" switch on top of the chassis is in the ANT. position. Connect output meter as for AM i-f alignment.

2. Tune signal generator to 1400 kc.

3. Set dial to 1400 kc. and adjust oscillator, r-f and antenna trimmers to maximum output on meter.

4. Set signal generator to 600 kc. and tune radio to signal. Adjust the 600 kc. padder to maximum output while simultaneously rocking the dial.

5. 1400 kc. calibration should then be checked and re-adjusted if necessary with the 1400 kc. oscillator trimmer.

The pointer on the radio dial should line up with t first vertical mark on the low frequency end of t dial glass. If the pointer does not line up, loosen t pointer on the dial string and move it to correct po tion. Re-tighten and re-cement the pointer to t string. Be sure the gang is fully meshed for t pointer alignment. Align AM first.

FM ALIGNMENT

DISCRIMINATOR ALIGNME

1. Tune signal generator to EXACTLY 10.775 mc connect to pin 4 of the 6SH7 Limiter tube s through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter bet point "B" on schematic diagram and ground (a .00047 mfd. capacitor—Pin 6 on 6H6 to ground)

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be w 10% of the voltage at 10.775 mc. and of opp polarity.

Note: If the signal generator is not capable of s ient output to produce a readable DC voltage amplification of the last i-f stage can be use increase the signal input to the limiter for dis inator alignment. To accomplish this, align the i-f stage as indicated in "IF Alignment". Then discriminator as above leaving the signal gene connected to the grid of the 6SG7 2nd i-f tube.

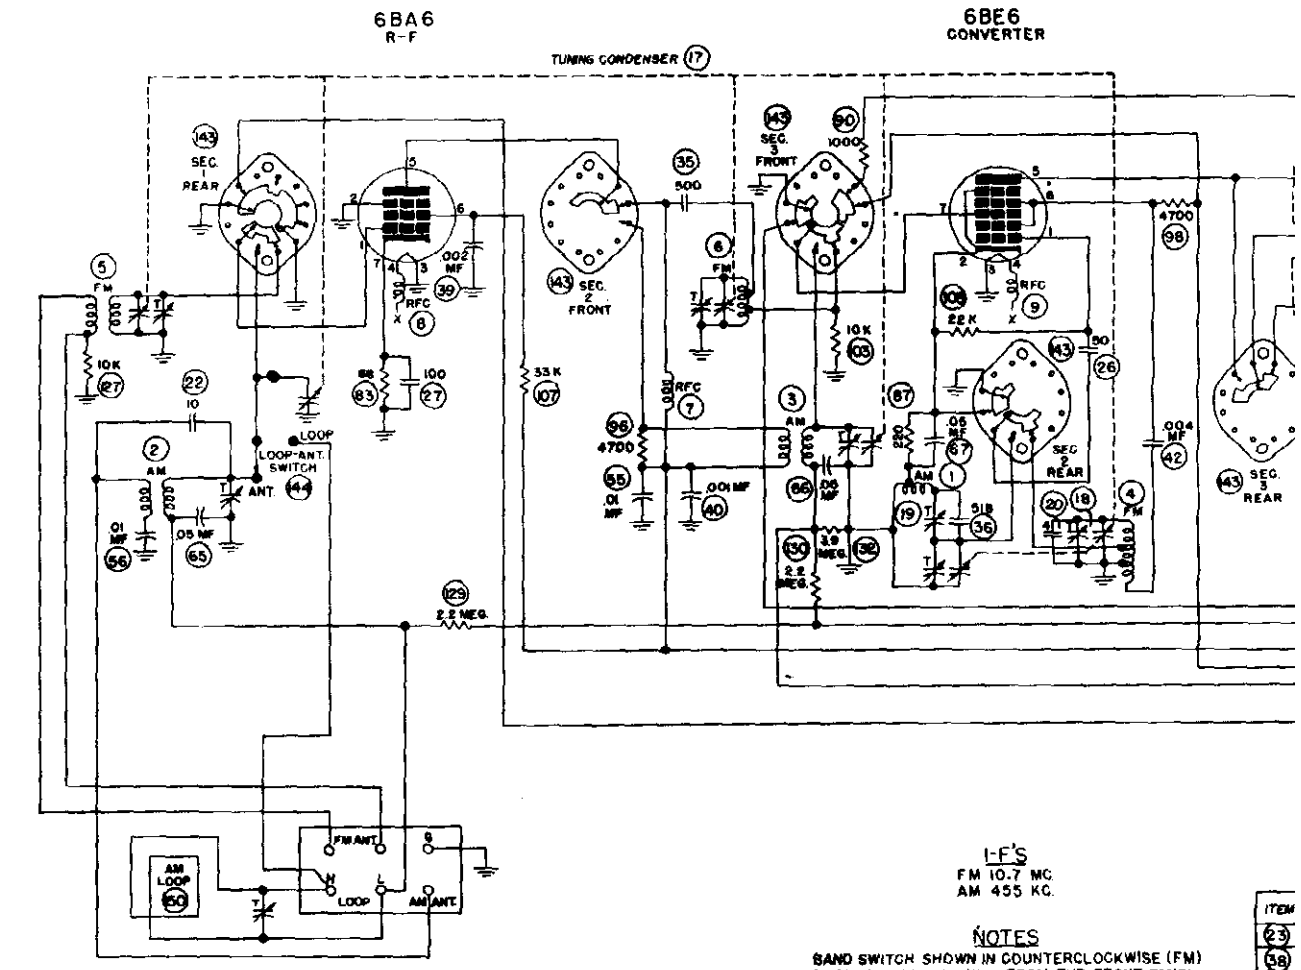
I-F ALIGNMENT

1. Connect high side of signal generator, thro .01 mfd. capacitor and a 1000 ohm resistor in s to pin 4 of the 6SG7 2nd i-f tube. Connect low si generator to chassis.

2. Close gang condenser and connect vacuum voltmeter across 220,000 ohm limiter grid res (Point "A" on schematic to ground). Adjust s generator output until a reading of at least 3 vo obtained. In order to reduce regeneration cause the vacuum tube voltmeter leads, a 1-megohm lating resistor, connected with as short leads as sible to point "A" should be used in series wit vacuum tube voltmeter. Align the 3rd i-f transfo for best peak as indicated on voltmeter.

3. Repeat above for each succeeding transform connecting signal generator to signal grid of fi tube 6SG7 then to the signal grid of 6BE6 conv The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligne not repeak with the signal into the grid of the



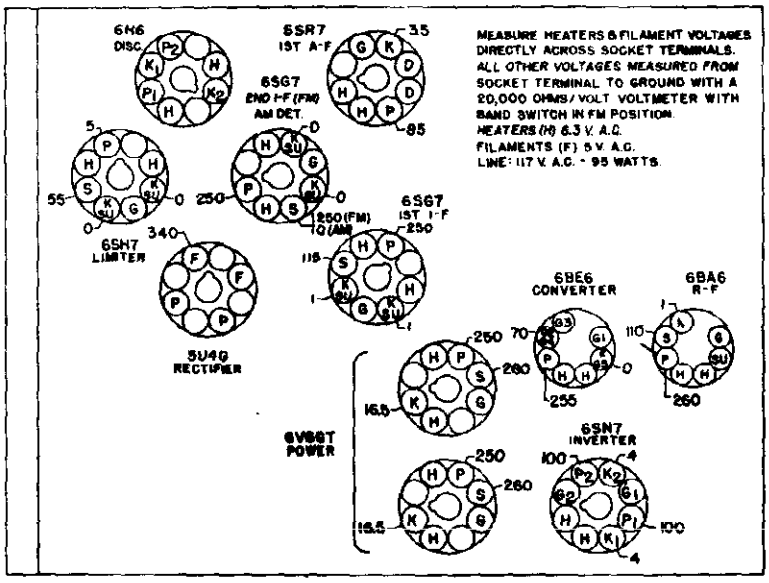
I-F'S
FM 10.7 MC.
AM 455 KC.

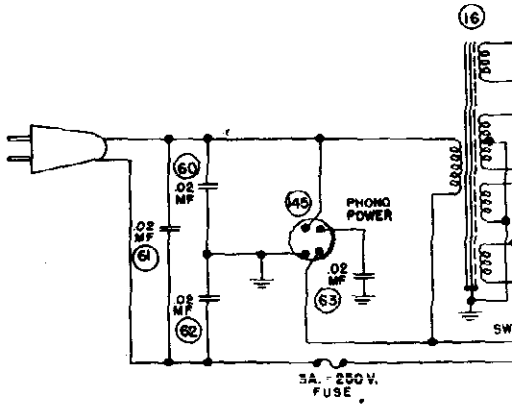
NOTES

BAND SWITCH SHOWN IN COUNTERCLOCKWISE (FM) POSITION WHEN VIEWED FROM THE FRONT PANEL.

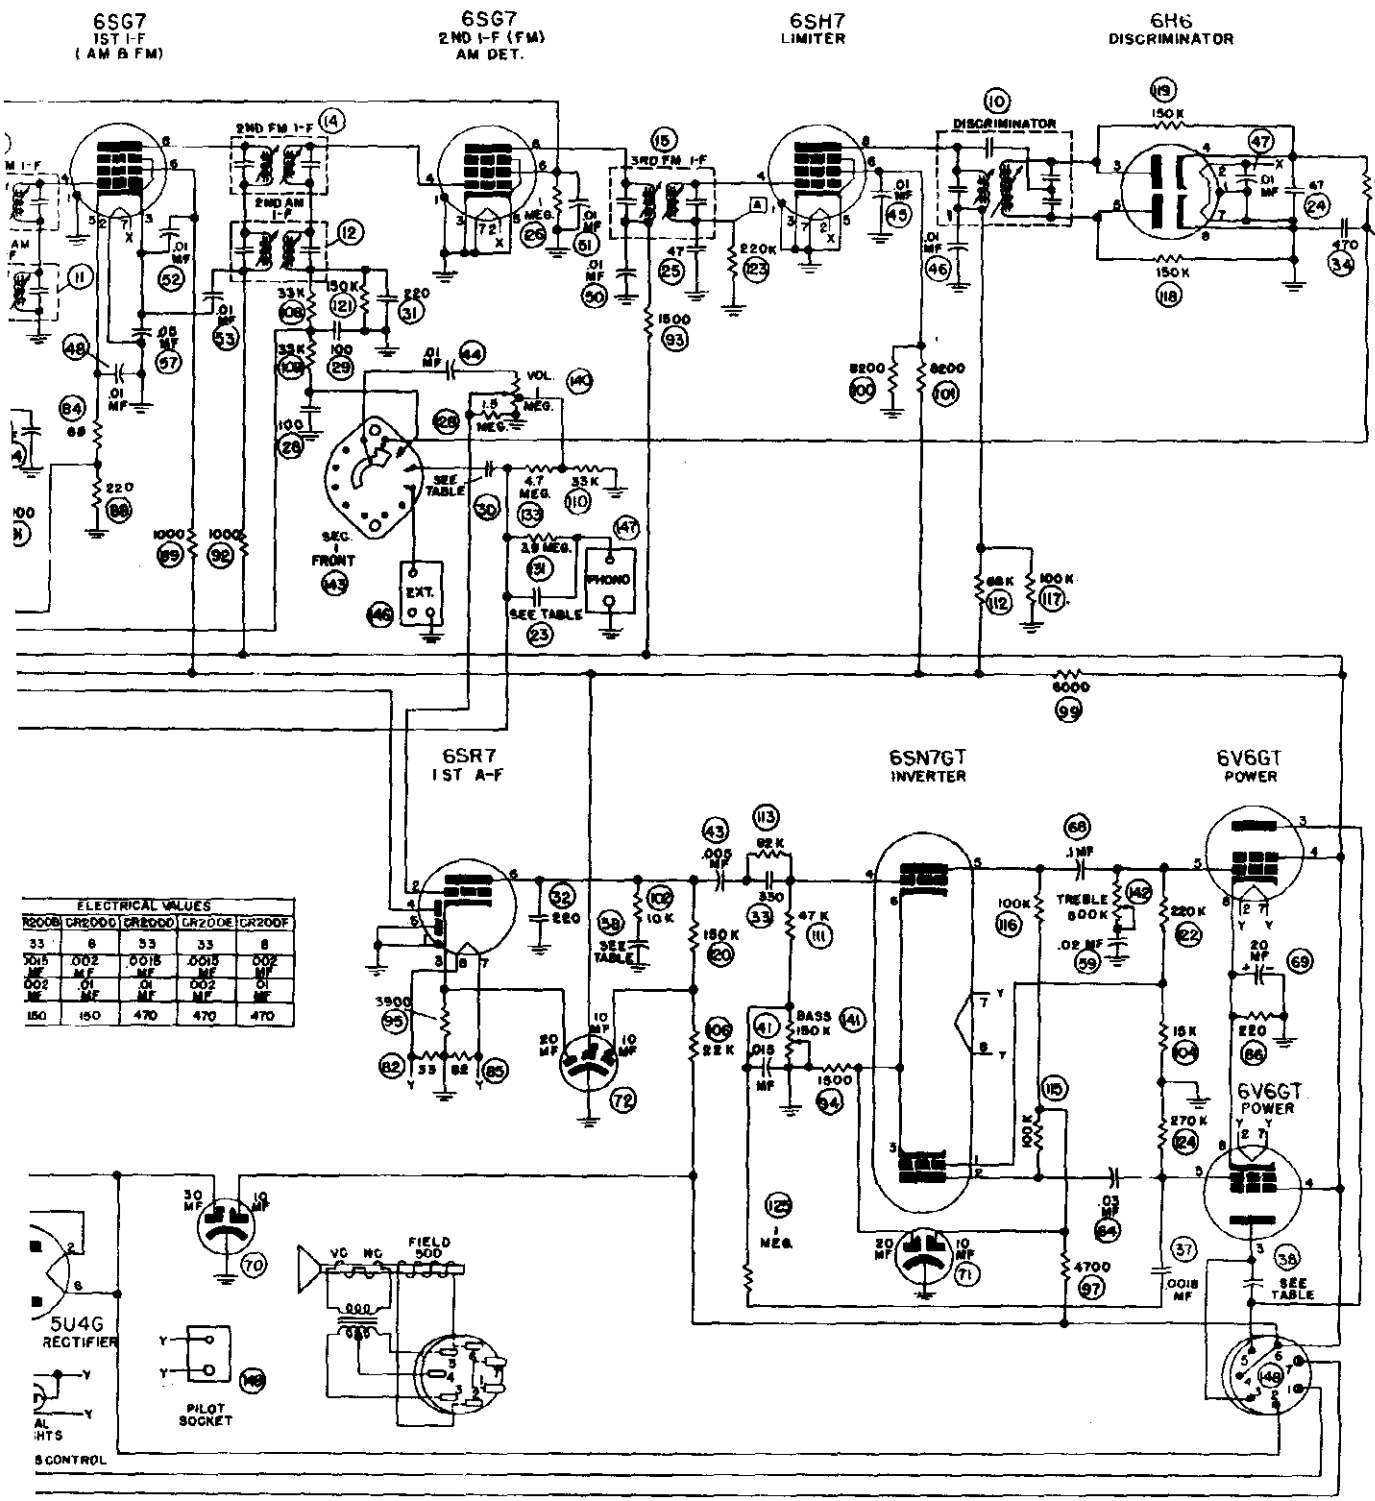
ALL ELECTRICAL VALUES SHOWN ARE IN OHMS OR MICROMICROFARADS UNLESS OTHERWISE SPECIFIED.

LETTERS SHOWN IN SQUARES DESIGNATE METER CONNECTION POINTS FOR ALIGNMENT DESCRIBED IN TEXT.





Models CR-200A, CR-200B and CR-200C a
except for circuit variations to provide
response in each of three different cabinets.
production of the CR-200 series chassis, CR-
and C were replaced by CR-200D, E and F
tively that incorporate a circuit change to
increased bass response at low volume se



e phonograph position. These circuit variations are
t all shown in the table on the schematic diagram,
r Figure 2.
3

CR-200A/D chassis is incorporated in the Model 240
Traditional, CR-200B/E in the Model 235 Chairside
and CR-200C/F in the Model 239 Mayfair.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter. Adjust signal generator output until a reading of at least 3 volts is obtained.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the dial while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

Antenna Post to R-F Grid at:

Speaker:	
Field coil resistance	500 ohms
Voice coil impedance (400 cycles)	3.0 ohms
Output transformer	8,000/3 ohms

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-200 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length excluding spring 19½ inches. Hook loop over the metal hook in pulley "D" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the dial assembly keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back;* then around the opposite side of pulley "D" into the pulley through the slot. Hook the end of tension spring "F" in the hole provided in pulley "D", completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slip a one-half inch length of sleeving over a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 19⅝ inches end to end excluding spring.

Place spring hook in top hole and draw cable through slot of pulley "D". Loop one end of cable around pulley "D" in a clockwise direction in front of condenser drive cable (viewing dial assembly from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulleys "B" and "C" as shown in Figure 1.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringihg operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of approximately 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

AM ALIGNMENT

I-F ALIGNMENT

1. Set treble control to SHARP TUNE position. Set volume and bass controls to maximum, the Band Switch to Broadcast position, and dial pointer to 1000 kc.

2. Tune the signal generator to EXACTLY 455 kc.

3. Connect output of modulated signal generator to the signal grid of the 6SB7Y (pin 8) through a .01 mfd. capacitor and signal generator ground to radio chassis.

4. All i-f transformers on this chassis are slug-tuned. Both slug adjustments for 455 kc. are located on top of the transformers; the 10.7 mc. adjustments are accessible on the bottom.

5. Connect output meter across voice coil of 12-inch speaker and peak in order the third, second and first i-f transformers.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 40 kc. sweep to signal grid of 6SB7Y (pin 8) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 220,000 ohm diode load resistor. Align for best possible peak in sharp tune position and symmetry in full range position.

BROADCAST BAND R-F ALIGNMENT

1. Connect signal generator through .00025 mfd. capacitor to antenna and ground terminals on antenna terminal strip on rear of chassis. Be sure "Ant-loop" switch on top of the chassis is in the ANT. position. Connect output meter as for AM i-f alignment.

2. Tune signal generator to 1400 kc.

3. Set dial to 1400 kc. and adjust oscillator, r-f and antenna trimmers for maximum indication on meter.

4. Set signal generator to 600 kc. and tune radio to signal. Adjust the 600 kc. padder to maximum output while simultaneously rocking the gang.

5. 1400 kc. calibration should then be checked and re-adjusted if necessary with the 1400 kc. oscillator trimmer.

The pointer on the radio dial should line up with the first horizontal mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the screws on the pointer drive pulley at the end of the tuning gang and adjust the pointer setting; tighten the screws after this adjustment. Be sure the gang is fully meshed for this pointer alignment.

SHORT WAVE BAND R-F ALIGNMENT

1. Set the Band Switch to Short Wave and replace the .00025 mfd. capacitor in series with the signal generator lead to the antenna terminal, with a 400-ohm resistor.

2. Set the signal generator and the receiver to 15 mc. and adjust the oscillator, r-f and antenna trimmers for maximum indication on the meter. While adjusting the 15 mc. oscillator trimmer, two peaks may be observed; only one is the correct peak for 15 mc. alignment. To obtain the correct peak, screw trimmer in to maximum capacitance, then decrease until the first peak is observed. This is the correct one.

Another method for checking for the correct peak is to tune the receiver to 15.91 mc. with signal generator at 15 mc. and with the output increased. If the 15 mc. oscillator is properly aligned, the signal will be received at 15.91 mc.—if incorrectly aligned, the signal will be received at 14.09 mc.

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter from Pin 4 on 6H6 tube socket to ground through a 1 megohm isolating resistor.

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a

.01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Points "A" to "X" on schematic). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for the 2nd and 1st transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6SB7Y converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligned, do not repeak with the signal into the grid of the 6SB7Y.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment. Adjust signal generator output until a reading of at least 3 volts is obtained.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the gang while adjusting the r-f trimmer.

STAGE GAINS*

Antenna Post to R-F Grid at:

600 kc.	5.8
6.5 mc.	2.9
98 mc.	1.0

R-F Grid to Converter Grid at:

600 kc.	11.6
6.5 mc.	9.5
98 mc.	6.8

R-F on Converter Grid to 455 kc. or I-F Grid at:

600 kc.	1.7
6.5 mc.	2.4
98 mc.	6.8

I-F on Converter Grid to 1st I-F Grid at:

455 kc. (dial pointer at 600 kc.)	2.6

1st I-F Grid to 2nd I-F Grid at:

455 kc.	20.5
10.7 mc.	37

2nd I-F Grid to Limiter Grid at:

10.7 mc.	34.5

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output** at 400 cycles is:
.015 volt with Amplifier AMP-109
with Band Selector Switch in BDCST setting.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:

600 kc.	4.5V.
6.5 mc.	4.6V.
98 mc.	5.4V.

or 0.3 ma. through 15,000 ohm Oscillator Grid Resistor at 600 kc., 0.31 ma. at 6.5 mc. and 0.36 ma. at 98 mc.

*Variations of ± 20% are permissible. All AM readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 watt speaker output at 400 cycles is equivalent to a reading of 1.22 V. as measured by a high resistance AC voltmeter across the voice coil.

**0.1 watt speaker output at 400 cycles is equivalent to a reading of 0.55 volts as measured by a high resistance AC voltmeter across the voice coil.

10 KC. FILTER ADJUSTMENT

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment the following procedure should be observed:

1. Adjust the treble control switch to the No. 4 setting.

2. Connect the output of an audio oscillator to the phonograph pickup socket on the radio chassis and adjust the oscillator to exactly 10,000 cycles.

3. Set the band selector to PHONO and adjust the 10 kc. trimmer for *minimum* output.

4. If an audio oscillator is not available for making this adjustment set the band selector to BDCST, set the treble control to position 4, connect the antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

DIAL CORD REPLACEMENT

Rotate the brass pulley designated "A" in Figure 1 until the dial pointer strikes the stop at the high frequency end of the dial calibration. In this condition the slot in pulley "A" should be approximately ten degrees to the left of being vertical—see Figure 1. If the slot in the pulley is in some other position under the above mentioned conditions, the pointer set screw is probably loose and has allowed the pointer to slip.

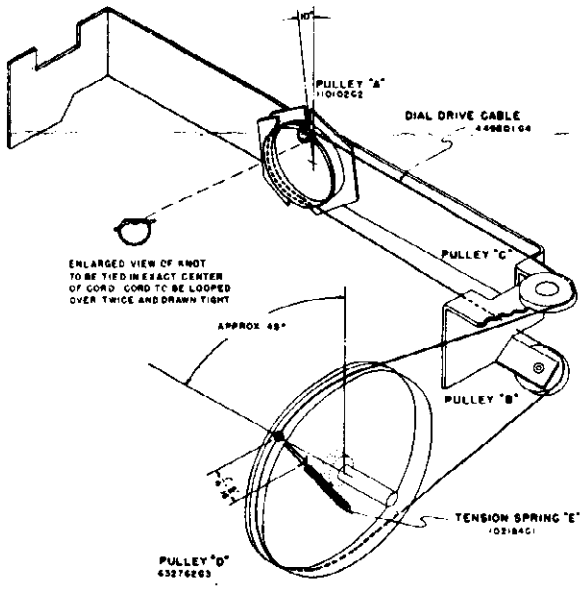

FIGURE 1

To correct this condition, first remove the glass dial and loosen the pointer screw. Then while holding pulley "A" so that its slot is approximately ten degrees to the left of vertical (when viewed from the rear) adjust the pointer until it is resting against the stop at the high frequency end of its travel. Then tighten the pointer set screw securely and replace the glass dial.

Completely unmesh the condenser gang and check the location of the hole or slot in pulley "D." If this hole is not approximately 45 degrees back from vertical as shown on Figure 1, loosen the two No. 6 Allen set screws in the hub of pulley "D" and slip the pulley on its shaft (while holding the condenser gang unmeshed) until the specified adjustment is obtained; then tighten one of the set screws securely. It will be shown later that this is a temporary setting. Next, tie a double knot in the exact center of a 25-inch length of dial cable and fold the cable back on itself so that the knot is at one end. The correct method for tying this knot is shown as an inset on Figure 1. Grasp the cable near the knotted end and slide it into the pulley slot so that the knot is against the inside rim of the pulley as shown in the sketch. The piece of cable nearest the dial frame should be wound in the direction shown for one-half turn; then over the lower pulley "B," around the bottom of the large pulley "D" and into the hole. Pull the cable taut and wrap the end around the small hook on pulley "D" temporarily.

The remaining piece of cable should be wound around pulley "A" in the direction shown, for one complete turn, over the upper pulley "C," and over the top of pulley "D." Thread the end through the small hole in pulley "D" and pull both ends of the cable taut. With one end of tension spring "E" fastened to the hook on pulley "D" lace the two free ends of the cable through the opposite end of the spring and tie a knot at a point that will allow ¼" to 5/16" of cable between the spring and the inside rim of pulley "D." Be sure to tie the knot around one coil of the spring in the manner shown.

Now with the condenser gang completely meshed, check the position of the dial pointer. If it is not in line with the last calibration mark at the low frequency end of the dial, loosen the set screw in pulley "D" and turn it until the pointer is in the specified position. Be sure that the condenser gang does not move during this adjustment. Then tighten the two screws in pulley "D" securely completing the operation.

CONDENSER GANG DRIVE ADJUSTMENTS

Whenever any of the mechanical parts in the condenser gang drive assembly require replacement due to rough handling or for any other reason, it is extremely important that clearances and adjustments shown on Figures 2 and 3 are correct; otherwise, the tuning mechanism will be sluggish or it may slip during operation.

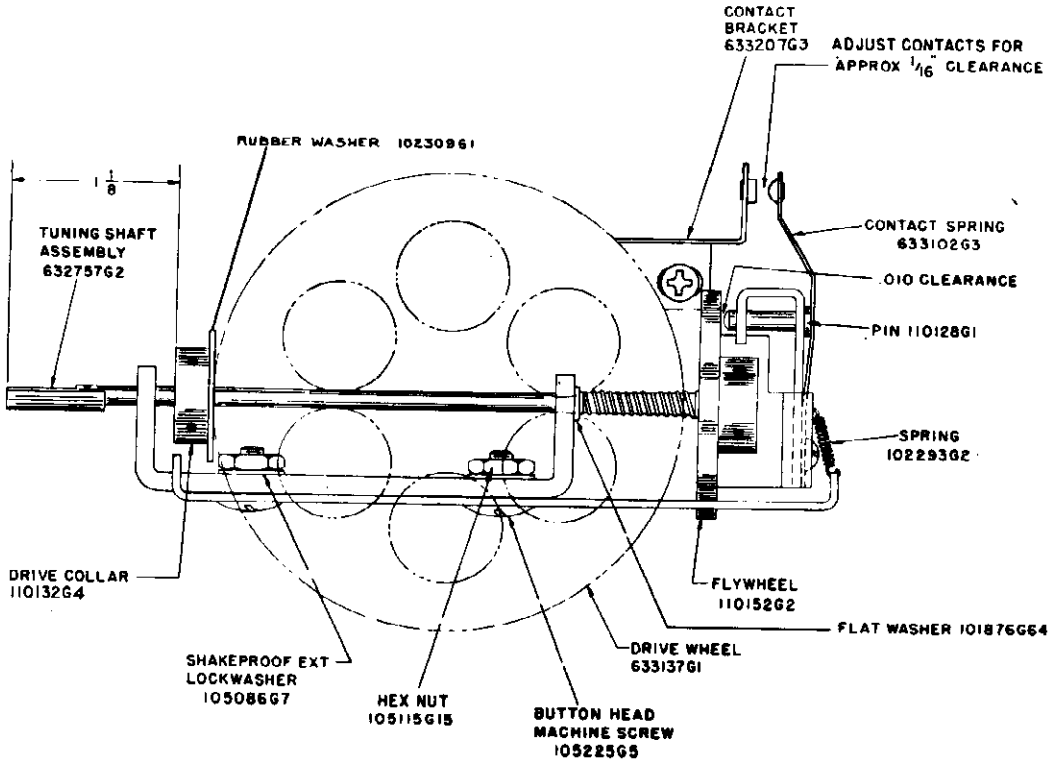

FIGURE 2

In reassembling the mechanism after any part was replaced, follow the procedure outlined below:

1. Assemble the Tuning Shaft, Drive Collar, Compression Spring and Flywheel in the order shown on Figure 3. The distance between the front of the Drive Collar and the front of the Tuning Shaft must be 1⅛ inches as specified on Figure 2. Install the Flywheel on the rear of the Tuning Shaft and slide it forward until it nearly touches the edge of the Drive Wheel; then tighten one of the set screws in the Flywheel hub. Insert a .010" gauge between the Flywheel and the Pin, and while holding the gauge in this position, loosen the set screw in the Flywheel hub that was previously tightened. The Compression Spring should force the Flywheel back against the gauge—when this occurs, tighten both set screws in the Flywheel hub.

2. Adjust the Muting Switch contact clearance by loosening the two screws in the Contact Bracket and sliding the bracket in the required direction until a 1/16" clearance is obtained. If this adjustment cannot be obtained in the manner prescribed, bend the Contact Bracket until proper clearance is realized.

3. The Drive Wheel is properly located on its shaft when its edge nearest the hub is in line with the outside edge of the Drive Collar as shown on Figure 3. Two Allen set screws in the Drive Wheel hub provide a means of adjusting the position of this wheel.

4. When the adjustment outlined in paragraph 2 is correct, the proper contact clearance will automatically be obtained when the Muting Switch is to be "unmuted" while the push buttons are being set. While pressure is applied to any one of the push buttons while they are being set up, a pressure applied simultaneously to the Tuning Control knob will cause the Muting Switch contacts to open. Detailed instructions on setting up these push buttons are shown elsewhere in this bulletin.

5. If the push button shafts at both ends do not engage the Treadle Bar as shown on Figure 3, the three screws in the Treadle Bar must be loosened and the Treadle Bar should be moved until the required condition is obtained.

DIAL CORD REPLACEMENT

Rotate the brass pulley designated "A" in Figure 1 until the dial pointer strikes the stop at the high frequency end of the dial calibration. In this condition the slot in pulley "A" should be approximately ten degrees to the left of being vertical--see Figure 1. If the slot in the pulley is in some other position under the above mentioned conditions, the pointer set screw is probably loose and has allowed the pointer to slip.

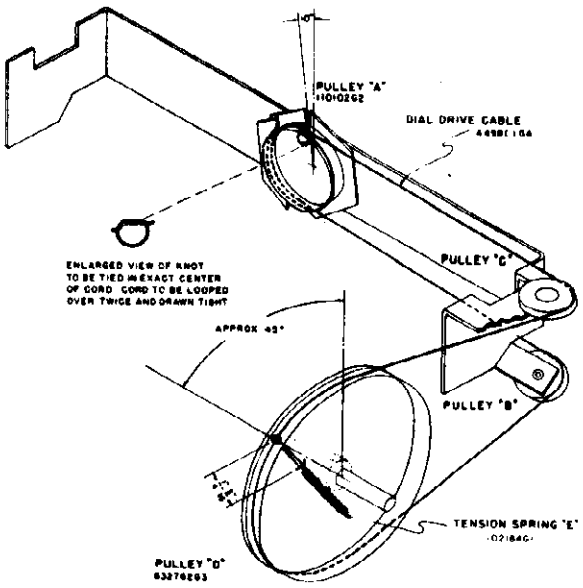

FIGURE 1

To correct this condition, first remove the glass dial and loosen the pointer screw. Then while holding pulley "A" so that its slot is approximately ten degrees to the left of vertical (when viewed from the rear) adjust the pointer until it is resting against the stop at the high frequency end of its travel. Then tighten the pointer set screw securely and replace the glass dial.

Completely unmesh the condenser gang and check the location of the hole or slot in pulley "D." If this hole is not approximately 45 degrees back from vertical as shown on Figure 1, loosen the two No. 6 Allen set screws in the hub of pulley "D" and slip the pulley on its shaft (while holding the condenser gang unmeshed) until the specified adjustment is obtained; then tighten one of the set screws securely. It will be shown later that this is a temporary setting. Next, tie a double knot in the exact center of a 25-inch length of dial cable and fold the cable back on itself so that the knot is at one end. The correct method for tying this knot is shown as an inset on Figure 1. Grasp the cable near the knotted end and slide it into the pulley slot so that the knot is against the inside rim of the pulley as shown in the sketch. The piece of cable nearest the dial frame should be wound in the direction shown for one-half turn; then over the lower pulley "B," around the bottom of the large pulley "D" and into the hole. Pull the cable taut and wrap the end around the small hook on pulley "D" temporarily.

The remaining piece of cable should be wound around pulley "A" in the direction shown, for one complete turn, over the upper pulley "C," and over the top of pulley "D." Thread the end through the small hole in pulley "D" and pull both ends of the cable taut. With one end of tension spring "E" fastened to the hook on pulley "D" lace the two free ends of the cable through the opposite end of the spring and tie a knot at a point that will allow ¼" to 5/16" of cable between the spring and the inside rim of pulley "D." Be sure to tie the knot around one coil of the spring in the manner shown.

Now with the condenser gang completely meshed, check the position of the dial pointer. If it is not in line with the last calibration mark at the low frequency end of the dial, loosen the set screw in pulley "D" and turn it until the pointer is in the specified position. Be sure that the condenser gang does not move during this adjustment. Then tighten the two screws in pulley "D" securely completing the operation.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of approximately 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

AM ALIGNMENT

I-F ALIGNMENT

1. Set treble control to SHARP TUNE position. Set volume and bass controls to maximum, the Band Switch to Broadcast position, and dial pointer to 1000 kc.

2. Tune the signal generator to EXACTLY 455 kc.

3. Connect output of modulated signal generator to the signal grid of the 6SB7Y (pin 8) through a .01 mfd. capacitor and signal generator ground to radio chassis.

4. All i-f transformers on this chassis are slug-tuned. Both slug adjustments for 455 kc. are located on top of the transformers; the 10.7 mc. adjustments are accessible on the bottom.

5. Connect output meter across voice coil of 15-inch speaker and peak in order the third, second and first i-f transformers.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 40 kc. sweep to signal grid of 6SB7Y (pin 8) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 220,000 ohm diode load resistor. Align for best possible peak in sharp tune position and symmetry in full range position.

BROADCAST BAND R-F ALIGNMENT

1. Connect signal generator through .00025 mfd. capacitor to antenna and ground terminals on antenna terminal strip on rear of chassis. Be sure "Ant-loop" switch on top of the chassis is in the ANT. position. Connect output meter as for AM i-f alignment.

2. Tune signal generator to 1400 kc.

3. Set dial to 1400 kc. and adjust oscillator, r-f and antenna trimmers for maximum indication on meter.

4. Set signal generator to 600 kc. and tune radio to signal. Adjust the 600 kc. padder to maximum output while simultaneously rocking the gang.

5. 1400 kc. calibration should then be checked and re-adjusted if necessary with the 1400 kc. oscillator trimmer.

The pointer on the radio dial should line up with the first horizontal mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the screws on the pointer drive pulley at the end of the tuning gang and adjust the pointer setting; tighten the screws after this adjustment. Be sure the gang is fully meshed for this pointer alignment.

SHORT WAVE BAND R-F ALIGNMENT

1. Set the Band Switch to Short Wave and replace the .00025 mfd. capacitor in series with the signal generator lead to the antenna terminal, with a 400-ohm resistor.

2. Set the signal generator and the receiver to 15 mc. and adjust the oscillator, r-f and antenna trimmers for maximum indication on the meter. While adjusting the 15 mc. oscillator trimmer, two peaks may be observed; only one is the correct peak for 15 mc. alignment. To obtain the correct peak, screw trimmer in to maximum capacitance, then decrease until the first peak is observed. This is the correct one.

Another method for checking for the correct peak is to tune the receiver to 15.91 mc. with signal generator at 15 mc. and with the output increased. If the 15 mc. oscillator is properly aligned, the signal will be received at 15.91 mc.—if incorrectly aligned, the signal will be received at 14.09 mc.

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter from Pin 4 cn 6H6 tube socket to ground through a 1 megohm isolating resistor.

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series,

to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Points "A" to "X" on schematic). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for the 2nd and 1st transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6SB7Y converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligned, do not repeak with the signal into the grid of the 6SB7Y.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment. Adjust signal generator output until a reading of at least 3 volts is obtained.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the gang while adjusting the r-f trimmer.

STAGE GAINS*

Antenna Post to R-F Grid at:

600 kc.	5.8
6.5 mc.	2.9
98 mc.	1.0

R-F Grid to Converter Grid at:

6.5 mc.	9.5
98 mc.	6.8

R-F on Converter Grid to 455 kc. on I-F Grid at:

600 kc.	1.7
6.5 mc.	2.4
98 mc.	6.8

I-F on Converter Grid to 1st I-F Grid at:

455 kc. (dial pointer at 600 kc.)	2.6

1st I-F Grid to 2nd I-F Grid at:

455 kc.	20.5
10.7 mc.	37

2nd I-F Grid to Limiter Grid at:

10.7 mc.	34.5

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output** at 400 cycles is:

.013 volt with Amplifier AMP-111A

.008 volt with Amplifier AMP-111B or C

with Band Switch in BDCST setting.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:

600 kc.	4.5V.
6.5 mc.	4.6V.
98 mc.	5.4V.

or 0.3 ma. through 15,000 ohm Oscillator Grid Resistor at 600 kc., 0.31 ma. at 6.5 mc. and 0.36 ma at 98 mc.

*Variations of ±20% are permissible. All AM readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 watt speaker output at 400 cycles is equivalent to a reading of 2.75V. as measured by a high resistance AC voltmeter across the voice coil of the 15-inch speaker.

**0.1 watt speaker output at 400 cycles is equivalent to a reading of 1.22 volts as measured by a high resistance AC voltmeter across the voice coil of 15-inch speaker

10 KC. FILTER ADJUSTMENT

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment the following procedure should be observed:

1. Adjust the treble control switch to the No. 4 setting.

2. Connect the output of an audio oscillator to the phonograph pickup socket on the radio chassis and adjust the oscillator to exactly 10,000 cycles.

3. Set the band selector to PHONO and adjust the 10 kc. trimmer for *minimum* output.

4. If an audio oscillator is not available for making this adjustment set the band selector to BDCST, set the treble control to position 4, connect the antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

CONDENSER GANG DRIVE ADJUSTMENTS

Whenever any of the mechanical parts in the condenser gang drive assembly require replacement due to rough handling or for any other reason, it is extremely important that clearances and adjustments shown on Figures 2 and 3 are correct; otherwise, the tuning mechanism will be sluggish or it may slip during operation.

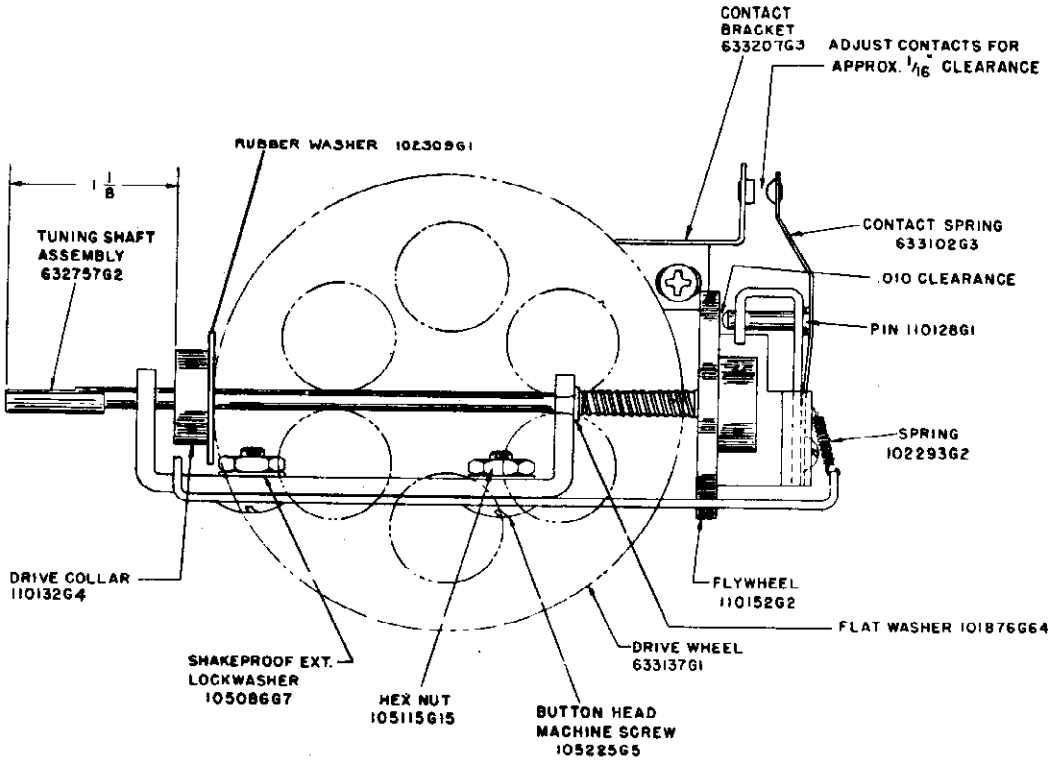

FIGURE 2

In reassembling the mechanism after any part was replaced, follow the procedure outlined below:

1. Assemble the Tuning Shaft, Drive Collar, Compression Spring and Flywheel in the order shown on Figure 3. The distance between the front of the Drive Collar and the front of the Tuning Shaft must be 1⅛ inches as specified on Figure 2. Install the Flywheel on the rear of the Tuning Shaft and slide it forward until it nearly touches the edge of the Drive Wheel; then tighten one of the set screws in the Flywheel hub. Insert a .010" gauge between the Flywheel and the Pin, and while holding the gauge in this position, loosen the set screw in the Flywheel hub that was previously tightened. The Compression Spring should force the Flywheel back against the gauge—when this occurs, tighten both set screws in the Flywheel hub.

2. Adjust the Muting Switch contact clearance by loosening the two screws in the Contact Bracket and sliding the bracket in the required direction until a 1/16" clearance is obtained. If this adjustment cannot be obtained in the manner prescribed, bend the Contact Bracket until proper clearance is realized.

3. The Drive Wheel is properly located on its shaft when its edge nearest the hub is in line with the outside edge of the Drive Collar as shown on Figure 3. Two Allen set screws in the Drive Wheel hub provide a means of adjusting the position of this wheel.

4. When the adjustment outlined in paragraph 2 is correct, the proper contact clearance will automatically be obtained when the Muting Switch is to be "unmuted" while the push buttons are being set. While pressure is applied to any one of the push buttons while they are being set up, a pressure applied simultaneously to the Tuning Control knob will cause the Muting Switch contacts to open. Detailed instructions on setting up these push buttons are shown elsewhere in this bulletin.

5. If the push button shafts at both ends do not engage the Treadle Bar as shown on Figure 3, the three screws in the Treadle Bar must be loosened and the Treadle Bar should be moved until the required condition is obtained.

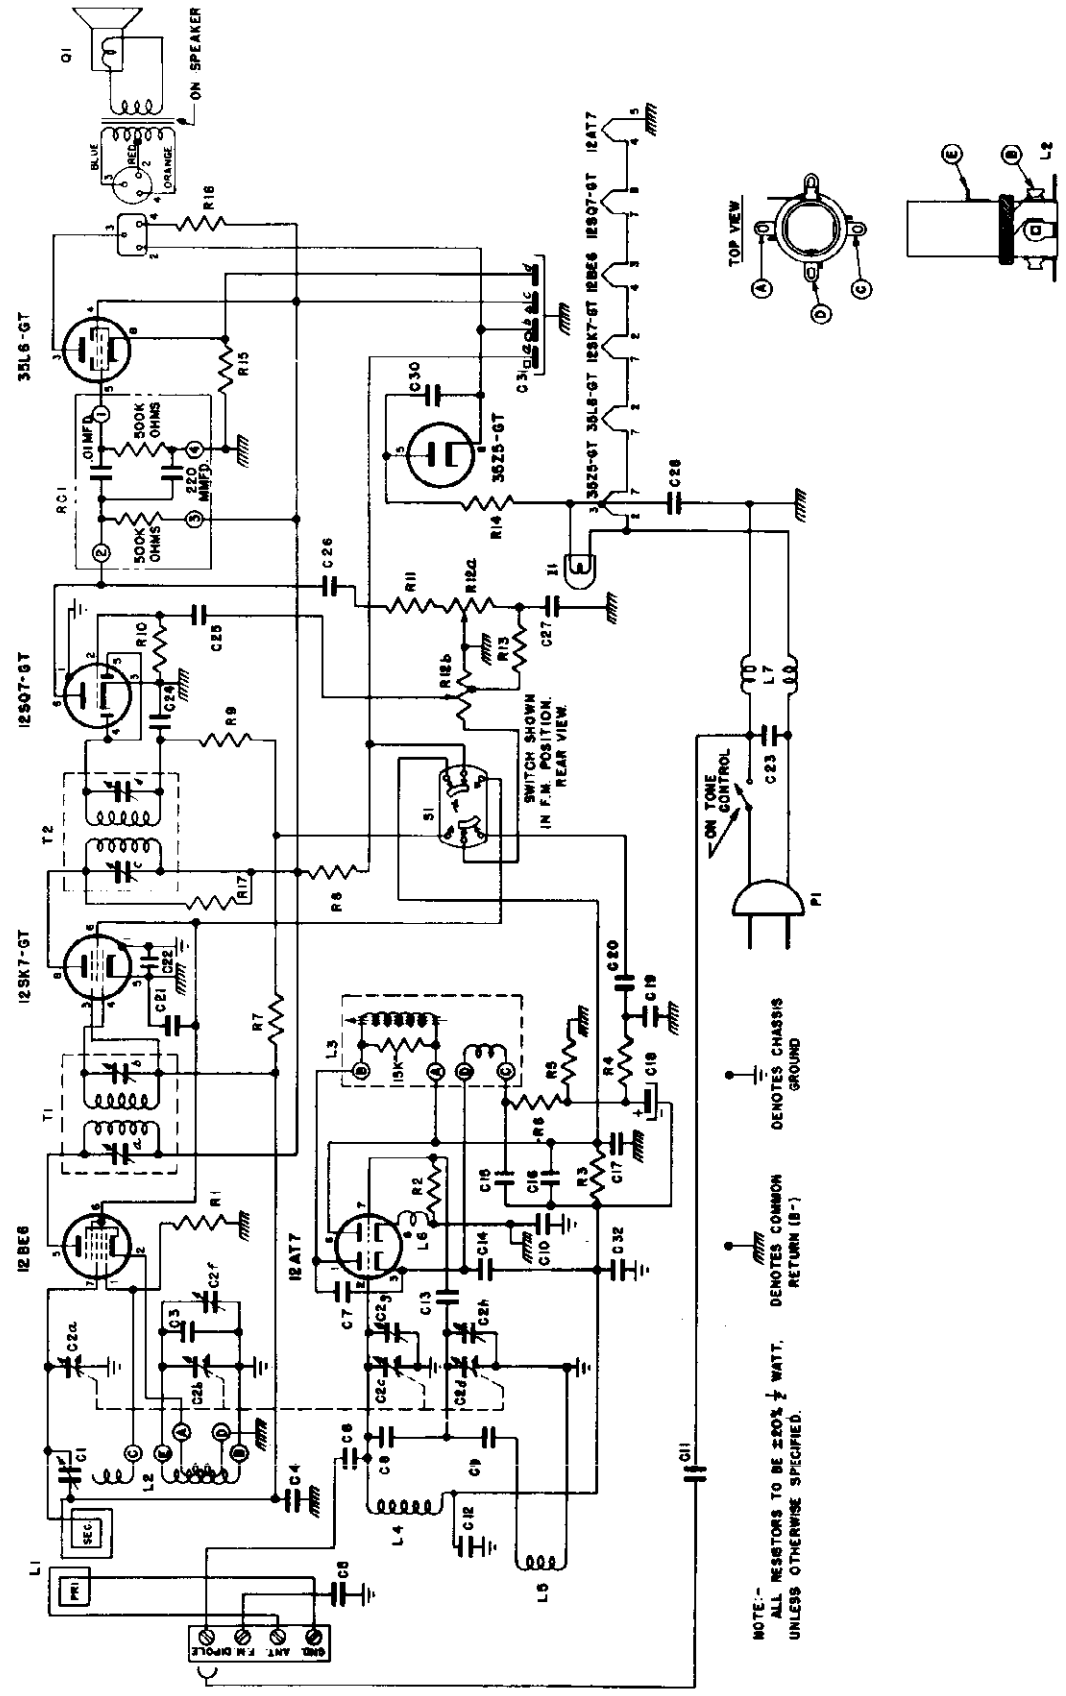
MAJESTIC RADIO & TELEV. CORP.

MODEL 6FM71
CHASSIS 6BC



MODEL 6FM714,
CHASSIS 6B02D

MAJESTIC RADIO & TELEV. CORP.

ALIGNMENT

Before aligning, set the dial pointer as follows: close the tuning gang condenser (plates fully closed). Set pointer in line with the last mark at the low frequency end of the dial scale. Set volume control on full, keep the signal output as low as possible to prevent AVC action and false readings.

STEP	DUMMY ANT.	TEST OSC. CONNECTION	TEST OSC. FREQUENCY	RECEIVER DIAL	ADJUST	REMARKS
1	.01 mf.	Ant.	455KC Modulated	Any quiet spot	D-C-B-A for max. output	Repeat in reverse order
2	--	*Loop	1500KC Modulated	150	C2F for max. output	--
3	--	*Loop	1500KC Modulated	150	C1 for max. output	Rock Gang while tuning
4	300 ohms	*FM Terminals	19M.C.Unmodulated	Any quiet spot	L3 for min. output	Min. noise in speaker
5	300 ohms	FM Terminals	104M.C.Unmodulated	104	C2h for min. output	Min. noise in speaker
6	300 ohms	FM Terminals	104M.C.Unmodulated	104	C2g for min. output	Rock Gang while tuning

*All Steps: Connect output meter across speaker.
Step 2 & 3: Make a 2 turn loop & connect to signal generator. Loosely couple the 2 turn loop to receiver loop.
Step 4: Disconnect lug if present from FM dipole terminal. Connect hot side of generator through 300 resistor to dipole terminal where lug was connected.

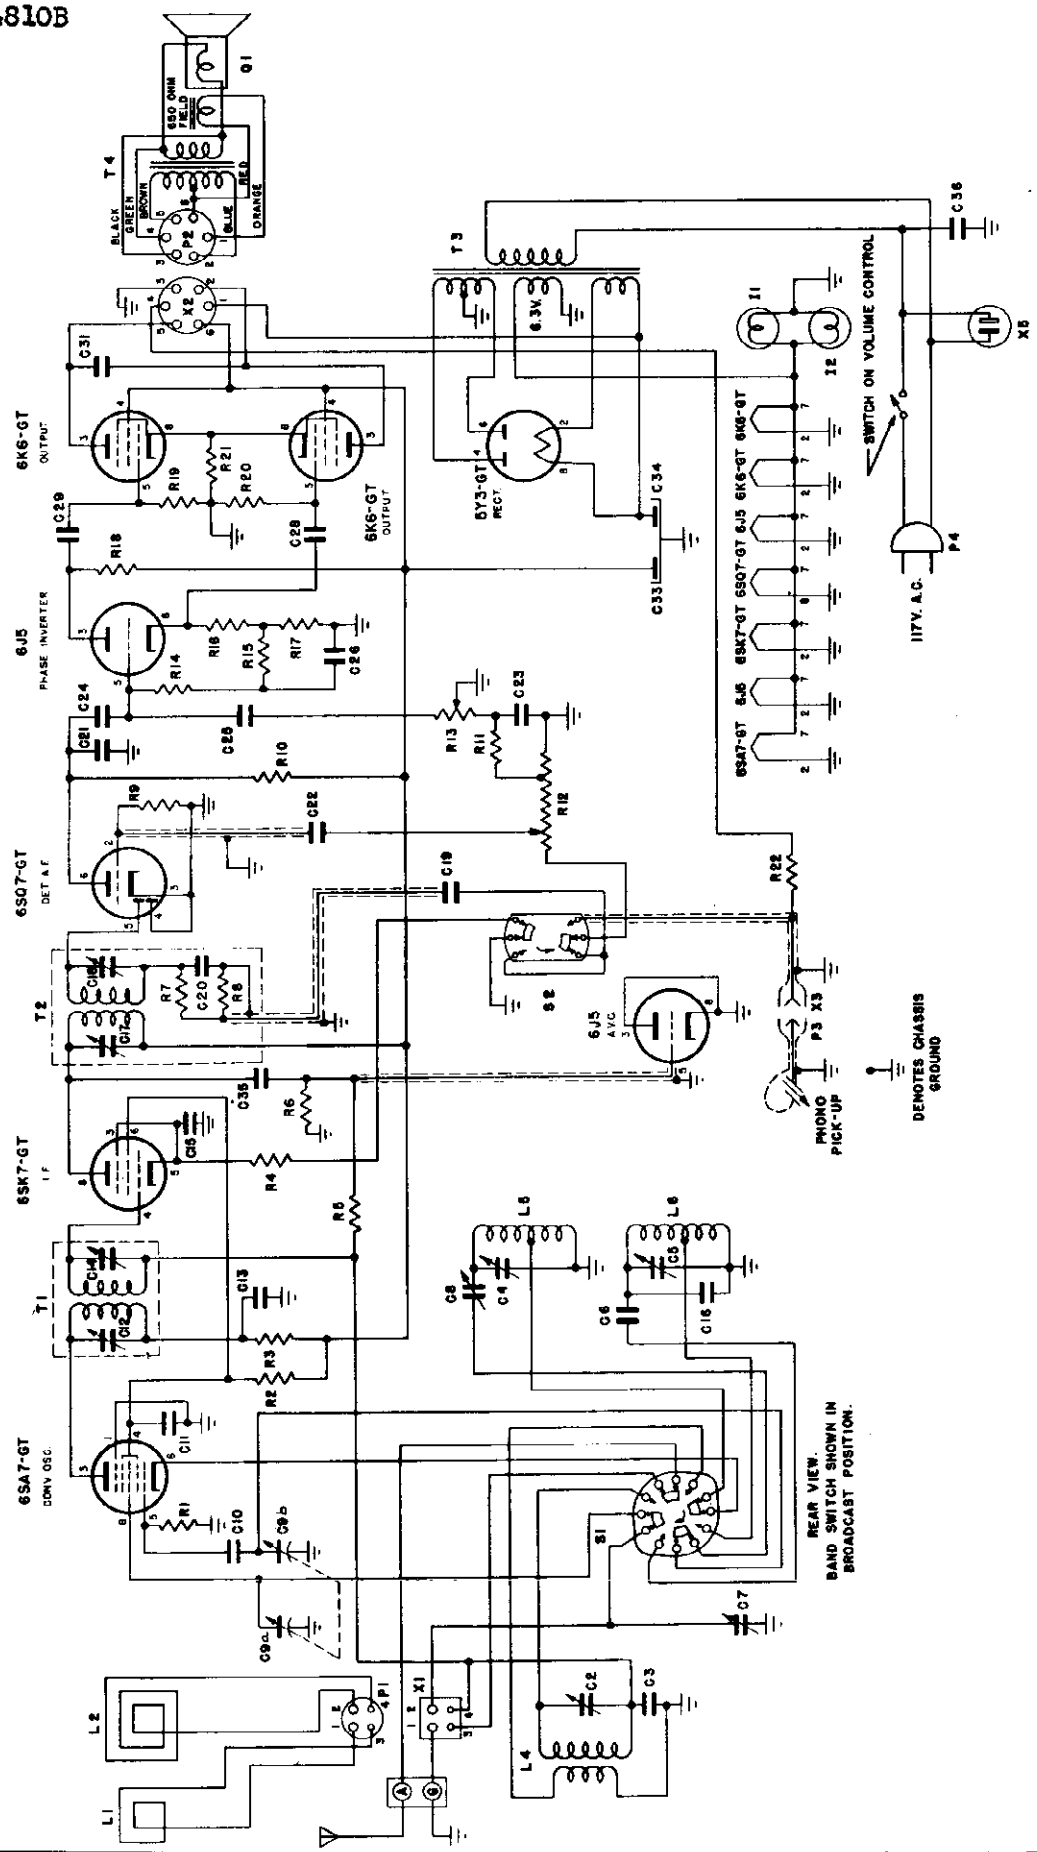
MODEL 8JL885,
CHASSIS 4810B

MAJESTIC RADIO & TELEV. CORP.



RECORD CHANGER: Aero Model 46-A, RCD.CH. 16-1

ALIGNMENT

Before aligning, close tuning condenser (plates fully meshed). Set pointer to center of extreme left hand mark on the dial.

When aligning broadcast band, connect to output of the signal generator a loop, about 12 inches in diameter, consisting of two or three turns of wire. Place this loop in a plane parallel to that of the receiver loop antenna and about a foot away from it. The receiver loop antenna should be in about the same portion relative to the chassis as it is when installed in the cabinet.

While aligning, turn the volume control full on and keep the generator output as low as possible.

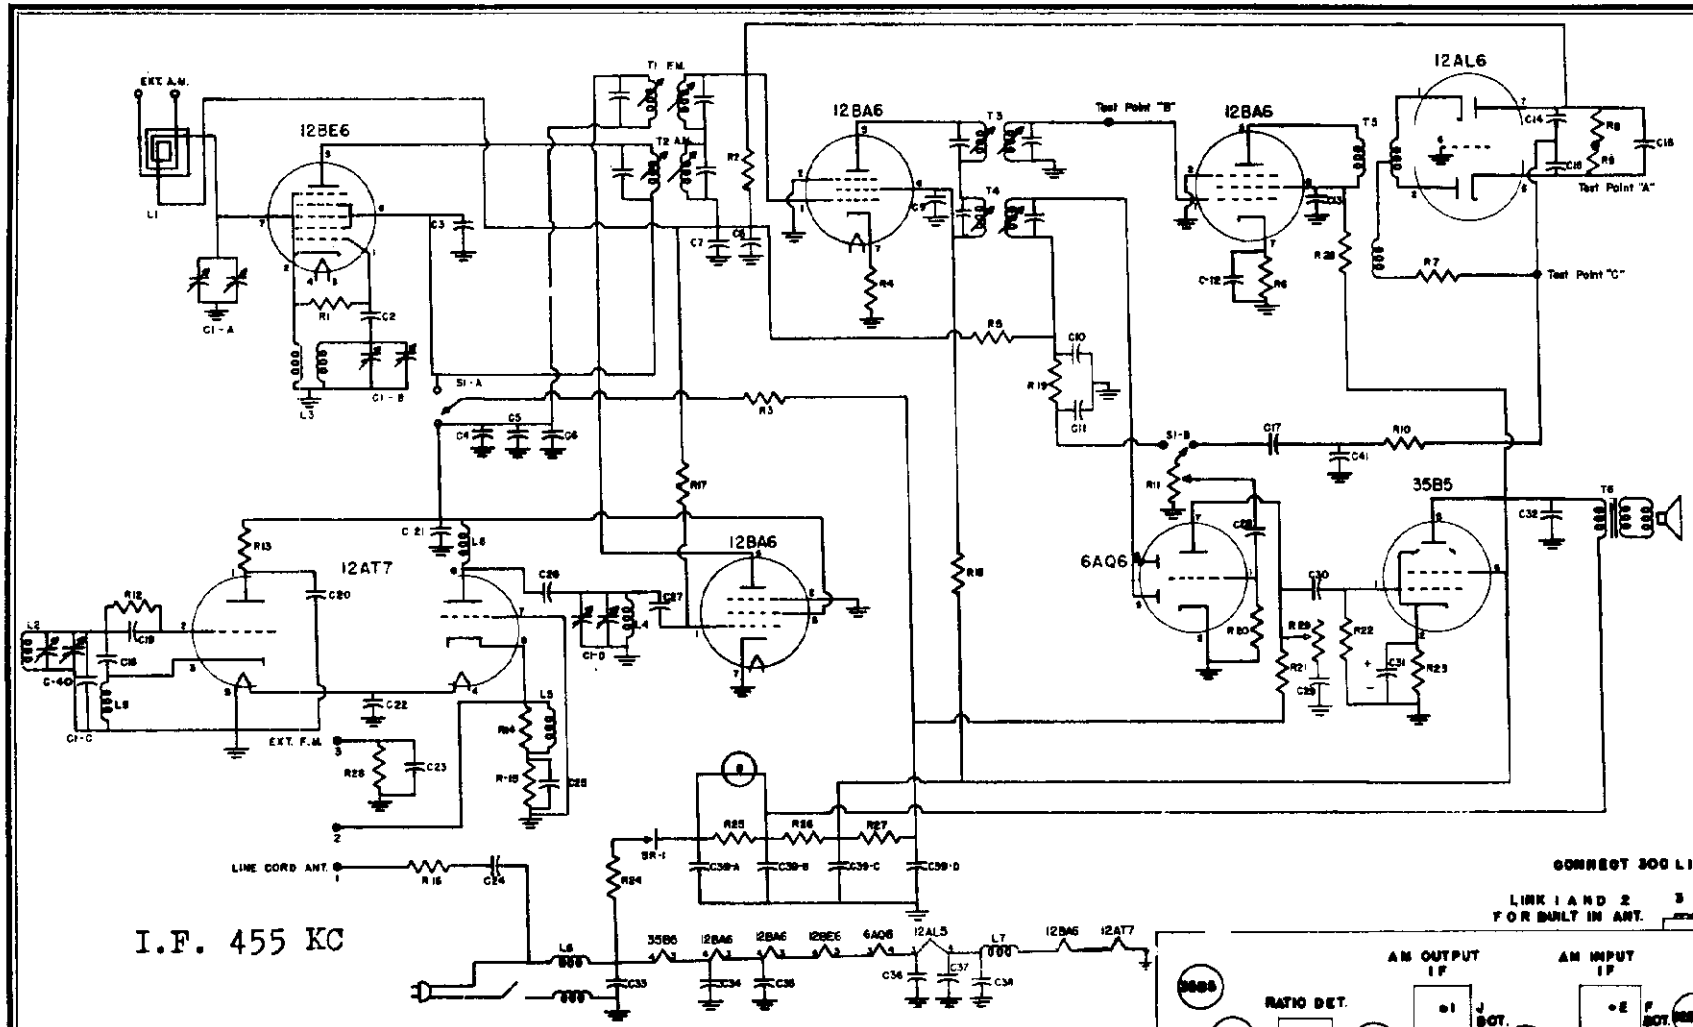
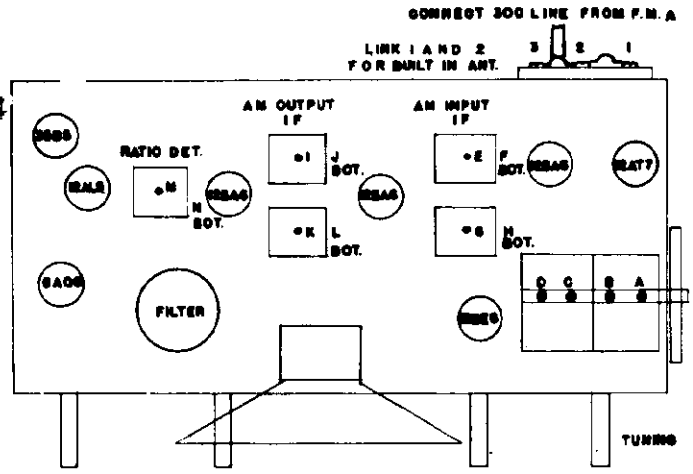
	128-48	Knob, bass-treble
	128-49	Knob, tuning.
	21-29	Record changer, Aero.
	122-42	Escutcheon, including glass (plain)





The tuning range of the receiver is 550 to 1600 Kc on AM (standard broadcast) and 88 to 108 Mc on FM.

ANTENNA

This receiver incorporates a high efficiency built-in loop antenna. For most locations and under average receiving conditions, this antenna will be adequate to provide excellent results. However, where extreme distance is desired, or where considerable local interference is present, reception may be improved by connecting the receiver to an external aerial and ground. Connections are provided on the rear of the receiver (A and G) for this purpose.

This receiver also incorporates a built-in FM antenna that will provide good local reception under average receiving conditions.

Where more distance is desired or where noise conditions make it desireable, a standard FM dipole antenna may be connected to Terminal #1 and #3. In

Intermediate Frequency: A-M, 456 KC. F-M, 4.3 MC.

NOTES ON VOLTAGE CHART

* These voltages are AC and should not be measured with a DC Voltmeter.

a These points show a slight voltage indication due to the thermal noise of the receiver unless one of the limiter tubes is removed from its socket.

b This voltage must be measured with the Interstation Noise Silencer Switch in the "on" position.

N A varying negative voltage of 15 to 20 volts may be measured at this point, depending upon the setting of the tuning condenser.

All voltages indicated above are measured with a 1000-ohms-per-volt meter with a line voltage of 117 volts.

NORMAL OPERATING VOLTAGES

On Tube Socket Terminals Designated by RMA Number

Voltages shown below are measured with Range Switch turned to F-M Position.

MODELS 9-1053, 9-1054

MEISSNER MFG. DIV.
MAGUIRE INDUSTRIES, INC.

ALIGNMENT PROCEDURE

The minimum of equipment required for correctly aligning this receiver is listed below.

A modulated service oscillator or signal generator capable of generating the frequencies 456 KC, 600 KC, 1400 KC, 6.0 MC, 16.0 MC and 46.0 MC.

An output meter.

A 0-200 or a 0-100 microampere meter.

An oscilloscope with vertical and horizontal amplifiers.

A wide-band frequency-modulated generator or "wobbulator" covering the intermediate frequency of 4.3 MC and with either 400-cycle or 60-cycle modulation. It must be capable of producing a deviation frequency of 150 KC. (Total frequency swing of 300 KC.)

While this instruction sheet describes the use of a generator for F-M alignment which has 400-cycle modulation and which has provision for bringing out the 400-cycle voltage for application to the horizontal plates of the oscilloscope, it is also possible to use a generator with 60-cycle modulation, and to use the 60-cycle sweep which is built into the oscilloscope, instead of obtaining the synchronizing voltage from the generator. If the service man has been using such a generator for A-M visual alignment he will be familiar with his instrument and will be able to adapt it to this alignment procedure.

Although it is possible to align this receiver wtih a generator or wobbulator not having quite as great a total frequency swing as 300 KC, it will be difficult to get satisfactory results. Note that the I-F response curve in Figure 1 is flat over a region about 150 KC wide. An unsymmetrical response curve in an F-M receiver quite seriously affects its performance at low signal levels. It is therefore essential to have proper equipment for alignment in order to get the best results.

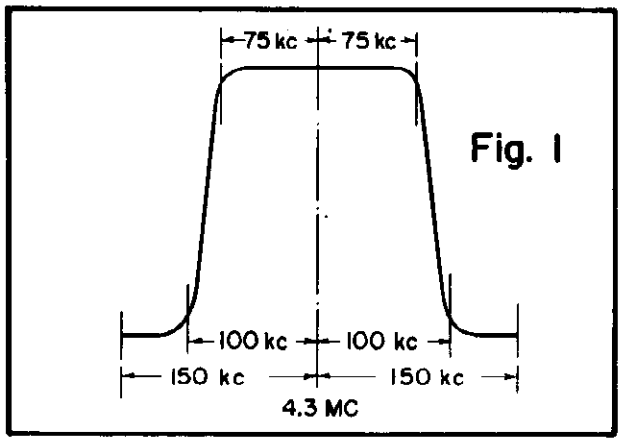

Fig. 1

A-M ALIGNMENT

The alignment of the A-M portion of this receiver is conventional and should be carried out as follows:

Connect the output meter to the receiver by any of the usual methods.

Connect the A-M signal generator between the chassis and the grid of the 6K8 tube, using a .0005-mfd. to .25-mfd. condenser between the grid and the high side of the generator output. Do not remove the grid clip for this operation. The range switch should be turned to the Broadcast band and the dial pointer set near 600 KC. Tune the signal generator to 456 KC and proceed to align the four I-F trimmers for maximum output. On this and on all following adjustments turn the audio control on full and use as weak a signal from the generator as will give a satisfactory indication on the output meter.

The generator should now be connected to the antenna-and-ground terminal strip. Leave "D" unconnected. Use a proper dummy antenna in series with the high side of the generator output (200-mmf. for Broadcast; 400-ohms for Short-Wave).

SHORT-WAVE BAND

Turn the range switch to the Short-Wave position and set the tuning dial and the signal generator to 16.0 MC. Adjust the oscillator trimmer (top trimmer in oscillator coil) to maximum response. If two responses of nearly equal intensity are found, adjust for the one with the trimmer farthest open. Now adjust the top trimmers in the Antenna and R-F coils for maximum response. Since, at this frequency, the R-F tuning slightly affects the oscillator frequency, it will be necessary to rock the tuning condenser slightly while adjusting the R-F trimmer in order to keep the signal tuned in.

Set the signal generator to 6.0 MC and tune in this signal with the receiver dial. Now, while rocking the tuning condenser back and forth, adjust the S-W oscillator padding condenser. (The rear section of the dual padder located in the top of the chassis over the range switch) for maximum output. This adjustment is not critical and the tuning of the S-W padder will be found to be quite broad.

BROADCAST BAND

Turn the range switch to the Broadcast position and substitute the 200-mmf. dummy antenna for the 400 ohms. Set the dial and the generator to 1400 KC and adjust the oscillator trimmer (bottom trimmer on oscillator coil) to maximum response. Next adjust the bottom trimmers of the Antenna and R-F coils for maximum response.

Now set the generator to 600 KC and tune in the signal with the dial. Rocking the gang condenser slightly, adjust the oscillator padder (front section of the dual padder) for maximum response. This adjustment will be much sharper than the padding adjustment on the short-wave band.

This completes the alignment of the A.M. portion of the receiver.

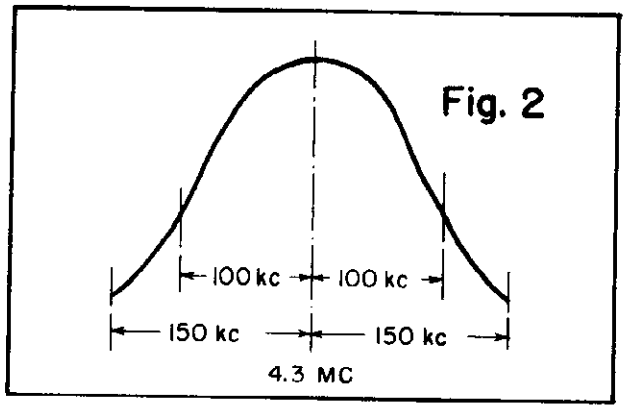
F-M ALIGNMENT

The F-M alignment is made in three major steps: namely, I-F alignment, discriminator alignment and R-F alignment.

For the first operation, I-F alignment, connect the output of the frequency-modulated generator between the grid of the 6SG7 2nd IF stage and chassis, using an .05-mfd. condenser in series with the high side of the generator output and connecting this condenser to the 6SG7 grid. Leave the grid lead of the 6SG7 tube connected. Now connect the synchronizing voltage output from the generator to the input of the horizontal amplifier of the oscilloscope. Note: The ground lead from the generator should always be connected to the chassis near the tube to whose grid the generator is connected to avoid spurious regeneration phenomena which change the shape of the IF curve.

Now connect the input to the oscilloscope vertical amplifier between chassis and the low potential end of the last I-F transformer (point "A" in circuit diagram) using a 100,000-ohm resistor in series with the high side. This resistor should be located at the receiver end of the connecting wires and should be connected with a short lead to the Point "A".

Having made the set-up, turn on the oscilloscope and the frequency-modulated generator. Turn down the receiver volume control. Set the generator to 4.3 MC and the deviation frequency (if calibrated on the generator) to 150 KC. Turn the vertical gain control of the oscilloscope well up and the horizontal gain control just high enough to give almost full-screen deflection of the horizontal pattern. Using just enough output from the generator to give good deflection on the screen adjust the trimmers of the last I-F transformer for the greatest gain and to give a pattern that is centered in the screen and that is symmetrical. This pattern should be similar to the one shown in Figure 2



Now without changing the generator frequency, remove the generator connection from the grid of the 6SG7 2nd I.F. amplifier and place it on the grid of the 6SG7 1st I.F. amplifier, using the .05-mfd. condenser as before, and changing the position of the ground lead as described above. Again use only enough output from the generator to give good vertical deflecton on the screen, and adjust the trimmers of the second I-F transformer in the same manner as before. The curve shape should remain practically the same as it was before.

Now remove the generator connections (ground as well as "hot") from the 6SG7 first I-F amplifier and place them on the signal grid and ground of the 6SA7, again using the .05-mfd. condenser. Proceed as before, turning down the output from the generator until there is just enough for good vertical deflection on the oscilloscope screen. Adjust the trimmers of the first I-F transformer for the greatest gain and to give a pattern similar to the one shown in Figure 2.

In all of the foregoing adjustments note that the oscilloscope vertical amplifier gain control has been turned well toward maximum gain, and that a low input from the generator has been used. The reason for this is that, as higher signal-input levels are used, the response curve of the I-F amplifier stages will change shape. If the symmetry of the response curve is kept good at low input levels, then any dissymmetry occurring at high input levels will be unimportant, since at high input levels the limiter tube will level out the response before the signal reaches the discriminator.

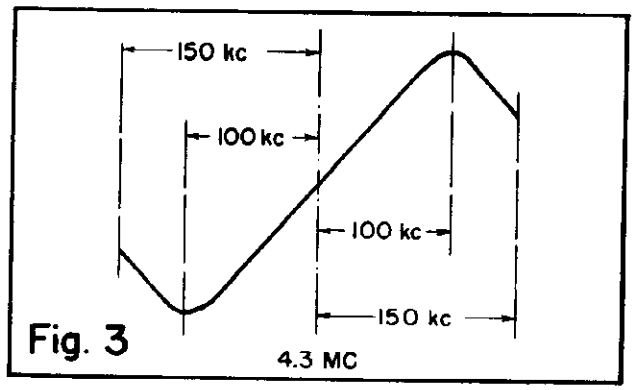
Should the I-F circuits for any reason be badly misaligned, the first 6SG7 I-F stage may oscillate when the input from the generator is placed on the grid of the 6SG7 second I-F tube, making it difficult to get a readable pattern on the oscilloscope screen. Should this condition occur, the remedy is to remove the 6SG7 first I-F tube from its socket until the last I-F stage has been aligned.

This completes the alignment of the I-F stages and the alignment of the discriminator comes next. Before proceeding with the discriminator alignment, however, it will be necessary to balance the tuning-eye circuit. With the 6SJ7 second-limiter tube removed from its socket, adjust the eye balance control, which is the short shaft with the screw driver slot on the back of the chassis, until the eye just closes but does not overlap. Now replace the 6SJ7 second-limiter tube.

DISCRIMINATOR ALIGNMENT

Leaving the set up as it was when the I-F alignment was completed, adjust the generator frequency until the I-F response pattern on the oscilloscope screen is centered and is symmetrical.

Now remove the connection to the low-potential side of the 1st I-F coil, which is the lead containing the 100,000-ohm resistor, and move this connection to the 6H6 discriminator cathode marked "B" in the circuit diagram. The pattern on the oscilloscope screen will go off scale and the input from the generator will have to be decreased. If the generator leakage is bad and its output cannot be turned down to a sufficiently low level, the oscilloscope vertical amplifier gain control may be turned down. With the setup made as described and with the generator deviation-frequency still set at 150 KC, adjust the trimmer on the primary side of the discriminator coil (The red Trimmer Screw) for greatest vertical deflection on the oscilloscope screen.



Next adjust the trimmer on the secondary side of this coil until a pattern similar to the one shown in Figure 3 is obtained. This adjustment is quite critical and should be made so that the pattern is as near symmetrical as possible. If the portion of the pattern in Figure 3 which appears straight, is not quite straight on the oscilloscope screen it may be made so by a slight readjustment of the trimmer on the primary side of the coil. Before leaving the adjustment of the discriminator coil a further refinement in the adjustment of the secondary trimmer should be made as follows: Decrease the frequency deviation of the generator from 150 KC to about 100 KC, or until the pattern on the oscilloscope screen just takes in the straight portion of the curve. Now, watching the action of the tuning eye, make a very slight readjustment of the secondary trimmer of the discriminator coil until the eye just closes but does not overlap. This completes two steps in the I-F alignment and the connections to the frequency-modulated generator and the oscilloscope may now be removed.

ANTENNA, R-F AND OSCILLATOR

In order to align the R-F Antenna and Oscillator circuits, an amplitude-modulated signal generator covering the range of 42-50 MC and a 0-200 microampere meter may be used. The signal generator need not be modulated.

Connect the meter in series with the ground end of the grid resistor of the 6SJ7 first-limiter tube, with the positive side of the meter to ground. This point is marked "C" in the circuit diagram. Now apply the output of the signal generator to the antenna and ground posts of the terminal strip on the back of the chassis which are marked "A" and "G". Leave "D" unconnected. Set the receiver dial and the signal generator to 46 MC and adjust the oscillator trimmer, which is the air trimmer mounted on top of the middle section of the tuning condenser, for maximum deflection on the 0-200 microampere meter. If two positions of the oscillator trimmer give almost equal deflection on the meter, select the point with the trimmer farthest in mesh, since the oscillator on this band operates below the signal frequency. Keep the generator output adjusted to such a value that about one quarter of full scale deflection is obtained on the meter. Next adjust the R-F trimmer, mounted on the front section of the tuning condenser, for maximum deflection of the meter; then perform the same operation for the antenna trimmer, which is mounted on the back section of the tuning condenser. The adjustment of the R-F trimmer affects the oscillator frequency slightly and the tuning condenser should be rocked back and forth when making this adjustment in order to keep the oscillator tuned to the signal frequency. If two points of response are found on the R-F or antenna trimmers, the point which requires the least amount of capacity in these trimmers should be selected.

As a final check of antenna, R-F and oscillator adjustment, signals from the generator should be tuned in at various points on the band to see that the sensitivity is equal over the band.

Broadcast Band Alignment Data -

Intermediate Frequency	455 Kilocycles
Adjust Trimmers at	1550 Kilocycles
Adjust Oscillator Padder at	580 Kilocycles

Frequency Modulation Band Alignment -

Equipment required for alignment: unmodulated R.F. signal generator that will cover 10.7 Megacycles and a range of 88 to 108 Megacycles, a D.C. vacuum tube voltmeter, and a microammeter capable of reading 50 microamperes. A more satisfactory discriminator alignment may be obtained if the following additional equipment is available. An F.M. generator capable of 200 kilocycles deviation at 10.7 megacycles and a cathode-ray oscilloscope.

Discriminator Alignment - (With F.M. signal and oscilloscope)

Remove 2nd I.F. tube.

Apply 1 V. modulated, 200 kc. deviation, 10.7 mc. signal to 1st limiter grid through .005 mica capacitor. Adjust bottom slug of discriminator transformer so that peaks of curve are symmetrical about the vertical axis. Adjust top slug to give maximum amplitude of peaks.

Discriminator Alignment - (With unmodulated signal and vacuum tube voltmeter)

Remove 2nd I.F. tube.

Apply 1 V. unmodulated signal 10.7 mc. to 1st limiter grid through .005 mica capacitor. Connect vacuum tube voltmeter (with high impedance input) from the junction of two .000050 ceramic condensers in discriminator output circuit to chassis and adjust top slug of discriminator transformer for maximum voltmeter reading. Then connect VT meter from discriminator audio output lead to chassis and balance bottom slug for zero reading.

I.F. Alignment -

Remove second 6001 limiter from socket. Insert microammeter in series with 47K 1st limiter grid resistor to ground. With 10.7 mc. signal input to antenna, adjust each I.F. transformer for maximum limiter grid current.

R.F. Alignment -

The R.F. section contains a double converter system in which the oscillator operates at one half signal frequency, minus 5.35 mcs. The image frequency is so far away from the signal frequency that it is normally not necessary to locate or pay any particular attention to the image during the alignment procedure.

Trimmers should be adjusted for maximum output at limiter stage with generator set to 108 mcs.

Standard Broadcast	535-1620 Kilocycles
Frequency Modulation	88-108 Megacycles

Power Supply

This receiver is designed to operate from a power supply main of 105-125 volts, 50-60 cycle alternating current (A.C.). NEVER PLUG INTO ANY OTHER SUPPLY !!

Speaker

The power amplifier is designed to operate a permanent magnet type of speaker with a voice coil impedance of 12 ohms.

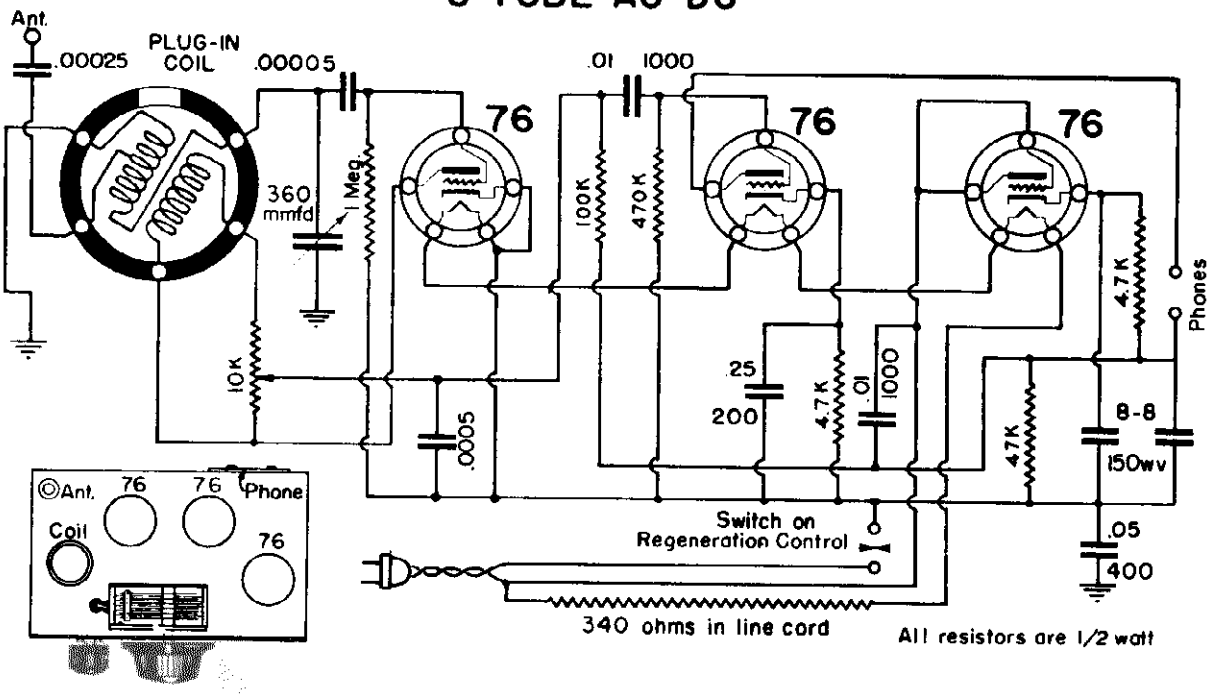
D.C. Voltage Table -

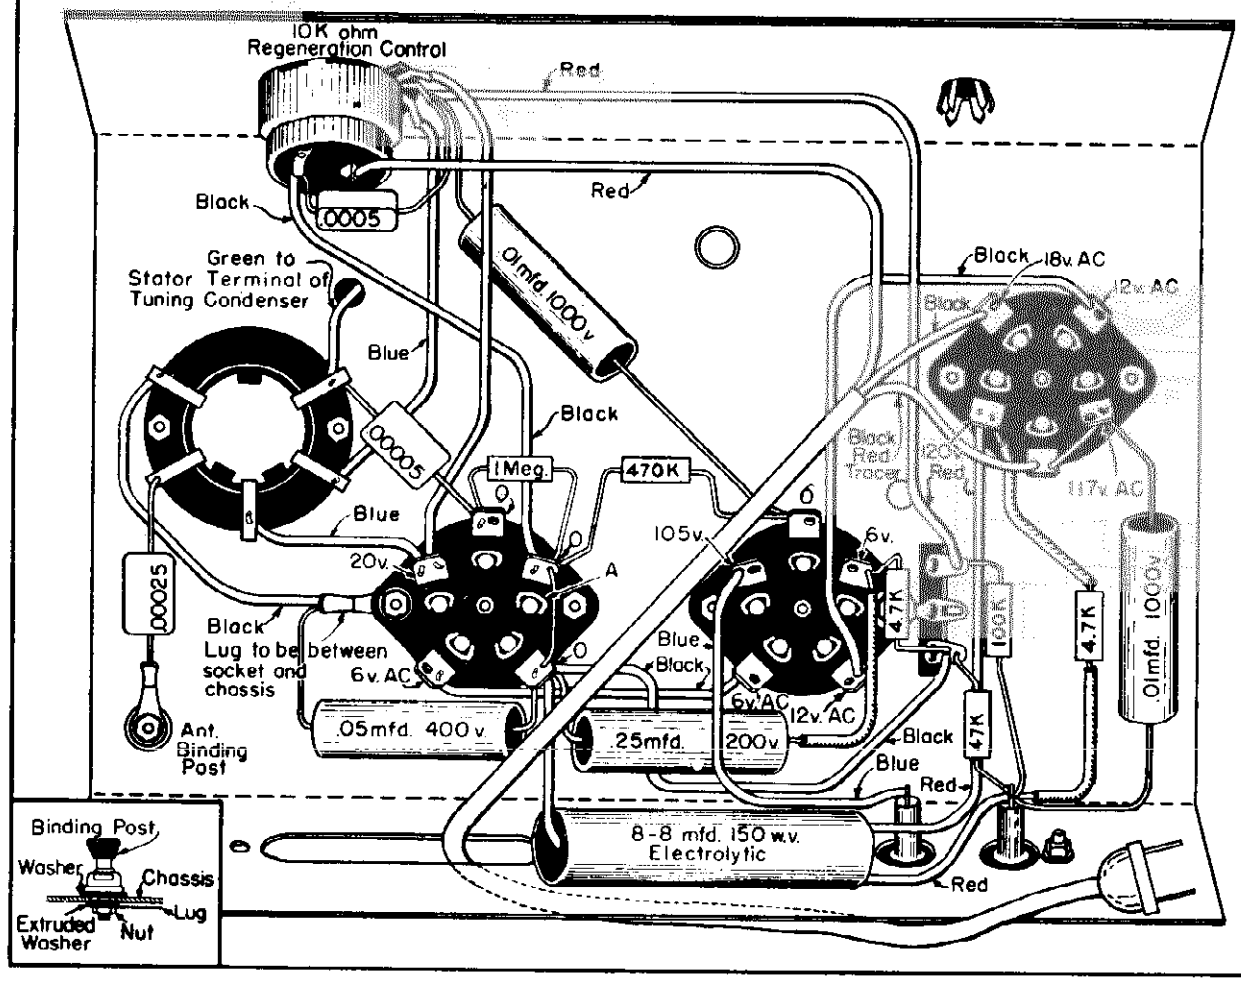
The voltages in the table above are the correct voltages which should be measured between the socket terminal and chassis with nominal line voltage and no signal. All voltages measured with a high impedance voltmeter (20,000 ohms/volt). Allowance should be made for loading if a low impedance voltmeter is used.

MEISSNER MFG. DIV.
MAGUIRE INDUSTRIES, INC.

MODEL 10-1

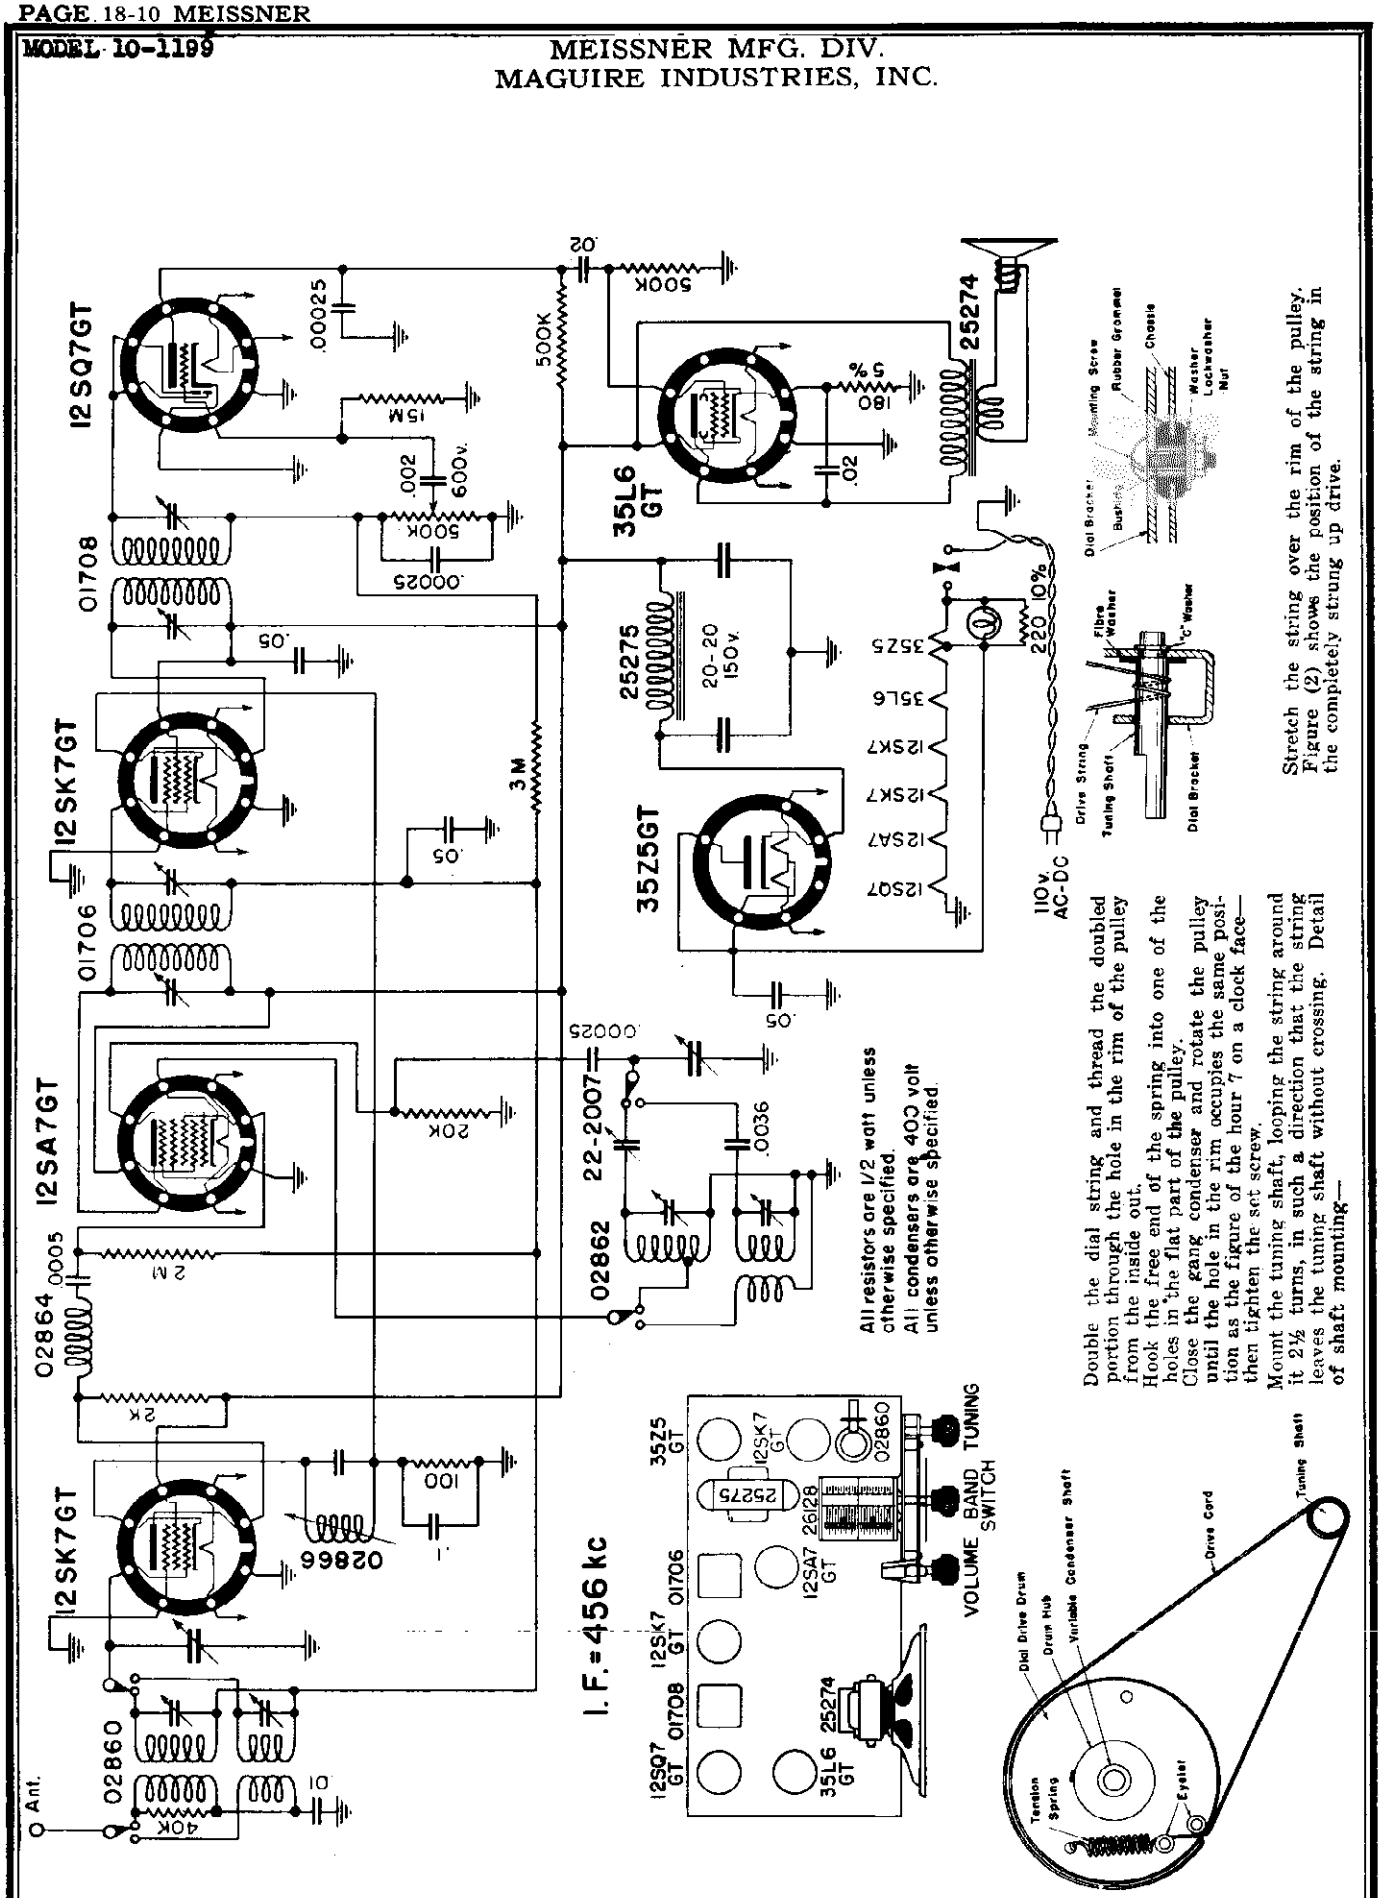
3 TUBE AC-DC





MODEL 10-1199

MEISSNER MFG. DIV.
MAGUIRE INDUSTRIES, INC.



Double the dial string and thread the doubled portion through the hole in the rim of the pulley from the inside out.
Hook the free end of the spring into one of the holes in the flat part of the pulley.
Close the gang condenser and rotate the pulley until the hole in the rim occupies the same position as the figure of the hour 7 on a clock face—then tighten the set screw.
Mount the tuning shaft, looping the string around it 2½ turns, in such a direction that the string leaves the tuning shaft without crossing. Detail of shaft mounting—

Stretch the string over the rim of the pulley, Figure (2) shows the position of the string in the completely strung up drive.

The signal generator should be connected to the signal grid or pin No. 8 of the 6SA7 mixer tube. This connection should be made through a .0005 to .25 mfd. condenser, the condenser being between the high side of the signal generator and the connection to the mixer grid. The signal generator should be set to 456 KC, which is the IF frequency, and the volume control of the receiver should be set at maximum or extreme clockwise. The output of the signal generator should then be turned up until a signal is heard and then the trimmers on the IF transformers adjusted (with insulated shaft screwdriver) for maximum output, reducing the output of the generator as the receiver becomes progressively more sensitive, always using as weak a signal as possible.

After the IF transformers have been properly adjusted, remove the connection from the generator to the mixer grid, reconnecting the generator to the antenna binding post. Leaving the frequency of the signal generator at 456 KC, adjust the wave trap by turning the adjusting screw which protrudes through the chassis. This adjustment should be made for the minimum of signal output. The generator output should be increased as the adjustment proceeds to insure maximum IF rejection.

When the IF transformers are adjusted for a maximum sensitivity, the antenna and oscillator trimmers should be adjusted in the following manner:

(1) Check the dial pointer position to see that it is horizontal when the gang condenser is closed.

(2) Set the band switch in the broadcast position or counter clockwise.

(3) Rotate the gang condenser until the pointer indicates 1400 KC.

(4) Adjust the signal generator to 1400 KC and connect the output of the signal generator to the antenna lead, using a .0002 mfd. condenser between the antenna and the high side of the oscillator. Increase the generator output to a medium level and adjust the oscillator trimmer, which is located through a hole on the top of the chassis just to the right of the speaker. The next step is to adjust the antenna coil by adjusting the trimmer which is closest to the chassis. Both of these trimmer adjustments should be made for maximum output, decreasing the generator signal strength as the set progressively becomes aligned. Leaving connections as they are, turn the dial pointer to approximately 600 KC and reset the signal generator for 600 KC, increasing the generator output until a signal can be heard. Adjust the padder screw, which is located near the center of the chassis, to maximum output. The best adjustment is obtained by simultaneously adjusting the padder screw and rocking the tuning control around 600 KC. Variation in wiring in circuit capacities may give the maximum output for 600 KC very slightly in error of 600 KC on the receiver dial.

(5) In the aligning of the short wave band, the the .0002 mfd. condenser with a 400 ohm resistor between the antenna post of the receiver and the output of the generator, set the generator to 16 megacycles and also the receiver dial pointer to 16 megacycles. Then adjust the oscillator trimmer, which is located through a hole on top of the chassis just to the right of the broadcast trimmer, for maximum output. When adjusting the oscillator trimmer on the short wave band, the trimmer should be tightened and then loosened to the second peak. The second peak will be the correct peak for this adjustment. Next adjust the short wave antenna coil, which is a trimmer located near the top of the coil. As before, the adjustments of these trimmers should be made with as low a signal level from the generator as possible, as the alignment proceeds. The padding of the short wave band is fixed.

CAUTION

The power line is connected directly to this chassis. The receiver must be suitably protected by a non-metallic cabinet and non-metallic knobs so that no one can make contact with any metal part of this radio when in operation. A cabinet back must be used to prevent accidental contact with the chassis. This back should have small holes or slots to permit ventilation yet prevent contact. Mounting screws used to hold the set in a cabinet should also be covered to prevent contact.

1 IF wave trap No. 02866
1 PM speaker with output transformer No. 25274
1 Variable condenser No. 26128
1 Filter choke No. 25275
6 Octal sockets
3 Tie lugs
1 Padder 22-7007
1 500 ohm volume control with switch
1 Band switch
1 Dial mechanism plate
1 Trimmer base assembly
1 Dial drum
4 Wood dowels
1 Dial cord and spring assembly
1 Dial shaft
1 "C" washer for dial shaft
1 Bakelite washer for dial shaft
1 Dial scale
1 Pilot socket and 6-8 volt pilot light
1 Dial pointer
3 Knobs
1 Line cord
1 Binding post assembly
2 Black rubber grommets for ⅜" hole
1 Black rubber grommet for ½" hole
3 Gum rubber grommets ⅜ I. D. for ¼" hole
1 Condenser mounting bracket
4 Chassis mounting brackets
2 Solder lugs
1 180 ohm resistor 5% ½ W. carbon
2 500,000 ohm resistor 20% ½ W. carbon
1 15 megohm resistor 20% ½ W. carbon
1 3 megohm resistor 20% ½ W. carbon
1 20,000 ohm resistor 10% ½ W. carbon
1 2 megohm resistor 20% ½ W. carbon
1 220 ohm resistor 10 % ½ W. carbon
1 100 ohm resistor 10% ½ W. carbon
1 2,000 ohm resistor 20% ½ W. carbon
1 40,000 ohm resistor 20% ½ W. carbon
2 .02 mfd. 400 volt paper condenser
1 .002 mfd. 600 volt paper condenser
3 .05 mfd 400 volt paper condenser
1 .01 mfd. 400 volt paper condenser
1 .1 mfd. 400 volt paper condenser
1 20-20 mfd. 150 volt electrolytic condenser
3 .00025 mfd. 20% mica condenser
1 .0036 mfd. 2% silver mica condenser
1 .0005 mfd. mica condenser

It has a high impedance primary antenna coil which permits the use of almost any length of antenna available. It also has one stage of untuned R. F. and an I. F. wave trap.

This receiver covers a frequency range of 530 KC to 1650 KC and from 5.7 MC to 18 MC, and will operate satisfactorily on voltages from 105 to 125, either D. C. or 50-60

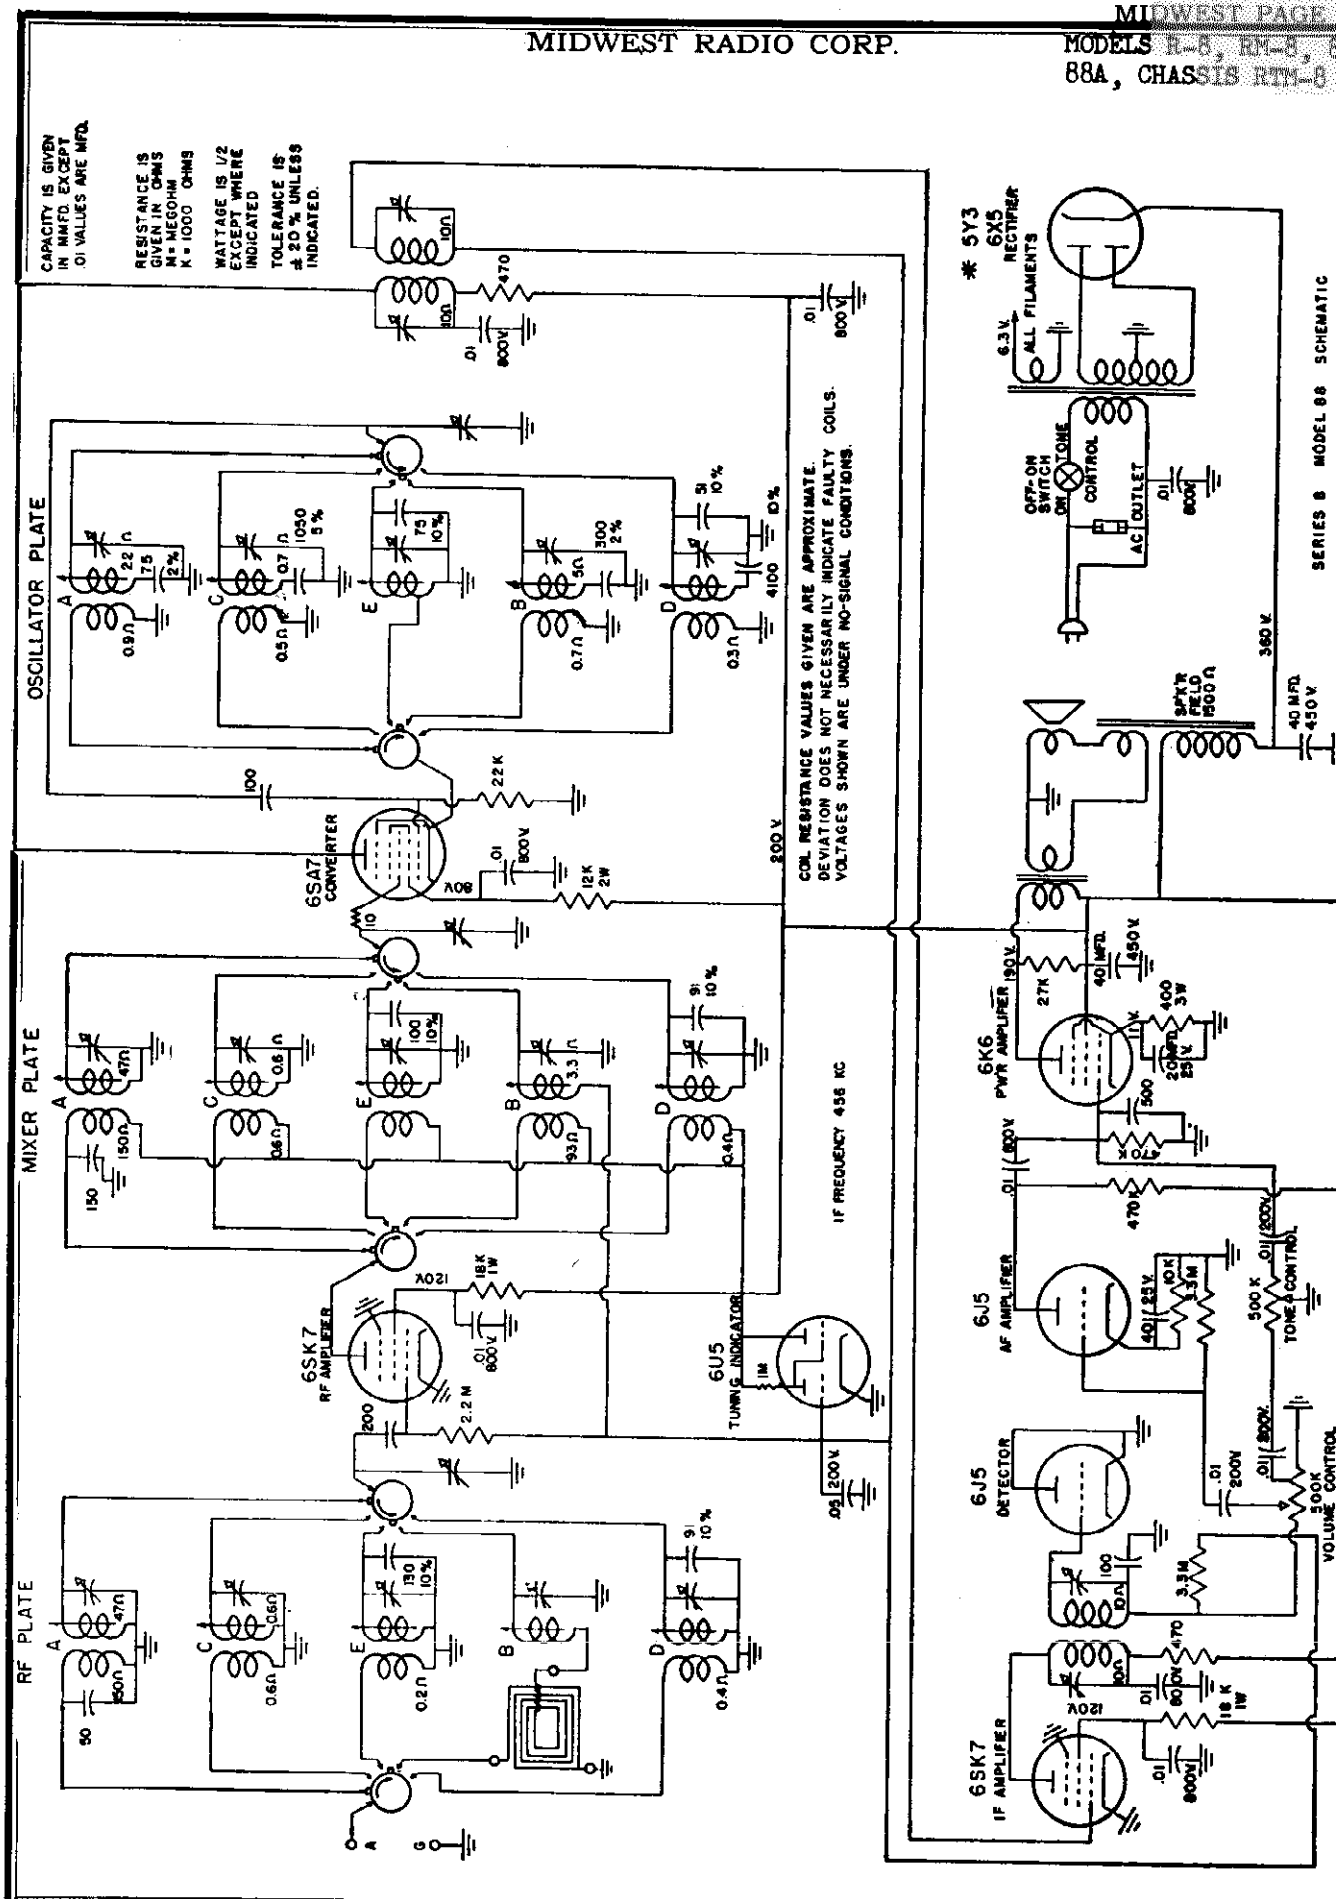
Measurements taken with 1,000 ohms per volt meter. 115 volts AC line.
NC indicates "No Connection"; all voltages indicated are positive with respect to chassis unless otherwise marked.

MIDWEST RADIO CORP.

MODELS R-8, RT-8, T
88A, CHASSIS RTW-8



ALIGNMENT — The output indicator may be an audio frequency meter across the voice coil or a vacuum tube voltmeter at the avc. For 0.5 watt the voltage at the voice coil is 1.2 volts or 2.5 to 3.5 volts avc. if a 30% modulated signal is used. I.F. alignment should be made with band switch on "B," pointer turned to 1000 kc. and signal to mixer grid through a .05 mfd. condenser. Trim both I.F. transformers for maximum reading.

R. F. alignment should be made in the usual manner. There is no inter-action between bands. The only precaution is that a dummy antenna be used between the generator and the antenna post on the receiver. This may be simply a 200 micro micro farad condenser in series with a 400 ohm resistor. The B band RF padder, 550 KC, is very broad and should not be adjusted. The loop must be plugged in when adjusting the B band RF trimmer, 1600 kc.

ALIGNMENT CHART

Coupling	Signal	Band Switch	Dial	Adjustment
To converter grid thru .05 mfd capacitor	456 KC	B	1000 KC	Peak 1st and 2nd IF trimmers.
To "A" on antenna-ground terminal strip through 200 mmfd. and 400 ohms in series.	400 KC	A	400 KC	Peak RF, converter and oscillator trimmers marked "A".
	150 KC	A	150 KC	Peak RF, converter and oscillator cores marked "A".
	1600 KC	B	1600 KC	Peak "B" trimmers. Loop must be plugged in.
	550 KC	B	550 KC	Peak "B" cores except RF. Loop must be plugged in.
	4.7 MC	C	4.7 MC	Peak "C" trimmers.
	1.6 MC	C	1.6 MC	Peak "C" cores.
	10 MC	D	10 MC	Peak "D" trimmers.
	5 MC	D	5 MC	Peak "D" cores.
	22 MC	E	22 MC	Peak "E" trimmers.
	11.5 MC	E	11.5 MC	Peak "E" cores.

Note: Modulate the signal with 400 cycles 30%. The output indicator may be an audio meter at the voice coil or a VTVM on the avc. The voltage at the voice coil is 1.2 and the avc. voltage is between 2.5 and 3.5 for ½ watt output. Do not use signals for alignment which will give output in excess of ½ watt.

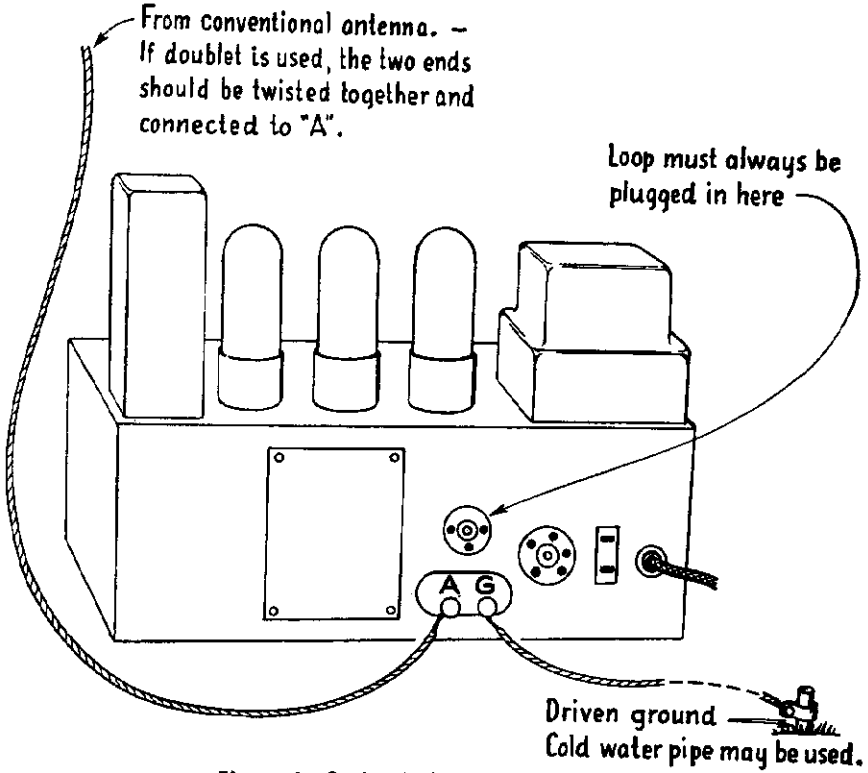


Figure 1. Series 8 Antenna Connections

In locations which have too high an interference level, reception can be greatly improved by the use of an external antenna and ground.

In areas far removed from radio stations you may need an external antenna and ground system for best reception. The Antenna System illustrated in our catalog is highly recommended.

Simply plug the power cord into a nominal 115 volt 60 cycles receptacle. If you are not sure that your power is 115 volt 60 cycles, call your power company because extensive damage can result if the receiver is connected to direct current or alternating current other than 60 cycles, or voltage other than 105 to 125.

Special receivers can be supplied for some non-standard power sources. When ordering for non-standard power sources check with your power company for the exact voltage and frequency

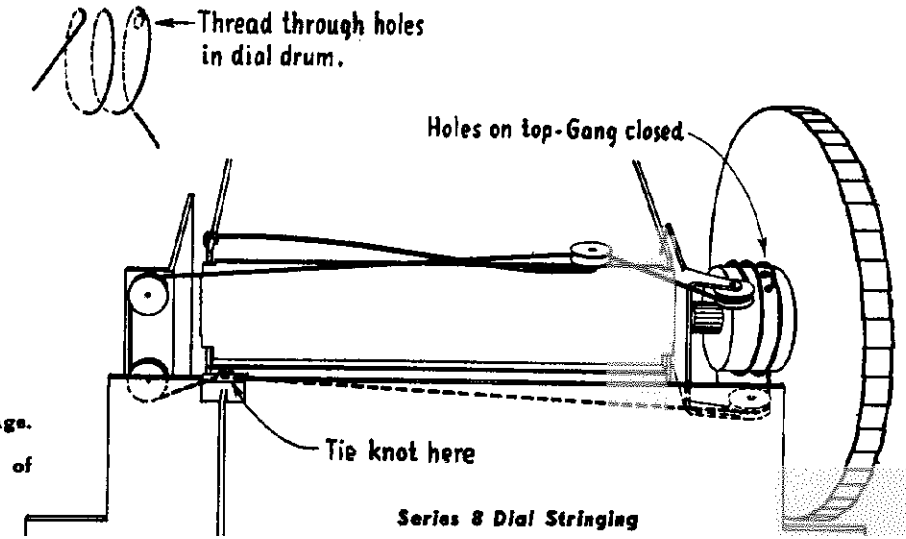
Note: Order resistors and condensers by value, tolerance and wattage or voltage.

Note: When ordering include serial number of chassis, since Midwest records of changes in parts specifications are kept by that number.

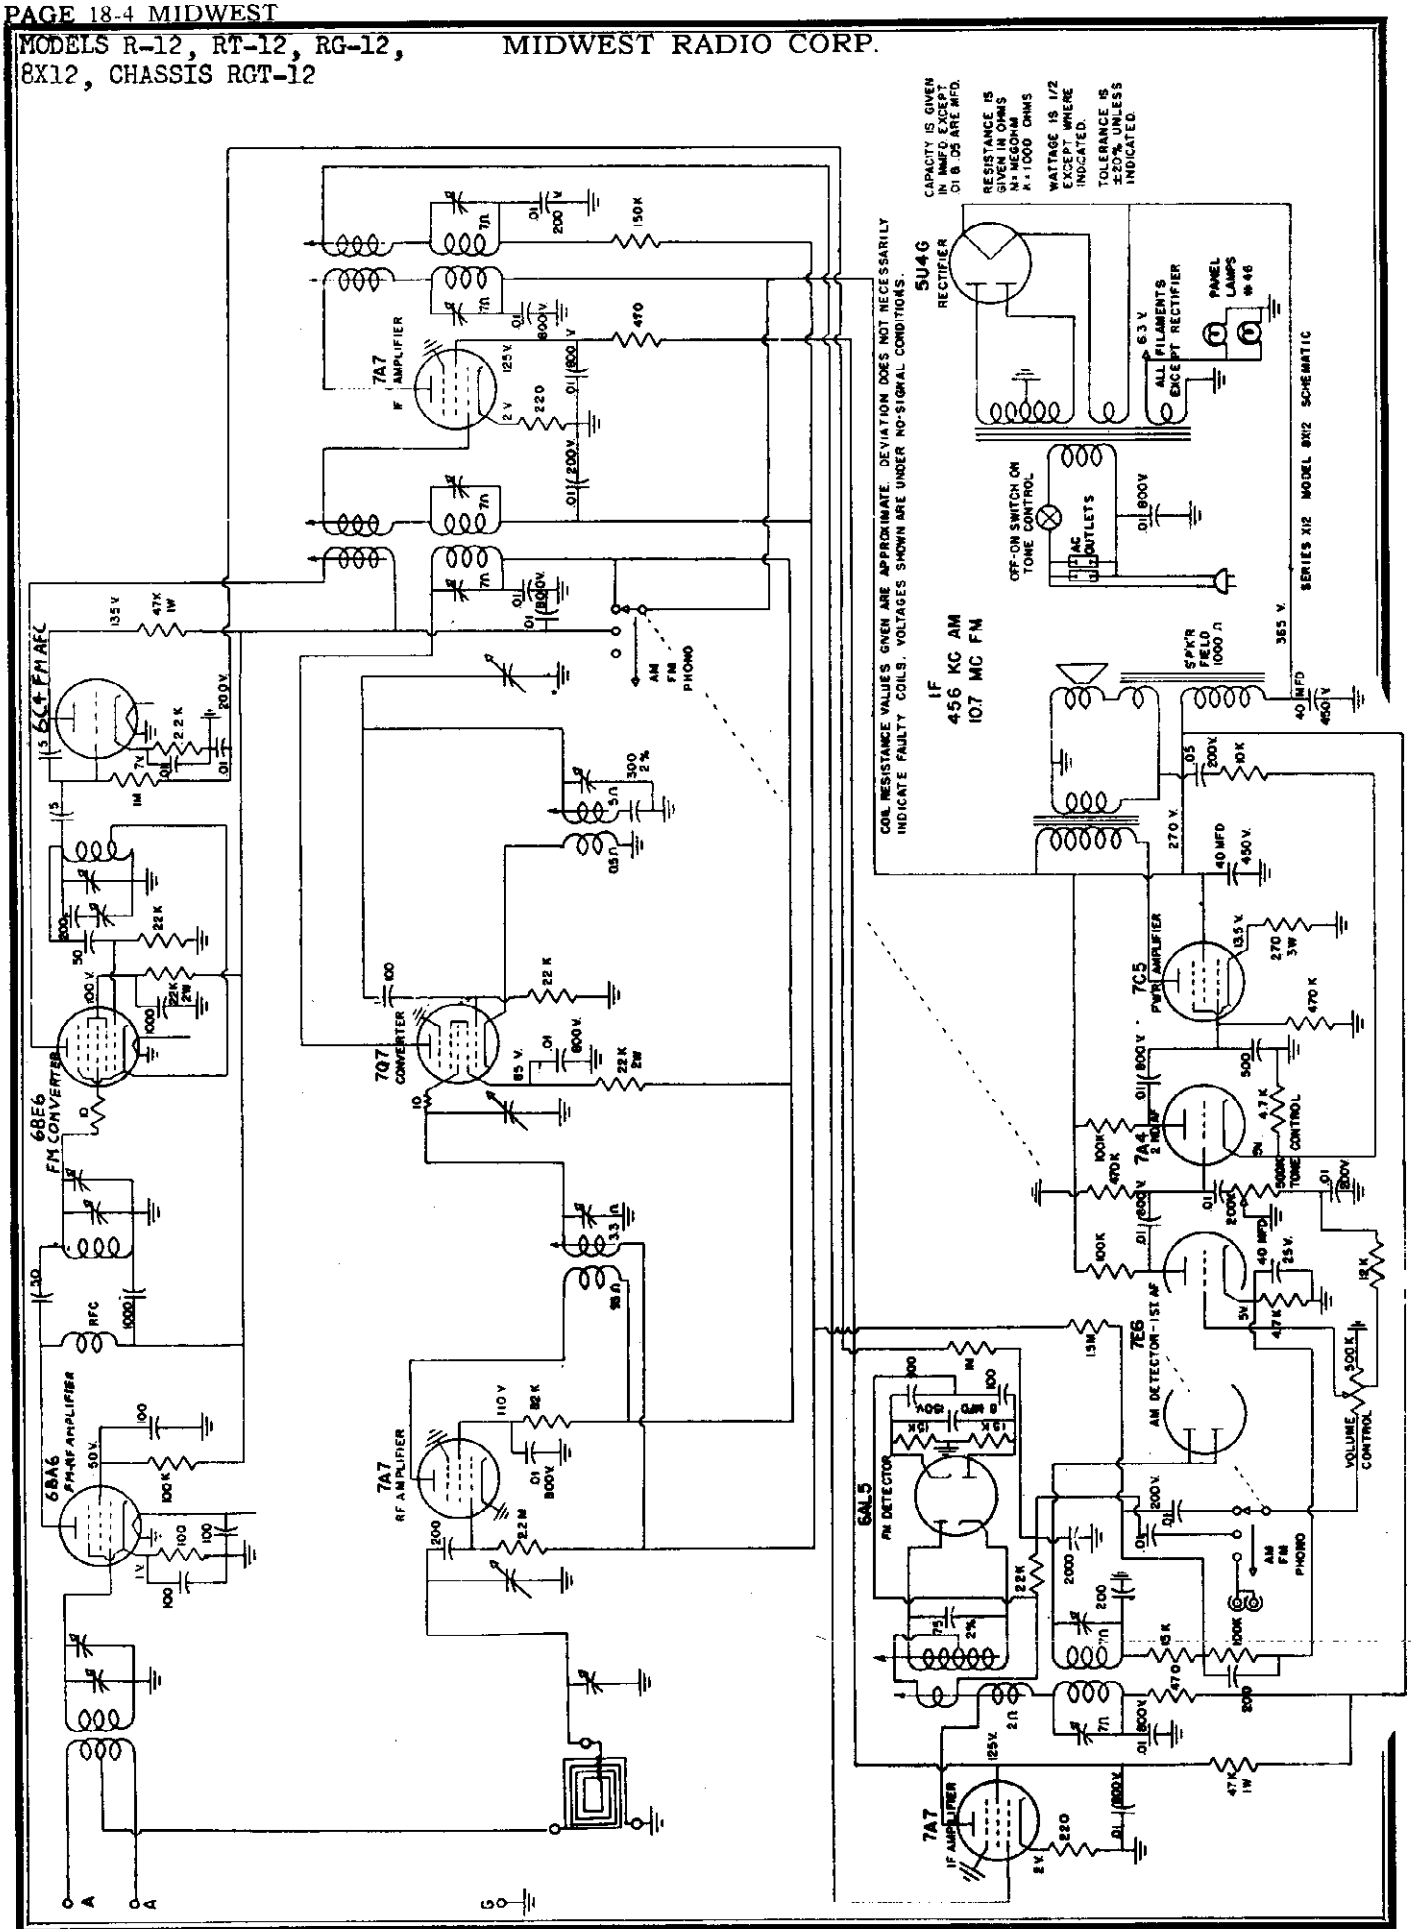
DIAL STRINGING — Use a light weight flexible dial cord when replacing worn or broken cord such as Beven-Wilcox FSN-25-12.



Series 8 Dial Stringing

MODELS R-12, RT-12, RG-12, 8X12, CHASSIS RGT-12

MIDWEST RADIO CORP.



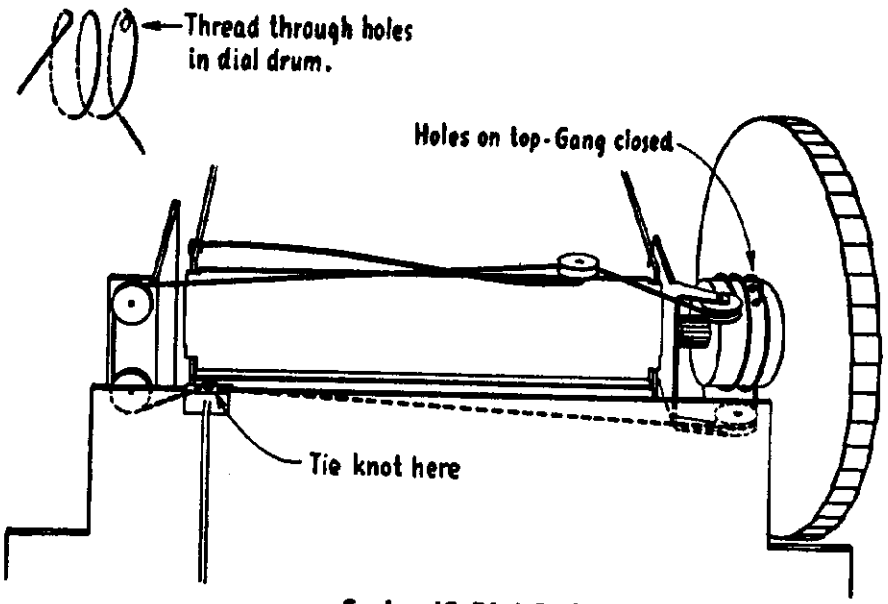
ALIGNMENT — Refer to the alignment chart for step by step procedure. It is preferable to align the FM IF stages with an AM or CW Signal. It should be noted that all adjustment are made for peak avc reading except the secondary of the third transformer. At this point, if you use an AM signal, it may be tuned for minimum audio signal; or the discriminator voltage may be used, reading it with a VTVM, and the secondary may be adjusted to the zero voltage. There may be some discrepancy between these methods, and if it is not excessive, is of no importance.

The FM RF alignment should be made using an FM signal and either avc or audio for peaking. In doing this alignment, or when feeding the IF signal into the FM mixer grid, care must be taken not to move the wiring. If the wiring is displaced so as to affect the inductance of the RF circuits it is difficult to re-establish the RF-Oscillator tracking.

The AM, RF and IF alignment should be done with a VTVM across the avc. The recommended signal value is one which will generate 10 volts of avc. When aligning the "AM" band the loop must be plugged in and you need not adjust the RF padder core. The RF padder is very broad and can be aligned only if the converter grid lead is connected to an RF type VTVM as indicator; this will usually involve a signal level greater than is normally available.

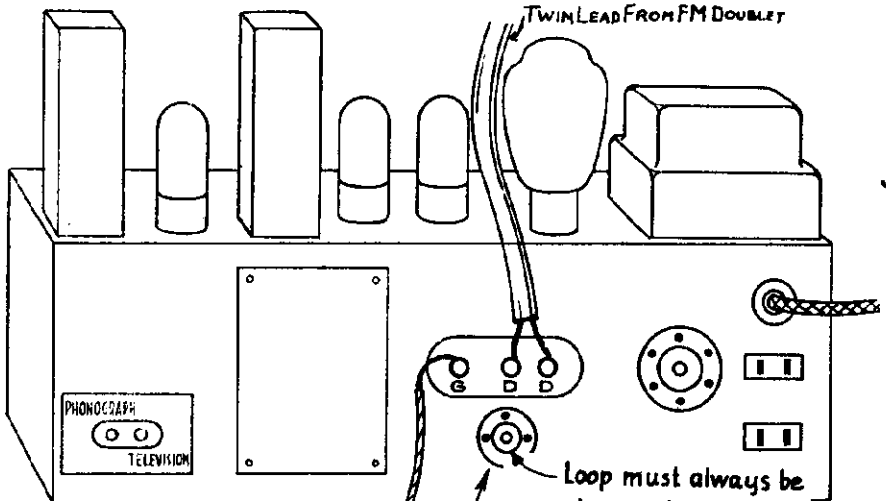
ALIGNMENT CHART

Coupling	Signal	Band Switch	Dial	Adjustment
To 7Q7 converter grid through .05 mfd. capacitor.	456 KC AM	AM	1000 KC	Peak 1st, 2nd and 3rd IF trimmers on top of IF cans.
To "A" on antenna ground terminal strip through 200 mfd. and 400 ohms in series.	1600 KC AM	AM	1600 KC	Peak RF, converter and oscillator trimmers marked "B"
	550 KC AM	AM	550 KC	Peak converter and oscillator padder cores marked "B". Loop must be plugged in. Do not adjust RF.
To 6BE6 mixer grid direct.	10.7 MC AM or CW *	FM	100 MC	Peak core adjustments for avc (around 3 volts) at 1st, 2nd and primary of 3rd IF. Adjust secondary of 3rd IF for audio null from 30% amplitude modulated 10.7 MC IF signal.
To "A" and "A" on doublet terminal strip through a pair 150 ohm resistors.	105 MC FM	FM	105 MC	Peak RF mixer and oscillator trimmers for avc or audio.



Series 12 Dial Stringing

DIAL STRINGING — Use a light weight flexible dial cord when replacing worn or broken cord such as Beven-Wilcox FSN-25-12.



Note: Order resistors and condensers by value, tolerance and wattage or voltage.

Note: When ordering include serial number of chassis, since Midwest records of changes in parts specifications are kept by that number.

*UK-13	Oscillator Coil Assembly

To set the push buttons this exact procedure should be followed. A small screw driver will be needed.

1. Turn on the receiver and allow at least three minutes to warm up.
2. Remove the push button by pulling straight out. A hooked instrument will assist in removing the end buttons.
3. Loosen the LOCK SCREW at least one half turn.
4. Using the screw driver with the blade in the screw slot, push the mechanism in firmly. Hold in during step 5. The mechanism may bind at first. Use sufficient force to break loose so that the push button and tuning control are independent.
5. Tune the pointer past the desired station then back to the desired station and make the tuning adjustment as carefully as you know how.
6. Tighten the LOCK SCREW.
7. Check the setting of this push button by tuning away from the station manually, then pushing in firmly. Pushing the button must return the pointer to the position it had when the LOCK SCREW was tightened. If the station is not now tuned in perfectly repeat the steps 2 to 6 carefully.
8. Adjust each of the seven buttons, or as many as you wish to set, exactly as outlined above.

Any button can be set for any pointer position, however, you may find it more desirable to select the button nearest the pointer position so that each successive adjustment moves the pointer in the same direction. That is, the "M" button will be set for a station at the left of the dial, the "W" button will set for a station near the center, etc.

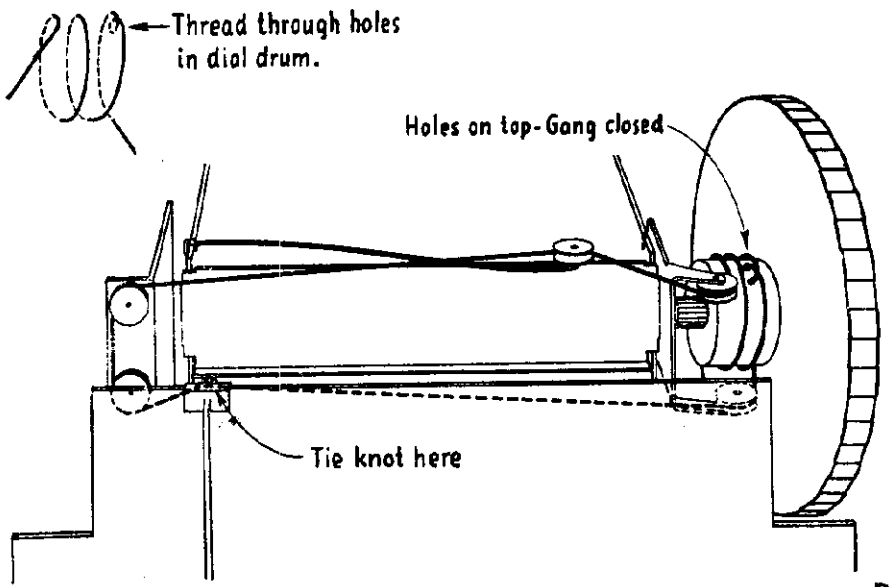
BAND-SWITCH SHOWN AT 5TH POSITION CLOCKWISE SHORT WAVE E BAND

ALIGNMENT — Refer to the alignment chart for step by step procedure. It is preferable to align the FM IF stages with an AM or CW Signal. It should be noted that all adjustment are made for peak avc reading except the secondary of the third transformer. At this point, if you use an AM signal, it may be tuned for minimum audio signal; or the discriminator voltage may be used, reading it with a VTM, and the secondary may be adjusted to the zero voltage. There may be some discrepancy between these methods, and if it is not excessive, is of no importance.

The FM RF alignment should be made using an FM signal and either avc or audio for peaking. In doing this alignment, or when feeding the IF signal into the FM mixer grid, care must be taken not to move the wiring. If the wiring is displaced so as to affect the inductance of the RF circuits it is difficult to re-establish the RF-Oscillator tracking.

The AM, RF and IF alignment should be done with a VTVM across the avc. The recommended signal value is one which will generate 10 volts of avc. When aligning the "B" band the loop must be plugged in and you need not adjust the RF padder core. The RF padder is very broad and can be aligned only if the converter grid lead is connected to an RF type VTVM as indicator; this will usually involve a signal level greater than is normally available.



Series 16 Dial Stringing

ALIGNMENT CHART

Coupling	Signal	Band Switch	Dial	Adjustment
To 7Q7 converter grid through .05 mfd. capacitor.	456 KC AM	B	1000 KC	Peak 1st, 2nd and 3rd IF trimmers on top of IF cans.

POWER OUTPUT:
  Undistorted ..... 1.5 watts
  Maximum ..... 3 watts
POWER SUPPLY:
  105-125 volts, a.c. 60 cycles
POWER CONSUMPTION: 45 watts
LOUDSPEAKER:
  5x7 inch oval (or 5-inch round);
  permanent magnet.
Voice Coil Impedance: 3.2 ohms at 400 cycles.

NOTES:
R19, R20 and C28, shown in the above schematic, were not included in earlier models.
The following changes were effected in later models: R2 changed from 10 to 2.2 megohms; R16 changed from 1800 to 560 ohms; R17 changed from 0.47 megohm to 0.22 megohm.
The rectifier output voltage of +110 volts, as shown above, may be 10 to 15 volts

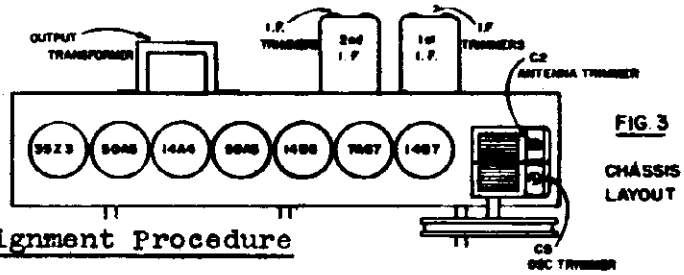

FIG. 3
CHASSIS LAYOUT

Alignment Procedure

A signal generator capable of producing a modulated radio-frequency signal, and a suitable output meter are required for proper alignment of the receiver.

Adjust the signal generator for 30%, 400 cycle modulation. At all times, use only the minimum signal intensity which will produce a readable indication on the output meter, in order to minimize alignment error due to a.v.c. action in the receiver.

Set the receiver controls for "Radio", maximum volume, and treble tone.

Make all adjustments with the signal generator connected directly to the external antenna lead of the receiver, and with the output meter across the speaker voice coil.

Use a non-metallic screwdriver in making all receiver alignment adjustments.

NOTE: The calibrated tuning dial of the receiver is fastened in the cabinet and cannot be used for reference during alignment. Therefore, calibration marks have been stamped on the plate on the front of the chassis, as shown in Figure 2. These are the reference marks referred to in the following procedure:

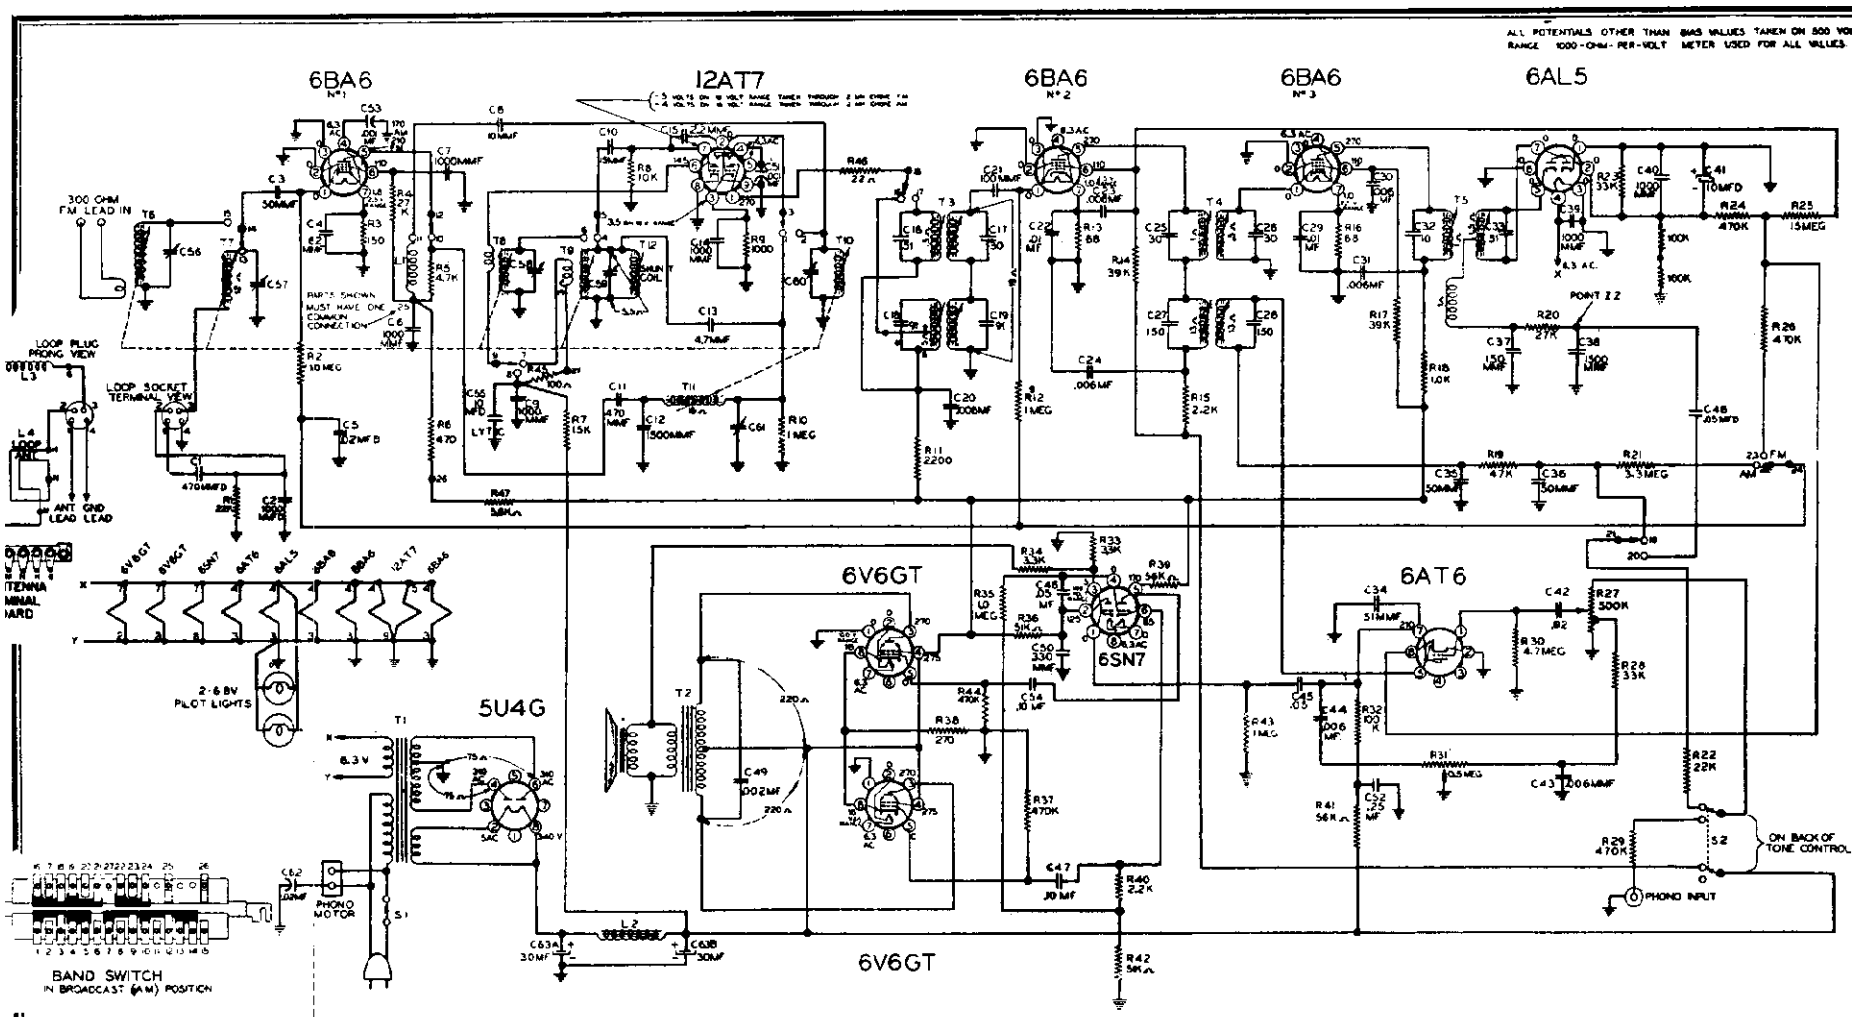
Step 1. Set signal generator to 455 kc. and the receiver dial to a "quiet spot" between stations. Peak the I.F trimmer condensers (Figure 3) for maximum signal indication on the output meter, beginning with the 2nd I.F. transformer.

Step 2. Turn ganged tuning condenser to maximum capacity (fully meshed) and adjust dial pointer on cord so that it coincides with the extreme left hand white mark on the metal dial plate.

Step 3. Set signal generator to 1500 kc. Turn ganged tuning condenser until pointer coincides with extreme right hand (1500 kc.) calibration mark. Adjust oscillator trimmer condenser C5 (Figure 3) for maximum indication on the output meter.

Step 4. With the signal generator and receiver dial set as in step 3, adjust the antenna trimmer condenser C2 for maximum indication on the output meter.

When chassis has been returned to cabinet after alignment, the receiver calibration should be checked against the tuning dial. It may be found necessary to slide the dial pointer slightly in either direction on the cord to correct for small deviations in calibration.



NOTE: The two 100K ohm resistors in series from PIN NO. 2 to ground are connected as shown only when aligning the FM I.F. Refer to FM I.F. alignment procedure.

NOTE: On some sets R46 — 22 ohm resistor is replaced with a 39 ohm resistor, Part no. C-9B1-45.

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-48 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-320 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—3 microvolts average
FM Sensitivity	(For .5 watt output—10 microvolts average.
Power Output	8 watts, 10% distortion. 10 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

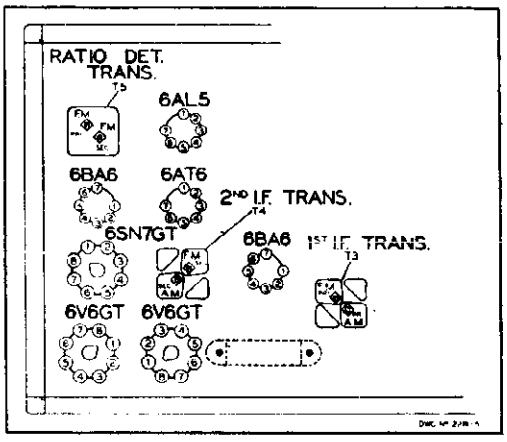
BROADCAST BAND - R. F. ALIGNMENT

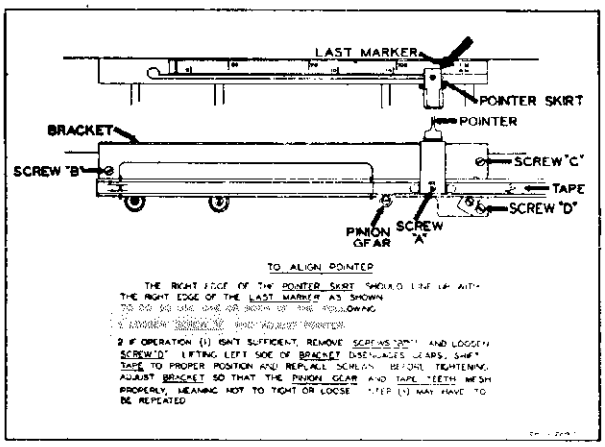
Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C59 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T12 for maximum ½ watt
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C57 and C61 for max. ½ watt. See note

NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism





ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin no. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale. See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of T4 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin no. 2 of 12AT7 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3 See top and bottom views	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

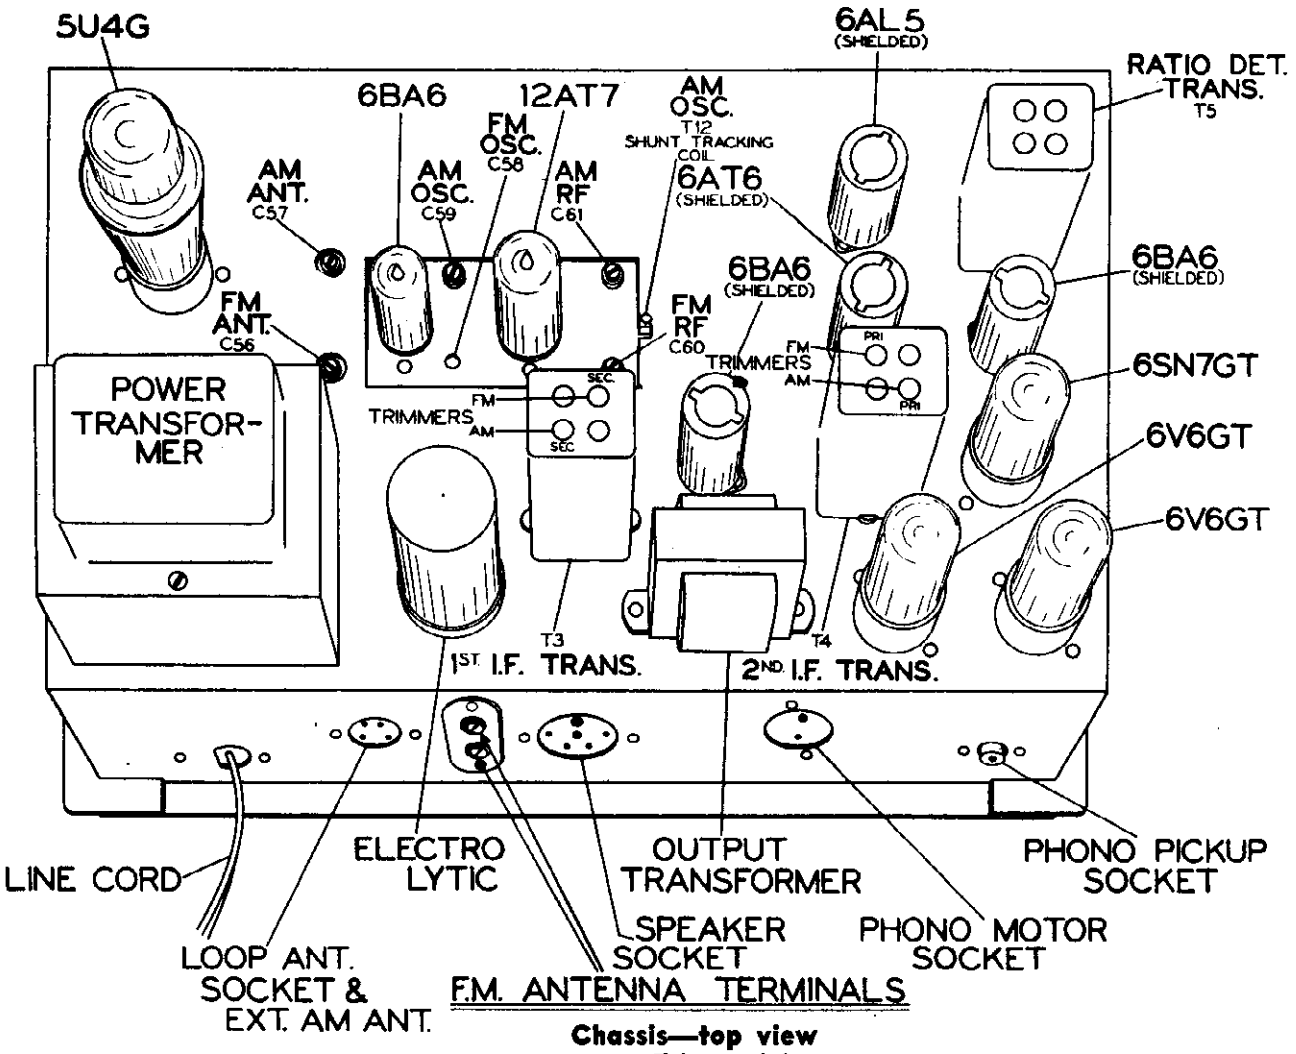
Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R.F. C56 Ant.	Pin no. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts.

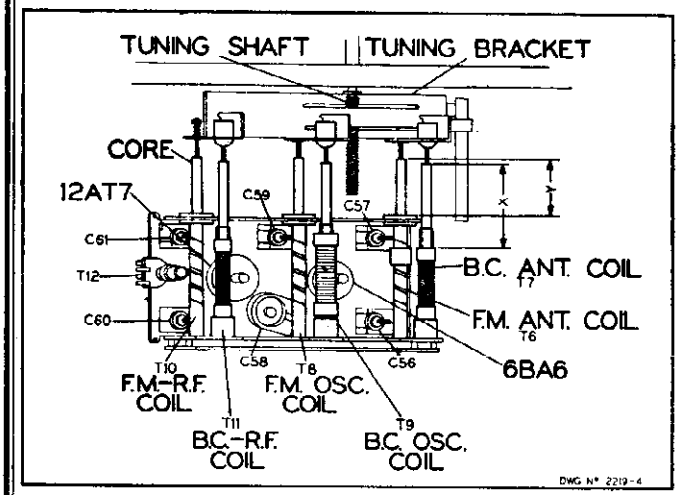
NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw

MODEL 74BR-2707A MONTGOMERY WARD



Chassis—top view

Tube and Lamp Complement.....
- 6BA6, FM—AM R.F. stage.
- 12AT7, FM—AM oscillator and mixer.
- 6BA6, FM—AM 1st I.F.
- 6BA6, FM— 2nd I.F.
- 6AL5, FM— ratio detector.
- 6AT6, AM detector. A. F. AMP. and A.V.C.
- 6SN7, Push-pull. Driver and phase-inverter.
- 5U4G, rectifier.
- 6V6, output.
- 6V6, output.
- T-44 dial lamp (2 used).



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.

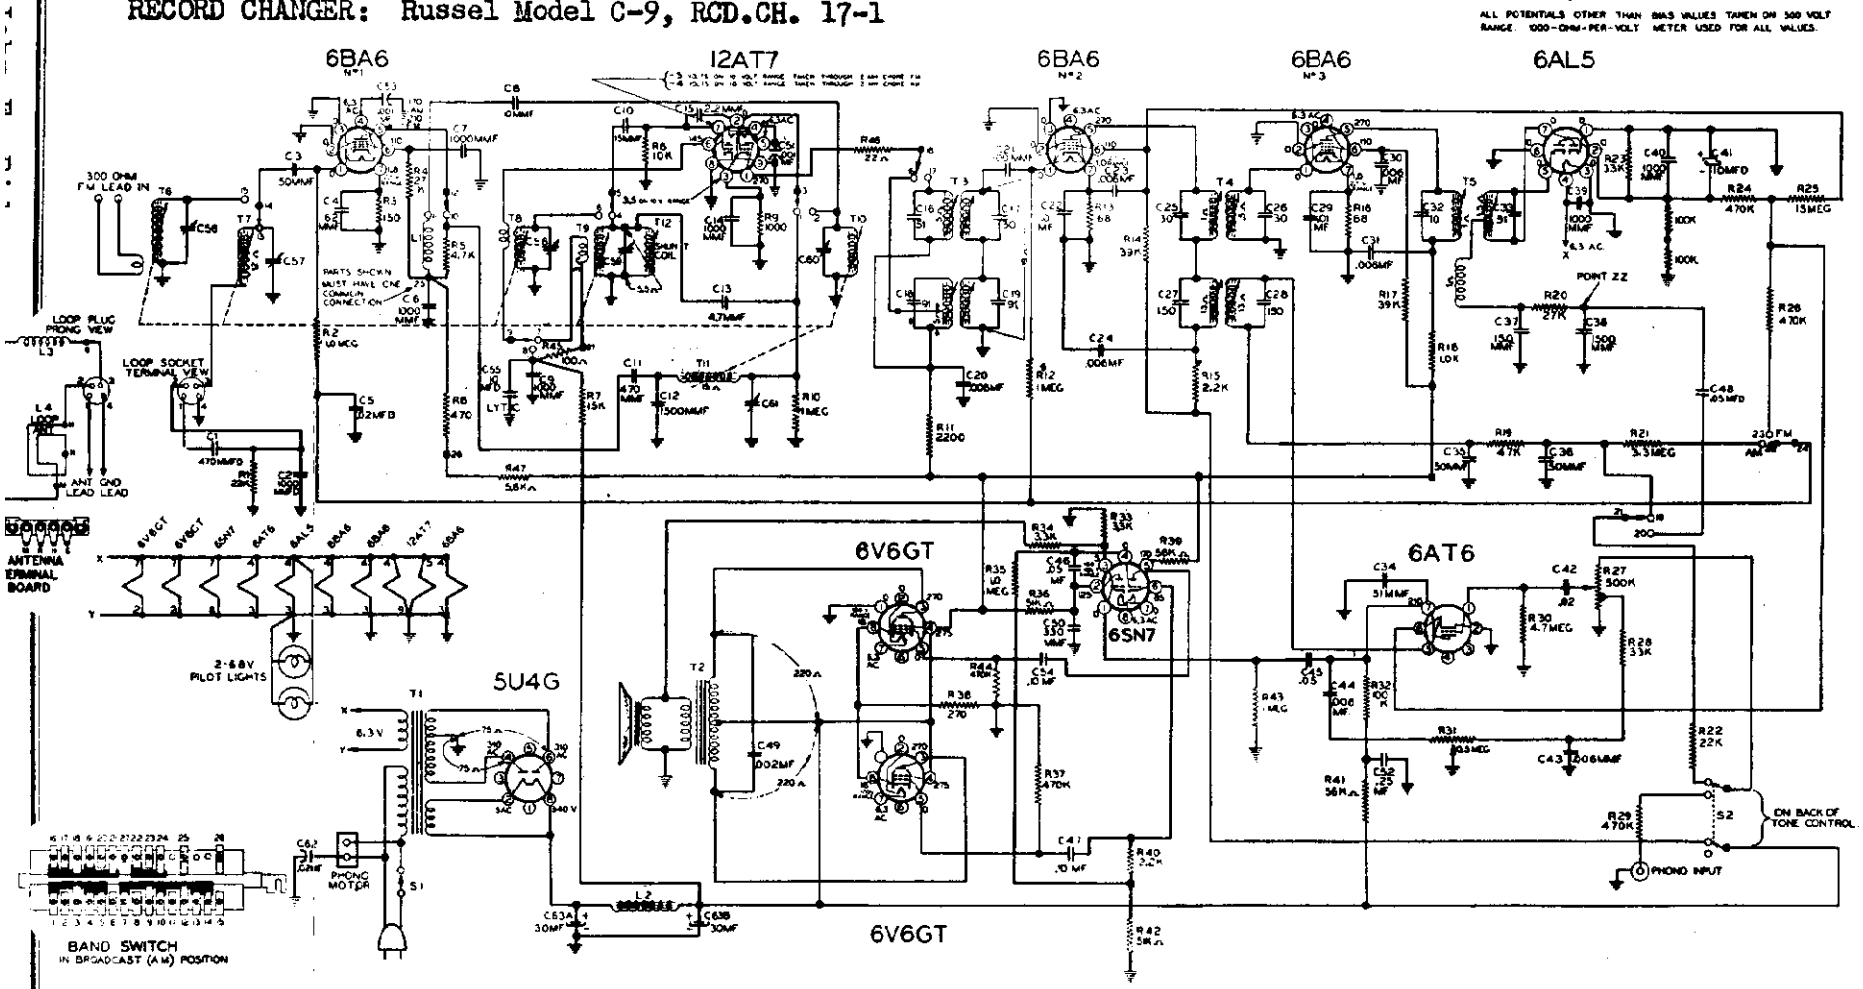
	8K-14224	Retracto crystal cartridge with needle	1
	55A-14225	Retracto needle only	

RECORD CHANGER: Russel Model C-9, RCD.CH. 17-1



NOTE: The two 100K ohm resistors in series from PIN NO. z to ground are connected as shown only when aligning the FM I.F. Refer to FM I.F. alignment procedure.

NOTE: On some sets R46 — 22 ohm resistor is replaced with a 39 ohm resistor, Part no. C-9B1-45.

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-48 kc. broad at 1000 times signal, measured at 1000 kc.
	I.F. FM-180 kc. broad at 2 times down.
	I.F. FM-320 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—3 microvolts average
FM Sensitivity	(For .5 watt output—10 microvolts average.
Power Output	8 watts, 10% distortion. 10 watts maximum.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

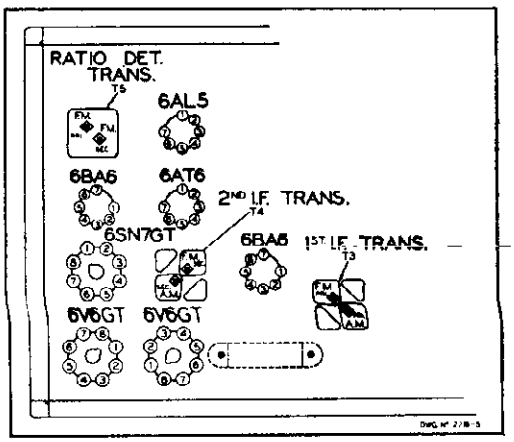
BROADCAST BAND - R. F. ALIGNMENT

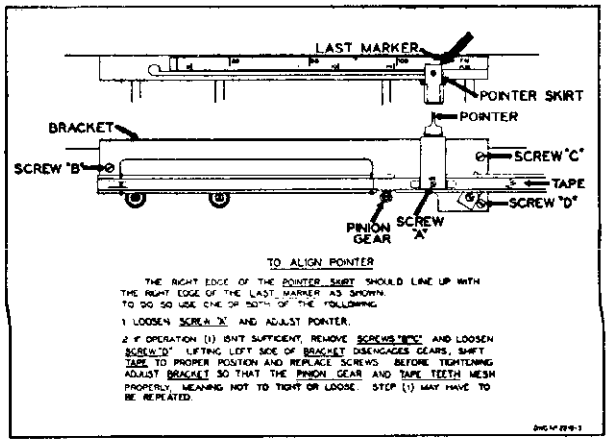
Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C59 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T12 for maximum ½ watt
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C57 and C61 for max. ½ watt. See note

NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism





MODEL 74BR-2710A

MONTGOMERY WARD

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin no. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale. See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of T4 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin no. 2 of 12AT7 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3 See top and bottom views	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

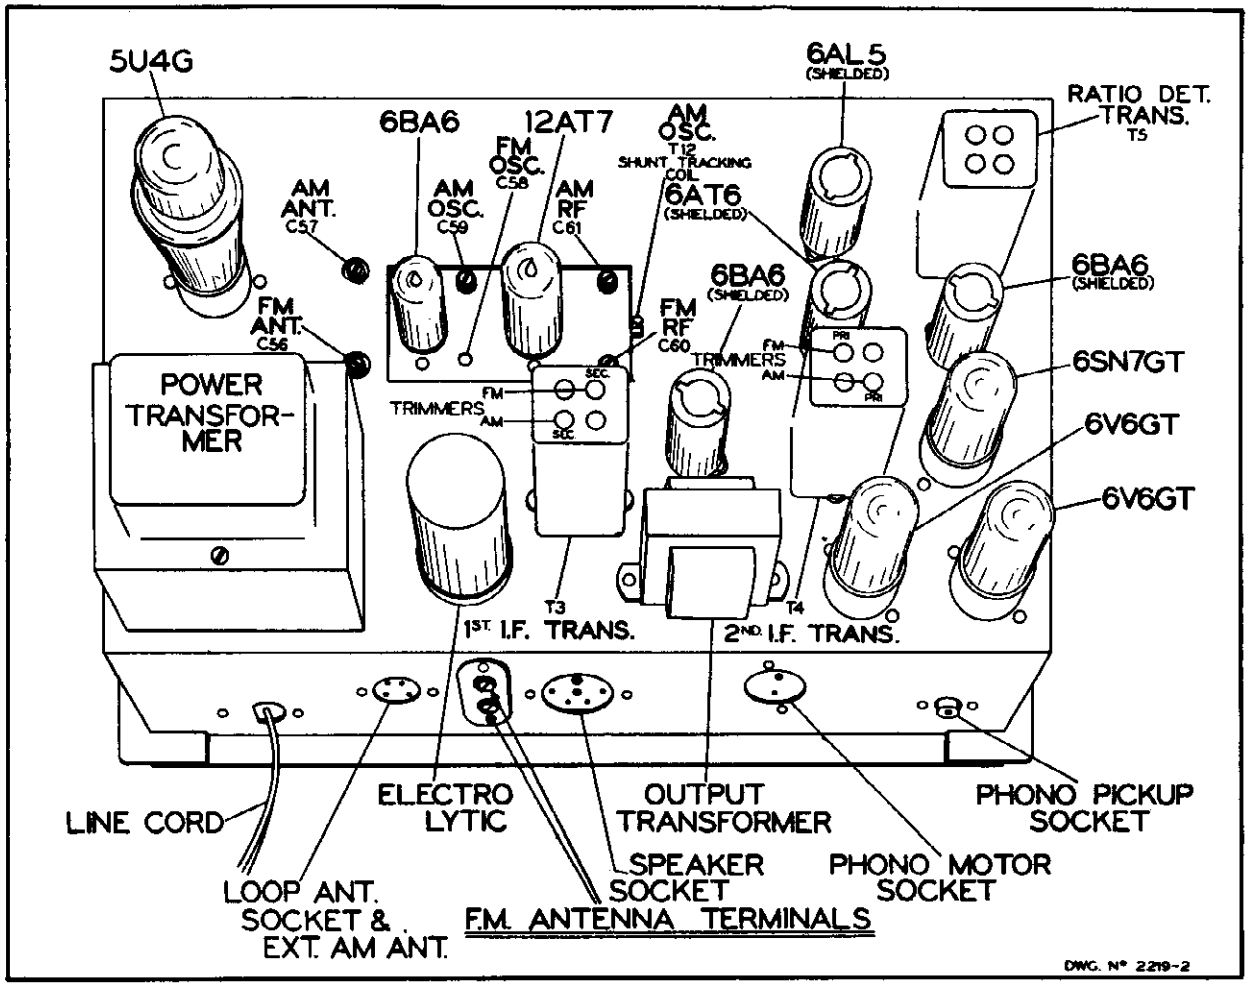
FM - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R.F. C56 Ant.	Pin no. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts.

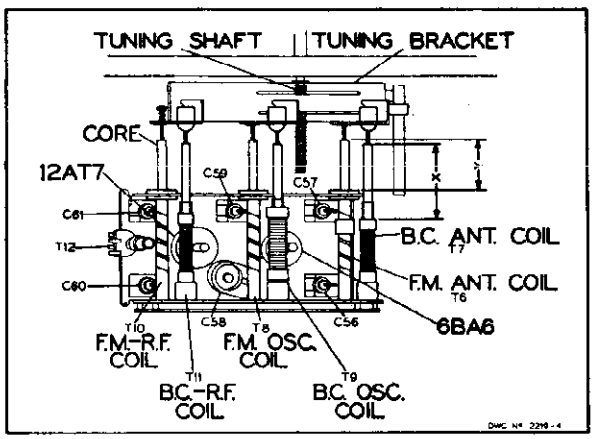
NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw



Chassis—top view

Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

Tube and Lamp Complement.....
- 6BA6, FM—AM R.F. stage.
- 12AT7, FM—AM oscillator and mixer.
- 6BA6, FM—AM 1st I.F.
- 6BA6, FM— 2nd I.F.
- 6AL5, FM— ratio detector.
- 6AT6, AM detector. A. F. AMP. and A.V.C.
- 6SN7, Push-pull. Driver and phase-inverter.
- 5U4G, rectifier.
- 6V6, output.
- 6V6, output.
- T-44 dial lamp (2 used).



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.

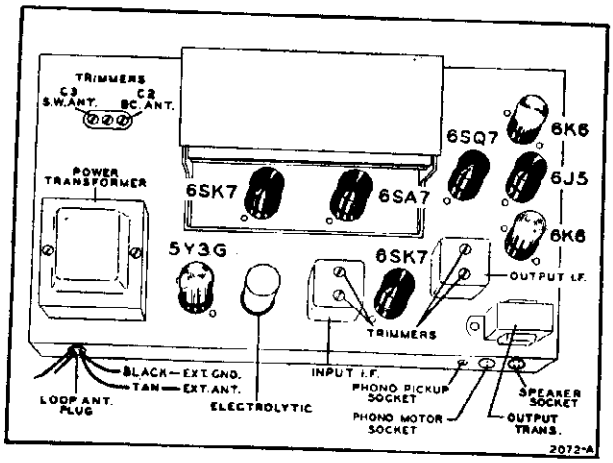
MODELS 74BR-2703A, 74BR-2708B, 74BR-2708

GENERAL DESCRIPTION

The radio is a 5-band, superheterodyne, AC set using seven tubes plus a rectifier. The five bands, permeability-tuned, include the standard broadcast band and four shortwave spread bands. Six pushbuttons are provided. A loop antenna is built into the cabinet; provision is made also for the connection of an external antenna and ground.



ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts AC, 60 cycles; 95 watts. Chassis only. 125 watt with phono operation.

Frequency Ranges....Broadcast band—540 to 1600 kc.
49-meter band—5.96 to 6.19 mc.
31-meter band—9.1 to 10 mc.
25-meter band—11.45 to 12.16 mc.
19-meter band—14.94 to 15.46 mc.

Intermediate Freq...455 kc.

Selectivity.....at 1000 kc, 35 kc at 1000 x signal

Sensitivity.....3.75 microvolts average for ½ watt output.

Power Output.....5.5 watts undistorted, 7.5 watts maximum.

Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms.

Tube and Lamp Complement.....6SK7, tuned R. F. amplifier.
6SA7, converter.
6SK7, I. F. amplifier.
6SQ7, detector, AVC, 1st audio.
6J5GT, phase inverter.
6K6GT, push-pull output.
6K6GT, push-pull output.
5Y3G, rectifier.
T-44 dial lamp (2 used).

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the inputs of various stages. All measurements are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. Variations in sensitivities of plus or minus 25% are usually permissible.

BAND	SIGNAL GENERATOR				INPUT FOR 500-MILLIWATT OUTPUT
	Frequency	Dummy Antenna	Connection to Receiver	Ground Connection	
Broadcast	1000 kc	200 mmf	External Antenna clip	Chassis	3.5 microvolts
	1000 kc	.1 mf	Grid (pin 4) of R. F. amp. (6SK7)	Chassis	8.9 microvolts
	1000 kc	.1 mf	Grid (pin 8) of Converter (6SA7)	Chassis	125 microvolts
	455 kc	.1 mf	Grid (pin 8) of Converter (6SA7)	Chassis	100 microvolts
	455 kc	.1 mf	Grid (pin 4) of I. F. amp. (6SK7)	Chassis	4500 microvolts
	400 cycles	.1 mf	Grid (pin 2) of Audio amp. (6SQ7)	Chassis	.1 volt
	400 cycles	.1 mf	Grid (pin 5) of Inverter (6J5GT)	Chassis	4.8 volts
31 meter*	9.6 mc	400 ohms	External Antenna clip	Chassis	1.6 microvolts
49 meter*	6.1 mc	400 ohms	External Antenna clip	Chassis	3.0 microvolts
25 meter*	11.8 mc	400 ohms	External Antenna clip	Chassis	5.0 microvolts
19 meter*	15.2 mc	400 ohms	External Antenna clip	Chassis	9.0 microvolts

*Average sensitivity on short-wave bands at grid (pin 4) of R. F. amplifier is 8.5 microvolts.

MODELS 74BR-2708A, 74BR-2708B, 74BR-2708

ALIGNMENT PROCEDURE

MECHANICAL ADJUSTMENT—The core tuning bar (see illustration of coils below) and dial pointer must be adjusted mechanically before any electrical alignment is attempted. Rotate the manual tuning control until the core bar is farthest from the coils. For proper adjustment the bar should be approximately 1/32 of an inch from the two rod guide angles.

With the core bar in this position, adjust the dial pointer to coincide with 1600 kc on the dial scale (see pointer alignment diagram below).

Rotate the core of each of the three broadcast coils (see illustration) until the end of the core is 1-5/32" from the end of the coil form. Rotate the three 9-mc cores until this dimension is 1-1/6" for these coils. After these adjustments have been made, the unit can be aligned electrically.

ELECTRICAL ADJUSTMENT—To align the set make the following preliminary adjustments: Set the tone control for treble tone; set the volume control at maximum; connect the ground post of the signal generator to the radio chassis; connect the output meter across a 3.2-ohm output load; and allow the receiver and signal generator to warm up for several minutes.

Align the set according to the sequence given in the chart. The indicated coupling capacitor is to be connected in series between the signal generator output lead and the receiver. Adjust the set for maximum output; reduce the input as needed to keep the output near 1.3 volts.

Locations of all the trimmers and coils are shown in the illustrations below. After adjustment, seal the coil cores with collodion or a similar substance (do not use cement).

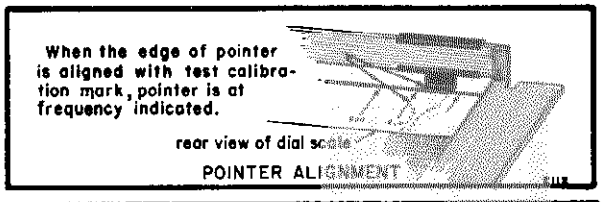
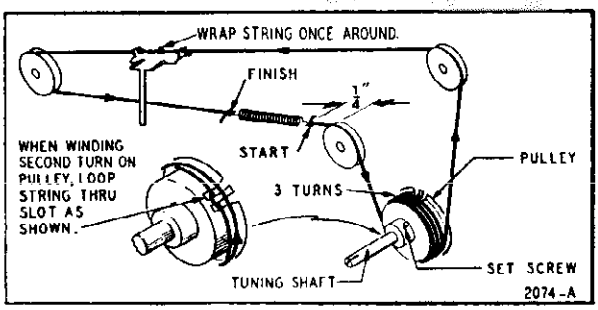
View of Trimmers and Tuning Coils





Replacing Dial Pointer Drive Cord

After stringing, spring must be 1/4" from idler when tuning shaft is in extreme counterclockwise position. To do this: Loosen set screw; hold tuning shaft firm and turn pulley by hand until spring is 1/4" from idler; tighten screw.

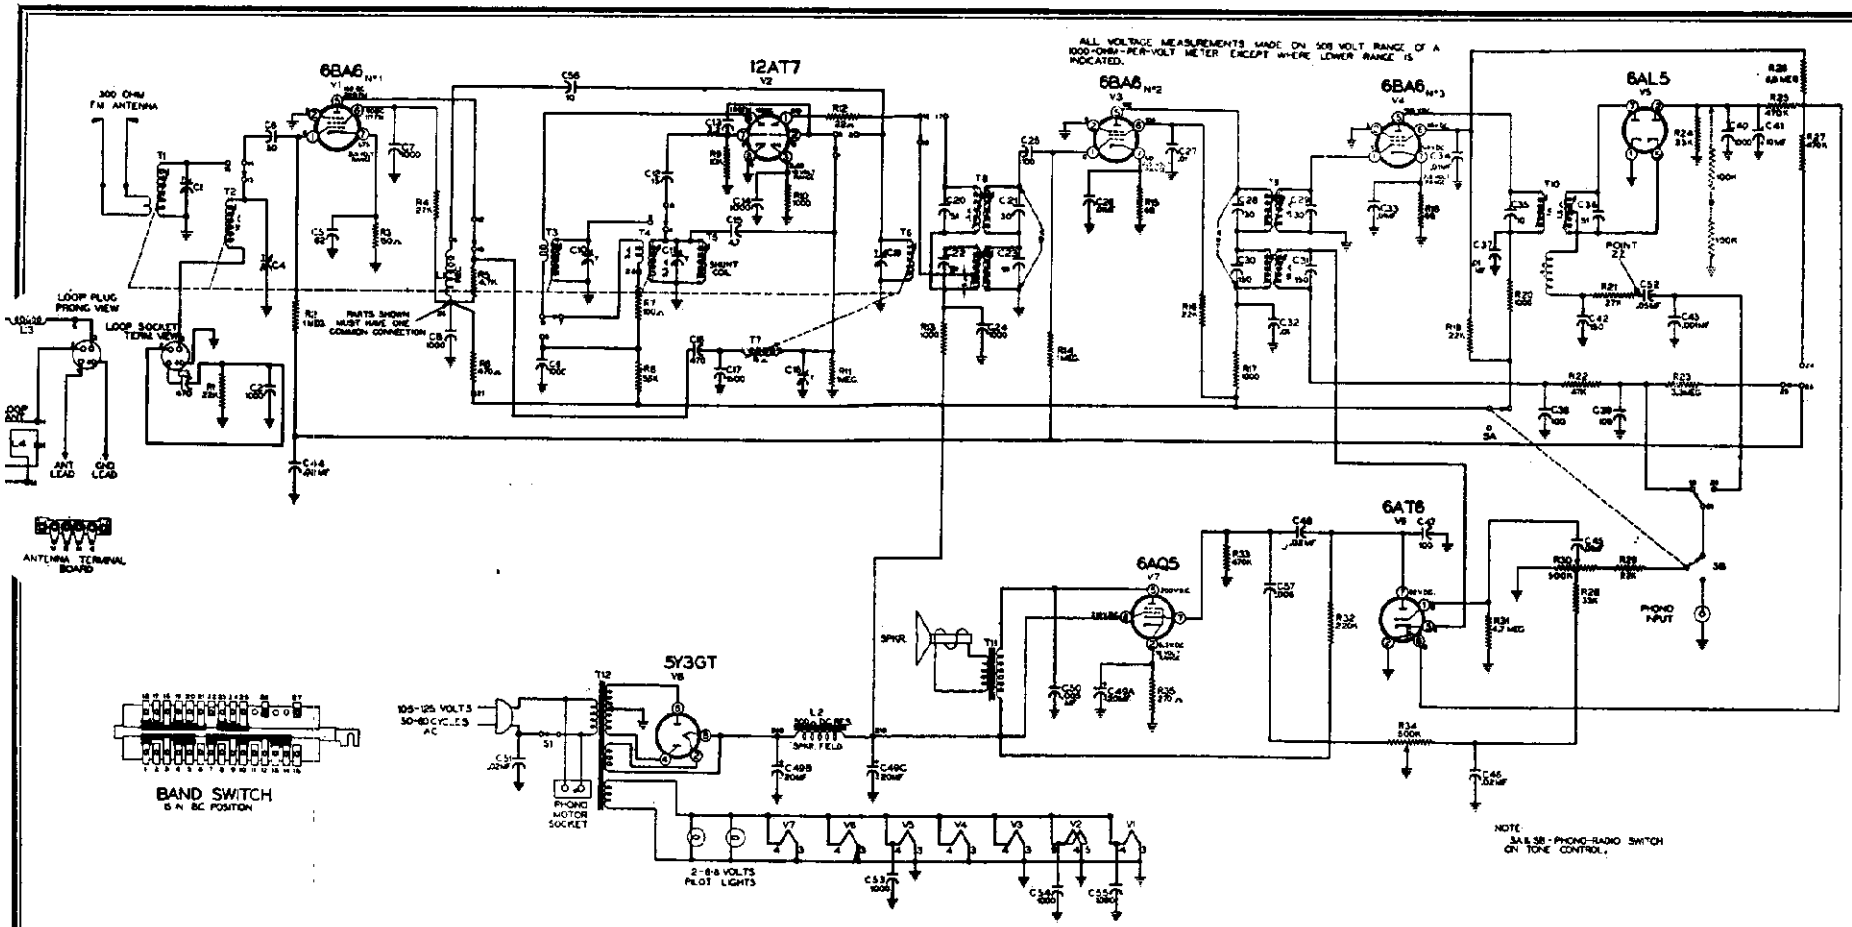
RECORD CHANGER PARTS

MODELS 74BR-2708A, B

	Nylon I-J crystal cartridge with needle	1
	Nylon needle only for above	1

MODEL 74BR-2708C

B-201-13304-1	C-9 Changer	1
P30	Crystal cartridge with special needle	1



NOTES: The two 100K ohm resistors in series from Pin No. 2 to ground are connected as shown only when aligning the FM I.F. Refer to FM I.F. alignment procedure

On some sets R12, 22 ohms, C-9B1-42 is replaced with C-9B1-45, a 39 ohm resistor.

On some sets C24, 40, 53 Part No. C-8G-13016 (uninsulated type) is replaced with an insulated type, same value, Part No. C-8G-13201.

On some sets C26 is .05 — 200 volts.

When T10 is Part No. B-13M-15475 which is tuned top and bottom, condenser C42 is 100 mmfd instead of 150 mmfd.

When T10 is Part No. B-13M-15475 which is top and bottom tuned, C34 and R19 are connected to the junction between C35 and C37.

Assembly number B-201-15176 is the 148 Changer with a P-30 cartridge as shown in the radio service manual and radio owner's guide. The needle information is correct.

On some sets, assembly number B-201-15173 is the 148 Changer with an Astatic LT crystal cartridge. This cartridge and needle is different than the P-30 above and when requiring a new needle, it should be specified for use with an LT cartridge.

RECORD CHANGERS: For 74BR-2715A and 84BR-2715A, VM Model 800, RCD.CH. 17-1. For 84BR-2715B, Webster Model 148, RCD. CH. 18-1

MODELS 74BR-2715A,

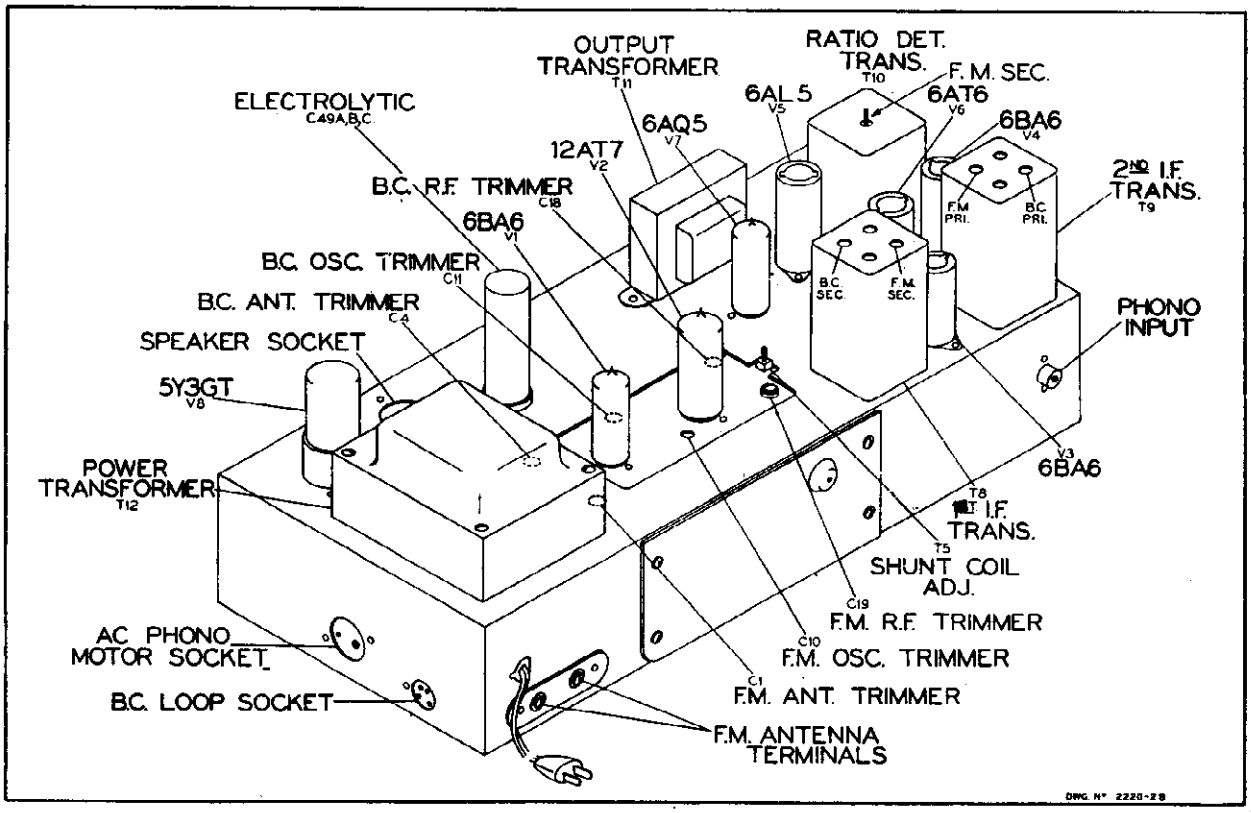
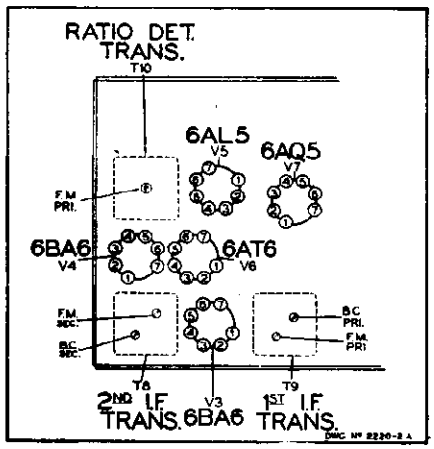
SPECIAL ALIGNMENT INFORMATION

Read this before attempting any alignment.





ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band— 88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-42 kc. broad at 1000 times signal, measured at 1000 kc.
	I.F. FM-200 kc. broad at 2 times down.
	I.F. FM-400 kc. broad at 10 times down.

This model radio is made with two groups of I. F. coil assemblies.

One group has T8 and T9 with iron cores which are slotted to accommodate the alignment tool and T10 with trimmers on top and bottom. The two views shown here should be used when aligning this type. The part numbers of these I. F.'s are as follows:

T 8	B-13A-15473	INPUT I. F.
T 9	B-13B-15474	SECOND I. F.
T10	B-13M-15475	RATIO DET. (top and bottom tuned)

The other group of I. F.'s has iron cores which have molded into them threaded screws which are slotted for the alignment tool.

The two views for the alignment of this type of I. F. are shown elsewhere in this manual. The part numbers of these I. F.'s are:

T 8	C-13A-13009	INPUT I. F.
T 9	C-13B-13014	SECOND I. F.
T10	C-203-11745-1	RATIO DET. (bottom tuned)

AM Sensitivity	(For .5 watt output with external antenna)—5 microvolts average.
FM Sensitivity	(For .5 watt output)—25 microvolts average.
Power Output	2 watts, 10% distortion. 4 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

MONTGOMERY WARD

MODELS 74BR-2715A
84BR-2715A, 84BR-

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for imum treble.

The signal source must be an accurately calibrated signal g rator capable of supplying the frequencies designated, modul 30% with a 400-cycle audio signal. A 400 cycle audio signa required for the audio measurement. Variations in sensitivitie plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 2400 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T9 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 70 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T8 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 60 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

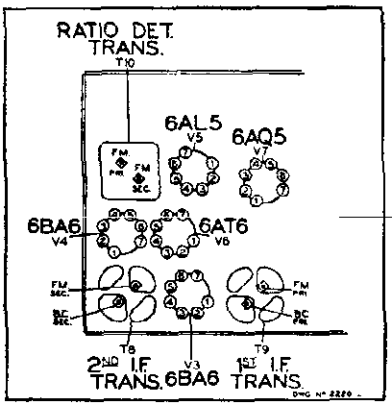
BROADCAST BAND - R. F. ALIGNMENT

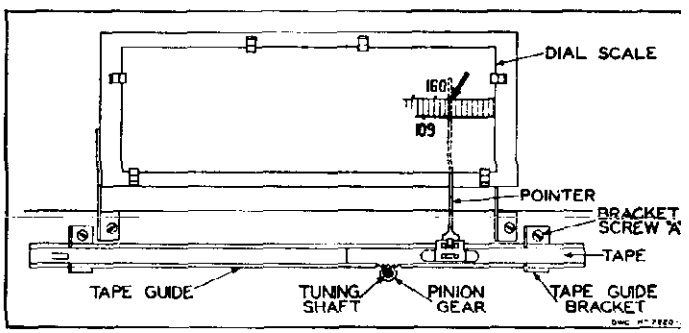
Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C11 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T5 for maximum ½ watt
1620 Kc. Use 5 microvolts	AM Antenna and Ground	200 mmf.	C4 and C18 for max. ½ watt. See note

NOTE: Racheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism.





TO ALIGN POINTER— Loosen bracket screw "A". Then tape guide bracket be moved up to allow proper meshing of tape teeth with pinion gear. Read bracket to eliminate backlash.

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T10	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T10	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T9 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T8 See top and bottom views	Resonance should be about 3 volts

NOTE ON FM - I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube volt-meter between the mid-point of the resistors and points zz.

NOTE "B" If T10 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

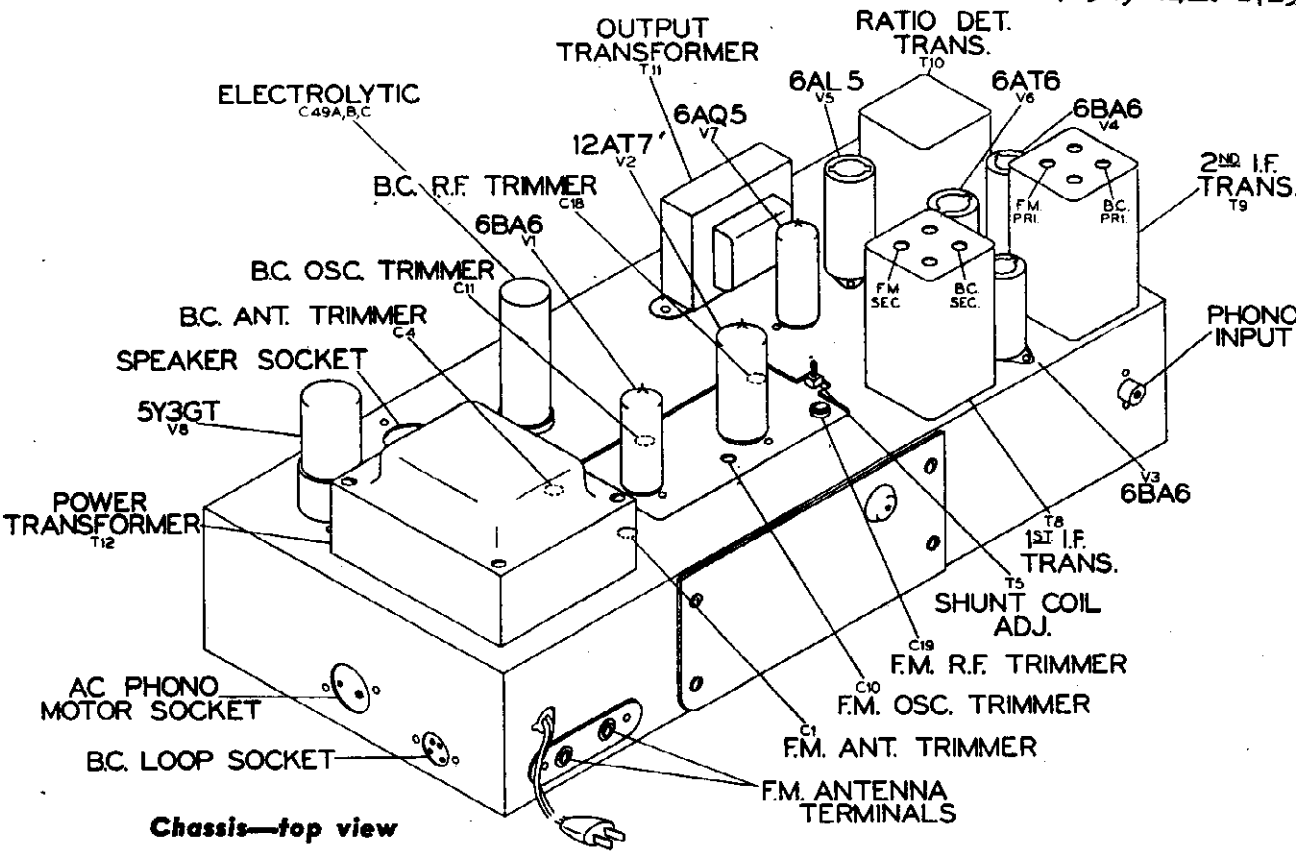
Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 25 microvolts	FM Antenna Terminals See note	300 ohms	C10 Osc. C19 R.F. C1 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

MONTGOMERY WARD

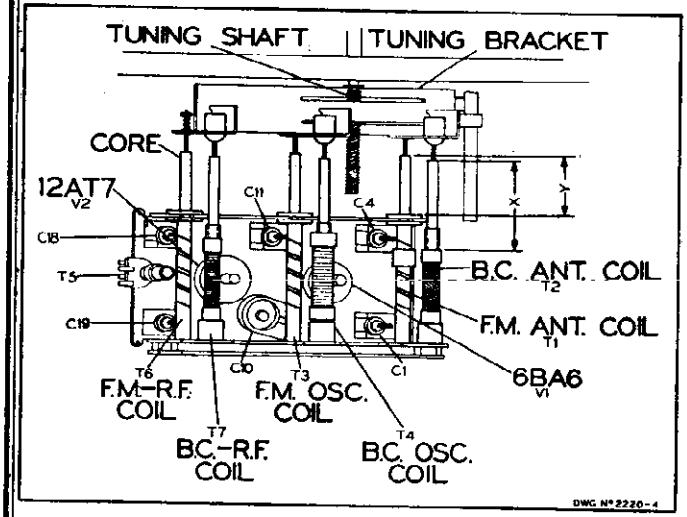
MODELS 74BR-2715A, 84BR-2715A, 84BR-2715



Chassis—top view

Tube and Lamp Complement

- 6BA6, FM—AM R.F. stage.
- 12AT7, FM—AM oscillator and mixer.
- 6BA6, FM—AM 1st I.F.
- 6BA6, FM—2nd I.F.
- 6AL5, FM ratio detector.
- 6AT6, AM detector. A.F. AMP. and A.V.C.
- 6AQ5, Audio output.
- 5Y3, rectifier.
- T-44 dial lamp (2 used).



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.

NOTES

VOLTAGES MEASURED WITH A 1000-OHMS-PER-VOLT VOLTMETER BETWEEN SOCKET TERMINALS AND CHASSIS.

(A)- 640 VOLTS A.C. BETWEEN PINS 4 AND 6.
(B)- 5.0 VOLTS A.C. BETWEEN PINS 2 AND 8.
(C)- CANNOT BE MEASURED WITH VOLTMETER.

RESISTOR VALUES ARE ½ WATT UNLESS OTHERWISE INDICATED.

NOTE: On some sets R9, 560 ohms is replaced with a 220 ohm resistor.

MONTGOMERY WARD

MODEL 74ER-2717

MODEL 74BR-2717A MONTGOMERY WARD

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the inputs of various stages. All measurements are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. Variations in sensitivities of plus or minus 25% are usually permissible.

BAND	SIGNAL GENERATOR				INPUT FOR 500-MILLIWATT OUTPUT
	Frequency	Dummy Antenna	Connection to Receiver	Ground Connection	
Broadcast	1000 kc	200 mmf	External Antenna clip	Chassis	3.5 microvolts
	1000 kc	.1 mf	Grid (pin 4) of R. F. amp. (6SK7)	Chassis	8.9 microvolts
	1000 kc	.1 mf	Grid (pin 8) of Converter (6SA7)	Chassis	125 microvolts
	455 kc	.1 mf	Grid (pin 8) of Converter (6SA7)	Chassis	100 microvolts
	455 kc	.1 mf	Grid (pin 4) of I. F. amp. (6SK7)	Chassis	4500 microvolts
	400 cycles	.1 mf	Grid (pin 2) of Audio amp. (6SQ7)	Chassis	.1 volt
	400 cycles	.1 mf	Grid (pin 5) of Inverter (6J5GT)	Chassis	4.8 volts
31 meter*	9.6 mc	400 ohms	External Antenna clip	Chassis	1.6 microvolts
49 meter*	6.1 mc	400 ohms	External Antenna clip	Chassis	3.0 microvolts
25 meter*	11.8 mc	400 ohms	External Antenna clip	Chassis	5.0 microvolts
19 meter*	15.2 mc	400 ohms	External Antenna clip	Chassis	9.0 microvolts

*Average sensitivity on short-wave bands at grid (pin 4) of R. F. amplifier is 8.5 microvolts.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts AC, 60 cycles; 95 watts. Chassis only. 125 watt with phono operation.

Frequency Ranges.....Broadcast band—540 to 1600 kc.
49-meter band—5.96 to 6.19 mc.
31-meter band—9.1 to 10 mc.
25-meter band—11.45 to 12.16 mc.
19-meter band—14.94 to 15.46 mc.

Intermediate Freq....455 kc.

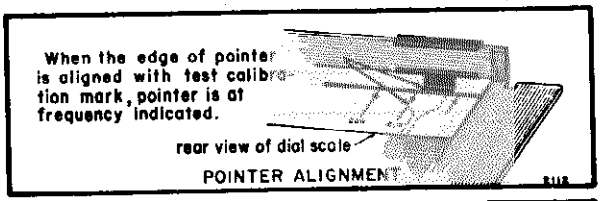
Selectivity.....at 1000 kc, 35 kc at 1000 x signal

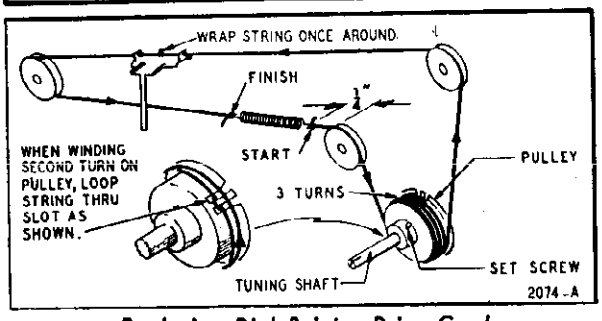
Sensitivity.....3.75 microvolts average for ½ watt output.

Power Output.....5.5 watts undistorted, 7.5 watts maximum.

Loud Speaker.....10" electrodynamic. Voice coil impedance 3.2 ohms.

Tube and Lamp Complement.....6SK7, tuned R. F. amplifier.
6SA7, converter.
6SK7, I. F. amplifier.
6SQ7, detector, AVC, 1st audio.
6J5GT, phase inverter.
6K6GT, push-pull output.
6K6GT, push-pull output.
5Y3G, rectifier.
T-44 dial lamp (2 used).





Replacing Dial Pointer Drive Cord

After stringing, spring must be 1/4" from idler when tuning shaft is in extreme counterclockwise position. To do this: Loosen set screw; hold tuning shaft firm and turn pulley by hand until spring is 1/4" from idler; tighten screw.

MONTGOMERY WARD MODEL 74BR-2717

ALIGNMENT PROCEDURE

MECHANICAL ADJUSTMENT—The core tuning bar (see illustration of coils below) and dial pointer must be adjusted mechanically before any electrical alignment is attempted. Rotate the manual tuning control until the core bar is farthest from the coils. For proper adjustment the bar should be approximately 1/32 of an inch from the two rod guide angles.

With the core bar in this position, adjust the dial pointer to coincide with 1600 kc on the dial scale (see pointer alignment diagram below).

Rotate the core of each of the three broadcast coils (see illustration) until the end of the core is 1-5/32" from the end of the coil form. Rotate the three 9-mc cores until this dimension is 1-1/6" for these coils. After these adjustments have been made, the unit can be aligned electrically.

ELECTRICAL ADJUSTMENT—To align the set make the following preliminary adjustments: Set the tone control for treble tone; set the volume control at maximum; connect the ground post of the signal generator to the radio chassis; connect the output meter across a 3.2-ohm output load; and allow the receiver and signal generator to warm up for several minutes.

Align the set according to the sequence given in the chart. The indicated coupling capacitor is to be connected in series between the signal generator output lead and the receiver. Adjust the set for maximum output; reduce the input as needed to keep the output near 1.3 volts.

Locations of all the trimmers and coils are shown in the illustrations below. After adjustment, seal the coil cores with collodion or a similar substance (do not use cement).

BAND SWITCH SETTING	SIGNAL GENERATOR			DIAL POINTER SETTING	ADJUST TO MAXIMUM OUTPUT IN ORDER SHOWN
	Frequency	Coupling Capacitor	Connection to Receiver		
Broadcast (for I. F.)	455 kc	.1 mf	Grid (pin 8) of converter (6SA7)	1600 kc	Trimmers on output and input I. F. cans

NOTES

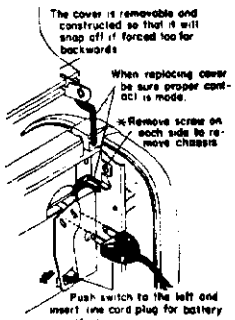
VOLTAGES AT TUBE SOCKETS ARE MEASURED WITH A 1000 OHM-PER-VOLT VOLTMETER

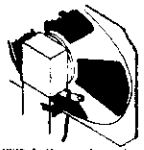
LINE VOLTAGE 117 VOLTS, AC 60 CYCLES

DC SIDE OF RECTIFIER + 140 V

ALL VOLTAGE READING BELOW 9 VOLTS TAKEN ON 10 VOLT SCALE, ABOVE 9 VOLTS ON 250 VOLT SCALE UNLESS OTHERWISE INDICATED

ALL PLUS VALUES TAKEN WITH MINUS SIDE OF VOLTMETER ON B- LINE.

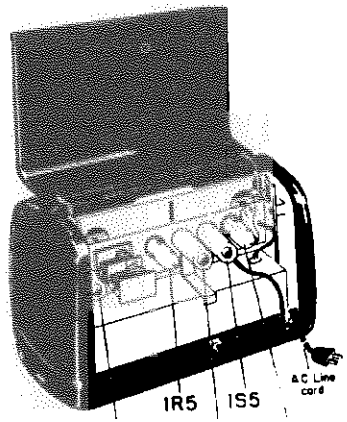




* With battery out, reach in and disconnect speaker lead before removing chassis

GENERAL DESCRIPTION

This model is a 3-way portable radio with 5 tubes plus rectifier. It contains a loop antenna built into the front cover and leads for external antenna and ground connections. When battery operation is desired, the line-cord plug is inserted into a socket switch on the chassis; the insertion automatically moves the switch contacts for battery operation. When the line-cord plug is out of the chassis socket and ready for insertion into a 105 to 125 volt outlet, the battery is automatically disconnected.



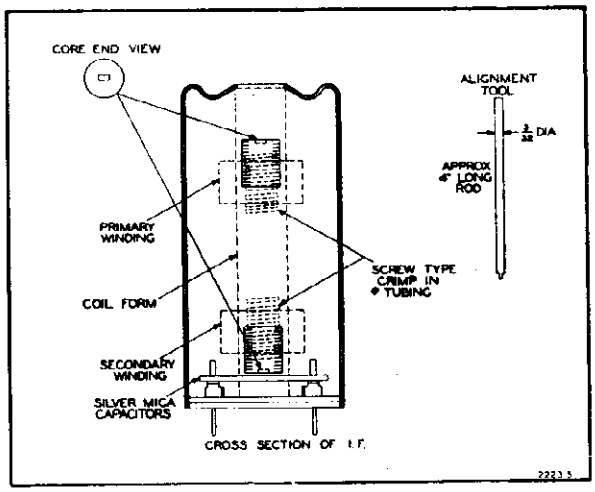
ALIGNMENT PROCEDURE AND RECEIVER STAGE SENSITIVITIES

The Alignment Procedure below includes the sensitivities at the input of various stage. All measurements are based on an output of 50 milliwatts. This may be measured by disconecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50 milliwatt output with speaker connected. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400-cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

FREQUENCY	COUPLING CAPACITOR	DIAL SETTING	CONNECTION TO RADIO	GROUND CONNECTION	ADJUST	INPUT FOR 50 MILLIWATTS OUTPUT
455 kc.	.1 mfd.	1000 kc.	Pin No. 6 of 1R5	B— (shell of lytic)	I.F. slugs	100 microvolts
1600 kc.	.1 mfd.	1600 kc.	Pin No. 6 of 1R5	B— (shell of lytic)	C1-C	———
1400 kc.	.1 mfd.	1400 kc.	Pin No. 6 of 1T4 R.F. tube	B— (shell of lytic)	C1-B	10 microvolts
1400 kc.	200 mmf.	1400 kc.	Ant. lead (see note below)	Ground lead	C1-A	2 microvolts
400 cycles	.05 mfd.	———	Pin No. 6 of 1S5	B— (shell of lytic)	———	.06 volts
400 cycles	.05 mfd.	———	Pin No, 3 of 3Q4	B— (shell of lytic)	———	3 volts

NOTE: This adjustment must be made with chassis installed in cabinet and loop knife switches connected. With one hand hold both covers open with their shoulders together. This allows access to the chassis and also allows the loop to work without undue chassis capacity effects. The antenna section of the gang has two trimmers. One is C1-A and the other is on the opposite side of the gang which is accessible when chassis is in the cabinet.



CAUTION—The I.F. transformer construction is such that two resonance peaks occur for each winding, one peak when the slug is above its coil and another peak when the slug is below its coil. Be sure the upper cores are above the top coils and the lower cores are below the bottom coils (see coil drawing).

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 50-60 cycle AC, 25 watts. Battery: Wards Battery Pack No. 62-33. Size: 9½" by 2⅝" by 4⅜". "A"—9 volts, 50 milliamperes. "B"—90 volts, 14 milliamperes.
Frequency Range	535 to 1600 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 36 kc at 1000 x signal.
Sensitivity	4 microvolts average for .05 watt output.
Power Output	125 milliwatts undistorted. 250 milliwatts maximum.
Loud Speaker	4" x 6", P.M., v.c. impedance 3.2 ohms.
Tube Complement	1T4 R.F. stage. 1R5 converter. 1T4 I.F. amplifier. 1S5 detector, AVC, audio amplifier. 3Q4 output amplifier.
Rectifier	Selenium type.

ALIGNMENT PROCEDURE

(Position of trimmers shown on next page)

- Output meter across 3.2-ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Loop antenna should be connected to receiver and in its proper position when making adjustments.

SIGNAL GENERATOR				TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT in order shown
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	0.1 mf	Grid (pin 4) of 12SK7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	2 trimmers on output IF can
455 kc	0.1 mf	Grid (pin 8) of 12SA7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	2 trimmers on input IF can
1630 kc	0.1 mf	Grid (pin 8) of 12SA7	Pin 3 of 12SK7 (B- of set)	Capacitor full open (plates out of mesh)	Oscillator trimmer C4 on gang
1400 kc	200 mmf	External antenna clip	Pin 3 of 12SK7 (B- of set)	Set dial pointer at 1400 kc	Antenna trimmer C3 on gang

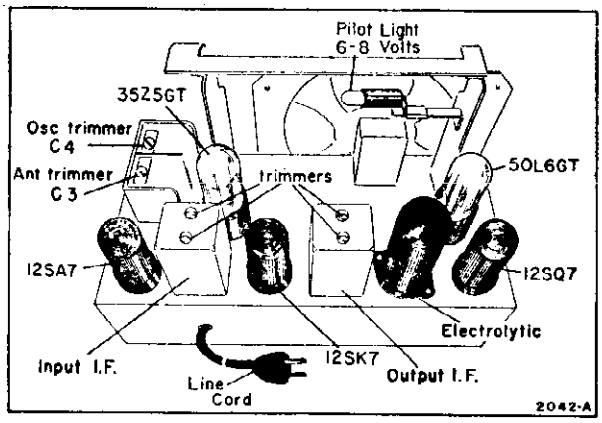
RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

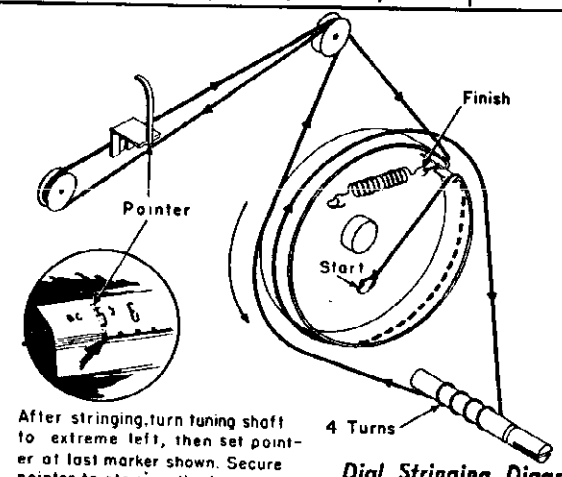
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal. Variations of plus or minus 25% are usually permissible.

The volume control must be set to maximum.

SIGNAL GENERATOR				INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf or RMA dummy antenna	External antenna clip	Pin 3 of 12SK7 (B- of set)	24 microvolts
1000 kc	0.1 mf	Grid (pin 8) of converter (12SA7)	Pin 3 of 12SK7 (B- of set)	98 microvolts
455 kc	0.1 mf	Grid (pin 8) of converter (12SA7)	Pin 3 of 12SK7 (B- of set)	74 microvolts
455 kc	0.1 mf	Grid (pin 4) of I.F. amp. (12SK7)	Pin 3 of 12SK7 (B- of set)	3200 microvolts
400 cycles	0.1 mf	Grid (pin 2) of audio amp. (12SQ7)	Pin 3 of 12SK7 (B- of set)	.043 volts
400 cycles	0.1 mf	Grid (pin 5) of output amp. (50L6GT)	Pin 3 of 12SK7 (B- of set)	2.0 volts



Chassis View, Showing Trimmer Location



After stringing, turn tuning shaft to extreme left, then set pointer at last marker shown. Secure pointer to string with glue.

MONTGOMERY WARD

GENERAL DESCRIPTION

This receiver is a single-band, AC-DC set which uses 4 tubes plus a rectifier. The antenna input and oscillator circuits are tuned by a two-gang capacitor. A loop antenna is built into the cabinet; provision is made also for the connection of an external antenna. Simple AVC voltage is applied to the grids of the converter and IF-amplifier tubes.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, DC or 50-60 cycle AC, 24 watts. Also made for 25-cycle AC.

Frequency Range .....530 to 1630 kc.

Selectivity .....At 1000 kc, 60 kc at 1000 x signal.

Sensitivity .....26 microvolts average for .05-watt output.

Power Output .....0.9 watt undistorted, 1.0 watt maximum.

Loud Speaker.....4" x 6" oval, P.M., v.c. impedance 3.2 ohms.

Tube Complement ....12SA7, converter
12SK7, IF amplifier
12SQ7, detector, AVC, audio
50L6GT, output amplifier
35Z5GT, rectifier
T-47, dial lamp, G.E., 6-8 volts

NOTE:— Disregard gang condenser and loop information shown below. B-8A-11628 gang condenser must be used with loop C-212-13035 (Walnut) or C-212-13035-1 (Ivory). B-8A-10827 gang must be used with C-212-10435 or C-212-11058 loops. Check part number on defective item and order accordingly.

*The values of the resistors and mica capacitors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with components of pre-standardized values. This receiver will operate equally well with components of either group. An illustration of the differences in both resistors and capacitors follows:

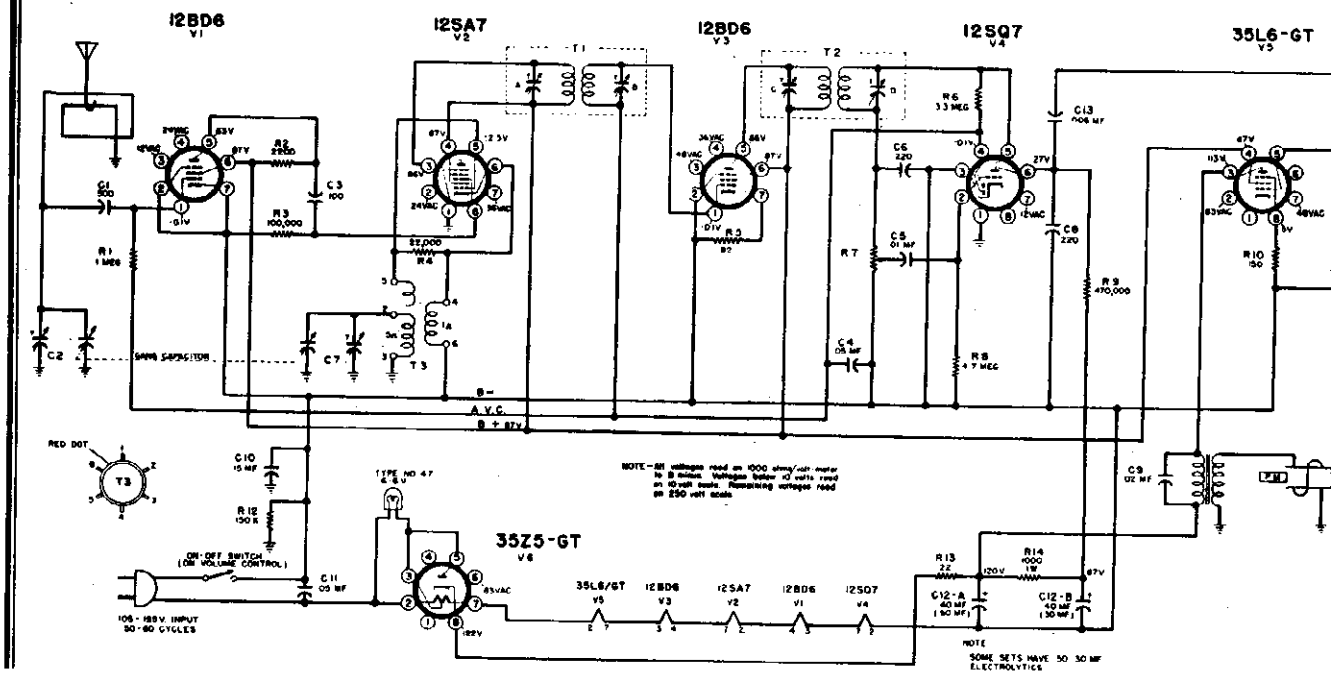
Pre-standardized value—50,000 ohms, 1/3 watt, 10%
RMA value—47,000 ohms, 1/2 watt, 10%
Pre-standardized value—200 mmf, 500 volts, 20%
RMA value—220 mmf, 500 volts, 20%

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube with another metal tube. Replace a glass 12SK7 tube with a metal tube or with an exact duplicate of the tube now in the set.

MONTGOMERY WARD

MODELS 84BR-1507
84BR-1508B



NOTE: On some sets slug tuned I.-F.'s are used instead of trimmer tuned I.-F.'s. 108-140H and 108-145 are trimmer tuned. B-13A-12023 and B-13B-12022 are slug tuned. The slug tuned I.-F.'s are tuned from the top and bottom (secondary on top, primar bottom).

When slug tuned I. F.'s are used, R5 is 270 ohms.

GENERAL DESCRIPTION

This receiver is a single-band, AC-DC set which uses 5 tubes plus a rectifier. The antenna input and oscillator circuits are tuned by a two-gang capacitor. A loop antenna is built into the cabinet; provision is made also for the connection of an external antenna. AVC voltage is applied to the grids of the R.F. converter, and IF-amplifier tubes.

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, DC or 50-60 cycle AC, 35 watts.
Frequency Range	530 to 1650 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc, 55 kc at 1000 x signal.
Sensitivity	40 microvolts average for .05 watt output.
Power Output	0.8 watts undistorted, 1 watt maximum.
Loud Speaker	5" P.M., v.c. impedance 3.2 ohms.
Tube Complement	12BD6, R. F. stage. 12SA7, converter. 12BD6, I. F. amplifier. 12SQ7, detector, AVC, audio amplifier. 35L6GT, output amplifier. 35Z5GT, rectifier.

REPLACING DIAL POINTER DRIVE CORD— Six inches of cord are required in the set. Use a piece slightly longer so that knots may be tied at each end. Numbers below correspond to circled numbers in diagram.

1. Rotate tuning knob to extreme clockwise positi This closes tuning condenser. Knob should remain in t position until installation is completed.
2. Tie cord to loop in spring as shown. Wind cord a turn around shaft in direction shown.
3. Pass cord over idler pulley.
4. Pass cord over pointer shaft; wind it one turn arou shaft; pass it through key washer; wind it one more tu around shaft.
5. Hook spring over end of dial support. Tie cord spring. *IMPORTANT:* Before tying knot stretch spri enough so that full contraction of spring will rota pointer shaft at least one-half turn.
6. Remove dial crystal by removing Cinch buttons.
7. Make sure tuning knob is in extreme clockwise po tion.

Then rotate pointer clockwise, against friction of sha until it is in horizontal position, as shown.

MONTGOMERY WARD

ALIGNMENT PROCEDURE AND RECEIVER STAGE SENSITIVITIES

The signal source must be an accurately calibrated signal generator capable of supplying R. F. signals modulated 30% with a 400-cycle audio signal. A 400-cycle source is necessary for the audio measurement.

The table below lists the sensitivity at various points. All measurements are based on an output of 50-milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected. Variations of plus or minus 25% are usually permissable. Volume control at maximum for all adjustments.

SIGNAL GENERATOR				TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection			
455 kc.	.1 mf.	Pin No. 8 of 12SA7	12SQ7 Pin 3	Rotor full open	Trimmers on output and input I.F. cans	100 microvolts
1650 kc.	.1 mf.	Pin No. 8 of 12SA7	12SQ7 Pin 3	Rotor full open	Oscillator trimmer C7 (on bottom)	———

(See note on I.-F.'s.)

INSTALLATION

This radio is a superheterodyne set which may be operated from either alternating (AC) or direct (DC) current. The set contains a built-in antenna (aerial) and may be used to tune in stations on the standard broadcast band, 530 to 1650 kilocycles.

ANTENNA AND GROUND—The antenna built into the rear of the cabinet is sufficient for receiving programs from local stations and from powerful nearby stations. This antenna is directional, that is, reception is improved when the antenna is facing in certain directions. Therefore after tuning in a station try the radio in several positions.

In locations remote from broadcasting stations or where receiving conditions are poor, an outside antenna, 50 to 75 feet long including lead-in, will give best results. The antenna should be erected as high as possible, as far from surrounding objects as is practical, and at right angles to street car lines and power lines. Connect the antenna lead-in wire to the antenna clip at the rear of the radio.

No ground wire is required with this radio.

POWER—This receiver has been designed to operate on 105 to 125 volt, either DC or 50- to 60-cycle AC. If you are in doubt as to the voltage of your power supply, consult your local power company. Do not insert the plug in the power receptacle unless you are sure that the correct voltage is available.

AC OPERATION—Insert the line-cord into your AC receptacle. Turn the set on and tune in a station. Keep the volume low. A low steady hum may be heard. Reverse the plug in the receptacle and notice whether there is any difference. Leave the plug in the position which gives less hum.

DC OPERATION—On direct current the set will not operate with the plug in one position in the receptacle even though the pilot lamp lights, but will operate normally with the plug in the other position. Insert the plug and turn the volume control to the right. If no sound is heard after one minute, reverse the plug.

OPERATION

CONTROLS—The knob on the front is both the on-off switch and the volume control. When this control is turned all the way to the left the set is off. A slight rotation to the right will click the switch and turn the set on. The knob may then be used to regulate the volume. When the set is turned on the dial lamp lights dimly; as the tubes warm up the light becomes brighter. Be sure your radio is turned completely off when not in use; otherwise the tubes will wear out unnecessarily.

The knob on the right side of the cabinet is the tuning knob; it may be used to tune in (select) stations in the standard broadcast band. When selecting a station turn the knob back and forth until the tone is clearest and loudest. Do not use the tuning knob to regulate volume; the volume control should be used for that purpose after the station has been tuned in properly.

The operating frequency, in kilocycles, of each of your local stations is listed in the radio section of your

newspaper. The numbers on the radio dial may be converted into kilocycles by multiplying by 10; for example, 90 on the dial represents 900 kilocycles.

SETTING THE PUSHBUTTONS—The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.

2. Push out the call letters of the six stations from the call-letter sheets supplied with this manual.

3. Insert one call-letter tab in the rectangular opening in each of the pushbuttons, in any sequence. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.

4. With the screwdriver supplied, check to see that the locking screw in the center of the tuning knob (see illustration) is loose. If it is not, turn it several turns to the left (counterclockwise).

5. Press the first pushbutton down *all the way*. With one hand hold the button down *firmly* and with the other carefully tune in the desired station. Release the pushbutton.

6. Follow this procedure for each of the five other buttons, adjusting each one for a different station.

7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.

8. The pushbuttons are now properly set for automatic tuning. Any of the six stations may now be tuned in simply by pressing the proper button down as far as it will go. If it is desired to reset any of the buttons for a new station, loosen the locking screw in the center of the tuning knob, set the pushbutton as described above, and re-tighten the locking screw.

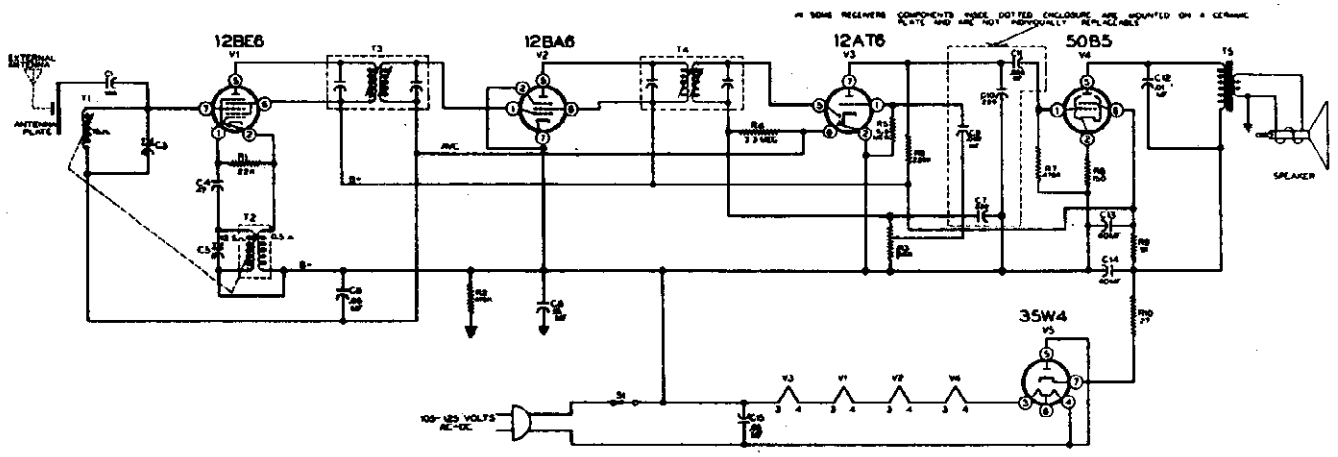
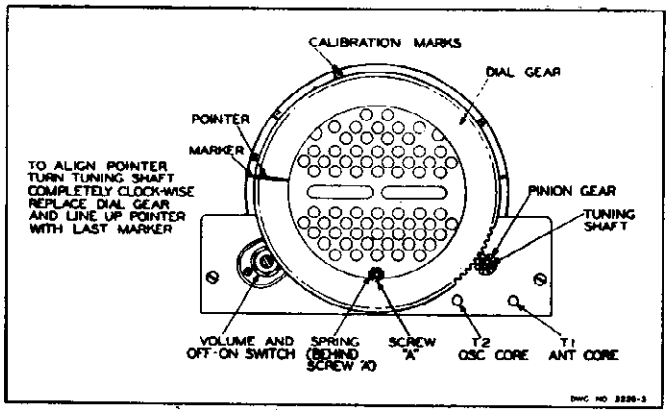
MODELS 84BR-1515A, 84BR-1516A, MONTGOMERY WARD 84BR-1815A, 84BR-1816A

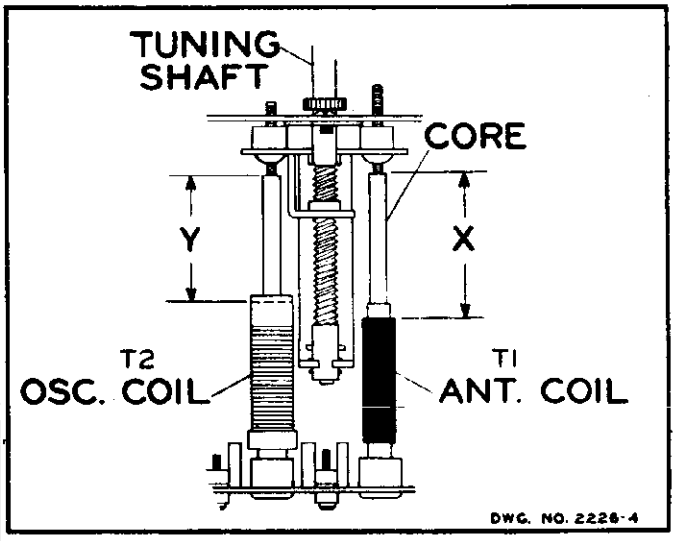


On some sets the four condensers C7, C9, C10, C11 are in one unit. Replace a defective section with an external single unit.

GENERAL DESCRIPTION

This radio is a permeability-tuned, AC-DC set using 4 tubes plus a rectifier. The metal back plate of the cabinet serves as a self-contained antenna. A clip is provided for connection of an external antenna; it is riveted to a washer which is capacity-coupled to the back plate. Simple AVC voltage is applied to the converter and IF-amplifier tubes. The filament string is across the AC line.





With tuner all the way out, dimension "Y" is 1-15/64". Dimension "X" is 1½".

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, DC or 50-60 cycles AC, 35 watts.
Frequency Range	535 to 1620 kc.
Intermediate Freq.	455 kc.
Selectivity	At 1000 kc., 55 kc. at 1000 x signal.
Sensitivity	20 microvolts average for .05 watt output.
Power Output	0.7 watts undistorted, 1.0 watts maximum.
Loud Speaker	4", P.M., v.c. impedance 3.2 ohms.
Tube Complement	12BE6, converter 12BA6, I.F. amplifier 12AT6, detector, AVC, audio amplifier 50B5, output amplifier 35W4, rectifier.

84BR-1815A, 84BR-1816A

ALIGNMENT PROCEDURE AND RECEIVER STAGE SENSITIVITIES

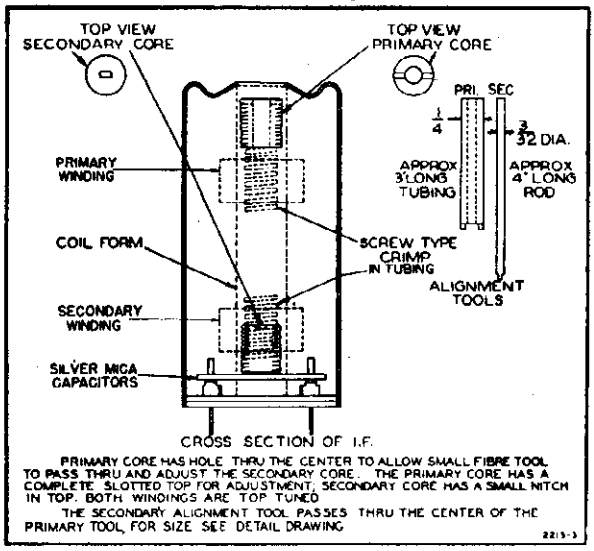
The signal source must be an accurately calibrated signal generator capable of supplying R. F. signals modulated 30% with a 400-cycle audio signal. A 400-cycle source is necessary for the audio measurements.

The table below lists the sensitivity at various points. All measurements are based on an output of 50-milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected. Variations of plus or minus 25% are usually permissable. Volume control at maximum for all adjustments.

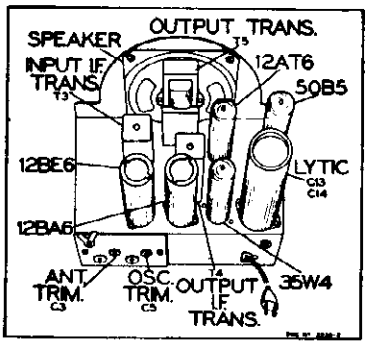
SIGNAL GENERATOR				TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection			
455 kc.	.1 mf	12BE6, Pin 7	12AT6, Pin 2	Iron cores all the way out	Cores in output and input I.F. cans	45 microvolts
1620 kc.	.1 mf	12BE6, Pin 7	12AT6, Pin 2	Iron cores all the way out	Oscillator trimmer C5	———
1620 kc.	2 mmf see note	External antenna clip	12AT6, Pin 2	1620 kc.	Antenna trimmer C3*	20 microvolts
1400 kc.	2 mmf see note	External antenna clip	12AT6, Pin 2	1400 kc.	Adjust position of ant. core (see coil illustration view)	20 microvolts
400 cycles	.1 mf	12AT6, Pin 1	12AT6, Pin 2	———	———	.03 volts

*After the antenna coil has been tracked at 1400 kc., it is necessary to check the antenna trimmer C3 again at 1620 kc. If no appreciable change in trimmer adjustment is necessary, the coil is in track. If the trimmer requires considerable change, the position of the antenna core at 1400 kc. must be readjusted. These two adjustments should be made several times, until no trimmer adjustment is required at 1620 kc.

NOTE: Anything larger than 2 mmfd. will produce mistrack.



CAUTION—The I.F. transformer construction is such that two resonance peaks occur for each winding, one peak when the slug is above its coil and another peak when the slug is below its coil. Be sure the upper core is above the top coil and the lower core is below the bottom coil (see coil drawing above).



ANTENNA AND GROUND—The plate antenna on the rear of the cabinet is sufficient for receiving programs from local stations and from powerful nearby stations. In locations remote from broadcasting stations or where receiving conditions are poor, an outside antenna, 50 to 75 feet long including lead-in, will give best results. The antenna should be erected as high as possible, as far from surrounding objects as is practical, and at right angles to street car lines and power lines. Connect the antenna lead-in wire to the antenna clip at the rear of the radio.

No ground wire is required with this radio.

POWER—This receiver has been designed to operate on 105-125 volts, either DC or 50- to 60-cycle AC. If you are in doubt as to the voltage of your power supply, consult your local power company. Do not insert the plug in the power receptacle unless you are sure that the correct voltage is available.

INSTALLATION

This radio is a superheterodyne set which may be operated from either alternating (AC) or direct (DC) current. The plate antenna on the rear of the cabinet serves as a built-in antenna for the set, which tunes over the standard broadcast band, 535 to 1620 kilocycles.

OPERATION

CONTROLS—The knob on the left is both the on-off switch and the volume control. When this control is turned all the way to the left the set is off. A slight ro-

MODELS 84BR-1515A, 84BR-1516A, 84BR-1815A, 84BR-1816A — MONTGOMERY WARD

tation to the right clicks the switch and turns the set on. The knob may then be used to regulate the volume. Be sure your radio is turned completely off when not in use; otherwise the tubes will wear out unnecessarily.

The knob on the right is the tuning knob; it may be used to tune in stations on the standard broadcast band. When selecting a station turn the knob back and forth until the tone is clearest and loudest. Do not use the tuning knob to regulate volume; the volume control should be used for that purpose after the station has been tuned in properly.

The operating frequency, in kilocycles, of each of your local stations is usually listed in the radio section of your newspaper. The numbers on the radio dial may be converted into kilocycles by multiplying by 10. For example, 80 on the dial represents 800 kilocycles.

DC OPERATION—On direct current the set will not operate with the plug in one position in the receptacle, but will operate normally with the plug in the other position. Insert the plug and turn the volume control to the right. If no sound is heard after one minute, reverse the plug.

AC OPERATION—Insert the line-cord into your AC receptacle. Turn the set on and wait 30 seconds for tubes to warm up; tune in a station; keep the volume low. A low steady hum may be heard. Reverse the plug in the receptacle and notice whether there is any difference. Leave the plug in the position which gives less hum.

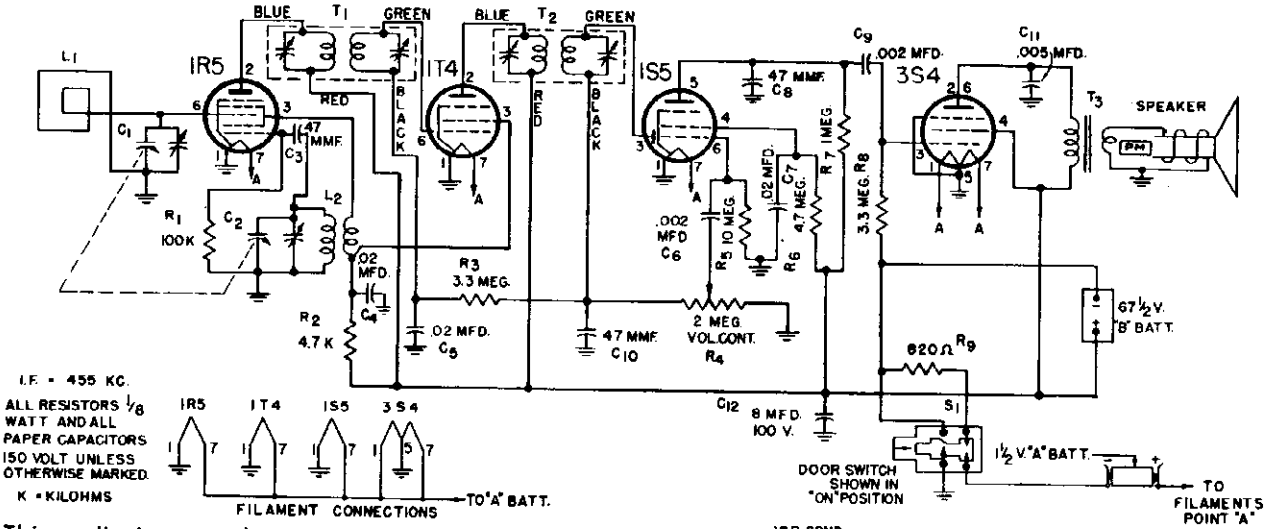
MONTGOMERY WARD MODEL 8L4GCB-1062



This radio is a condenser tuned receiver using cut plate tracking oscillator section and employs four tubes in a superheterodyne circuit. A highly efficient litz wound loop is assembled in a low loss polystyrene cover and is connected to the receiver input by means of flexible plastic covered leads passing through an insulating bushing. No provision is made for the use of an external antenna.

Power is obtained from a single 1½ volt flashlight type cell and a 67½ volt "B" battery. All tube filaments are connected in parallel. A.V.C. voltage is applied to the I.F. amplifier tube only. Bias for the output tube is obtained from a resistor in the minus B lead.

BATTERY REQUIREMENTS—The following batteries are required:

QUANTITY	TYPE	MANUFACTURER
1	1½ volt "A"	Airline #62-23, Eveready size "D", Burgess No. 2, Ray-O-Vac size "D" or equivalent.
1	67½ volt "B"	Airline #62-43 or #62-10, Eveready #467, Burgess type XXD, Ray-O-Vac Type #4367 or equivalent.

MODEL 84GCB-1062A MONTGOMERY WARD

ALIGNMENT PROCEDURE AND RECEIVER STAGE SENSITIVITIES

The signal source must be an accurately calibrated signal generator capable of supplying R.F. signals modulated 30% with a 400-cycle audio signal. A 400-cycle source is necessary for the audio measurements.

In order to make the adjustments listed in the table below, it is necessary to first remove the front panel in order to remove the chassis from the cabinet. The loop leads must also be disconnected (unsolder) and extended by means of short leads. The table below lists the sensitivity at various points. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected. Variations of plus or minus 25% are usually permissible. Volume control at maximum for all adjustments.

SIGNAL GENERATOR				DIAL SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling	Connection to Radio	Ground Connection			
455 KC	.1 mfd condenser	Stator lug Var. Capacitor (front section)	Chassis	Variable Condenser fully open	Trimmers 1st and 2nd I.F. transformer	100 microvolts
1650 KC	Coupling loop see note 1	None	None	Variable Condenser fully open	Oscillator Trimmer (Rear section)	———
1500 KC	Coupling loop see note 2	None	None	1500 KC	Ant. trimmer (front section)	———
400 cycles	.1 mfd condenser	High side of volume control	Chassis	———	———	.045 volts

Note 1 — Connect signal generator leads to a three turn radiating loop approximately 4" in diameter placed about 8" from the loop of the receiver.

Note 2 — After chassis is installed in cabinet and reconnected to its loop re-adjust the antenna trimmer by ear, with low signal input.

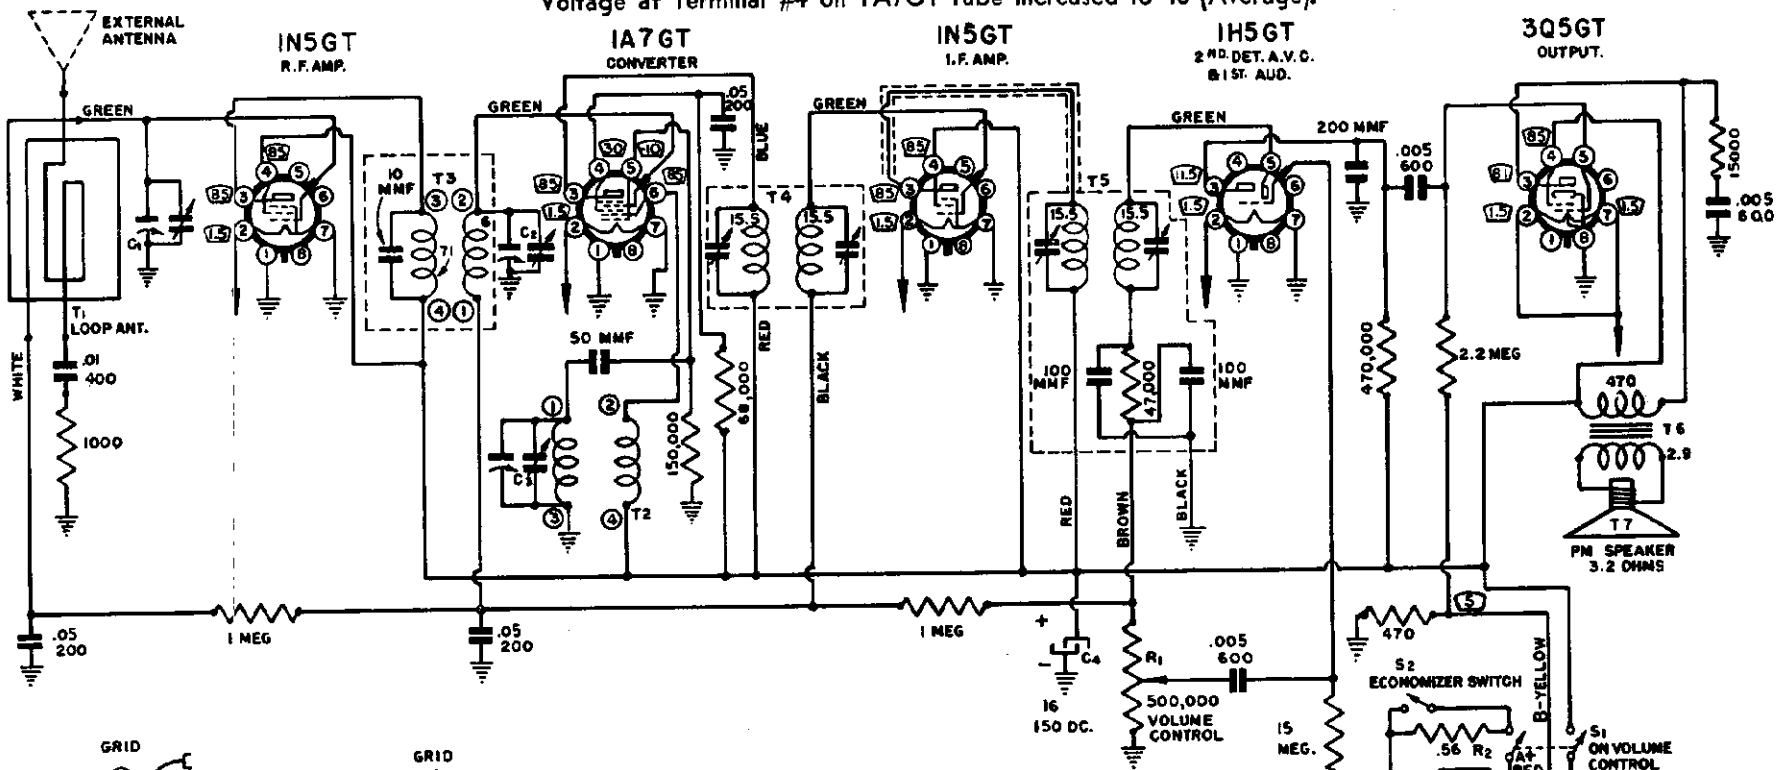
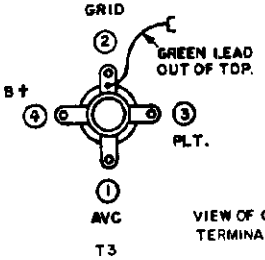
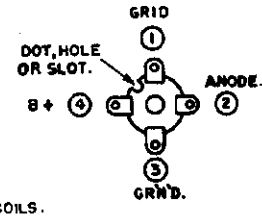
Note on "B" Models—Resistor - 68,000 Ohm in Screen Circuit of 1A7GT Tube, Replaced with 33,000 Ohm.

Voltage at Terminal #4 on 1A7GT Tube Increased to 48 (Average).







VIEW OF COILS. TERMINAL END.

NOTES:

- VOLTAGES MEASURED WITH A 1000 OHMS PER VOLT D.C. METER BETWEEN CHASSIS AND POINTS DESIGNATED.
- CAPACITOR VALUES IN MFD. UNLESS OTHERWISE INDICATED.
- RESISTOR AND COIL VALUE IN OHMS.
- WHERE VALUE OF COILS IS NOT SHOWN, RESISTANCE IS LESS THAN ONE OHM.
- ALL RESISTORS ARE RATED AT 1/2 WATT, ±20%

TUNING RANGE . . . 535-1620 KC.

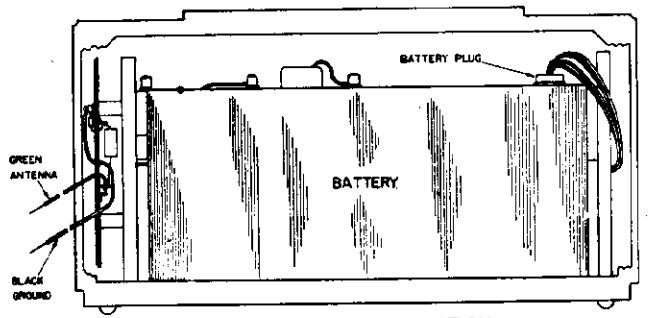
INTERMEDIATE-FREQUENCY . . . 455 KC.

SELECTIVITY . . . Over-all band width 35 KC at 1000 X signal at 1000 KC.

SENSITIVITY . . . 12 Microvolts for 50 Milliwatts output.

POWER OUTPUT . . . 150 M. W. undistorted 330 M. W. maximum.

LOUD SPEAKER . . . 5 inch diameter P. M. Magnet 2.15



BATTERY INSTALLATION

MONTGOMERY WARD

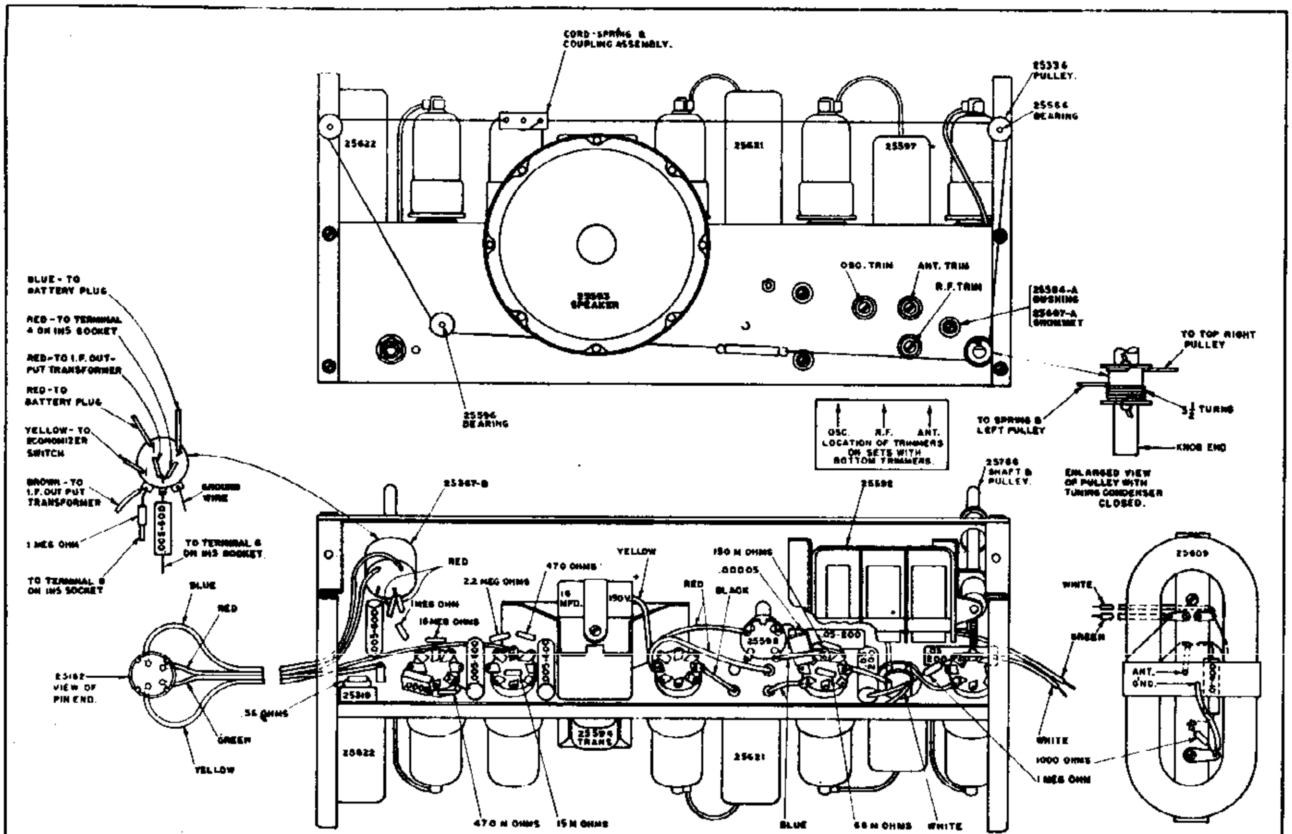
RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 kc for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal. Variations of plus or minus 25% are usually permissible.

The volume control must be set to maximum.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RADIO	GROUND CONNECTION	
1000 KC	200 Mmf or RMA Dummy Antenna	External Antenna Clip	To Ground Lead	12 uv
1000 KC	.1 Mfd.	Grid (Top Connection) of R. F. Amp. (1N5)	To Chassis	20 uv
1000 KC	.1 Mfd.	Grid (Top Connection) of Converter (1A7)	To Chassis	220 uv
455 KC	.1 Mfd.	Grid (Top Connection) of Converter (1A7)	To Chassis	125 uv
455 KC	.1 Mfd.	Grid (Top Connection) I. F. Amp. (1N5)	To Chassis	6000 uv
400 Cycles	.1 Mfd.	Grid (Top Connection) Audio Amp. (1H5)	To Chassis	.1 v.
400 Cycles	.1 Mfd.	Grid (Pin) of Output Amp. (3Q5)	To Chassis	1.5 v.



- Output meter across 3.2-ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Loop antenna should be connected to receiver and in its proper position when making adjustments.

SIGNAL GENERATOR				TUNER SETTING	ADJUST TRIMMERS TO MAXIMUM OUTPUT IN ORDER SHOWN
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RADIO	GROUND CONNECTION		
455 KC	.1	Grid Cap of 1N5GT (I.F.)	To Chassis	Capacitor full open (plates out of mesh)	2 trimmers on output IF can T5 (25622)

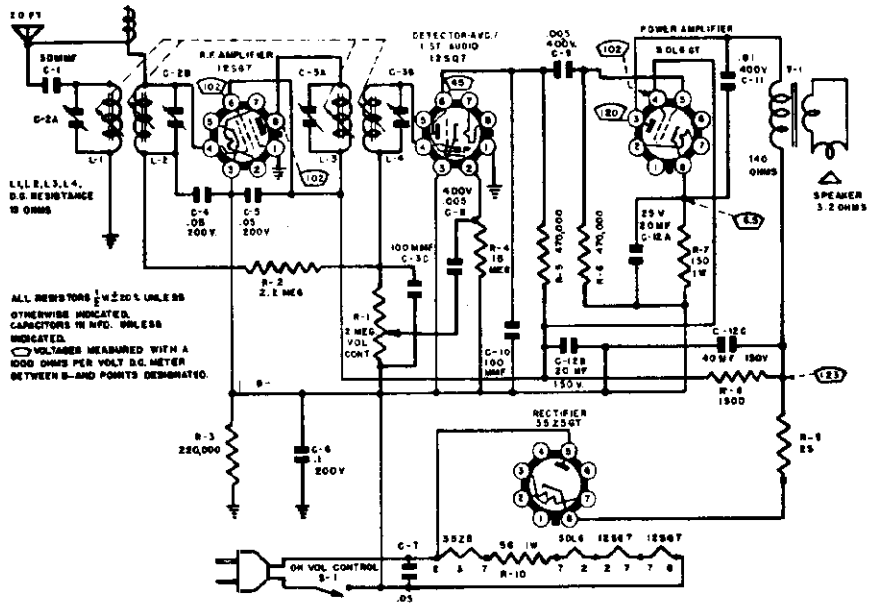
*The values of the resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value - 50,000 ohms,
RMA value - 47,000 ohms,

Note on "B" Models—#25040 resistor replaced with #25144 resistor 33,000 ohm, 1/2 watt 20%.

BATTERY USED . . . (Wards 62-57): Battery dimensions, 16 x 6 5/8 x 4 1/2". "A" 1 1/2 volts. "B" 90 volts. "A" current 300 M. A., B current 11.5 M. A.



ANTENNA—For maximum operating performance unwind the full length of the antenna wire from the back of the radio. For local stations it is not necessary to unwind more than sufficient length to obtain satisfactory volume.

CAUTION—Do not use a ground connection or attach to a water pipe in any manner.

POWER SUPPLY—This radio will operate on a power supply of 117 volts AC, 50 to 60 cycle or 117 volts DC. Reverse the line plug, selecting the position which gives the least hum.

CAUTION—117 Volt DC Operation—When used on a DC line, if the set does not operate after one minute, reverse the line plug.

GENERAL DESCRIPTION

This model is a 3 tube (plus rectifier) tuned radio frequency receiver using four core tuned circuits.

ELECTRICAL SPECIFICATIONS

POWER SUPPLY	105-125 Volt AC or DC 50-60 Cycles
FREQUENCY RANGE	540-1620 KC
SELECTIVITY	80 KC Broad at 100 times signal, 1,000 KC
SENSITIVITY	450 Microvolts input for 50 MW (.05 watts) output
POWER OUTPUT	1.6 Watts maximum
LOUD SPEAKER	4" PM Dynamic
VOICE COIL IMPEDANCE	3.2 Ohms at 400 cycles
ANTENNA	20 Ft. of Antenna wire attached to radio
TUBE COMPLEMENT	1-12SG7 R.F. Amplifier 1-12SQ7 Det., 1st Audio A.V.C. 1-50L6 Power Output 1-35Z5 Rectifier

RECEIVER STAGE SENSITIVITIES

SIGNAL GENERATOR			INPUT FOR 50 MW OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	
1000 KC	50 MMF	Disconnect Antenna and use 50 MMF coupling capacitor	450 Microvolts
1000 KC	.05 MFD	12SG7 R.F., Pin 4	1,400 Microvolts
1000 KC	.05 MFD	12SQ7 DET., Pin 4	13,000 Microvolts
400 Cycle	.05 MFD	12SQ7 1st A.F., Pin 2	.024 Volts
400 Cycle	.05 MFD	50L6 Output, Pin 5	1.1 Volts

NOTE: Generator Grounded to B—.

ALIGNMENT PROCEDURE

Volume Control—Maximum for all adjustments. Use output meter across voice coil terminals. Core adjustment tool can be made by slotting end of Bakelite rod.

CAUTION: Do not make any alignment adjustments except at frequencies shown on chart.

SIGNAL GENERATOR		RADIO	
FREQUENCY SETTING	CONNECTION TO RADIO	DIAL SETTING	ADJUST TO MAXIMUM
1620 KC	No direct connection (See Note)	High frequency extreme (Cores backed out of coils)	Trimmer Condensers 26140, 26141 (Remove cardboard back to expose trimmer adjustment)
1400 KC	No direct connection (See Note)	1400 KC	Cores 26145, 26146 (Be sure there is a resonance point on all 4 cores)

NOTE: Unwind attached antenna wire and place near a short wire connected to signal generator terminal. Do not make direct connection between radio and generator. No ground connection required.

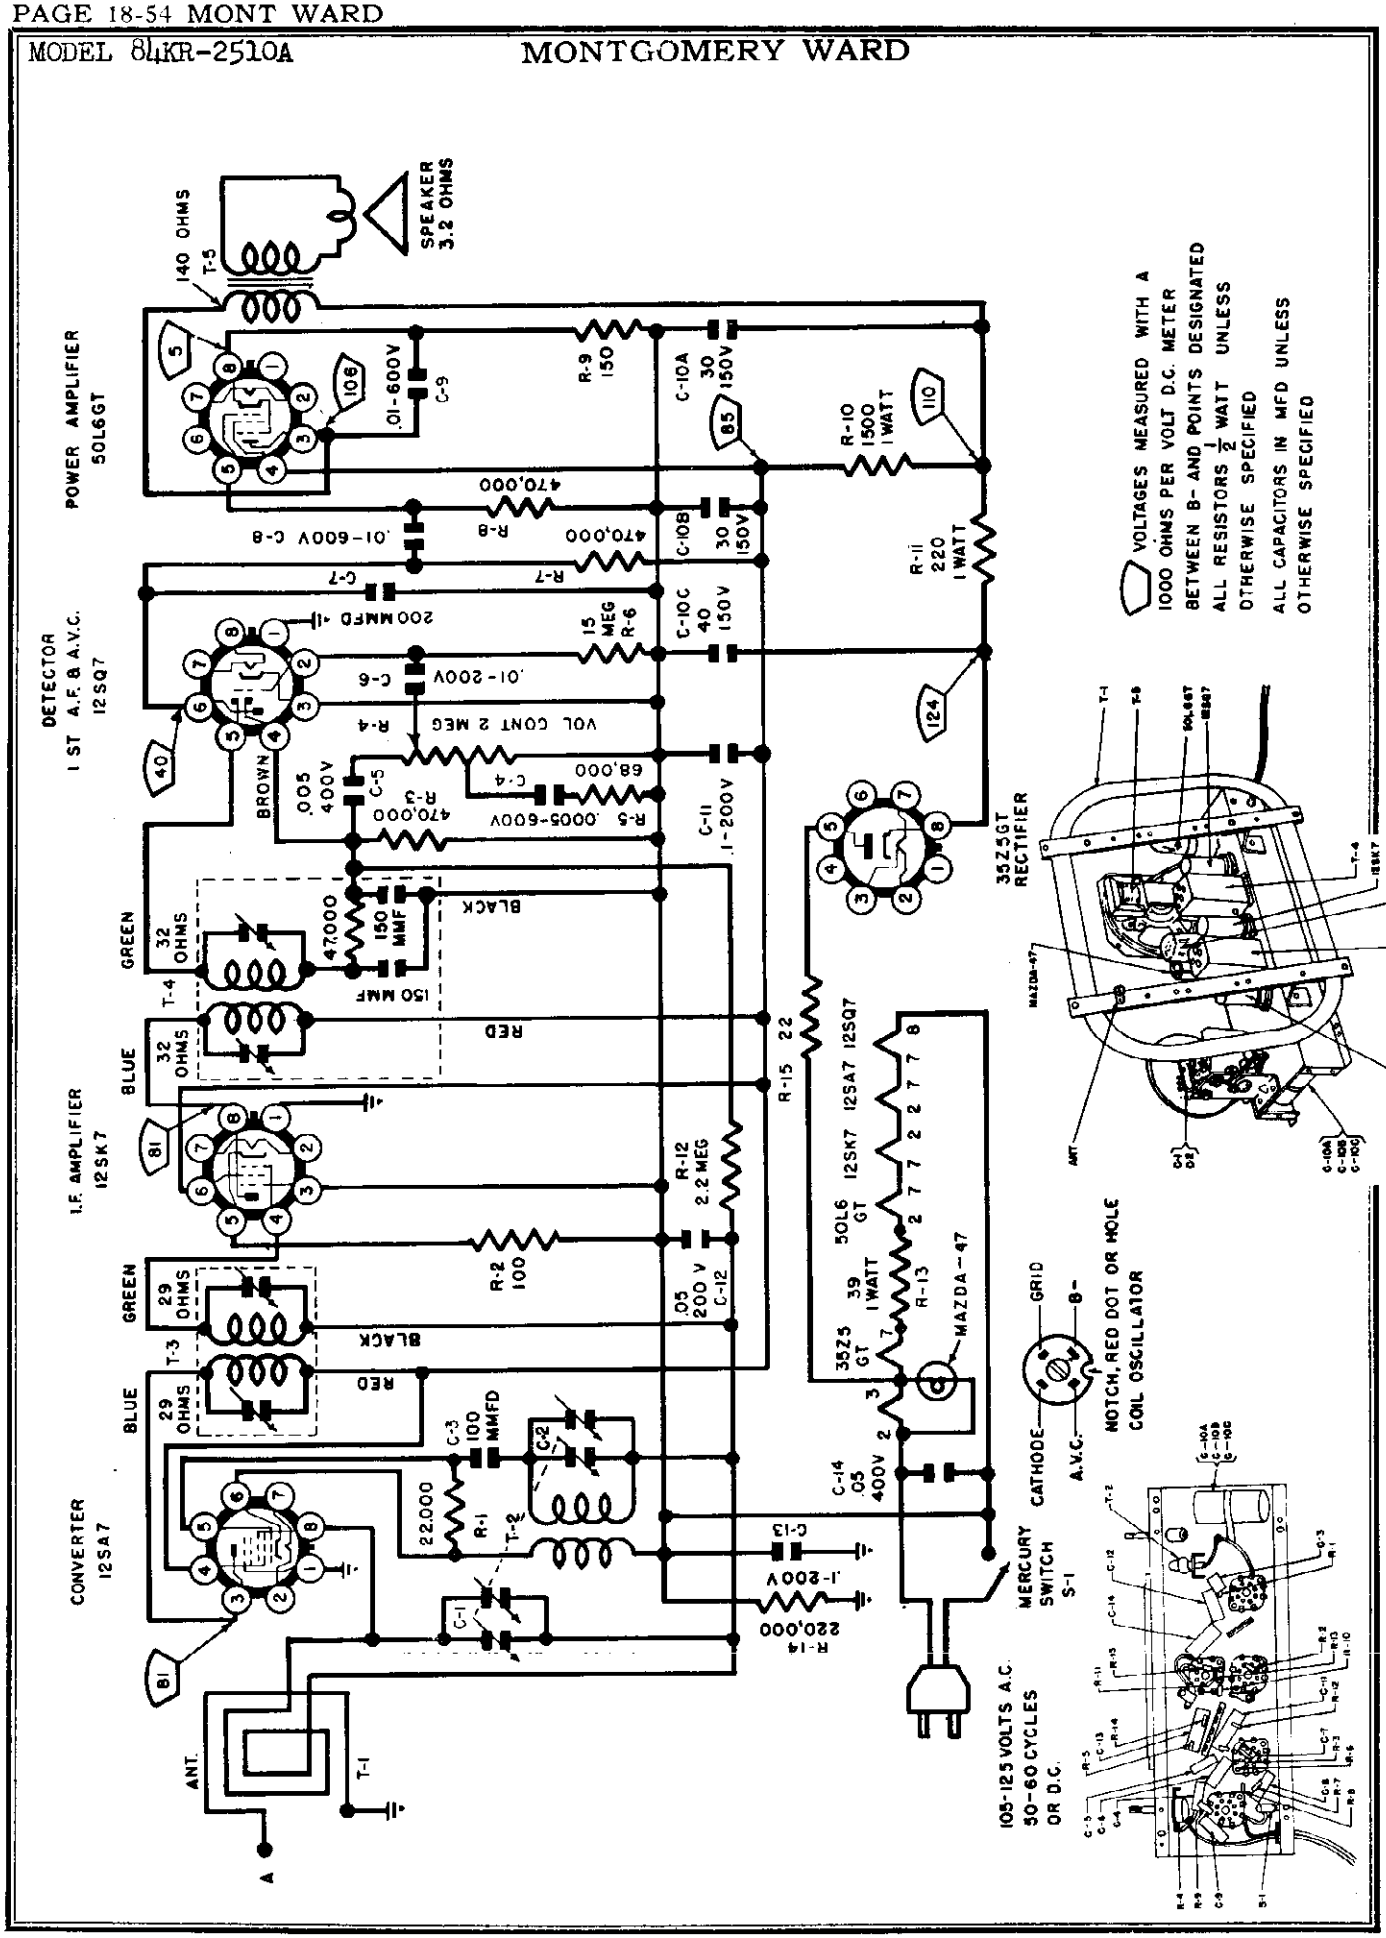
MODEL 84KR-2510A

MONTGOMERY WARD



ALIGNMENT PROCEDURE

VOLUME CONTROL MAXIMUM FOR ALL ADJUSTMENTS

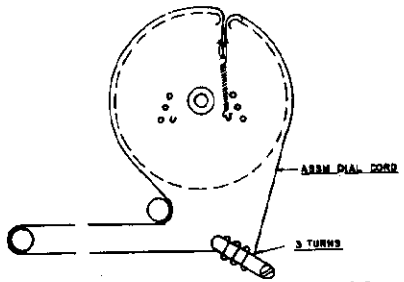
Connect radio to Signal Generator. (See Page 2.)
Allow the chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:
A signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output indicating meter; non-metallic screw driver.
Dummy antennas—.1 mfd., 200 mmfd. condensers.

Signal Generator		Connection To Radio	Condenser Setting	Adjust Trimmers To Maximum
Frequency Setting	Dummy Antenna			
455 kc	.1 Mfd.	12SA7, Pin 8	Turn rotor plates to full open	1st IF Transformer 2nd IF Transformer
1620 kc	200 Mmfd.	Antenna Lead "A"	Turn rotor plates to full open	Osc. trimmer on tuning condenser
1400 kc	200 Mmfd.	Antenna Lead "A"	Tune rotor to Maximum output	Ant. section trimmer on tuning condenser

The dial pointer may be adjusted to the scale calibration by slipping the pointer on the dial cord.

DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 26440 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture for correct installation.



DIAL CORD 31½" OVER LOOPS

RECEIVER STAGE SENSITIVITIES

The following table lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .05 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 0.4 volts across this resistor will be equivalent to a .05 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .05 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External Antenna Lead "A"	No Connection	23 microvolts
1000 kc	.1 mfd.	12 SA7 Mixer, Pin 8	12SK7 Pin 8 (B–)	110 microvolts
455 kc	.1 mfd.	12 SA7 Mixer, Pin 8	Same as above	95 microvolts
455 kc	.1 mfd.	12SK7 I-F, Pin 4	Same as above	5700 microvolts
400 cycles	.1 mfd.	12SQ7 1st A-F, Pin 2	Same as above	.065 volts
400 cycles	1 mfd.	50L6GT Output, Pin 5	Same as above	1.6 volts

GENERAL DESCRIPTION

This model is a 4-tube (plus rectifier) A.C.-D.C. End Table Radio. Controls are provided for tuning and volume. Other features include a P. M. dynamic speaker, bass boost circuit, and built-in loop antenna. An automatic "Off-On" switch is provided.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts A.C. or D.C. 27 watts.
Frequency Range	540-1620 KC.
Intermediate Frequency	455 KC.
Selectivity	48 KC broad at 1000 times signal, 1000 KC.
Sensitivity	(for .05 watts output) 23 microvolts average.
Power Output	550 milliwatts maximum 330 milliwatts at less than 10% distortion.
Loud Speaker	4" P.M. dynamic.
Voice Coil Impedance	3.2 ohms at 400 cycles.
Tube and Dial Light Complement	1 12SA7 Mixer 1 12SK7 I.F. Amp. 1 12SQ7 2nd Det. 1st AF. & A.V.C. 1 50L6GT Power output 1 35Z5GT Rectifier 1 No. 47 Dial Lamp

ANTENNA—This radio has an effective self-contained loop antenna and should require no outside antennan for the average installation. If an outside antenna is required, attach to the connection "A" (see Removal of Chassis). The loop is directional and various room locations may affect the stations received.

CAUTION—Do not use a ground connection or attach to a water pipe in any manner.

POWER SUPPLY—This radio will operate on a power supply of 117 volts A.C. 50-60 cycle, or 117 volts D.C. Reverse the line plug, selecting the position which gives the least hum.

CAUTION—117 Volt D.C. Operation—When used on a D.C. line if the set does not operate after one minute reverse the line plug.

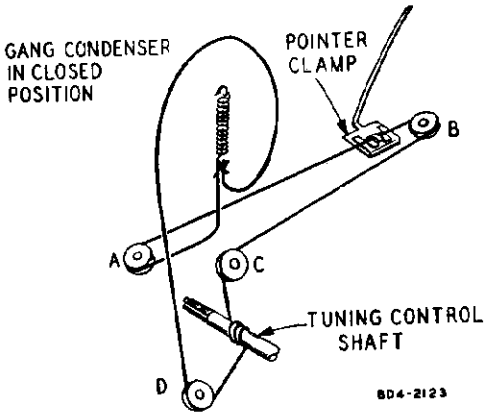
TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals with set operating on AC. All voltages except those for the filaments are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ±10% is usually permissible.

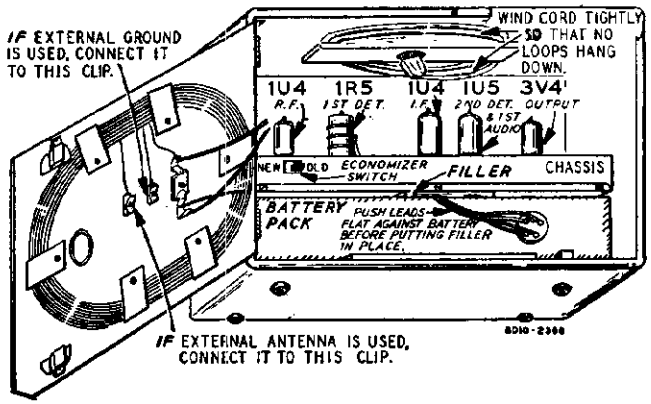


DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully closed position. Use a new 10X52 Drive Cord Assembly and fasten one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue around pulley rim ¼ turn clockwise. Pass cord around pulleys A, B, and C as shown in the illustration. Wind three turns clockwise (viewed from rear of chassis) around tuning control shaft. The turns must progress toward rear of chassis. Pass cord around pulley D and continue ¾ turn clockwise around large drive pulley. Pass cord through the slot in the pulley rim then stretch the tension spring and fasten free end of cord to it.

GENERAL DESCRIPTION

This model is a five tube AC-DC or battery operated portable radio. Controls are provided for tuning, volume and AC-DC or Battery selection. Other features include a built-in Air Wave Loop Aerial, automatic volume control, tuned R-F stage, PM dynamic speaker and a selenium rectifier for AC operation. The dial scale is calibrated to cover frequencies between 540 and 1600 kilocycles.



ELECTRICAL SPECIFICATIONS

Power Supply	"A" Battery Supply—9 Volts, 50 Ma. "B" Battery Supply—90 Volts, 11 Ma. or 105-125 volts AC, 25-60 cycles, 12 watts or 105-125 volts DC
Battery Pack	Ward's Battery Pack No. 62-35
Frequency Range	540-1600 KC
Intermediate Frequency	455 KC
Selectivity	At 1000 KC, 45 KC wide at 1000 times signal
Sensitivity	(for .05 watt output with external antenna) 10 microvolts average
Power Output	0.3 watt maximum 0.125 watt 10% distortion
Loud Speaker	5¼" PM dynamic
Voice Coil Impedance	3.2 ohms at 400 cycles

Tube Complement

1 1R5 1st Detector
1 1U4 I-F Amplifier
1 1U4 R-F Amplifier
1 1U5 2nd Detector, AVC and 1st A-F Amplifier
1 3V4 Power Output

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.
The equipment in column at right is required for aligning:
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antenna—.1 mf., 50 mmf.

1400 kc Note C	50 mmf	External Antenna Clip On Loop See Note A	External Ground clip on loop	Turn Rotor To Max. Output. Set Indicator to 1400 KC See Note B	Gimmick
1400 kc	Same as Above	Same as Above	Same as Above	Same as Above	Antenna (C-2)

NOTE A—Re-assemble chassis in cabinet and close the cabinet back before making adjustment.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, move the pointer on the string to the 1400 KC mark.

NOTE C—Some receivers may have a "gimmick" capacity formed by twisting two wires together on the gang condenser. The "gimmick" capacity is set at the factory and normally will not require adjustments when realigning the receiver. Adjustment is obtained by twisting or untwisting the wires.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volt AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Output variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Ext. Gnd. Clip	4.0 microvolts
1000 kc	.1 mf.	1U4 R-F—Pin 6	"X" Point	25 microvolts
455 kc	.1 mf.	1R5 1st Detector—Pin 6	"X" Point	90 microvolts
455 kc	.1 mf.	1U4 I-F—Pin 6	"X" Point	3500 microvolts
400 cycles	.1 mf.	1U5 1st A-F—Pin 6	"X" Point	.022 volt
400 cycles	.1 mf.	3V4 Output—Pin 3	"X" Point	1.8 volts

F – FILAMENT	Fm – FILAMENT MID-TAP
G – GRID	P – PLATE

BD9-2307

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the filaments are between the socket terminals and the negative terminal on C-18.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 300 volt scale. Conditions of measurement are:

Line voltage..... 117 volts AC
Volume control..... maximum
Signal input..... none

A variation of ±10% is usually permissible.

ALIGNMENT PROCEDURE

The following equipment is required for aligning.

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter — Non-Metallic Screwdriver.

Dummy Antenna—.1 mf.

Volume Control — Maximum All Adjustments.

Allow Signal Generator to "Heat Up" for several minutes.

SIGNAL GENERATOR				RECEIVER	
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection	Condenser Setting	Adjust for maximum output. See trimmer illustration.
	Remove chassis from case (See paragraph Removal of Chassis From Case) and temporarily solder a .5 megohm resistor across the two loop terminals on the chassis.

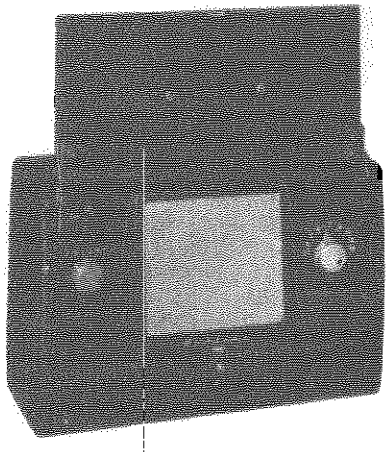
Freq.	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	.1 mf	1R5 Mixer Pin 6	X Point (Note B, Page 2)	130 microvolts
455 kc	.1 mf	1R5 Mixer Pin 6	X Point (Note B, Page 2)	120 microvolts
455 kc	.1 mf	1U4 IF Amp. Pin 6	X Point (Note B, Page 2)	4000 microvolts
400 cycles	.1 mf	1U5 2nd Det. Pin 6	X Point (Note B, Page 2)	.053 volt
400 cycles	.1 mf	3V4 Output Pin 6	X Point (Note B, Page 2)	3.2 volts

REMOVAL OF CHASSIS FROM CASE

To remove the chassis from the case it will be necessary to open the front cover and carefully remove the two control knobs, pointer and the screw on the front panel above the volume control knob at the side of the ON-OFF switch plunger. Then open the back cover and unsolder two antenna leads. Remove two chassis mounting clamps located underneath the chassis and withdraw the batteries.



GENERAL DESCRIPTION

This model is a 4 tube AC-DC or battery operated portable radio receiver. Controls are provided for tuning, volume, and AC-DC or battery selection. Features include a built-in Airwave Loop Aerial, automatic volume control, PM dynamic speaker and a Selenium rectifier for AC operation. The dial scale is calibrated to cover frequencies between 540-1600 kilocycles.

ELECTRICAL SPECIFICATIONS

Power Supply	One—67½ Volt "B" Battery Four—1½ Volt "A" Batteries (Size "D" Flashlight Cells) 105-125 volts AC, 25-60 cycles, 10 watts or 105-125 volts DC
Wards Battery Numbers	62-43 or 62-10 "B" Battery 62-23—"A" Battery (4 required)
Frequency Range	540-1600 kc
Intermediate Frequency	455 kc
Selectivity	At 1000 kc, 45 kc wide at 1000 times signal
Sensitivity	300 microvolts per meter average (for .05 watt output)
Power Output	.100 watt maximum .060 watt 10% distortion
Loud Speaker	4" PM Dynamic
Voice Coil Imp	3.2 ohms at 400 cycles

MODEL 8LWG-2506A MONTGOMERY WARD

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

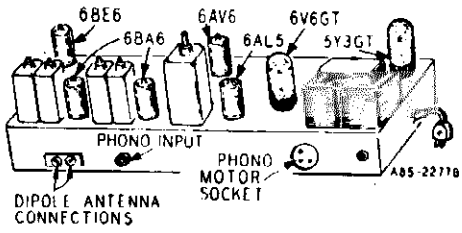
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	25 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	60 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	58 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	2400 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

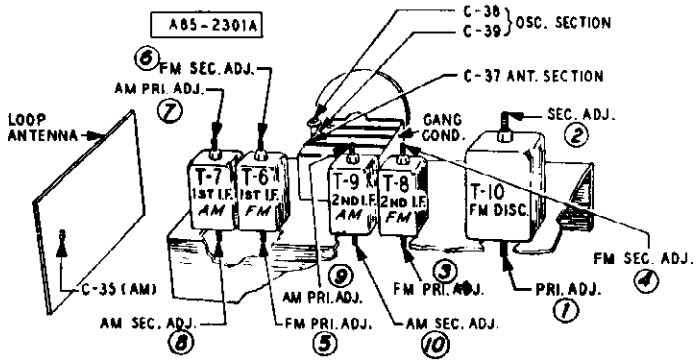
FM STAGES

The tables below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	200 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	1,000 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	40,000 Microvolts



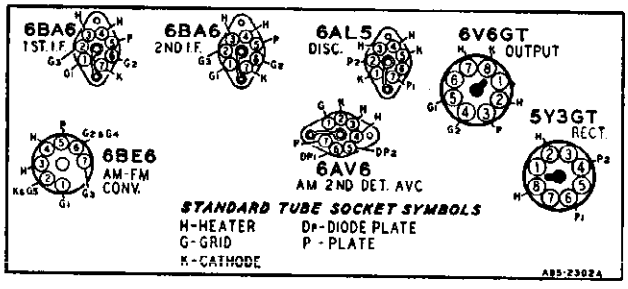


TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

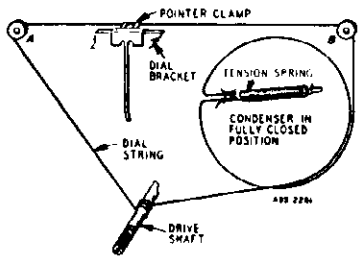
A variation of ±10% is usually permissible.



DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. and Sec. (9) and (10)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-39	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-35	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor — .01 mf, 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range approximately 3 volts.
(If a zero center scale meter is not available, a standard s vacuum tube voltmeter may be used by reversing the meter con tions for negative readings).
Allow chassis and signal generator to "Heat Up" for several minu

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it at the audio takeoff point at the 1 megohm resistor (R-14) and its junction with the term strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in N A. Adjust input to give some output on the zero center vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the l from pin 7 of 6BE6 tube to the band switch before atten ing to check the antenna and oscillator adjustments.

Power Output	4.5 watts maximum 2.5 watts 10% distortion
Loud Speaker	10" PM Dynamic
Voice Coil Impedance	3.2 ohms 400 cycles

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Sever Minutes.

SIGNAL GENERATOR

455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. C-14 and C-15	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-39	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-35	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor — .01 mf, 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range approximately 3 volts.

(If a zero center scale meter is not available, a standard sca vacuum tube voltmeter may be used by reversing the meter conne tions for negative readings).

Allow chassis and signal generator to "Heat Up" for several minute

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.

Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in No A. Adjust input to give same output on the zero center D vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the lea from pin 7 of 6BE6 tube to the band switch before attemp ing to check the antenna and oscillator adjustments.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempti to adjust 2nd I-F (FM) tuning slug.

MODEL 8LWG-2506B

MONTGOMERY WARD

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

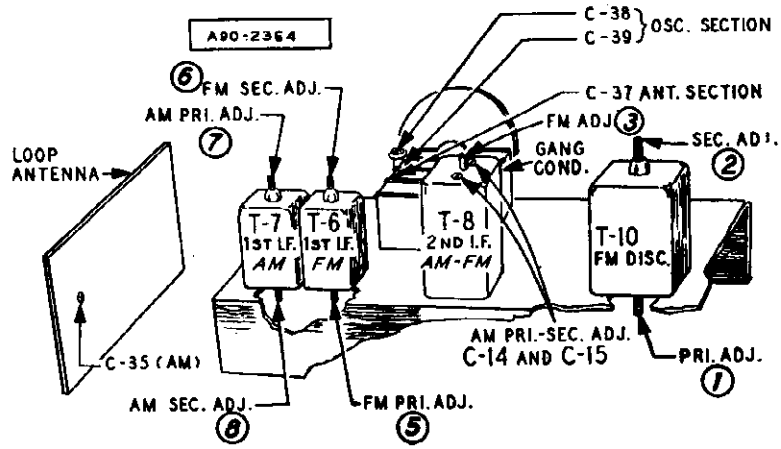
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	25 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	60 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	58 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	2400 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

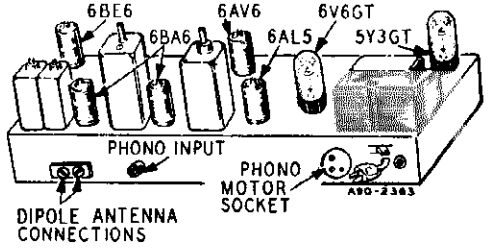
FM STAGES

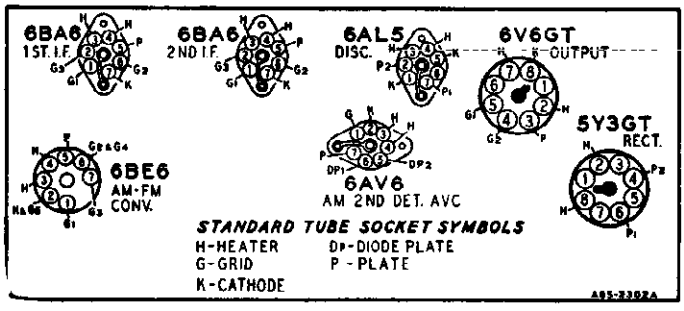
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	200 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	1,000 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	40,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usually permissible.

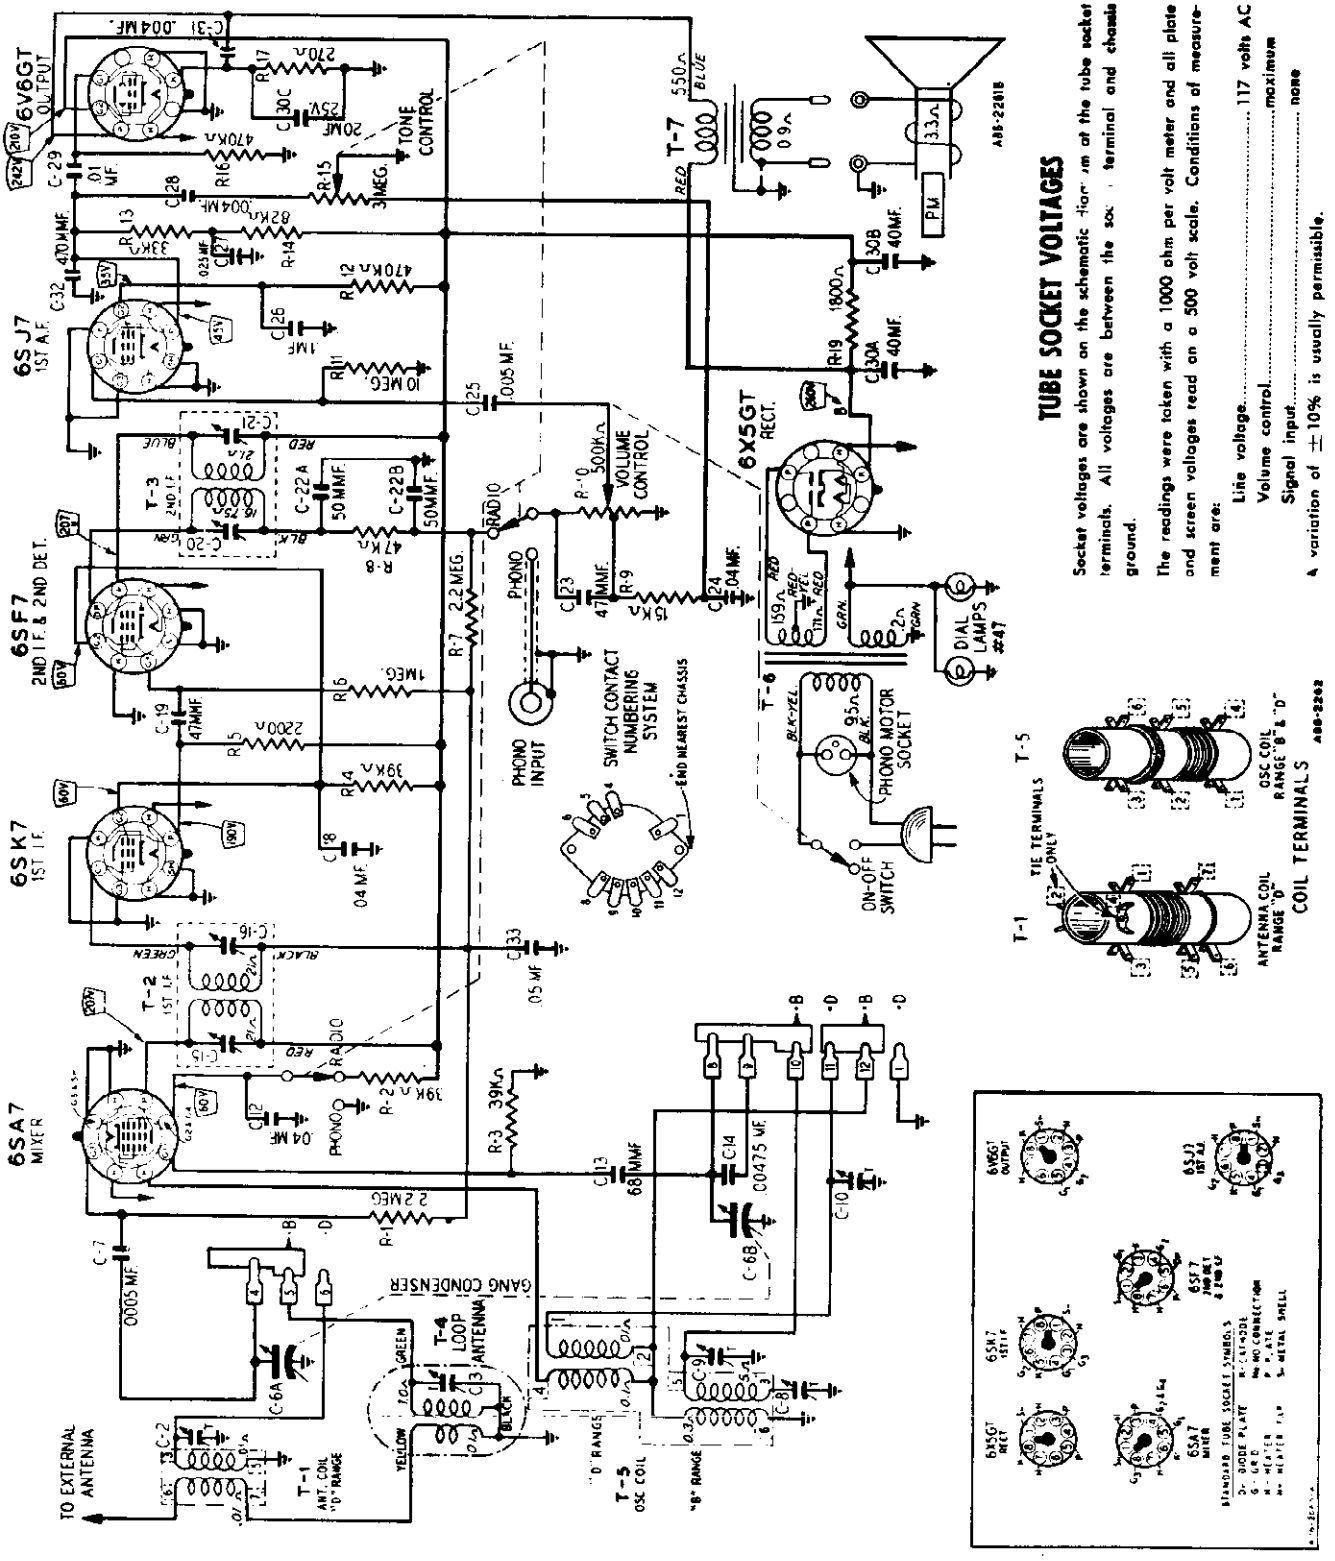
MODEL 84WG-2704D

MONTGOMERY WARD



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage..... 117 volts AC
Volume control..... maximum
Signal input..... none

A variation of ±10% is usually permissible.

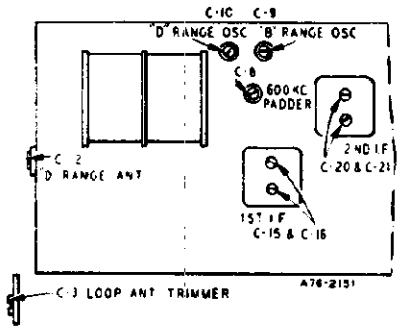
ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.



After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SA7, Pin 8	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C-20) & (C-21) 1st I-F (C-15) & (C-16)
RANGE B	1620 kc	Antenna Lead	50 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output. Set Indicator to 1400 KC. See Note A	Antenna Range B (C3)
	600 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output	600 kc (C8) Rock Rotor—See Note B
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.						
RANGE D	18.3 mc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 mc	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Antenna Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output	Antenna Range B (C3)

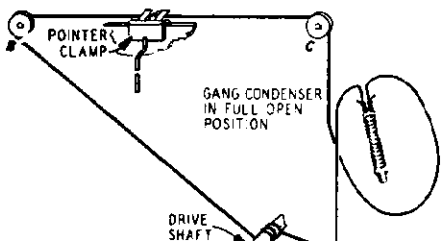
RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External antenna lead	Chassis	9 microvolts
1000 kc	.05 mf	6SA7 Mixer, Pin 8	Same as above	42 microvolts
455 kc	.05 mf	6SA7 Mixer, Pin 8	Same as above	40 microvolts
455 kc	.05 mf	6SK7 1st I-F, Pin 4	Same as above	1075 microvolts
455 kc	.05 mf	6SF7 2nd I-F, Pin 2	Same as above	3900 microvolts
400 cycles	.05 mf	6SJ7 1st A-F, Pin 4	Same as above	.08 volt
400 cycles	.05 mf	6V6GT Output, Pin 5	Same as above	3.75 volts

DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new 10X65 drive cord assembly or a piece of cord 48 inches long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley. Pass the cord through the slot in the drive pulley rim around idler stud A and wind three and one-half turns clockwise around the tuning shaft (turns must progress away from chassis). Then pass cord over idler pulleys B and C. Wrap cord counterclockwise around drive pulley, stretch tension spring and fasten free end of cord to spring.



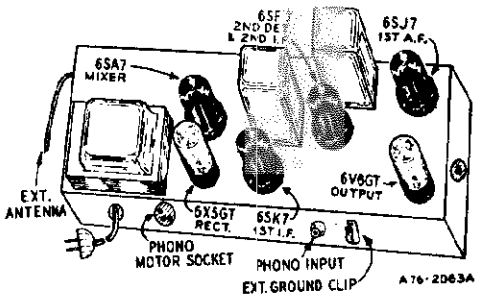
GENERAL DESCRIPTION

This model is a five tube (plus rectifier tube) AC console receiver with automatic record changer. Controls are provided for tuning, volume, tone, and band selection. The dial scale is calibrated in two bands, the broadcast band in channel numbers to cover frequencies between 540-1600 KC and the short wave band directly in megacycles from 5.75 to 18.3 MC. Other features include a built-in Air Wave Aerial, automatic volume control, beam power audio output stage and a PM dynamic speaker. A switch is provided on the tone control for selection of either radio or phono operation.

50 CYCLE OPERATION

If it is desired to use the record changer on a 50 cycle power supply, it will be necessary to replace the drive sleeve assembly on the record changer motor shaft with a 50 cycle drive sleeve assembly. This assembly is listed in the parts list.

To change the sleeve turn the record selector shelf to the 12" position and lift the turntable off of the record changer. Loosen the set screw holding the drive sleeve on the motor shaft and remove the old sleeve. Install the new 50 cycle drive sleeve and replace the turntable.



Power Supply	105-125 volts AC, 60 cycles, 45 watts. (65 watts phono operating)
Frequency Range	B range—540-1600 KC D range—5.75 to 18.3 MC
Intermediate Frequency	455 KC
Selectivity	40 KC broad at 1000 times signal, 1000 KC
Sensitivity	(for .5 watt output) with external antenna B range—9 microvolts average D range—20 microvolts average
Power Output	4 watts maximum 2.3 watts, 10% distortion
Loud Speaker	10" PM dynamic
Voice Coil Impedance	3.2 ohms at 400 cycles

MODEL 84WG-2712A

MONTGOMERY WARD

A 100,000 Ohm 1/2 Watt Resistor (R50) was connected between the top of the Volume Control R-24 and ground, this resistor improves the Audio Amplifier stability. See Figure 2. for the location of this Resistor.

The following additional parts are used:

REFERENCE NO.	PART NO.	DESCRIPTION
R-49	B-84222	2,200 Ohm 0.5 Watt
R-50	B-85104	100 K Ohm 0.5 Watt

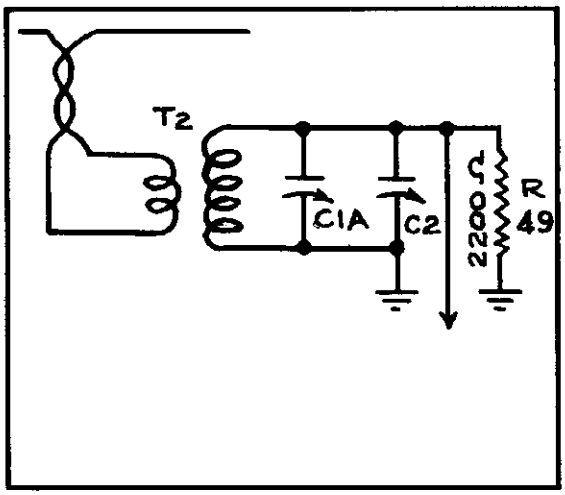

FIG. 1

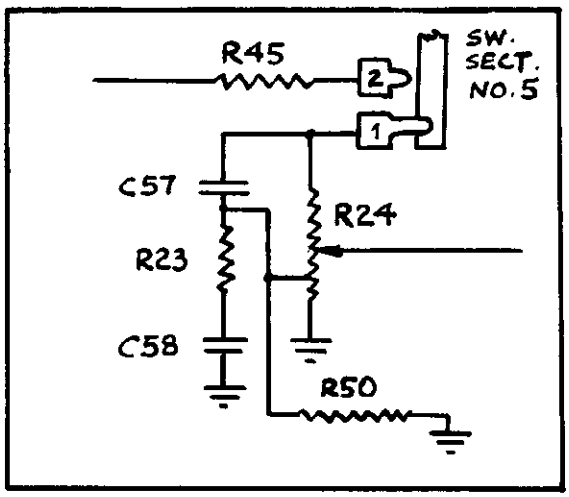

FIG. 2

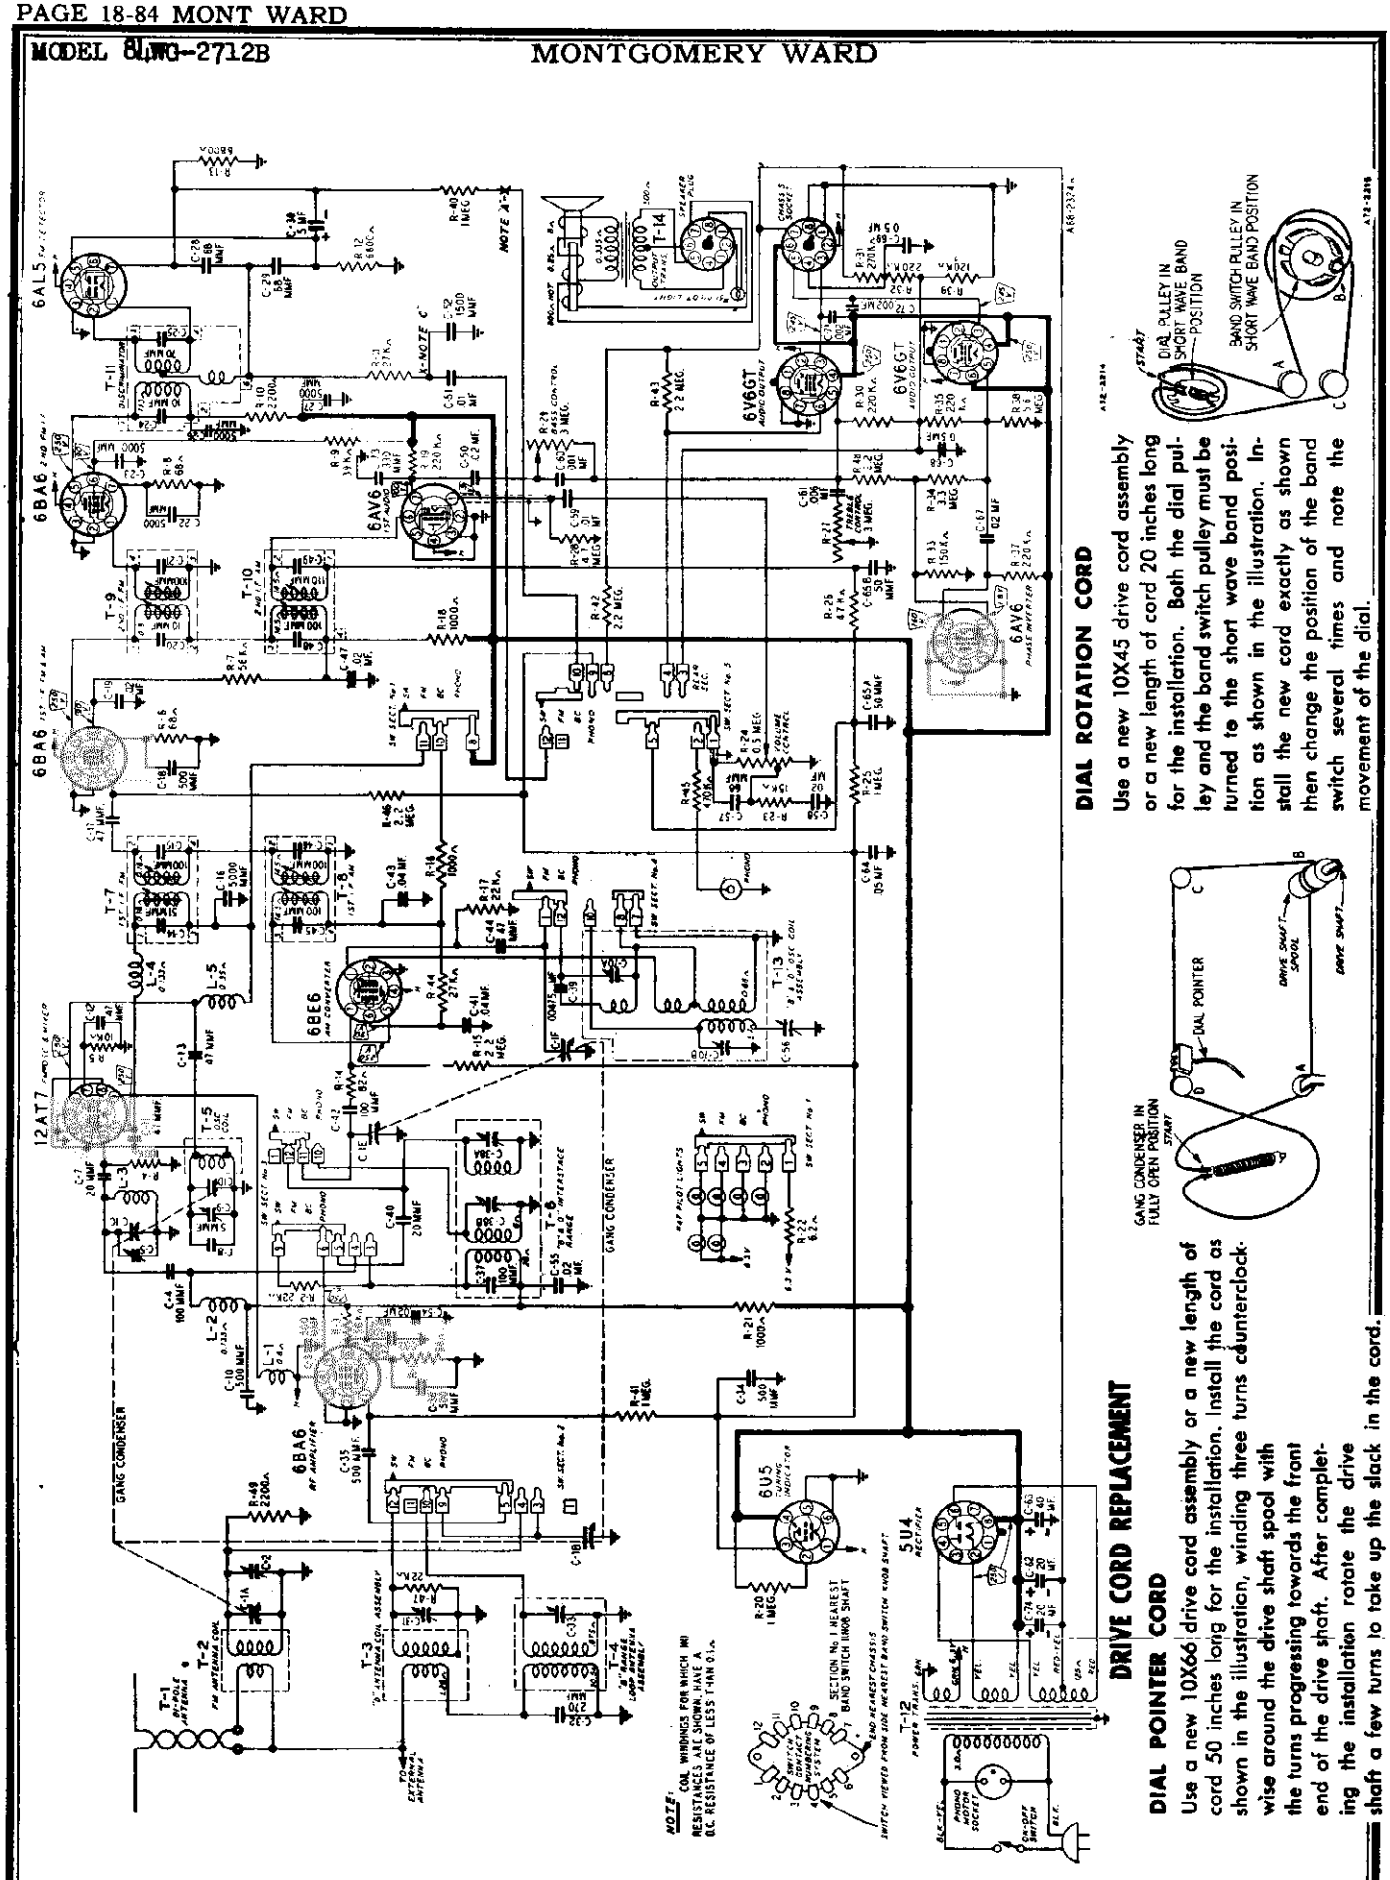
Two production changes were made as follows:

A 2,200 Ohm, 1/2 watt Resistor (R49) was connected across the secondary of the F.M. Antenna Coil T-2. This resistor broadens the frequency response curve of this coil. See Figure 1. for location of this Resistor.

MODEL 8UWG-2712B

MONTGOMERY WARD



DIAL ROTATION CORD

Use a new 10X45 drive cord assembly or a new length of cord 20 inches long for the installation. Both the dial pulley and the band switch pulley must be turned to the short wave band position as shown in the illustration. Install the new cord exactly as shown then change the position of the band switch several times and note the movement of the dial.

DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 50 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft spool with the turns progressing towards the front end of the drive shaft. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

ALIGNMENT PROCEDURE

FM STAGES

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 5000 ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.

Allow chassis and signal generator to warm up for several minutes.

	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	RF, C-5	Maximum Deflection
	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	Ant. C-2	Maximum Deflection
Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the 1 megohm resistor R-40 and the band switch terminal for all adjustments except the discriminator secondary adjustment, for which see Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

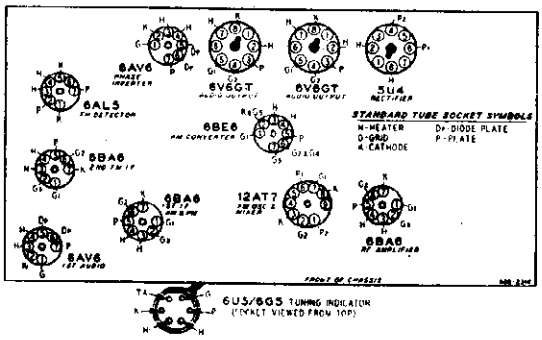
NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and reconnect to junction of R-11, C-51 and C-52. Adjust for zero voltage indication.

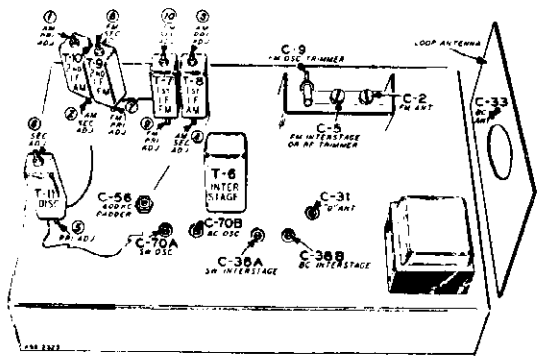
NOTE D—Before adjusting Pri. core connect 5000 ohm load resistor across the 2nd I.F. secondary terminals.

NOTE E—Disconnect 5000 ohm load resistor from secondary terminals and reconnect across the 2nd I.F. primary terminals.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency below signal frequency.





TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usally permissible.

MODELS 8LWG-2712A, 8LWG-2712B

MONTGOMERY WARD

RECEIVER STAGE SENSITIVITIES
AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting an 8 ohm, 10 watt resistor across the secondary winding of the output transformer. A reading of 2 volts across this resistor will be equivalent to a .5 watt output. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	2 Microvolts
1000 KC	.05 mf	6BA6 Interstage Pin 1	Chassis	8 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	65 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	55 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	3500 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.045 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	1.65 Volts

FM STAGES

The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 Mc	300 ohms	External Antenna Terminal	External Ant. Terminal	25 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2200 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	50,000 Microvolts

ALIGNMENT PROCEDURE
AM BROADCAST AND SHORT WAVE BAND

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, 200 mmf and 400 ohms.

Volume Control—Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO

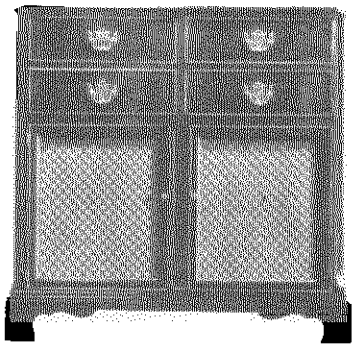
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer C-70B causes no further improvement in output.							
Short Wave	18.3 MC	External ant. lead	400 ohm	Short Wave	Rotor Fully Open	SW Oscillator C-70A	Maximum Output
	17 MC	External ant. lead	400 ohm	Short Wave	Turn Rotor to Max. Output	SW Interstage C-38A "D" Antenna C-31	
Reassemble chassis in cabinet							
Broadcast	1400 kc	External ant. lead	200 mmf	Broadcast	Turn Rotor to Max. Output	Loop Antenna C-33	

After each range is completed, repeat the procedure as a final check.

Note A—If the pointer is not at 1400 KC on the dial, reset pointer at the 1400 KC mark on the dial scale.

Note B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.



This is a three band, ten tube (plus tuning eye and rectifier tube) receiver with automatic record changer, for the reception of both AM and FM stations. The R-F and I-F stages use the latest type high gain miniature type tubes and built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include the new Roto-Selector dial with only one band visible at a time, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, electro dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

50 CYCLE AC OPERATION

If it is desired to operate this radio on a 50 cycle 105-125 volt AC power source no changes are necessary to the radio chassis.

If it is desired to use the record changer on a 50 cycle power supply, it will be necessary to replace the drive sleeve assembly on the record changer motor shaft with a 50 cycle drive sleeve assembly. This assembly is listed in the parts list.

To change the sleeve turn the recorder selector shelf to the 12" position and lift the turntable off of the record changer. Loosen the set screw holding the drive sleeve on the motor shaft and remove the old sleeve. Install the new 50 cycle drive sleeve and replace the turntable.

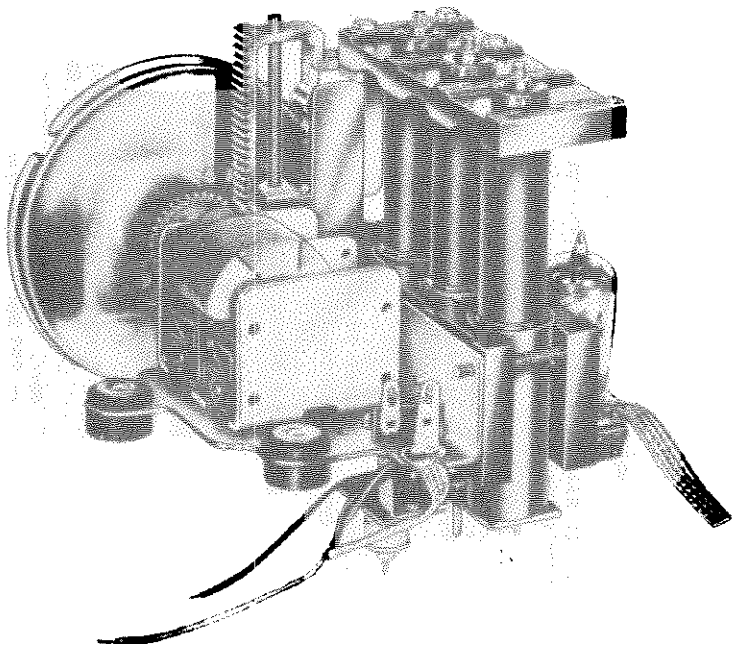
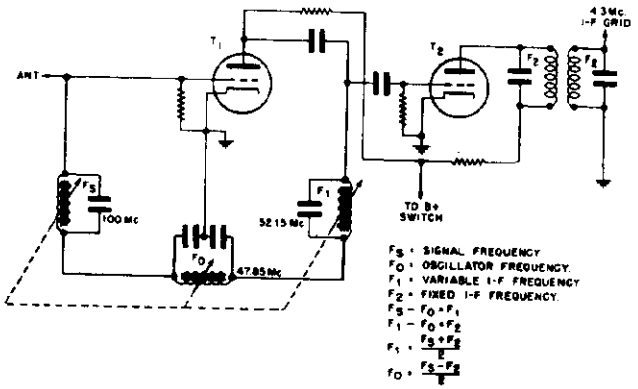
ACTUAL DIAGRAM





FUNCTIONAL DIAGRAM

THEORY OF THE FM TUNER

Referring to the functional schematic diagram in Figure 2, the triode T1 serves both as an oscillator and first converter, and triode T2 serves as the second converter. Oscillator voltage injection for the second converter is obtained thru the coupling capacitor from the plate of T1. T1 and T2 are sections of the 12AT7 twin-triode tube.

The frequency relationships are given in Figure 2. The oscillator F_O beats with the incoming signal F_S to produce the first intermediate frequency F_1, which is variable. F_1 then beats with the same oscillator frequency F_O in the second converter to produce the second intermediate frequency F_2 which is 4.3 Mc. With a 100 Mc signal the oscillator frequency is 47.85 Mc and the variable intermediate frequency is 52.15 Mc.

This system of reception permits the oscillator to be resonated with a high capacitance, 250 micromicrofarads in this case. Consequently, changes in the tube characteristics during warm-up do not produce objectionable changes in oscillator frequency. This contributes materially to the stability of the system.

Below are instructions and methods for replacing the integral parts of the Tuner. Although this paragraph does not include instructions for all of the replaceable parts, the instructions are explicit enough to guide and assist the service man whenever it becomes necessary to replace any part that becomes faulty. A short analysis of the Tuner mechanism by the service man before attempting any replacement is highly recommended. It will be noticed that it is necessary, in some cases, to remove the Tuner from the chassis before making the replacement. Since it entails disconnecting leads, removing the Tuner from the chassis should be avoided, unless it is an absolute necessity. Many parts, such as cores, dial pulley, tuning gang and top core clamp, can be replaced without removing the Tuner from the chassis. A constant reference to Figure 4 will be necessary for the exact location of the component parts. Also, it will be necessary to refer to the specific receiver service manual for dial cord restringing instructions and alignment procedure. Of course, alignment of the FM and BC circuits will be necessary if the gang capacitor, iron cores, inductors, or trimmers are replaced, or if the position of the iron cores or inductors have changed in the Tuner.

IRON CORE REPLACEMENT

1. Remove the three screws (29) and lockwashers (17).

2. Remove the clamp and iron core assembly from the Tuner by merely lifting "up" on the bakelite piece (7) to which the cores are mounted.

3. Remove the core requiring replacement by turning the core in a counterclockwise direction.

4. To make the replacement, place spring (33) over the core stud and screw the core into the swivel nut (18).

5. Reassemble the Tuner.

6. It will be necessary to realign the FM circuits after replacing any core.

V.H.F. INDUCTOR REPLACEMENT

1. Unsolder all leads attached to the Tuner.

2. Disconnect the dial restringing system.

3. Remove the tuner mounting screws and lift the Tuner from the chassis.

4. Loosen the four screws (39).

5. To replace the faulty inductor, insert the center conductor of the inductor into the slot in the iron core. The tip must be pointed toward the front of the Tuner. The inductor should be placed between the clamp (7) as follows: The metal tubing of the first inductor (from the rear of the tuner) must be even with the top of the clamps (7); 1/32" of the metal tubing must be above the top of the clamps for the center inductor and 1/16" of the metal tubing of the third inductor should be above the clamps. It must be remembered that the oscillator frequencies depend upon the amount of iron core inserted in the inductor and during alignment the setting of this initial dimension is obtained by turning the swivel nuts (18).

6. Tighten the four screws (30). Care must be exercised when tightening these screws. If the screws are extremely tight, the inductor may be damaged or the iron core will not slide freely in the inductor.

7. Mount the tuner in the chassis.

8. Resolder all leads.

CAUTION: When soldering to the antenna or variable IF inductor, be careful that solder does not run over the threads of the capacitor. Never attempt to change the length of the connecting leads, as this may affect tuner tracking and performance.

9. It will be necessary to realign the FM circuits after replacing any inductor.

DRIVE PULLEY NOTES

Should it ever become necessary to remove or adjust the drive pulley (19) observe the following points when replacing:

1. The gang capacitor (C-5) must be positioned by means of its mounting screws (27) so that the drive pulley split gear (19) engages the rack gear (20) properly.

2. To eliminate play between the drive pulley and rack gear, it is necessary to offset the drive pulley split gear so that the torsion spring (35) will exert tension against the two halves of the split gear.

3. Before tightening the drive pulley setscrews (31) make sure that you position the drive pulley (19) as shown in Figure 4 - Detail A. With gang capacitor (C-5) fully meshed, the perm tuning cores should be spaced .020 as shown.

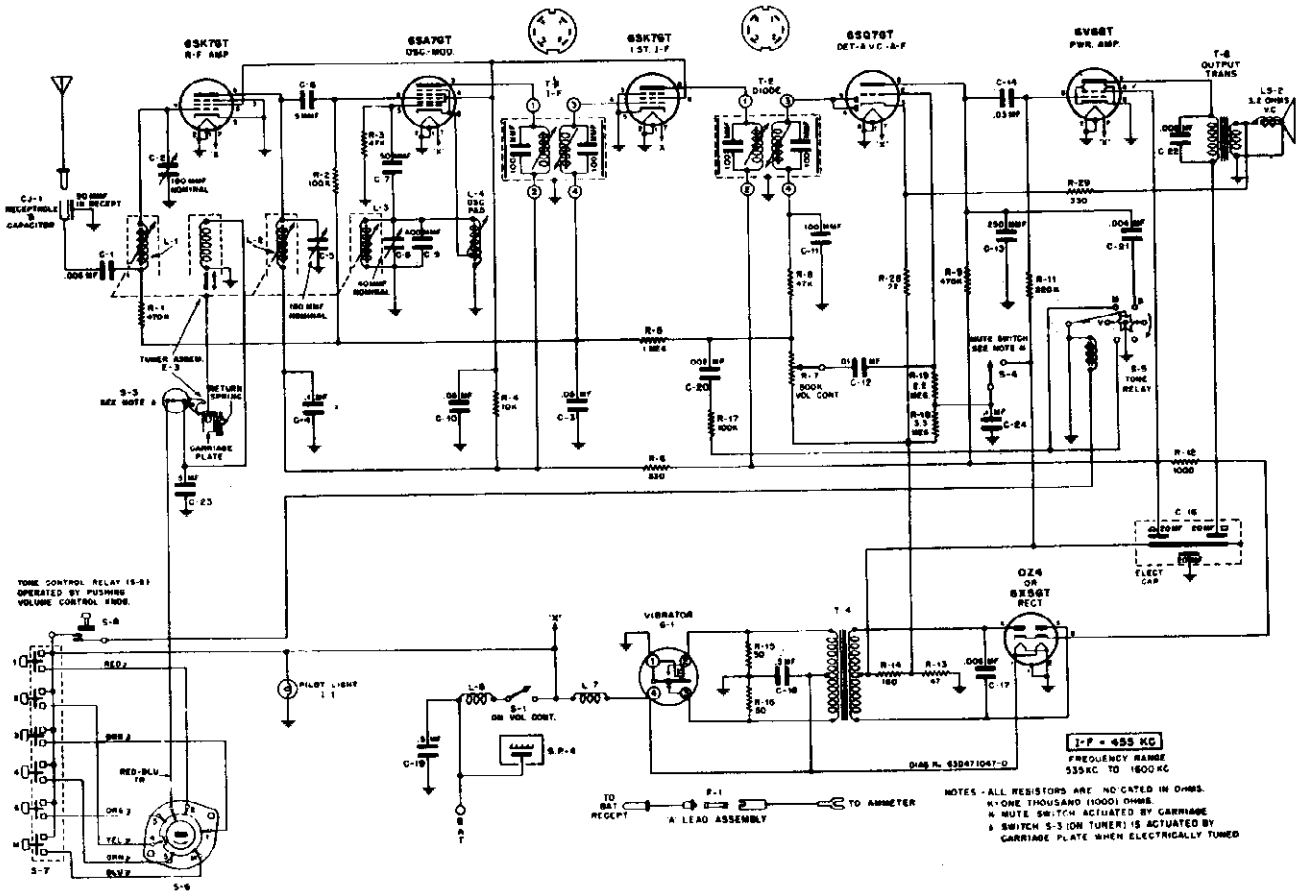
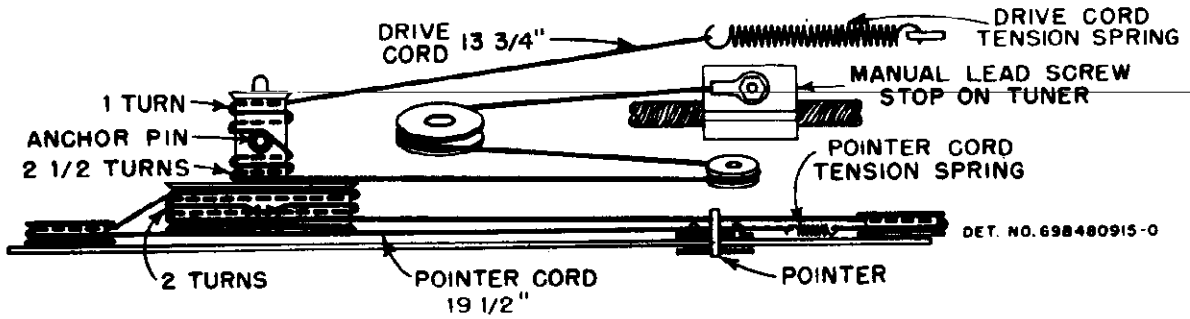
MODEL SR7

MOTOROLA INC.



TO SET THE PUSH BUTTONS

1. Turn on the receiver and press the "M" button.
2. With the tuning knob, tune in the station you desire to set up. Make a mental note of the program.
3. Press the No. 1 button.
4. Push the set-up button(on left side of radio) in as far as it will go and release.
5. Turn the tuning knob until the previously noted program is heard. (The dial will not indicate the station to which the button is set). The dial pointer may reach the end of the dial scale before the desired station is received; however, continue turning the tuning knob until the station is received. The dial mechanism will not be affected.
6. Press the "M" button and the No. 1 button is set. Check the setting of the button by tuning in the desired station having the "M" button pushed in and then push the automatic button. Either button should give the same volume and clarity.
7. Repeat the above procedure, steps 2 through 6 for each of the remaining push buttons.



STRING DRIVE

ALIGNMENT

INSTRUCTIONS.- Remove front and rear covers to expose all adjustments. Use alignment tool (Motorola Part No. 66A76278) for adjusting tuner cores; a small screwdriver can be used for all other adjustments. Construct RF dummy antenna as shown in Figure 1; the 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas. Tuner gauge (Motorola Part No. 66X76825) is useful though not essential for more accurate setting of tuner to alignment frequencies at 1600 and 1425 Kc. Set volume control at maximum and keep output of signal generator no higher than is necessary to obtain output reading. Push "M" button to place tuner in manual position. IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores; the slightest inward pressure may move the tuner carriage and result in inaccurate alignment.

STEP	TUNER POSITION SET TO	DUMMY ANTENNA	SIG. GEN. LEAD CONNECTED TO	SIG. GEN. SET AT	ADJUST FOR PEAK
1.	High frequency end (cores out).	.1 mfd at Sig.Gen.	Osc.Mod grid (#8 pin)	455 Kc	1 & 2, 3 & 4
2.	High freq. end, tuning shaft against stop. Cores should be set to project 1-1/8" from cans.*	60 mmf at Sig.Gen. in series with 21" long coax lead.	Ant. recpt.	1600 Kc	5, 6 & 7
3.	EXACTLY one full turn in from high freq.end. Use knob setscrew as indicator. Start measuring turn the moment tuner carriage starts moving inward. *	"	"	1425 Kc	8, 9 & 10
4.	EXACTLY four more full turns in (as indicated by knob setscrew)	"	"	Power off.	11 for max. noise.
	NOTE: If oscillator padder core (11) adjustment is too far off, repeat alignment procedure, steps 2, 3, & 4. It may be necessary to repeat alignment more than once if padder adjustment has been tampered with.				
5.	Assemble receiver and peak antenna trimmer (#7) to car antenna.				

*For greater accuracy in setting tuner to alignment frequencies, use gauge (Motorola Part No. 66X76825).

TUBE COMPLEMENT - 1R5 - Converter
1U4 - IF Amplifier
1S5 - Detector, AVC & 1st AF Amplifier
3S4 - Power Amplifier

MODEL 48L11, CHASSIS HS-113

MOTOROLA INC.

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A low range output meter should be connected to the speaker voice coil terminal and receiver chassis. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

The IF and diode transformer tuning cores are slotted for a small size fibre screwdriver. Do not press hard on the fibre screwdriver during alignment as damage to the coil forms or tuning cores may result.

Loop antenna should be connected to chassis during alignment.

Chart I gives complete alignment procedure for Chassis HS-113.

ALIGNMENT PROCEDURE

(Refer to Figure 2 for location of all alignment trimmers and cores).

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Converter grid* & chassis	455 Kc	1,2 & 3	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	.1 mf	Converter grid* & chassis	1620 Kc	4	This sets oscillator to dial scale
3.	-	-	-	-	-	Install chassis in cabinet, leaving output meter connected to speaker.
4.	1400 Kc	None	Radiation loop**	1400 Kc	5	Tune signal in on receiver, then adjust loop trimmer (5) for maximum. Loop trimmer is reached through hole under plug button on side of cabinet.

* A convenient point for this connection is the stator lug of the loop section of the tuning capacitor.

** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

If the receiver is operated from an AC power line during alignment, use an isolating transformer between receiver and power line.

A low range output meter should be connected to the speaker voice coil terminal and receiver chassis. Set receiver volume control to maximum.

For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

The IF & diode transformer tuning cores are slotted for a small size fibre screwdriver. Do not press hard on the fibre screwdriver during alignment as damage to the coil forms or tuning cores may result.

Loop antenna should be connected to chassis during alignment.

CHART I. ALIGNMENT PROCEDURE

(Refer to Figure 2 for location of all alignment trimmers and cores).

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Converter Grid* & chassis	455 Kc	1,2 & 3	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	.1 mf	Converter grid* & chassis	1620 Kc	4	This sets oscillator to dial scale.
3.	-	-	-	-	-	Install chassis in cabinet, leaving output meter connected to speaker.
4.	1400 Kc	None	Radiation loop**	1400 Kc	5	Tune signal in on receiver, then adjust loop trimmer (5) for maximum. Loop trimmer is reached through hole under plug button on side of cabinet.

* A convenient point for this connection is the stator lug of the loop section of the tuning capacitor.

** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

TL = TIE LUG.

NC = NO CONNECTION.

CONDITIONS OF MEASUREMENTS

A VTVM WAS USED TO MAKE ALL MEASUREMENTS.

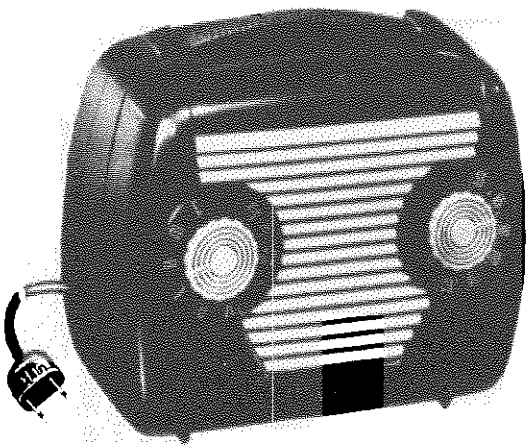
MEASUREMENTS ARE MADE FROM TUBE BASE PIN INDICATED TO CHASSIS.

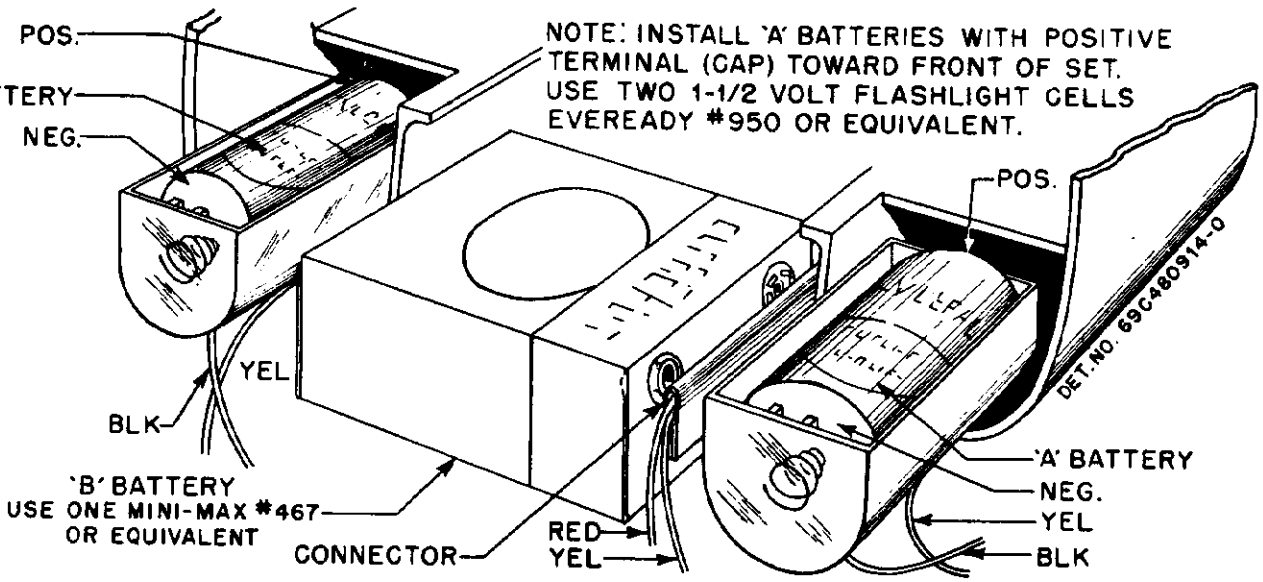
SET IS OPERATED FROM 117 V AC DURING VOLTAGE MEASUREMENTS.

SWITCH LEVER IS SET TO AC/DC POSITION

VOLTAGE TOLERANCE ±10%. RESISTANCE TOLERANCE ±20%.

VOLTAGE & RESISTANCE DIAGRAM - AC OPERATED





BATTERY REPLACEMENT DETAIL

TUBE COMPLEMENT - 1R5 - Converter
1U4 - IF Amplifier
1S5 - Detector, AVC & 1st AF Amplifier
3S4 - Power Amplifier
Rectifier - Selenium type - for AC/DC operation

POWER SUPPLY - Operates from 105-125 volts AC/DC (15 watts) or from the following self-contained batteries:
Two 1-1/2V flashlight cells (Eveready #950 or equivalent)
One 67-1/2V "B" battery (Eveready #467 or equivalent)

NOTE: The chassis of this receiver is connected directly to the power line. When operating chassis outside of its cabinet (from an AC power line) use an isolating transformer between power line and receiver to reduce possibility of electrical shock.

Tubes can be replaced without removing chassis from cabinet. Just open back cover and remove chassis insulator to expose tubes. Two plug buttons hold chassis insulator in position.

To remove the chassis from the cabinet:

1. Remove control knobs.
2. Open back cover and remove chassis insulator.
3. Disconnect the two loop leads from the pin receptacles.
4. Remove the two Phillips head screws on each end of chassis and slide chassis out of cabinet.

MODEL 65F21, CHASSIS HS-26 MOTOROLA INC.

ALIGNMENT

Refer to Figure 2 for location of adjustment trimmers and cores. Connect a low range output meter across speaker voice coil. Volume control should be set at maximum for all operations.

The signal generator used, should possess good frequency stability and should be of the modulated type. For greatest accuracy, keep the receiver output at approximately 50 milliwatts (.38V on output meter) during aligment. Vary signal generator output (not receiver volume control) to maintain this output during alignment.

Step	Gang Setting	Band	Dummy	Generator Connected to	Generator Frequency	Trimmer or Core	Remarks
1	Fully opened	B.C	.1mf	Mixer grid & chassis	455 kc	1,2,3,&4	Adjust I.F. & Diode trans. for maximum
2	Fully opened	B.C	-	Radiation loop*	1620 kc	5	Set oscillator to dial scale
3	1400 KC	B.C	-	Radiation loop*	1400 kc	6 ‡	Tune signal generator for max. on output meter, then peak trimmer.
4	12.2 MC	SW	50mmf	Short wave antenna terminal	12.2 Mc	7	Set osc. to dial scale.
5	11.5 MC	SW	50mmf	Short wave antenna terminal	11.5 Mc	8	Tune signal generator for max. on output meter, then peak trimmer.

‡ Repeak after chassis and loop are installed in cabinet.

* Connect output of signal generator to a 5" diameter, 3 turn loop. With volume on full, bring loop close enough to receiver until output of 50 milliwatts is obtained. (.38V on output meter). Vary distance between generator and receiver loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

POWER SUPPLY - 117V A.C. 65 Watts.

INSTRUCTIONS FOR SETTING PUSH BUTTONS

1. Turn the radio "on" and allow it to warm up for a period of at least fifteen minutes.
2. Make a list of the frequencies of the nearby stations you wish to tune in automatically. It is recommended that you select the most powerful stations.
3. Turn the band switch to "BC" position and carefully tune in the first station to be set up.
4. Adjust a signal generator to zero beat with this station. NOTE: While it is advisable to use a signal generator for accuracy, it is not an absolute necessity.
5. Turn the band switch to "PB" position.
6. Push the button to be set up, making sure to select a button having the proper frequency range to include the station you are setting. See Figure 3.
7. The tuner adjustment screws are accessible from the back of the radio. (See Figure 2).
8. Adjust the oscillator screw until the signal from the generator, or station is heard. Carefully adjust the screw to maximum volume.
9. Now adjust the antenna trimmer screw for maximum volume.
10. Follow the same procedure for the remaining buttons.
11. It is advisable, after all buttons are set up, to repeat steps 6,8 and 9 for maximum performance

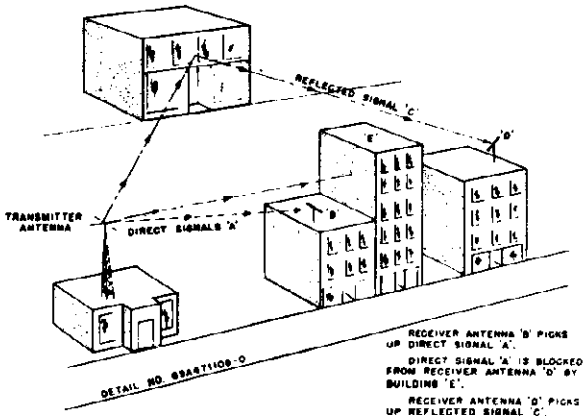
EXTERNAL ANTENNA TERMINALS



DIRECT & REFLECTED FM RECEPTION PATHS

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator output to B- instead of the receiver chassis.

If set oscillates when aligning the broadcast band, connect receiver B- to receiver chassis. CAUTION: Don't forget to disconnect B- from receiver chassis after alignment.

Use an insulated wrench when adjusting the FM tuner trimmers. Order Motorola FM Alignment Wrench, Part Number 66A471864.

A special wrench for adjusting the slotted nuts on the tuner cores will be required also. You can easily fabricate one from a Motorola auto set Volume Control Shaft and Coupling Assembly (Part Number 1B70847, $.30 list) by simply spreading out the forked ends and filing to fit. Solder the assembly together to make it rigid.

COMPLETE ALIGNMENT PROCEDURE USING AM SIGNAL GENERATOR

An AM (30% amplitude modulated) signal generator covering the frequencies shown in Alignment Chart I, is used to align the broadcast and FM bands. A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The broadcast alignment is conventional; instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the discriminator does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the discriminator secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of the FM circuits, proceed to align the discriminator secondary by applying a 4.3 Mc AM signal to the control grid (Pin #7) of the 2nd FM converter tube and adjusting the discriminator secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the discriminator secondary has been properly aligned.

CHART I. ALIGNMENT PROCEDURE USING AM SIGNAL GENERATOR

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
455 Kc IF CHANNEL ALIGNMENT							
1.	1620 Kc	BC	.1 mf	12BE6 (V-2) BC Conv. Grid (Pin #1)	455 Kc	1, 2, 3 & 4	Adjust for maximum output.
BROADCAST BAND ALIGNMENT							
2.	1620 Kc (gang fully opened)	BC	.1 mf	12BE6 (V-2) BC Conv. Grid (Pin #1)	1620 Kc	5	This sets oscillator to dial. (Calibrate pointer by fully closing gang and noting position of pointer slider. Pointer slider should be in line with right hand hole in dial background, as shown in Figure 7.)

ALIGNMENT (cont'd)

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
3.	1400 Kc	BC	None	Radiation loop*	1400 Kc	6	Tune in signal with receiver tuning knob, then peak trimmer 6.
4.3 MC IF CHANNEL ALIGNMENT							
4.	-	-	-	-	-	7	Detune discriminator secondary by screwing core out as far as it will go.
5.	(extreme high frequency end)	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (#7 Pin)	4.3 Mc	8,9,10, 11 & 12	Adjust for maximum output.
6.	-	-	-	-	-	13	Check the position of the FM Osc. tuning core 13. Set spacing between the core and bakelite piece to which it is mounted, to two turns fro tight by turning tuning core slotted nut.
7.	98 Mc	FM	None	FM Ant. terminal	98 Mc	16	Tuner is set to 98 Mc by moving cores out with tuning shaft until spacing between bakelite pieces is 1-9/32". See Figure 4. Peak 16 for maximum output.
8.	90 Mc	FM	None	FM Ant. terminal	90 Mc	17 & 18	Tune in signal with receiver tuning knob, then adjust 17 & 18 for maximum output.
9.	105 Mc	FM	None	FM Ant. terminal	105 Mc	14 & 15	Tune in signal with receiver tuning knob, then adjust 14 & 15 for maximum output.
10.	-	-	-	-	-	-	Repeat Steps 8 and 9 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., trimmers 17 & 18 105 Mc).
11.	105 Mc	FM	None	Radiate signal (or use station after performing Step 12).	105 Mc	17	Adjust for maximum output with built-in antenna connected.
ALIGN DISCRIMINATOR SECONDARY							
12.	-	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (#7 Pin)	4.3 Mc	7	Adjust discriminator secondary for minimum response. The correct adjustment is sharply defined minimum response point between the two peaks.

* Connect output of signal generator to a 5" diameter, 3 turn loop and radiate signal into receiver loop. Minimum distance between loops should never be less than 12".

MODEL 67XM21, CHASSIS HS-64 MOTOROLA INC.

ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

STEP **OPERATION**

455 Kc IF Channel Alignment

1. Same as Step 1 in Chart I (Use AM signal generator)

Broadcast Band Alignment

2. Same as Steps 2 and 3 in Chart I (Use AM signal generator)

4.3 Mc IF Channel Alignment (Use FM Signal Generator & Oscilloscope)

3. (A) Discriminator

   1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and B-.

   2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 5. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required.

   3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .001 mf capacitor to the control grid (pin #1) of tube V-3 in the 2nd FM IF Amplifier stage.

   4. Adjust discriminator primary (8) for maximum amplitude. The phase shifting network resistor is adjusted to give only one trace.

   5. Adjust discriminator secondary (7) until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. See Figure 6. It will be necessary to go over discriminator primary (8) and secondary (7) adjustments several times before a pattern of maximum amplitude and correct symmetry is obtained.

   (B) 4.3 Mc IF Amplifiers

   1. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-2 in the 1st FM IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (9 & 10) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.

   2. Apply an FM 4.3 Mc signal (100 Kc deviation) to the FM antenna terminal and adjust both primary and secondary cores (11 & 12) until a symmetrical pattern substantially linear between peaks, is obtained.

FM Band Alignment - Use FM Signal Generator & Output Meter

4. Check the position of the FM oscillator tuning core (13). Set the spacing between the core and the bakelite piece to two turns from tight by turning tuning core slotted nut.

5. Connect generator output directly to the receiver FM antenna terminal.

6. Set receiver tuner to 98 Mc by moving cores out with tuning shaft until spacing between bakelite pieces is 1-9/32". See Figure 4. Also set FM signal generator to 98 Mc (22-1/2 Kc deviation). Adjust FM oscillator trimmer (16) for maximum output.

7. Set FM signal generator to 90 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust FM variable IF and FM antenna trimmers (17 & 18) for maximum output.

8. Set FM signal generator to 105 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust variable IF and antenna cores (14 & 15) for maximum indication on output meter.

9. Repeat steps 7 and 8 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., 17 & 18 at 105 Mc.)

10. Close FM antenna link on loop panel. Radiate an FM 105 Mc (22-1/2 Kc deviation) signal into FM antenna (line cord). Tune in signal with receiver tuning knob and then repeak FM antenna trimmer (17).

MOTOROLA INC.

MOTOROLA INC.

MODEL 68L11, CHASSI
HS-119

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A suitable output meter should be connected across the speaker voice coil. Set receiver volume control to maximum; for greatest accuracy keep output of receiver at approximately .05 watt throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment. (.05 watt = .40 volt on output meter). The alignment tool should be of an insulated type such as Motorola part number 66A71008.

If receiver is operated from AC line during alignment, it is suggested that an isolating transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator to B- instead of the receiver chassis.

Refer to Figure 1 for location of all adjustments.

Normally, alignment can be made with trimmers 5, 6 & 7. However, if range of these trimmers is insufficient to obtain peak, adjustment can be made with trimmers 5A and 6A.

R.F. COIL. The inductance of this coil is set at time of manufacture by adjusting the iron core. No resetting of this core should be made unless it has been tampered with. If so, readjustment can be made by proceeding as follows:

Tune in 600 Kc signal and peak Padder Adj. (8). Next tune in 1400 Kc signal and peak trimmer (6). Repeat both adjustments until maximum response is obtained at both ends; the last adjustment should be trimmer (6).

RF ALIGNMENT						
2.	1600 Kc**	-	Radiation loop***	1600 Kc	5	This sets osc. to dial scale
3.	1400 Kc	-	Radiation loop***	1400 Kc	6 & 7	Tune signal for max. with receiver tuning knob, then peak trimmers 6 & 7.
4.	1400 Kc	-	Radiation loop***	1400 Kc	7	With chassis assembled into cabinet, repeak antenna trimmer. Cabinet rear cover should be closed.

* A convenient point is the stator of the tuning capacitor.

** First close gang fully and set last mark on dial scale tape to calibration mark as shown in Figure 2 then set to 1600 Kc.

*** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

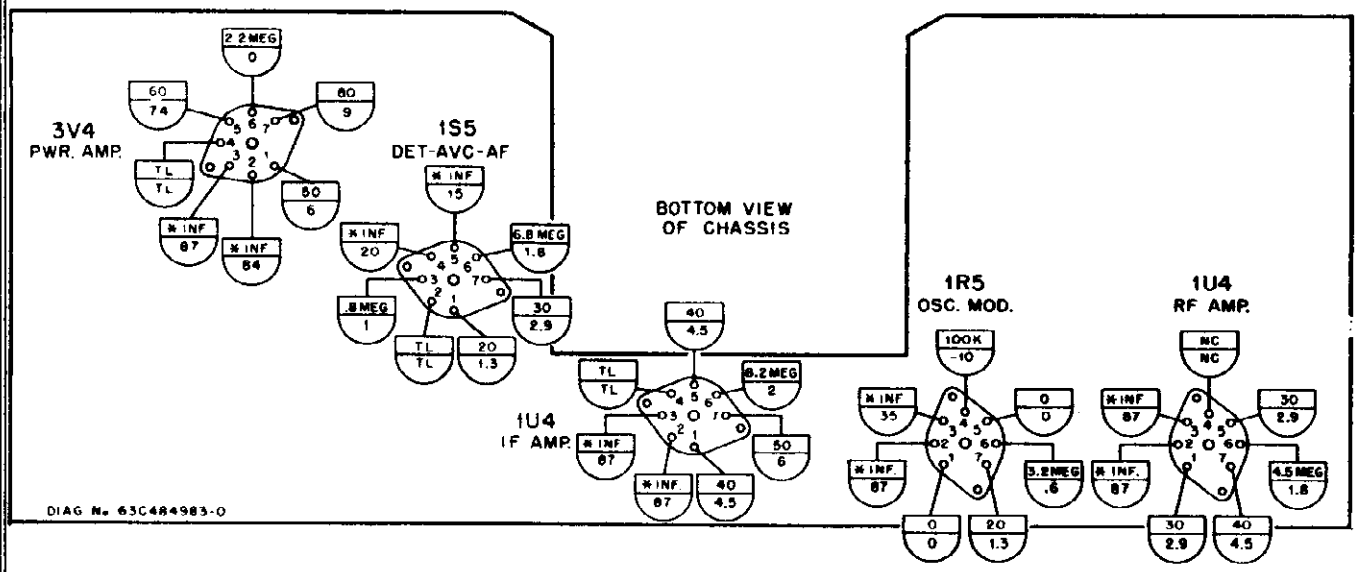
TUNING RANGE - 535 to 1620 Kc **IF FREQUENCY** - 455 Kc

TUBE COMPLEMENT - 1U4 - RF Amplifier
1R5 - Oscillator-Modulator
1U4 - IF Amplifier
1S5 - Detector, AVC & 1st AF Amplifier
3V4 - Power Amplifier
Rectifier - Selenium type (for house current operation)

POWER SUPPLY - Operates from 105-125 volts AC or DC (15 watts), or self-contained battery pack. Use Eveready #753 or General #80A-6F8-5.

MODEL 68L11, CHASSIS HS-119

MOTOROLA INC.



NOTE: A VTVM WAS USED TO MAKE MEASUREMENTS.

MEASUREMENTS ARE MADE FROM TUBE BASE PIN TO B-(⏚)

SET WAS OPERATED FROM FRESH BATTERY FOR VOLTAGE MEASUREMENTS.

SET WAS IN 'BATTERY' POSITION AND POWER SWITCH WAS 'ON' FOR RESISTANCE MEASUREMENTS; BATTERY WAS DISCONNECTED.

VOLTAGE TOLERANCE ±10%. RESISTANCE TOLERANCE ±20%.

= RESISTANCE MEASUREMENTS.

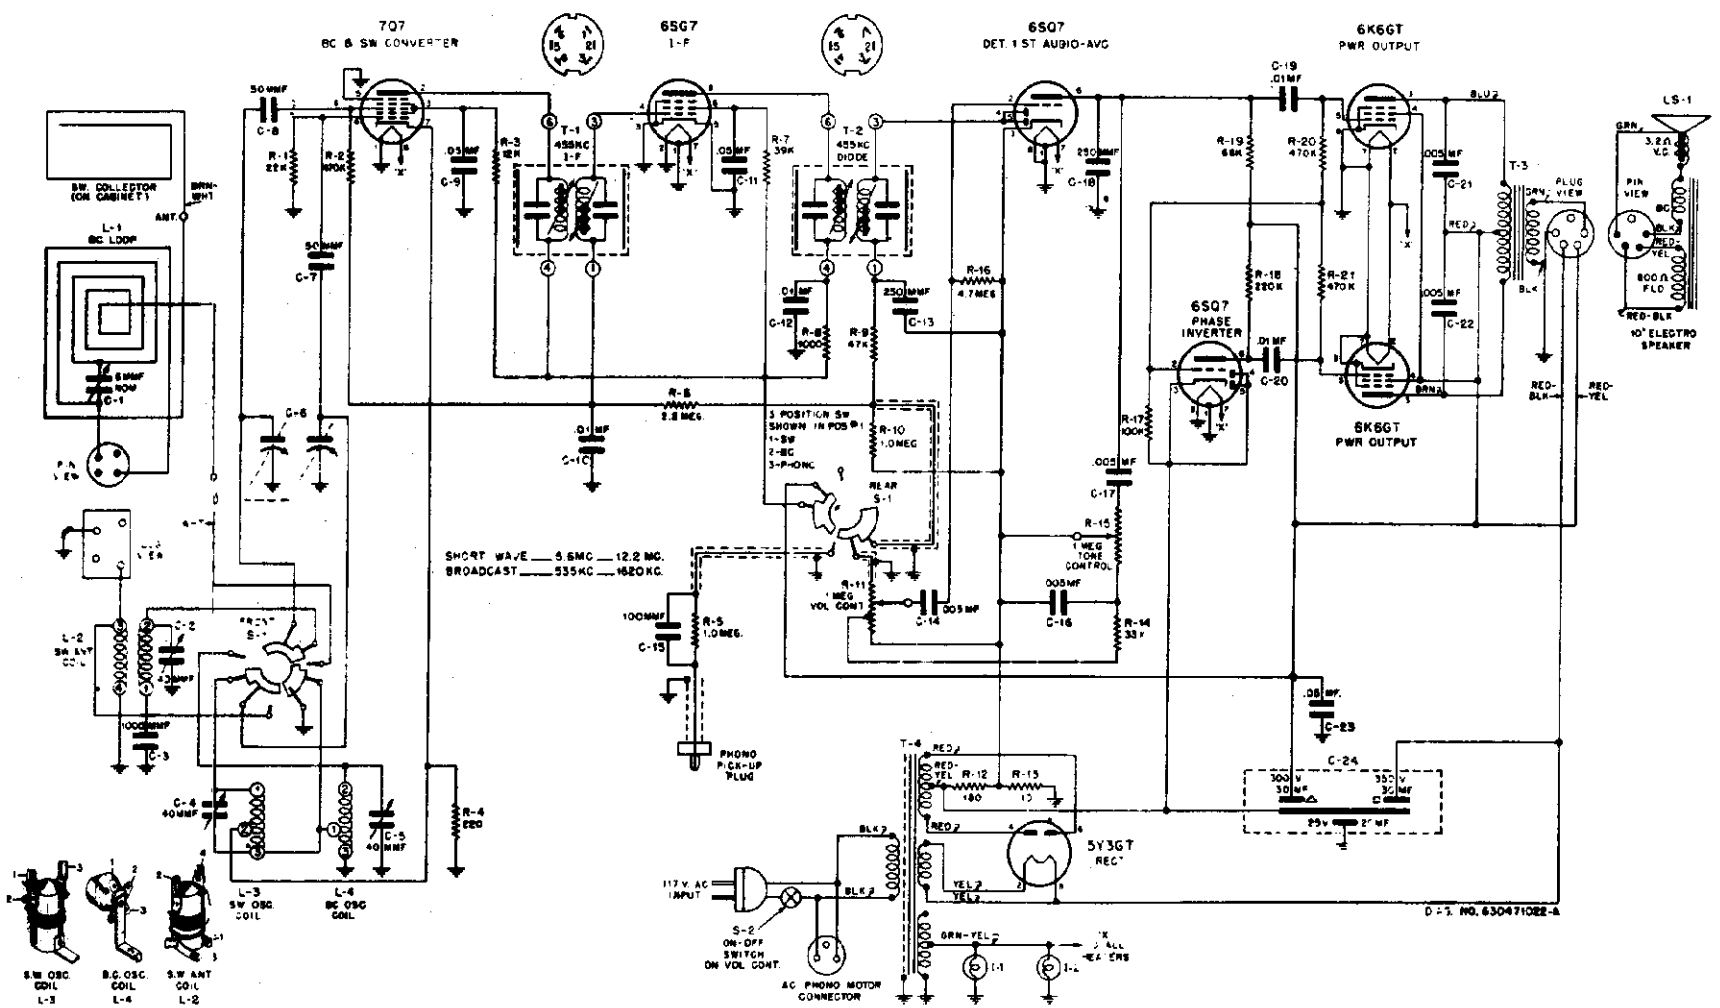
31	5S7708	Rivet: .122 x 9/32; steel; nkl pl (line cord lock mtg)
32	5A71246	Rivet, shoulder: .187" long; nkl pl
33	34B480127	Scale, dial: flexible tape
34	3S2974	Screw: 4-40 x 5/16; Phillips head machine screw; cad pl (speaker mtg)
35	3S7311	Screw: 5-40 x 7/8 slotted hex head machine screw; cad pl (rectifier mtg)
36	3S2695	Screw: #6 x 3/16 PKZ plain hex head sheet metal screw; cad pl (slider switch mtg and knob shaft bracket mtg)
37	4S3376	Screw: #6 x 1/4 PKZ slotted hex head sheet metal screw; cad pl (handle assembly mtg & volume control bracket mtg)
38	3S7506	Screw: #6 x 1/4 PKZ plain hex head sheet metal screw steel; cad pl (osc coil mtg)
39	3S2294	Screw: 6-32 x 1/2 plain hex head binding type machine screw; cad pl (gang)
40	3S7113	Setscrew: 8-32 x 1/4 slab head machine screw; (gang pulley mtg)
41	3S2654	Setscrew: 8-32 x 3/8 Allenhead; cad pl (scale tape pulley retainer)
42	47A480113	Shaft, idler pulley
43	47A480124	Shaft, volume and tuning
44	2B70107	Shield, coil (for T-1)
45	1A71049	Shield and Sleeve Assembly (for T-2 & T-3)
46	9A472534	Socket, tube: miniature 7-prong
47	41A480151	Spring, knob retainer
48	41A14244	Spring, tension coil (dial drive)
49	31A84796	Strip, terminal: 2 insulated lugs, #1 mtg
50	29R5419	Terminal, plain pin: small
51	29A5400	Terminal, plain pin: large
52	4K24124	Washer "C": shaft retainer
53	4S1719	Washer: 3/8 x .140 x .030 (line cord lock mtg)



TYPE - 7 tube combination AM radio-phonograph with loop antenna.

TUBE COMPLEMENT - 7Q7 BC and SW Converter, 6SG7 IF Amplifier, 6SQ7 Det-AVC-1st audio. 6SQ7 Phase Inverter, (2) 6K6GT Power Output and 5Y3GT Rectifier.

POWER SUPPLY - 117 Volts - AC, 60 cycles; 110 watts.

TUNING RANGE - 2 Bands BC 535-1620 Kc. **IF FREQUENCY** - 455 Kc
SW 5.6-12.2 Mc.

MODEL 75F21, CHASSIS HS-91 MOTOROLA INC.

ALIGNMENT

Refer to Figure 2 for location of adjustment trimmers and cores. Connect a low range output meter across speaker voice coil. Volume control should be set at maximum for all operations.

The signal generator used, should possess good frequency stability and should be of the modulated type. For greatest accuracy, keep the receiver output at approximately 50 milliwatts (.38V on output meter) during alignment. Vary signal generator output (not receiver volume control) to maintain this output during alignment.

Step	Gang Setting	Band	Dummy	Generator Connected to	Generator Frequency	Trimmer or Core	Remarks
1	Fully opened	B.C	.1mf	Conv. grid & chassis.	455 kc	1, 2, 3, &4	Adjust I.F. & Diode trans. for maximum
2	Fully opened	B.C	-	Radiation loop*	1620 kc	5	This sets osc. to dial scale.
3	1400 KC	B.C	-	Radiation loop*	1400 kc	6 ‡	Tune signal generator for max. on output meter, then peak trimmer.
4	12.2 MC	SW	50mmf	Short wave antenna terminal	12.2 Mc	7	This sets oscillator to dial scale.
5	11.5 MC	SW	50mmf	Short wave antenna terminal	11.5 Mc	8	Tune signal generator for max. on output meter, then peak trimmer.

‡ Repeak after chassis and loop are installed in cabinet.

* Connect output of signal generator to a 5" diameter, 3 turn loop. With volume on full, bring loop close enough to receiver until output of 50 milliwatts is obtained. (.38V on output meter). Vary distance between generator and receiver loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

MECHANICAL PARTS

REF. NO.	PART NO.	DESCRIPTION
CHASSIS PARTS		
	11M8944	Cord dial: 18 lb. black
	30K21859	Cord line: 9 ft. long; with plug
	1X77397	Dial Bracket & Slider Assembly; complete includes dial brackets, pullies, pulley mounting brackets, slider rail and pointer slider (does not include dial scale and pointer)
	37K15125	Grommet, rubber, gang cushion
	1X76402	Lead Assembly, phono-pick-up; includes 1 pin plug; 42" long
	1X76404	Lead Assembly, speaker: includes receptacle
	32A24815	Lock, line cord: fibre
	9A12706	Plate, electrolytic capacitor mtg; bakelite
	28K71775	Plug, 1 pin (on phono pick-up lead)
	28K19871	Plug, 4 pin (antenna loop)
	52A71280	Pointer, dial
	49A23960	Pulley, cord: 1/4" groove (cord guide)
	49A21741	Pulley, cord: 5/8" groove (cord guide)
	9A30680	Receptacle: 3 prong (on phono-motor lead)
	9K28049	Receptacle, 4 prong: bakelite (loop antenna receptacle
	1X76352	Shaft Assembly, tuning
	1A71049	Shield & Iron Core Sleeve Assembly: (for IF and Diode transformers)
	9A74416	Socket, pilot light; with mtg. bracket
	9A6788	Socket, tube; octal; plain
	9A70165	Socket, tube: octal; shielded type
	9A70519	Socket, tube: loctal
	41A21332	Spring, tension coil (pointer cord)
	32A27678	Strip, shaft bearing: fibre (for band-switch shaft)
	31A14655	Strip, terminal: 3 insulated lugs; #3 mtg.
	31A75233	Strip, terminal: 7 insulated lugs; #1 & #9 mtg.
	9K14906	Wafer, insulating: armite (electrolytic capacitor insulating)
MISCELLANEOUS CHASSIS HARDWARE		
	5A12105	Eyelet, gang assembly mtg.
	4S7855	Lockwasher: 3/8" internal; cadmium plated (band switch mounting)
	2S1376	Nut: 3/8-32 x 1/2" hex; cadmium plated (band switch mounting)
	2S7051	Nut: 3/8-32 x 9/16" hex Palnut; cadmium plated (volume & tone control mtg)
	5A12814	Rivet, shoulder: 5/32" long; nickel plated (cord pulley mtg)
	3S7481	Screw: #8 x 3/4 PKZ slotted hex head; cadmium plated (gang assem. mtg)
CHASSIS MOUNTING PARTS		
	5A71092	Grommet, rubber: 5/8 x 3/4" diam. (chassis cushion)
	5A71130	Grommet, rubber (chassis retainer)
	5A70098	Eyelet: 25/64 x 7/32 I.D. x 1/2 diameter head
	3S3359	Screw: #8 x 1-5/8 PKA slotted hex head sheet metal screw; cadmium plated
CABINET PARTS		
	16F75821	Cabinet, phono-radio console

ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

STEP **OPERATION**

455 Kc IF Channel Alignment

1. Same as step 1 in Chart I (Use AM signal generator)

Broadcast Band Alignment

2. Same as steps 2 & 3 in Chart I (Use AM signal generator)

SW Band Alignment

3. Same as steps 4 & 5 in Chart I (Use AM signal generator)

4.3 Mc IF Channel Alignment Using FM Signal Generator & Oscilloscope

4. (A) Discriminator -

   1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the re ceiver volume control and the chassis.

   2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input t the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 9 (This phase shifting network may not work with every oscilloscope. Different values of R & may be required).

   3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .01 mf capacitor to the control gr (pin #4) of the 7W7 tube in the second IF amplifier stage.

   4. Screw discriminator secondary core (9) out as far as it will go.

   5. Adjust discriminator primary until the pattern obtained on the scope is symmetrical about th vertical axis. The phase shifting network resistor is adjusted to give only one trace. Th pattern obtained is the resonance curve of the primary, whose maximum response should be a exactly 4.3 Mc. (See Figure 10).

   6. Adjust discriminator secondary until a symmetrical pattern is obtained, with peaks occurrin at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trac should pass through the intersection of the vertical and horizontal axis. The phase shiftin network should be adjusted to give only a single pattern at all times. (See Figure 11).

(B) 4.3 Mc IF Amplifiers -

   1. Apply an FM 4.3 signal (100 Kc deviation) to the control grid (pin #4) of the 6SG7 tube in th 1st IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondar cores (11 & 12) to get a symmetrical pattern as before, with peaks occurring at a slightl lower deviation.

   2. Apply an FM 4.3 signal (100 Kc deviation) to the control grid (pin #1) of the 7F8 tube, an adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantiall linear between peaks, is obtained.

FM Band Alignment

5. Check the position of the FM oscillator tuning core (18). Set the spacing between the core and the ba lite piece to which it is mounted, to 1/32" by turning tuning core slotted nut.

MODELS 75F31, 75F31A, 75F31B, 76F31, CHASSIS HS-36, HS-36A, HS-98 MOTOROLA INC.

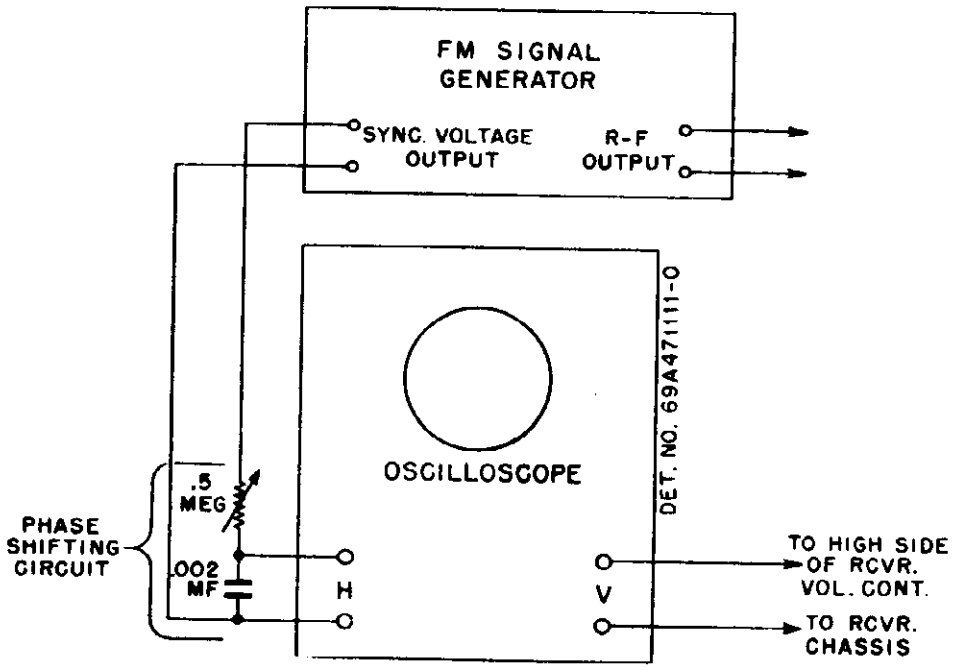
6. Remove the FM loop and connect generator output directly to the receiver FM loop receptacle.

7. Set receiver dial to 90 Mc and also FM signal generator to 90 Mc. (22-1/2 Kc deviation). Adjust FM oscillator, antenna and variable IF trimmers (15, 16 & 17) for maximum indication on output meter. (Output meter should be connected across speaker voice coil).

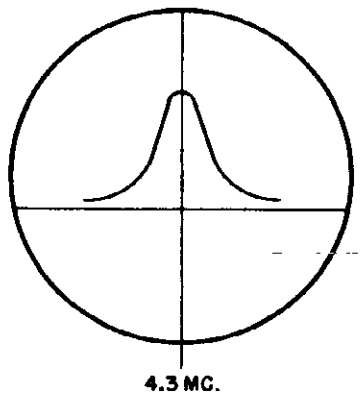
8. Set receiver dial to 105 Mc and also FM signal generator to 105 Mc (22-1/2 Kc deviation). Adjust FM oscillator, antenna and variable IF Cores (18, 19 & 20) for maximum indication on output meter.

9. Repeat steps 7 & 8 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e. trimmers 15, 16 & 17 at 105 Mc).

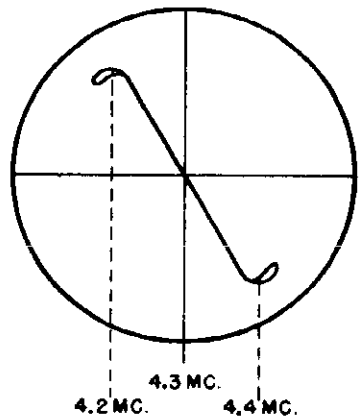
10. Connect FM loop antenna to receiver receptacle. Radiate an FM 105 Mc (22-1/2 Kc deviation) signal into FM loop. Set receiver dial to 105 Mc and adjust trimmer (17) for maximum.



SIGNAL GENERATOR & OSCILLOSCOPE HOOK-UP



PATTERN WITH DISCRIMINATOR PRIMARY (10) CORRECTLY ADJUSTED



PATTERN WITH DISCRIMINATOR SECONDARY (9) CORRECTLY ADJUSTED.

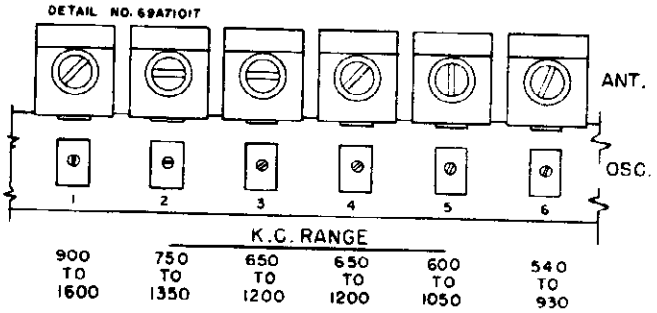
INSTRUCTIONS FOR SETTING PUSH BUTTONS

NOTE: Only standard broadcast stations can be set up on pushbuttons.

1. Turn the radio "on" and allow it to warm up for at least fifteen minutes.
2. Make a list of the frequencies of the nearby stations you wish to tune in automatically. It is recommended that you select the most powerful stations.
3. Turn the band switch to "BC" position and carefully tune in the first station to be set up.
4. Adjust a signal generator to zero beat with this station. **NOTE:** While it is advisable to use a signal generator for accuracy, it is not an absolute necessity.
5. Turn the band switch to "PB" position.
6. Push the button to be set up, making sure select a button having the proper freque range to include the station you are setti
7. The tuner adjustment screws are accessible f the back of the radio.
8. Adjust the oscillator screw until the sig from the generator, or station is heard, ca fully adjust the screw to maximum volume.
9. Now adjust the antenna trimmer screw for ma mum volume.
10. Follow the same procedure for the remaini buttons.
11. It is advisable, after all buttons are set u to repeat steps 6, 8 and 9 for maximum perfo mance.



PUSH BUTTON TUNER ADJUSTMENTS

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE RECEIVER ALIGNMENT.

An AM (amplitude modulated) signal generator covering the frequencies shown in alignment chart, is used to align the broadcast, short wave and FM bands. A low range output meter, connected across the speaker voice coil is used as an output indicator.

The broadcast and short wave alignment is conventional; full instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the discriminator does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the discriminator secondary and leave it that way until a of the FM circuits have been aligned. After co pleting the alignment of the FM circuits, proceed align the discriminator secondary by applying 4.3 Mc AM signal to the control grid of the 7 2nd FM converter tube and adjusting the discrim nator secondary core for minimum audio output. adjustment of the FM circuits should be attempt with AM after the discriminator secondary has be properly aligned.

Use a 30% AM (amplitude modulated) sign throughout entire alignment procedure.

A special wrench for adjusting the slott nuts on the tuner cores will be required. You c easily fabricate one from a Motorola auto se Volume Control Shaft and Coupling Assembly (Pa No. 1B70847, $.30 list) by simply spreading out t forked ends and filing to fit. Solder the assemb together to make it rigid.

Use an insulated screwdriver when adjusting the FM tuner trimmers.

FM-BC TUNER PT-10

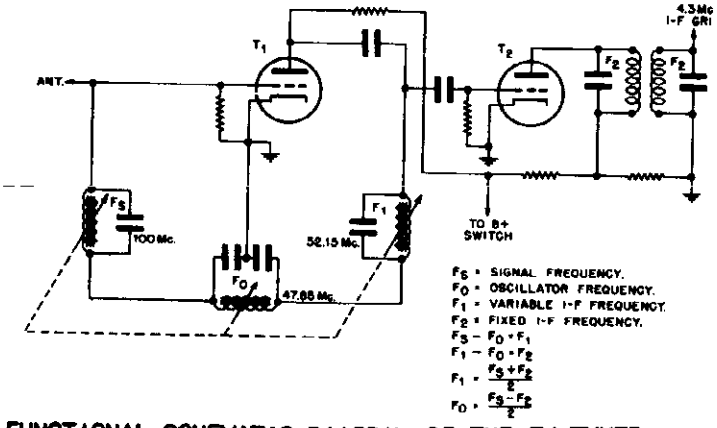
THEORY OF THE FM TUNER

Referring to the functional schematic diagram in Fig. 21, the triode T1 serves both as an oscillator and first converter, and triode T2 serves as the second converter. Oscillator voltage injection for the second converter is obtained through the coupling capacitor from the plate of T1. T1 and T2 are sections of the 7F8 twin-triode tube.

The frequency relationships are given in Fig. 21. The oscillator F_0 beats with the incoming signal F_s to produce the first intermediate frequency F_1, which is variable. F_1 then beats with the same oscillator frequency F_0 in the second converter to produce the second intermediate frequency F_2 which is 4.3 mc. With a 100 mc signal the oscillator frequency is 47.85 mc and the variable intermediate frequency is 52.15 mc.

This system of reception permits the oscillator to be resonated with a high capacitance, 250 micromicrofarads in this case. Consequently, changes in the tube characteristics during warm-up do not produce objectionable changes in oscillator frequency. This contributes materially to the stability of the system.



FUNCTIONAL SCHEMATIC DIAGRAM OF THE FM TUNER

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator output to B- instead of the receiver chassis.

If set oscillates when aligning the broadcast band, connect receiver B- to receiver chassis. **CAUTION: Don't forget to disconnect B- from receiver chassis after alignment.**

Use an insulated wrench when adjusting the FM tuner trimmers. Order Motorola FM Alignment wrench part number 66A471864.

A special wrench for adjusting the slotted nuts on the tuner cores will be required also. You can easily fabricate one from a Motorola auto set Volume Control Shaft and Coupling Assembly (Part Number 1B70847, $.30 list) by simply spreading out the forked ends and filing to fit. Solder the assembly together to make it rigid.

COMPLETE ALIGNMENT PROCEDURE USING AM SIGNAL GENERATOR

An AM (30% amplitude modulated) signal generator covering the frequencies shown in alignment Chart I, is used to align the broadcast and FM bands. A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The broadcast alignment is conventional; instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the discriminator does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the discriminator secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of the FM circuits, proceed to align the discriminator secondary by applying a 4.3 Mc AM signal to the control grid (pin #7) of the 2nd FM converter tube and adjusting the discriminator secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the discriminator secondary has been properly aligned.

ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE RECEIVER ALIGNMENT

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
455 Kc IF CHANNEL ALIGNMENT							
1.	1620 Kc	BC	.1 mf	12BE6 (V-2) BC Conv. Grid (Pin #1)	455 Kc	1,2,3 & 4	Adjust for maximum output.
BROADCAST BAND ALIGNMENT							
2.	1620 Kc (gang fully opened)	BC	.1 mf	12BE6(V-2) BC Conv. Grid (Pin #1)	1620 Kc	5	This sets oscillator to dial. (Calibrate pointer by fully closing gang and noting position of pointer slider. Pointer slider should be in line with right hand hole in dial background bracket as shown in Figure 7.)
3.	1400 Kc	BC	None	Radiation loop*	1400 Kc	6	Tune in signal with receiver tuning knob, then peak trimmer 6.
4.3 Mc IF CHANNEL ALIGNMENT							
4.	-	-	-	-	-	7	Detune discriminator secondary by screwing core out as far as it will go.
5.	(extreme high frequency end)	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (#7 Pin)	4.3 Mc	8,9,10,11, 12, 13 & 14	Adjust for maximum output.
FM BAND ALIGNMENT							
6.	-	-	-	-	-	15	Check the position of the FM Osc. tuning core 15. Set spacing between the core and bakelite piece to which it is mounted, to two turns from tight by turning tuning core slotted nut.

MOTOROLA INC. MODELS 77XM21, 77XM22, 77XM23
CHASSIS HS-102

ALIGNMENT (cont'd)

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
7.	98 Mc	FM	None	FM Ant. terminal	98 Mc	18	Tuner is set to 98 Mc by moving cores out with tuning shaft until spacing between bakelite pieces is 1-9/32". See illustration. Peak 18 for maximum output
8.	90 Mc	FM	None	FM Ant. terminal	90 Mc	19 & 20	Tune in signal with receiver tuning knob, then adjust 19 and 20 for maximum output.
9.	105 Mc	FM	None	FM Ant. terminal	105 Mc	16 & 17	Tune in signal with receiver tuning knob, then adjust 16 and 17 for maximum output.
10.	-	-	-	-	-	-	Repeat steps 8 & 9 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., trimmers 19 & 20 at 105 Mc.)
11.	105 Mc	FM	None	Radiate signal (or use station after performing Step 12)	105 Mc	19	Adjust for maximum output with built-in antenna connected.
ALIGN DISCRIMINATOR SECONDARY							
12.	-	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (Pin #7)	4.3 Mc	7	Adjust discriminator secondary for minimum response. The correct adjustment is sharply defined minimum response point between the two peaks.

* Connect output of signal generator to a 5" diameter, 3 turn loop and radiate signal into receiver loop. Minimum distance between loops should never be less than 12".

ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

STEP OPERATION

455 Kc IF Channel Alignment

1. Same as Step 1 in Chart I (Use AM signal generator)

Broadcast Band Alignment

2. Same as Steps 2 & 3 in Chart I (Use AM signal generator)

4.3 Mc IF Channel Alignment-Use FM Signal Generator & Oscilloscope

3. (A) Discriminator

1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and B-.

2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 5. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required.

3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .001 mf capacitor to the control grid (pin #1) of tube V-4 in the third FM IF Amplifier stage.

4. Adjust discriminator primary (8) for maximum amplitude. The phase shifting network resistor is adjusted to give only one trace.

5. Adjust discriminator secondary (7) until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. See Figure 6. It will be necessary to go over discriminator primary (8) and secondary (7) adjustments several times before a pattern of maximum amplitude and correct symmetry is obtained.

(B) 4.3 Mc IF Amplifiers

1. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-3 in the 2nd FM IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (9 & 10) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.

2. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-2 and adjust both primary and secondary cores (11 & 12) until a symmetrical pattern substantially linear between peaks, is obtained.

3. Apply an FM 4.3 Mc signal (100 Kc deviation) to the FM antenna terminal and adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantially linear between peaks, is obtained.

FM Band Alignment - Use FM Signal Generator & Output Meter

4. Check the position of the FM oscillator tuning core (15). Set the spacing between the core and the bakelite piece to two turns from tight by turning tuning core slotted nut.

5. Connect generator output directly to the receiver FM antenna terminal.

6. Set receiver tuner to 98 Mc by moving cores out with tuning shaft until spacing between bakelite pieces is 1-9/32". See Figure 4. Also set FM signal generator to 98 Mc. (22-1/2 Kc deviation). Adjust FM oscillator trimmer (18) for maximum output.

7. Set FM signal generator to 90 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust FM variable IF & FM antenna trimmers (19 & 20) for maximum output.

8. Set FM signal generator to 105 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust variable IF and antenna cores (16 & 17) for maximum indication on output meter.

   Repeat steps 7 & 8 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., trimmers 19 & 20 at 105 Mc.)

9. Close FM antenna link on loop panel. Radiate an FM 105 Mc (22-1/2 Kc deviation) signal into FM antenna (line cord). Tune in signal with receiver tuning knob and then repeak FM antenna trimmer (19).

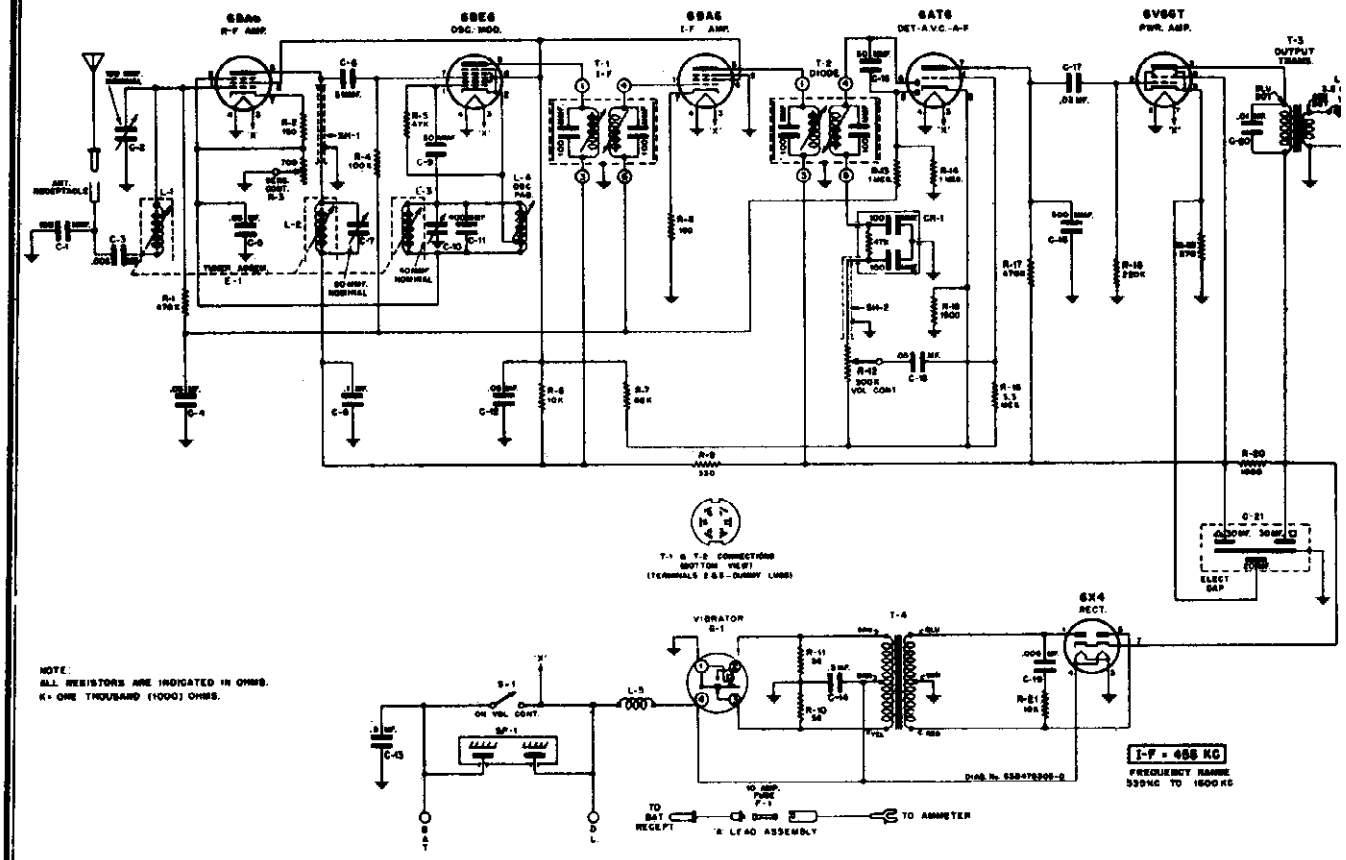
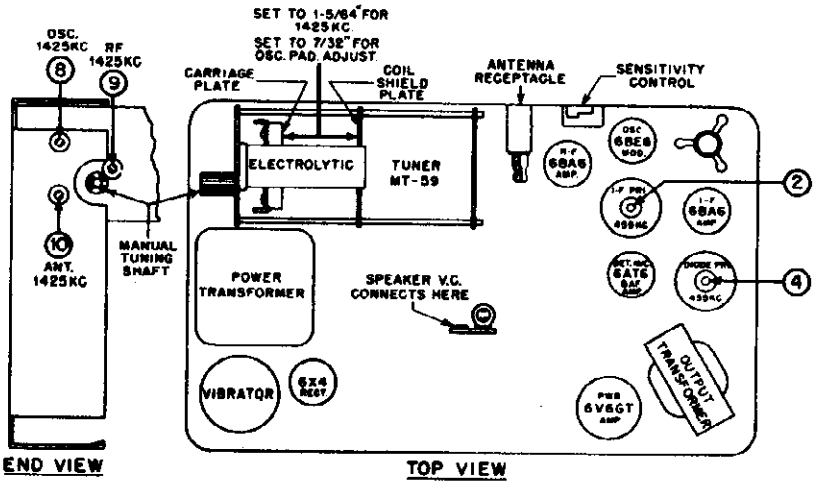
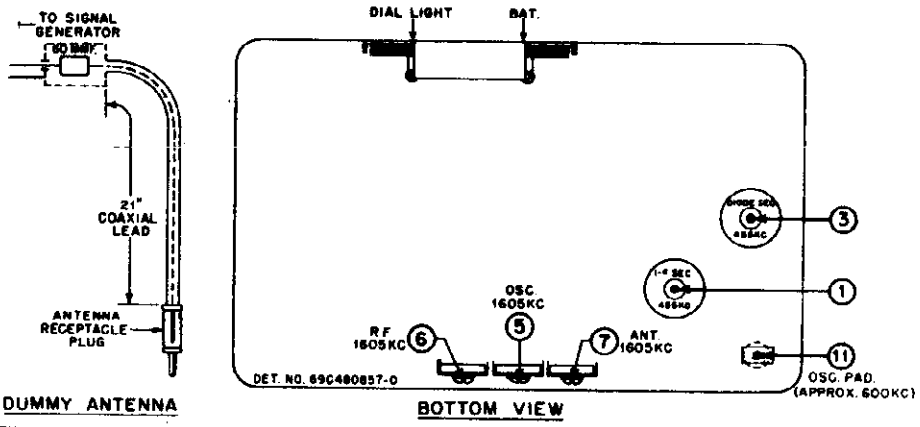
MOTOROLA INC.



NOTE:
ALL RESISTORS ARE INDICATED IN OHMS.
K = ONE THOUSAND (1000) OHMS.





ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.
2. A small screwdriver for IF & RF alignment.
3. An accurately calibrated AM modulated signal generator.
4. A low range output meter.
5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antenna.

PROCEDURE

1. Remove the front and rear housings. All adjustments are now exposed.
2. Connect a PM speaker (3.2 ohm VC) to VC terminal and chassis of receiver and connect the output meter across the voice coil. If the receiver internal speaker is used, ground receiver front housing to chassis.
3. Connect a 6 volt storage battery to chassis and BATT terminal of receiver; turn receiver on and allow it to warm up for a few minutes. Set receiver volume control at maximum.
4. SENSITIVITY CONTROL - This control must be set to provide 2 ± 1/2 volts bias on the RF tubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.
5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.
6. IF ALIGNMENT
   A. Connect high side of signal generator through .1 mf capacitor to 6BE6 grid (pin #7) and the low side to chassis. Set generator to 455 Kc and peak adjustments (1, 2, 3 & 4), in this order, for maximum output.
   B. Check alignment by repeating procedure.
7. RF ALIGNMENT
   A. Connect signal generator to antenna receptacle through special dummy antenna (60 mmf capacitor in series with 21" coax lead).
   B. Move carriage plate (by turning manual tuning shaft) to extreme high frequency position and screw coil cores out so that at least 1-1/8" of all three cores shall be outside of the coil shield can. Set signal generator to 1605 Kc and peak trimmers (5, 6 and 7), in this order.
   C. Move the carriage plate (by turning manual shaft) so carriage plate is spaced exactly 1-5/64" from coil shield plate. Set signal generator to 1425 Kc and adjust coil cores (8, 9 & 10), in this order, for maximum output.
   D. Move carriage plate (by turning manual tuning shaft) so carriage plate is spaced approximately 7/32" from coil shield plate. Leave signal generator connected but turn signal generator power off. Peak oscillator padder core (11) for maximum noise. If the padder core must be moved more than 1/2 turn from its original position, the carriage plate should be moved to extreme high frequency position, the coil cores (8, 9 & 10) should be screwed out so that 1-1/8" of each core is exposed and steps 7A, B, C & D repeated until it is necessary to move the padder core less than 1/2 turn in this step.

IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.

8. SETTING THE SENSITIVITY CONTROL - After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).
9. ANTENNA TRIMMER ADJUSTMENT - Once steps 7A, B, C, D & 8 have been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

MODEL 408

HOUSING PARTS

13D472890	Escutcheon (complete) .....
1X472751	Housing, front: includes 2 grounding wipers; less escutcheon .....
15D472547	Housing, rear .....
5S7730	Rivet: .122 x 1/8 steel; antique copper finish (grounding wiper mtg) .....
3S3394	Screw: #8 x 1/4 slotted hex head thread cutting type: cad. pl. (escutch.mtg) ..
3S7456	Screw: #8 x 1/4 PKA slotted acorn head sheet metal screw; antique copper finish (housing screws) .....
3S2696	Screw: #10 x 3/8 PKA plain hex washer head sheet metal screw; cad. pl. (spkr.mtg)
39K470032	Wiper, grounding .....

ACCESSORIES

3A51494	Bolt, "J" (receiver mtg) .....
8A4491	Capacitor, generator .....
1X74340	Lead Assembly, dial light: complete with bulb
9B473111	Lead Assembly, fuse: complete with 10 amp fuse
4S7653	Lockwasher: 5/16 int-ext; cadmium plated (receiver mtg) .....
3S2863	Nut: 5/16-18 x 9/16 hex; cad.pl (receiver mounting) .....
1K75148	Shaft, flexible: with hsng; 24" long ...
6X4141	Suppressor, distributor .....

6X4141	Suppressor, distributor .....

*Part of Tuner ST-60

SECTION 1. DESCRIPTION

1-1. *General*

The NC-57 is a superhetrodyne Radio Receiver, having a complement of seven tubes plus a voltage regulator and rectifier, with a continuous frequency coverage of from 540 kilocycles to 55 megacycles. This Receiver is designed to provide reception of amplitude modulated voice or music and code telegraph signals throughout its entire frequency range. Operational controls mounted on the front panel are held to a minimum consistent with good operation and full utilization of the circuit features contained in the NC-57. The separate bandspread control knob and dial scale makes possible fine, vernier-type tuning for any portion of the frequency spectrum covered by the Receiver. The usefulness of this feature will be outstanding on crowded bands such as the amateur or foreign broadcast bands. The NC-57 employes a voltage regulator tube to assure a high order of stability in the high frequency and beat frequency oscillator circuits.

1-2. *Circuit*

A stage outline of the circuit employed in the NC-57 is given below together with the tube associated with each stage.

R.F. Amplifier.....6SG7
Converter.....6SB7-Y
First I.F. Amplifier.....6SG7
Second I.F. Amplifier.....6SG7
Second Det. - A.V.C. - A.N.L.....6H6
First Audio - C.W.O.....6SN7GT/G
Audio Output.....6V6GT/G
Voltage Regulator.....OD3/VR-150
Rectifier.....5Y3GT/G

1-3. *Tuning System*

The three-gang main tuning capacitor, the panel-mounted Trimmer control and five sets of coils are used to tune the frequency range of the Receiver in five tuning bands as shown on the following table. The main tuning capacitor and bandspread capacitor are connected in parallel on all bands.

BAND	FREQUENCY COVERAGE
A	35.0 - 55.0 Mc.
B	13.5 - 35.0 Mc.
C	4.65 - 13.5 Mc.
D	1.6 - 4.65 Mc.
E	0.54 - 1.6 Mc.

It will be noted that Band E encompasses the entire Standard Broadcast Band.

The Amateur bands tuneable by the NC-57 are listed below with their respective receiver band locations and are spread on the bandspread dial by means of the bandspread capacitor approximately as follows:

BAND	AMATEUR BAND	FREQUENCY	DIVISIONS
A	6	50.0 - 54.0 Mc.	37
B	10, 11	27.16- 29.7 Mc.	44
	15	21.0 - 21.5 Mc.	28
	20	14.0 - 14.4 Mc.	65
C	40	7.0 - 7.3 Mc.	47
D	80	3.5 - 4.0 Mc.	60

The main dial has five scales accurately calibrated directly in megacycles. The respective scales are marked with heavy black scorings to clearly locate for the operator such short-wave features as the Amateur, Police and Foreign Broadcast bands. These locating markers are identified by letters AM, P and F, respectively.

1-4. *Audio Output*

Two audio output circuits are provided:

(1) The loudspeaker in the NC-57 is a 5 inch PM type capable of faithfully reproducing the ample audio volume delivered by the Receiver. An output transformer is mounted on the loudspeaker to match the impedance of the output tube.

(2) A Phones jack is mounted on the front panel and is wired so as to silence the loudspeaker when headphones are used. The headphone load impedance is not critical permitting a wide range of headphones types, including crystal, to be used.

1-5. *Power Supply*

The NC-57 Receiver is designed for operation from a 105/130 volt, 50/60 cycle, source of supply. Normal power consumption is approximately 84 watts. The built-in power supply provides all voltages required by the heater and B supply circuits - 2.7 amperes at 6.3 volts and 100 milliamperes at 250 volts, respectively.

The NC-57 is readily adaptable to battery operation and instructions for using batteries are given in detail in Section 2.

1-6. *Accessory Connector Socket*

An octal type socket is mounted at the rear of the NC-57 to permit convenient connection of external accessories. The Tuning Meter, SM-57, which is available for use with the NC-57, is fitted with a cable and plug to connect directly to this socket. Varied accessories such as a crystal calibrator or record player are readily connected to the socket. When a record player is connected to the NC-57, the R.F. GAIN control should be set at the extreme counterclockwise position. The drawing of the Accessory Connector Socket on the Schematic Diagram shows the various connections made to the pins of the socket and the voltages available. As will be noted B plus and filament voltages are available at pins 2 and 3, respectively.

SECTION 2. INSTALLATION

2-1. *Installation Procedure*

Carefully unpack the Receiver from its packing crate and procede as follows:

(1) Make sure A.C. jumper plug, P-1, (at rear of Receiver) and all tubes are seated firmly in their sockets.

(2) Connect a good external ground to the terminal labeled G on the antenna ground strip at the rear of the Receiver. This connection is not absolutely required but in certain localities considerable reduction in interfering noise can be achieved by such a connection.

(3) Connect the antenna as recommended in Section 2-3.

(4) Connect the power cord, P-2, to a 105/130 volt, 50/60 cycle, A.C. source of supply.

(5) Set controls as recommended in Section 3 for the reception of signals.

NOTE

Where the Receiver is located in the field of a transmitting station, as would be the case when the NC-57 is used as the Receiver in a transmitting station, it is advisable to provide some means of preventing damage to the receiver antenna coil. If a separate receiving antenna is used, a means for disconnecting the antenna from the Receiver or grounding the antenna during transmission periods should be provided.

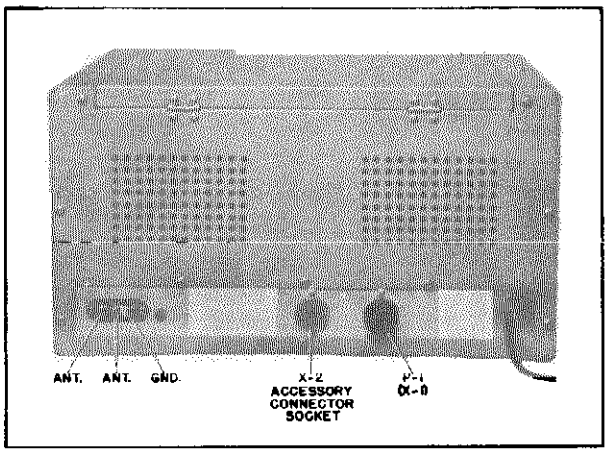

Figure No. 1. Rear View of Receiver

2-2. *Battery Operation*

The NC-57 Receiver is readily adaptable to portable or emergency service by connecting batteries to the terminals of the power socket, X-1, at the rear of the Receiver. The A.C. jumper plug, P-1, may be rewired for battery connection or if changeover operation is desired another octal plug should be obtained. Do not use the A.C. jumper plug, P-1, for battery operation without first removing the jumper wires. The battery plug used should be wired in accordance with the drawing shown on the schematic diagram. The voltage regulator tube should be removed during battery operation. A 6 volt heater supply (storage battery) should be connected to terminals 3 and 5 and 180 to 250 volt "B" supply connected to terminals 1 and 8. Current drain is approximately 70 milliamperes and 2.65 amperes at 180 and 6 volts, respectively. A suggested refinement is to include a switch in the A+ lead so that the tube heaters may be turned off when the Receiver is not in use without the necessity of removing the battery plug. The Send-Receive switch on the Receiver is operative with battery operation the same as for A.C. operation. The A.C. line switch on the front panel does not render the Receiver inoperative during battery operation.

The recommendations of Section 3, Operation, apply to the battery powered NC-57.

2-3. *Antenna Recommendations*

The antenna input circuit of the NC-57 is arranged for operation from either a single-wire type, doublet type antenna or other types having impedances of 70 ohms or more. The input impedance of the antenna circuit is approximately 300 ohms.

The most practical antenna for use in installations where the Receiver is to be used over a wide range of frequencies is the single-wire type. An antenna length of 50 to 100 feet is recommended although the length is not critical and any length between 25 and 200 feet may be used. In installations where the Receiver is tuned to one frequency or narrow band of frequencies optimum results will be obtained by designing the antenna for the operating frequency. In an installation where the Receiver is to be used as the receiving unit, in a transmitting station, the most efficient operation will usually result from use of the transmitting antenna as a receiving antenna also. For switching the antenna from transmitter to receiver, an antenna change-over relay with good high frequency insulation is recommended.

The method of connecting the various types of antennae to the antenna terminal strip at the rear of the Receiver is as follows:

(1) Single-wire type -- Connect antenna to terminal A at the left of the strip and ground the unused A terminal by means of the metal link.

(2) Doublet type -- Connect the antenna feeders to the two terminals marked A; the metal link is not used.

(3) Concentric transmission line type -- Connect the inner conductor to terminal A at the left of the strip and the outer conductor to the other A terminal which, in turn, should be connected to the metal link.

SECTION 3. OPERATION

3-1. *Controls*

This section on controls is presented prior to the actual operating instructions to give the operator of an NC-57 an understanding of the function of each control on the Receiver. All controls are clearly identified by front panel markings and are arranged in a manner to facilitate operation.

The R.F. GAIN control adjusts the sensitivity (ability to receive weak and distant stations) of the Receiver from a minimum at the extreme counterclockwise position of the knob to a maximum at the extreme clockwise position. This is accomplished by adjustment of the amplification of the R.F. and I.F. amplifier stages.

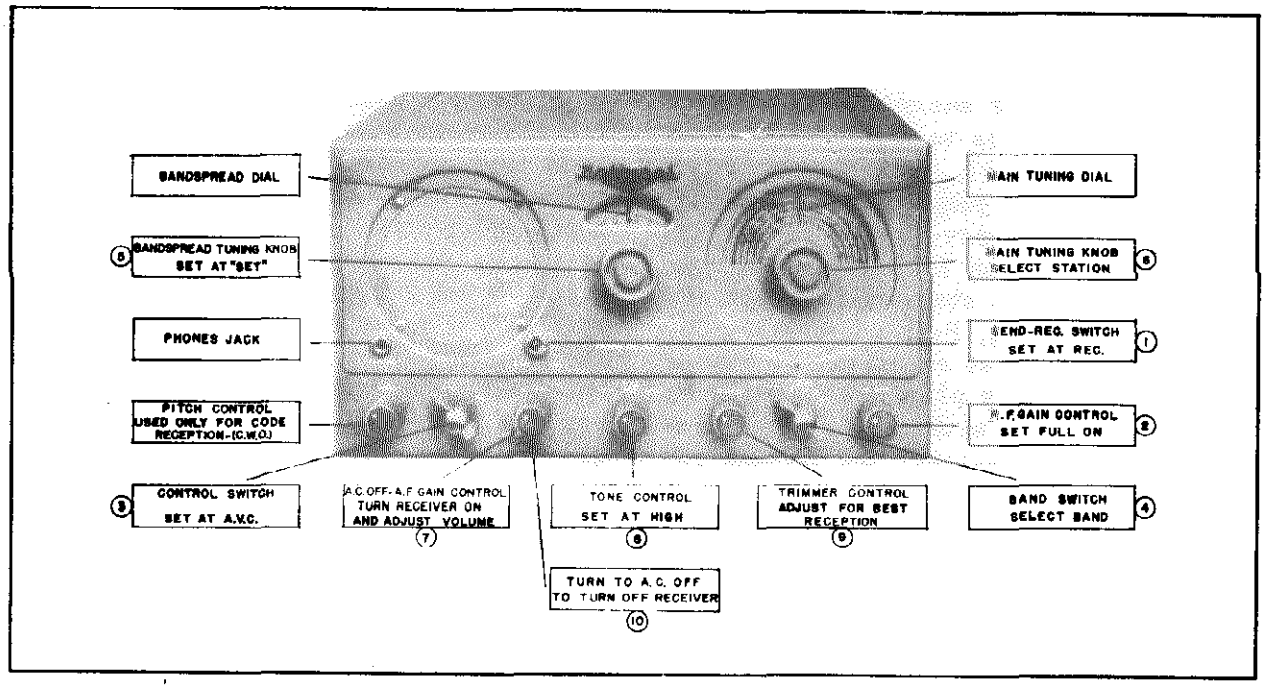

Figure No. 2. Simplified Operating Instructions

The BAND switch has five positions and serves to select the band of frequencies to be tuned by the Receiver. The five positions are marked with identifying band designations which correspond to the markings which appear on the main tuning dial.

The TRIMMER control operates a tuning capacitor trimmer which is connected across the first R.F. amplifier main tuning capacitor section. The trimmer control is used to tune the R.F. amplifier stage properly under a wide variety of antenna loading conditions.

The TONE control adjusts the tonal value of the audio output of the Receiver. The three positions select a tonal output as follows: High--normal receiver reproduction in which an average tonal output is achieved; Med--reproduction in which the higher tones are moderately attenuated; Low--in this position the higher tones are subdued emphasizing the lower tones.

The A.F. GAIN-A.C. OFF control is a dual purpose type. In the A.C. OFF position the Receiver is turned off; when the control knob is turned clockwise the A.C. line switch is closed, thus turning on the Receiver. The other function of this control is to adjust the audio output volume of the Receiver. Audio volume is progressively increased to a maximum when the knob is turned to the extreme clockwise position.

The control switch labeled C.W.O., M.V.C., A.V.C. and A.N.L. has four functions corresponding to the switch markings. In the A.V.C. position the automatic volume circuit is switched into the circuit to compensate for fluctuating volume due to fading. In the A.N.L. position the automatic noise limiter is switched on to effectively reduce interference caused by static, automobile ignition noise etc. Limiting action automatically takes place at a relatively high percentage modulation. The automatic volume control circuit remains operative in the A.N.L. position of the control switch. The M.V.C. position disables the A.V.C., C.W.O. and A.N.L. circuits. The C.W.O. position switches into the circuit the C.W. oscillator to permit reception of code telegraph signals.

The PITCH control is used in conjunction with the C.W.O. position of the control switch and has no effect on receiver performance with any other control switch setting. The PITCH control is used to adjust the beat note of the incoming code signal to an audio tone pleasing

to the operator. The C.W. oscillator is tuned to the Receiver's intermediate frequency mid-scale on the control knob. The range of the PITCH control is approximately ±3,000 cycles.

The SEND-RECEIVE switch is used to quiet the Receiver during transmission periods or other times when it is desirable to be able to resume reception immediately after a period of silence (i.e. not having to wait for the tubes to warm up). The SEND-RECEIVE switch should not be used to shut off the Receiver. The Receiver should be turned off by turning the A.F. GAIN control to A.C. OFF position. The function of the SEND-RECEIVE switch may be duplicated at an external (remote) position by connecting a switch or relay to terminals 5 and 8 of the A.C. jumper plug (P-1). This is a parallel arrangement permitting the panel-mounted SEND-RECEIVE switch to remain operative.

The main tuning control knob and dial scale are used to tune the frequency range of the Receiver. The band of frequencies tuned at any one time is determined by the BAND switch setting. To maintain correct calibration when using the main tuning knob the bandspread dial pointer must be at the "set" mark (located at 100 on the bandspread dial scale).

The bandspread control knob and dial scale are used to spread out over a wide range any small portion of the frequency range of the Receiver. Bandspread tuning is accomplished by setting the main tuning dial pointer at the high-frequency limit of the band of frequencies to be spread (for example: to tune the amateur 10 meter band set the pointer at 29.7 megacycles on the B band) and rotate the bandspread knob in a clockwise direction.

3-2. *Voice or Music Reception*

After the NC-57 Receiver is properly installed, as outlined in Section 2, it is placed in operation by adjusting the receiver controls as follows:

1. Set the SEND-RECEIVE switch at Receive.
2. Turn the R.F. GAIN control to the extreme clockwise position.
3. Set the control switch at A.V.C.
4. Set the BAND switch at the band of frequencies to be tuned. The Standard Broadcast Band is band E.
5. Set the bandspread dial pointer at the "Set" mark.
6. Set the main tuning dial pointer at the desired frequency.
7. Turn the A.F. GAIN-A.C. OFF control from the A.C. OFF position to the point providing the desired audio volume. Reset main tuning dial pointer if necessary.
8. Set the TONE control at High.
9. Set the TRIMMER control for maximum response. Maximum response is clearly indicated by use of the SM-57 Tuning Meter; the correct setting of the TRIMMER control is indicated by maximum deflection of SM-57 meter pointer. In order to secure a good aural indication of the correct TRIMMER setting, if the SM-57 is not used, it is recommended that the control switch be set at M.V.C. temporarily to adjust the TRIMMER control. In this case it may be necessary to retard the R.F. GAIN control if overload of the Receiver occurs, as will be indicated by excessive distortion. In the absence of signals the trimmer control may be "peaked" by setting it for maximum receiver background noise.

The settings given above are for the reception of signals of average strength. An improvement in the reception of exceptionally weak signals or signals accompanied by interfering noise pulses may be realized by modification of the above settings.

For improvement in the reception of weak signals set the control switch at M.V.C. and modify the other control settings as follows:

1. Set the A.F. GAIN control at approximately three-quarters rotation.
2. Adjust the audio volume by means of the R.F. GAIN control.

When a signal is accompanied by static peaks or noise pulses of high intensity and short duration, optimum noise-free reception will be had by setting the control switch at A.N.L. The resulting automatic limiting action will greatly reduce the interfering noise without noticeably affecting the signal. Best limiting action will be realized with the R.F. GAIN control.

fully advanced; the audio volume should be adjusted by means of the A.F. GAIN control. A further improvement in noise reduction will be realized by setting the TONE switch at Med. or Low depending on the degree of noise.

3-3. *Code Telegraphy Reception*

The adjustment of the receiver controls for code reception is the same as that for voice or music except for the following:

1. Set the control switch at C.W.O.
2. Set the A.F. GAIN control at three-quarters rotation.
3. Adjust the audio volume by means of the R.F. GAIN control.
4. Adjust the PITCH control to secure an audio tone pleasing to copy.

The action of the TONE control is the same as that described in Section 3-2.

SECTION 4. MAINTENANCE AND TEST DATA

4-1. *General Maintenance Data*

The NC-57 is designed and constructed to assure a long period of uninterrupted service. A few service hints are given below to aid in locating individual components which, due to age or weakness, cause faulty operation of the Receiver.

Vacuum tube failure may be evidenced by reduction in sensitivity, intermittent operation or an inoperative Receiver. Tubes may be checked in suitable tube testing equipment, or by replacement with tubes of proven quality. Care must be taken that tubes removed for checking are returned to their original sockets. Tubes of the same type will vary slightly in their individual characteristics and this fact should be borne in mind if replacement of the R.F. oscillator tube becomes necessary. A check of the dial calibration should be made if this tube is replaced to determine whether or not realignment is necessary.

Bypass or filter capacitors which become open may cause decreased sensitivity, oscillation, poor stability or complete failure of the Receiver. The defective unit can be located by temporarily connecting a good capacitor in parallel with each suspected capacitor. Leaky or short-circuited capacitors can be detected by an ohmmeter check; a zero resistance reading of the ohmmeter will indicate a shorted capacitor.

Defective resistors, sometimes caused by capacitor failure in associated circuits, can be definitely located by measuring the resistance of each resistor. The Schematic Diagram should be consulted to ascertain that any particular resistor under test is not connected in parallel with some other circuit element which might produce a false measurement. An overloaded resistor may be located by visual inspection if the surface of the resistor becomes scorched due to excessive heating.

4-2. *Dial Cord Replacement*

The dial cords used on the NC-57 are a twisted type with a tensile strength of 5 2 lbs. and will give enduring service. There are three separate lengths of cord used and if replacement of any one of the three becomes necessary it is not necessary to disassemble the other dial cords. Complete instructions for the stringing of the dial cords are given on the following drawing. The two cords driving the main tuning and bandspread tuning capacitors, respectively, can be strung from the top inside of the cabinet. It is, however, necessary to remove the cabinet from the chassis in order to string the dial cord which drives the bandspread dial. Instructions for removing the cabinet are as follows:

1. Remove the top and back piece of the cabinet by releasing the ten drive screws at the back which fasten the piece to the chassis and cabinet wrap around.
2. Remove the bottom cover of the Receiver which is held in place by four drive screws.
3. Remove the four mounting feet at the bottom of the Receiver. These feet are fastened by means of a screw and speed nut arrangement.
4. Unsolder the two loudspeaker leads to the output tube (6V6GT/G). A red lead

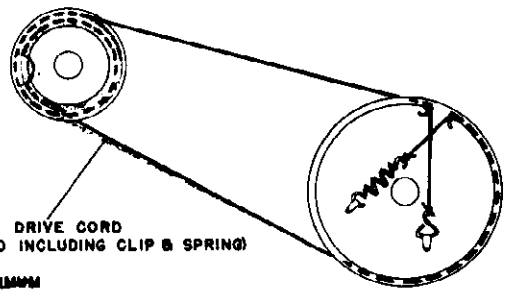
3. FASTEN SPRING END TO PULLEY

REAR VIEW OF DIAL ASSEMBLY



BANDSPREAD DIAL SCALE DRIVE CORD
LENGTH: 18 5/8" (MEASURED INCLUDING CLIP & SPRING)
STRING AS FOLLOWS:
1. SET CAPACITOR AT MINIMUM
2. FASTEN CLIP END TO PULLEY
3. SET SMALL PULLEY WITH CUTOUT AT TOP
4. WIND ONE TURN AROUND PULLEY & PASS CORD UNDER CUTOUT
5. SET DIAL AT SET MARK WITH COUNTERCLOCKWISE ROTATION
6. BRING CORD TO LARGE PULLEY & FASTEN SPRING END

FRONT VIEW OF BAND SPREAD DIAL DRIVE ASSEMBLY

Figure No. 3. Dial Cord Stringing Instructions

is soldered to pin 4 and a blue lead to pin 3.

5. Remove all knobs from the front of the Receiver. All knobs, with the exception of the main tuning and bandspread tuning knobs, are mounted on flatted shafts by clip springs. A notch in the knobs permits the insertion of a screwdriver, which, pressed on the spring releases the knob.

6. Remove the retaining nuts on the control switch, BAND switch, bandspread tuning control, main tuning control and the SEND-REC switch.

After completing the six steps above, the chassis can be withdrawn from the cabinet. After the dial cord has been strung, reassembly of the Receiver can be accomplished by following the disassembly procedure in reverse order.

4-3. *Voltage Tabulation*

The measurements of voltage shown on the following table are tabulated using a high-impedance vacuum tube voltmeter with a line voltage of 115 volts. The control settings to be observed are as follows:

1. R.F. GAIN full on. (extreme clockwise position)
2. BAND switch at E.
3. Main tuning dial pointer at 1.5 mc.
4. Control switch at M.V.C. except as noted.

All voltages are measured between specified terminal and chassis.

TUBE TERMINAL	PIN	VOLTS ±15%
R.F. Amp. Cathode	3&5	1.6
R.F. Amp. Screen	6	145

* Control Switch at A.N.L.
** Control Switch at C.W.O.

SECTION 5. ALIGNMENT DATA

5-1. *General*

The alignment of the NC-57 may be divided into two steps:

1. Intermediate Frequency Amplifier Alignment.
2. General Coverage Alignment.
   a. H.F. Oscillator
   b. First Detector and R.F. Amplifier.

The necessity for any realignment may be determined by checking the performance of the Receiver against its normal operation, as outlined in Section 3, and the dial calibration. It is recommended that, if tests indicate realignment is required, the instructions given in this section are thoroughly read and understood before realignment is attempted. For alignment purposes the Receiver should be set up as specified in Section 2-1 except that the antenna should be disconnected. An output meter with a resistive load of 8 ohms should be connected to the Phones jack on the front panel of the Receiver.

5-2. *I.F. Amplifier Alignment*

The intermediate frequency of the NC-57 Receiver is 455 kilocycles. The two I.F. transformers and the detector input transformer have permeability tuned iron-core inductors with screw adjustments for

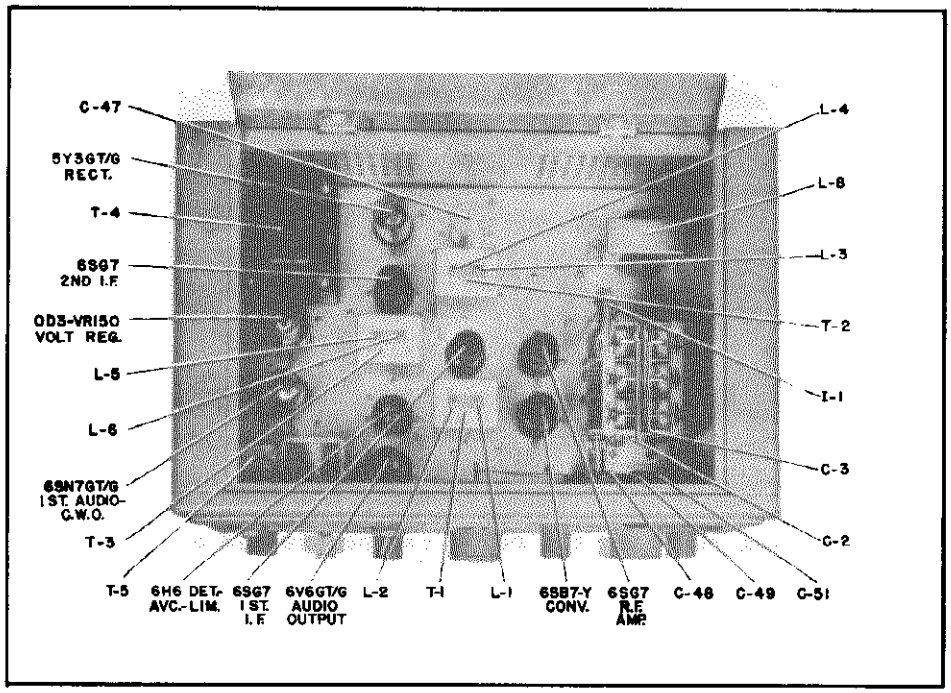

Figure No. 4. Top View of Receiver

alignment purposes. These adjustments are accessible from the top inside of the cabinet as shown on Figure No. 4.

The Alignment procedure is as follows:

1. Connect the "high" output lead of an accurately calibrated signal generator to the stator of the detector portion of the main tuning capacitor, C-2B, and the grounded lead to any convenient grounded point on the chassis. This is a direct connection, no dummy antenna being required. Set the signal generator at 455 kilocycles and turn the modulation on.

2. Set the control switch at M.V.C.

3. Set the R.F. GAIN control full on.

4. Set the TONE switch at High.

5. Set the A.F. GAIN full on.

6. Adjust the output attenuator of the signal generator to provide a signal of approximately 100 microvolts. While making I.F. amplifier adjustments, it will be necessary to retard the attenuator of the signal generator if I.F. amplifier gain increases to a point where overload occurs.

7. Adjust the I.F. tuned inductors L-1 through L-6 for maximum gain, as indicated on the output meter. The order in which these adjustments are made is not important.

At the conclusion of the I.F. amplifier alignment the tuning of the C.W. oscillator may be checked by turning the modulation of the signal generator off and setting the control switch at C.W.O. With this setting zero beat with the test signal should occur with the PITCH control set at mid-scale. If the above test indicates realignment of the C.W. oscillator is required procede as follows:

1. Remove the bottom cover of the Receiver.

2. Loosen the set screw on the collar of the C.W. oscillator transformer shaft.

3. Without loosening the PITCH control knob on its shaft withdraw the knob and shaft from the cabinet.

4. The screw driver adjustment on the C.W. oscillator inductor, L-7, will then be accessible through the shaft opening in the cabinet. Adjust L-7 for zero beat with the test signal.

5. Replace the PITCH control knob and shaft so that the white dot on the knob is at mid-scale.

6. Position the collar so that the set screw is directly opposite (180°) from the stop and tighten the set screw making

sure that the position of the PITCH control knob does not change from mid-scale.

5-3. *General Coverage Alignment*

General coverabe alignment and bandspread alignment are accomplished simultaneously, since the main tuning and bandspread tuning capacitors are connected in parallel on all bands. The Receiver should be set up as specified in Section 2-1 except that the antenna should be disconnected. Adjustment of the H.F. oscillator trimmers of the A, B and C bands can be made from the top inside of the cabinet as shown on Figure No. 4. All other trimmer and padder adjustments can be made through the holes in the bottom cover of the Receiver after removal of the small cover plate as shown on Figure No. 6. The preliminary alignment procedure is as follows:

1. Connect an accurate signal source (signal generator or crystal oscillator) to the antenna input terminals through a standard dummy antenna of 300 ohms.
2. Connect an output meter with a resistive load of 8 ohms to the Phones jack.
3. Set the control switch at M.V.C.
4. Turn the R.F. GAIN control to full on.
5. Set the bandspread dial at the set mark.

The Alignment Chart in this section outlines the procedure for alignment of the H.F. oscillator, first detector and R.F. amplifier stages.

(a) H.F. Oscillator

Care should be taken when aligning the H.F. oscillator of any band to insure that the oscillator is aligned to the fundamental frequency and not the image. This can be checked by tuning the Receiver to the image frequency. On the A and B bands the image should appear 910 kilocycles above the fundamental signal. On the C, D and E bands the image should appear 910 kilocycles below the fundamental signal. If the image does not appear at its correct setting the H. F. oscillator trimmer should be adjusted for the correct calibration.

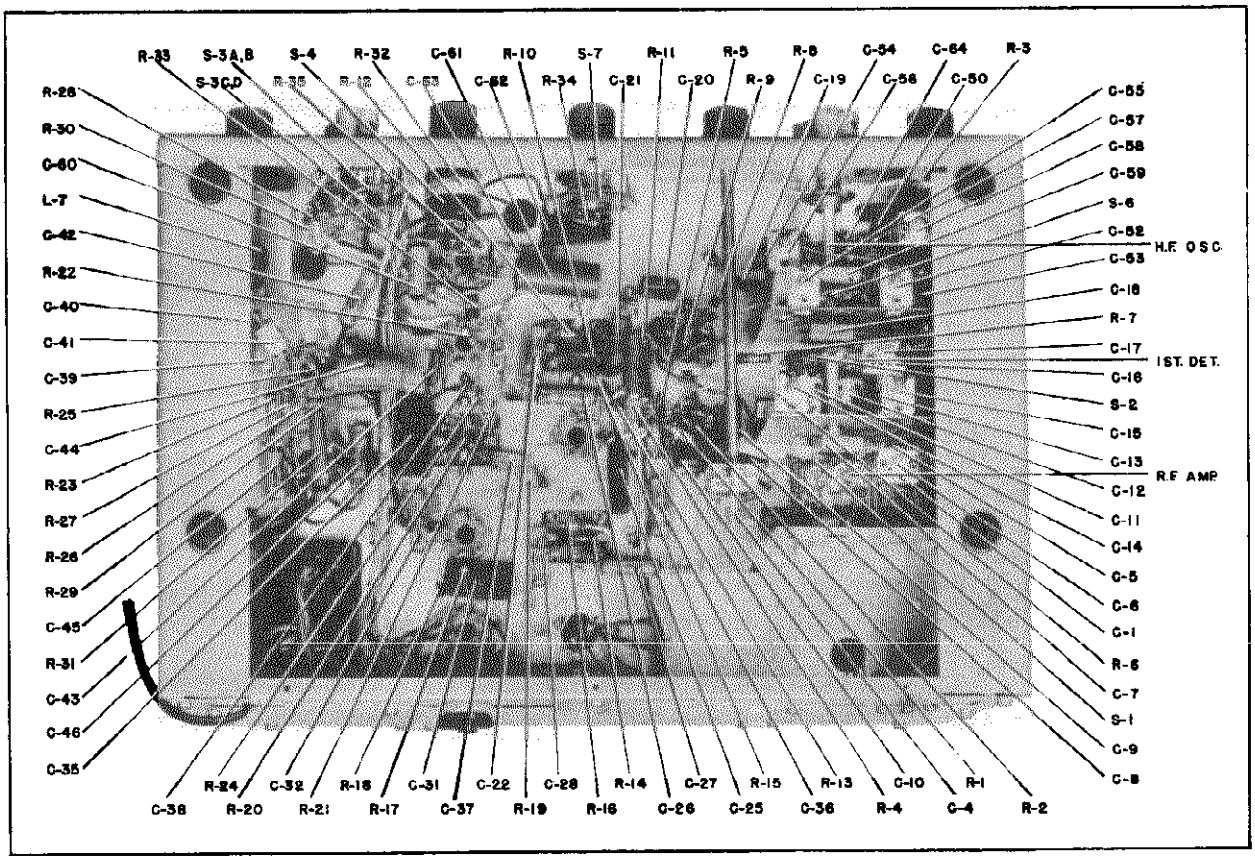

Figure No. 5. Bottom View of Receiver

Figure No. 6. Alignment Trimmer Locations

SECTION 6. SM-57 TUNING METER

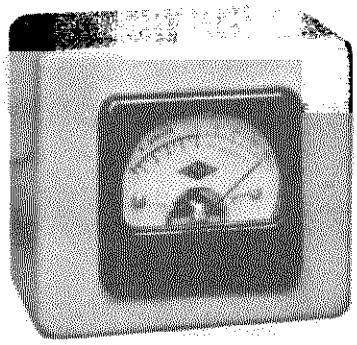

Figure No. 7. SM-57 Tuning Meter

6-1. *General*

The SM-57 Tuning Meter is available as an accessory for use with the NC-57 as a tuning indicator and relative signal strength indicator. The SM-57 is fitted with a cable and plug for connection to the Accessory Connector Socket at the rear of the NC-57 and is contained in a metal case finished to match the Receiver.

To utilize the SM-57 the following receiver control settings must be observed:

1. Control switch at A.V.C. or A.N.L.

2. R.F. GAIN control full on. (Retarding the R.F. GAIN control will reduce the sensitivity of the meter.)

The correct dial setting for any specific station on the dial is that setting which provides maximum deflection of the meter pointer.

6-2. *Meter Adjustment*

Two adjustments are provided on the SM-57; one mechanical and the other electrical.

1. Mechanical -- With the Receiver turned off, the meter pointer should read 40 db. (the last scale marking). If it does not, correction is effected by the screw adjustment on the front of the meter.

2. Electrical -- With the Receiver turned on and controls adjusted for meter operation, the meter pointer should read zero (the first scale marking). This test must be made with no signal input to the Receiver. Correction of the zero setting, if required, is made by means of the screwdriver adjustment (R-101) at the rear of the meter case.

Figure No. 9. Schematic Diagram NC-57 Receiver

INSTALLATION

INSTALLING THE OUTSIDE ANTENNA

The built in loop antenna on your CO-OP Radio is highly efficient for the reception of local or nearby stations on the broadcast band. Short-wave reception will require some sort of an antenna connected to the set — 5 to 15 ft. of wire stretched on the floor and connected to one of the antenna clips.

However, in locations where reception with the built in loop antenna is not satisfactory, a good outside antenna should be installed. The total length of the outside antenna, including the lead-in, should be from 50 to 80 ft. for good operation, and it should be as high as possible. Keep the antenna away from metallic objects such as other wires, guttering, grounded fire escapes, etc.

When the antenna is connected to a receiver, the antenna trimmer on the back of the chassis base must be readjusted. To do this, connect the antenna to one of the antenna terminals in the rear of the set; tune in a weak station near 600 kc. (60 on the dial); and adjust the trimmer screw with a screw driver until the signal is loudest. Antennas shorter than about 30 ft. should be connected to the SHORT ANT clip; those much longer than this will need to be connected to the LONG ANT clip. If in doubt which to use, try both adjusting the trimmer for each, and use the connection which gives the best performance.

A good ground connection should always be provided when an outside antenna is used, and sometimes it is useful in reducing noise even when no antenna is connected to the set. Connect a wire from the GND clip in the rear of the receiver to a convenient water pipe, radiator, or conduit. If none of these are available, a wire may be run to a metal stake or pipe driven into the ground to a distance of 4 to 6 ft.

PREPARING RECORD CHANGER FOR OPERATION

The record changer has been mounted tightly to the cabinet shelf (or drawer bottom in the Console Model) to prevent damage in shipping. A string tied around the needle arm post holds the drawe closed in the Console Model. Cut this string BEFORE trying to oper the drawer. Before attempting to use the phonograph, loosen the three mounting bolt nuts on the UNDER SIDE of the shelf or drawer until the record changer is floating on its spring shock absorbers. (These mounting bolts are located on top of the rectangular base.) Now, remove the two rubber bands that hold the pickup arm secure and remove the cardboard holder. Remove the cardboard disc from the turntable. Finally, remove the needle guard from the pick-up arm by grasping the guard with your thumb and forefinger at the rounded ends and pulling firmly but gently downward

OPERATION

Broadcast Band (535 - 1620 Kilo cycles): The broadcast band is cal brated in channel numbers. Add zero to the dial number to get th kilocycle number.

Short-Wave Band (9 to 15.6 Mega cycles): The short-wave band i calibrated in megacycles.

On-Off Switch and Volume Control Turn on the radio by turning the vo lume knob to the right--a click wil be heard. Wait about thirty second for the tubes to warm up. Continuin to turn the knob to the right wil increase the volume. Turn off b turning the knob to the left until click is heard.

Tuning Knob: Turn the tuning kno until the desired station is heard Then slowly rotate the knob back an forth until the signal is clearest If, at the clearest point, the sig nal is too strong, reduce it by mean of the VOLUME CONTROL--NOT by usin the tuning knob.

Tone Control and Phono-Radio Switch Adjust the tone knob to desired ton AFTER the program is tuned in. Th most natural and intelligible re ception is obtained as the tone con trol is turned to the right. Turn ing the knob toward the left firs increases the bass notes and the cuts the high treble notes as th left hand end is approached. Th proper adjustments, in any case will be determined by the amount o noise present and your persona preference.

MODELS 6A47WT,WTR,WTC; 6AWC2,C3;6AFMT;6AMM

NATIONAL COOPERATIVES, INC.

Turning the knob all the way to the right throws a switch which cuts out radio reception and connects the phone-jack on the rear of the chassis base. Phonograph records may then be played through Model 6A47WT by connecting any record player to this jack. To restore radio reception, turn the tone knob all the way to the left to throw the switch back to the radio portion.

Band Switch: This knob has two positions. The position to the right (SW) switches the tuning to the short-wave band. The position to the left (BC) provides reception on the regular broadcast band.

CONDITIONS AFFECTING RADIO RECEPTION

It is not always possible to obtain perfect reception from your radio. Often this is due to conditions entirely external to the receiver such as:

Atmospheric Static

Local Interference caused by sparking in all kinds of electrical apparatus. This can be reduced by keeping the antenna's lead-in as far away from the electrical apparatus as possible, and by shielding and filtering the electrical apparatus causing the disturbance. It may, however, be necessary to call in your CO-OP Service Man or get in touch with your local power company if their apparatus is the cause.

Fading is a phenomenon that is noticeable when a distant station is being received. It manifests itself as a periodic change of signal strength and also as a periodic "mushing" or distortion of the signal. The automatic volume control incorporated in your CO-OP Radio tends to overcome the change of signal strength. However, change of signal strength may also be caused by a faulty antenna system or poor tubes.

The A.C. Line Voltage changes during the day and evening in some communities, particularly during peak load hours. This condition may reduce the life of some parts of any radio. Therefore, if this condition is prevalent, it is advisable to consult your local power company. If your electric lights flicker or vary, it may be an indication of this fluctuation of line voltage.

CARE

If your radio does not operate satisfactorily, proceed as follows:

1. Be sure there is power at the outlet by connecting a lamp to the same outlet to which the radio is connected. Frequently it is necessary to bend the prongs of the plug if it does not fit properly into the outlet.

2. Be sure the tubes are in the correct sockets as shown in the diagram on the back of your radio chassis base. Also be sure the tubes are operating — glass tubes will light very dimly and metal tubes will be hot to the touch.

When it is necessary to replace a tube in your set, proceed as follows: If there is a back panel on your set (as on Model 6A47WT), pull out the studs around the edge of the panel and remove this panel first. Loosen and remove the four mounting screws on the under side of the board supporting the chassis. Pull off the dial knobs at the front of the cabinet and disconnect the phono-plugs. These plugs go into the sockets on the rear of the chassis base— one is a circular metal plug with three prongs and the other is a single-prong plug in the center of the rear panel of the chassis base. Remove the speaker plug-it is a single-prong plug located on top of the chassis base and next to the 6SG7 metal-covered tube. Now, slide the chassis out of the cabinet and replace any tubes that are not operating.

To remove the tubes in the 6A47WTR model it is necessary to remove the record changer first. To do this, remove the three mounting screws in the base of the changer. Disconnect all "plug-ins" as described. Lift the record changer out of the cabinet. Next, remove the three screws holding the metal cover in front of the changer and remove this cover. The tubes should now be easily accessible without removing the set from the cabinet. If not, proceed as described in the preceeding paragraph and remove the chassis from the cabinet.

3. Check the antenna and ground If an external antenna is being used, inspect the antenna system to be sure that it is not grounded at any point, and that all connections are in good condition.

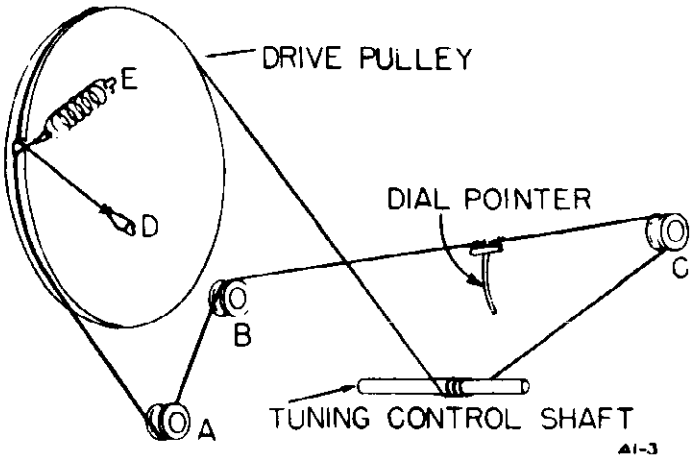
SERVICE DATA

STRINGING THE DIAL DRUM

1. Turn the gang condenser to FULL CLOSED position.
2. Attach the looped end of the line cord assembly (Part #WCA103) to lug "D" as shown in the diagram.
3. String the cord through the opening on the rim of the pulley, upward and around the top of the pulley, down behind the dial and under the tuning shaft.
4. Take four turns around the shaft in a clockwise direction as viewed from the front of the chassis, progressing outward from the chassis. (Check to be sure that none of the turns lie on top of one another to avoid sloppy tuning.)
5. Continue stringing the cord from the tuning shaft up to and around the small pulley "C" at the upper left hand corner of the dial bracket (as viewed from the front of the chassis). In going from the shaft to pulley "C", be sure to lead the cord between the bracket mounting leg and the tone control shaft.
6. Now, string the cord along the upper edge of the dial bracket to pulley "B" at the upper right hand corner of the bracket. (As the cord passes along the top of the dial, be sure to thread it through the opened prongs on the dial pointer.)



A1-3

7. String the cord over pulley "B", downward around pulley "A" (at the lower right hand corner of the chassis as viewed from the front), up through the opening on the rim of the dial pulley, and hook to the tension spring which has been hooked over lug "E" on the pulley.

The stringing is now completed. To fasten the pointer to the cord:

1. With the gang condenser still in CLOSED POSITION, slide the pointer to the last dot at the left hand end of the BC band (as viewed from the front of the chassis).
2. Pull the cord out from the prongs in the pointer and wrap a small piece of 1/4" tape around it at the point where the pointer prongs come.
3. Re-insert, and bend the two end prongs backward over the tape and middle prong forward. This fastens the pointer securely to the cord in the correct position, completing the stringing of the dial.

STRINGING THE TUNER

In order to string the tuner, remove tuner assembly from the chassis and remove the dial drum from the condenser shaft with a soldering iron. In doing this, it is important to note the position of the dial drum relative to the condenser plates, in order to reassemble properly.

Part #WCA102--cord and core assembly is used for stringing the tuner. Proceed as follows:

1. Remove the S.W. coil from the fuse clip brackets.
2. Insert the S.W. core as shown in the diagram, attaching the tuner spring to loop "E", and allowing the spring to lie loose until it is to be stretched around the pulleys and connected to the right hand hook of the P.C. core.
3. Replace the S.W. coil in the fuse clips in the approximate position shown in the diagram.

4. Rotate the gang condenser to FULL OPEN position (counterclockwise looking from above as in the diagram).

5. Pull the core by means of the cord fastened to the left hand hook, until the left end of the core is exactly 1/4" from the first tooth on the larger radius of the cam (tooth "A" with cam rotated 180° from position shown on the diagram).

6. Proceed with the stringing as shown in the diagram, making sure that the cord is not unduly stretched or left loose between any of the teeth on the cam.

When the stringing has been completed around the cam:

7. Lay the B.C. core, which has been attached to the other end of the cord, on the bracket and remove the BC coil from the clips that hold it.

8. Insert the B.C. core in the coil form and push it through (with a small wire) until the bare hook comes into view at the other end.

9. Replace the B.C. coil in the approximate position shown on the diagram.

10. Recheck the gang--it should be in FULL OPEN position.

11. Grasp the tuner shaft firmly to prevent it from rotating. String the cord loop with the spring attached, from the right end of the S.W. core, around pulley "B" only. Hook the spring to the right hand hook on the B.C. core. (The spring should be barely accessible at the right end of the B.C. coil.)

12. Release the gang condenser (being sure it is still in FULL OPEN position), and stretch the spring around the second pulley "C". Be careful not to damage the spring during this operation.

13. Adjust the B.C. coil to its correct position by sliding the coil to a point 1¼" from the right-hand end of the B.C. core to the beginning of the coil winding. The tuner is now strung and ready for adjustment of the S.W. coil position:

Turn the gang condenser to its FULL CLOSED position. Insert a piece of wire which has been marked 5/8" from one end into the coil form until it hits the S.W. core. The distance from the left end of the coil form to the left end of the core should be 5/8". If this measure is not within 1/32", there has been some error made during the stringing procedure or the parts are defective. Carefully review the steps taken. If no apparent error is in evidence and the measure does not fall within this tolerance, get in touch with your local CO-OP dealer who will furnish you a complete tuner subassembly already strung.

If the final measure was within the tolerance, the tuner is properly strung and ready to be replaced on the chassis base. Solder the dial drum back on, making sure that you replace it in the same position with respect to the gang plates as it originally was.

WARNING: When removing the B.C. and S.W. coils from the fuse clips, be careful not to break the fine wires or loosen any soldered connections.

NOTE: The S.W. core is distinguished from the B.C. core in that the S.W. core has a somewhat lighter color and a more satiny surface.

ALIGNMENT PROCEDURE

I.F. ALIGNMENT

Whenever one or both I.F. transformers (T3 and T4) are changed, or the wiring associated with these transformers or with the 6SA7 or 6SF7 tubes is disturbed, it is imperative to realign the I.F. transformers. Proceed as follows:

1. Connect an output meter, a.c. voltmeter, or other suitable instrument across either primary or secondary of the output transformer, T5.

2. Turn the volume control to its maximum (clockwise); and turn the bandswitch to BC (counterclockwise).

3. Connect a signal generator from the input grid (pin 8) of the 6SA7 tube to ground, and feed in a modulated signal at 455 kc., using as small an input signal as possible yet maintaining a convenient deflection on the output meter.

4. Adjust each of the 4 screws on top the I.F. transformers for maximum output, at the same time decreasing the input from the signal generator to be sure to get a true maximum reading.

When this is completed, the I.F. transformers are in alignment.

MODELS 6A47WT, 6A47WTR, 6A47WTC, 6AWC2, 6AWC3, 6AFMT, 6AMM

NATIONAL COOPERATIVES, INC.

R. F. ALIGNMENT

When service operations of any sort have been performed on the antenna coil, interstage coils (T1, T2), loop antenna, gang condenser-oscillator assembly, 6SG7 tube, or circuits associated with any of these, it is important to realign the R.F. circuits for best performances.

Shortened Alignment Procedure--If the service operations have not involved the gang condenser-oscillator assembly or its associated capacitors (C18, C19, C13, C14), a shortened procedure may be used, as follows:

1. Connect the output meter and check the I.F. alignment.
2. Using broadcast stations as a guide, check the calibration of the broadcast and short-wave bands. (If no stations are available, use a signal generator--it is less likely to be accurate however, WWV time signals on 10 mc. and 15 mc. can sometimes be used to check the short-wave band calibrations). If the calibration is not reasonably close, the complete alignment procedure will be necessary. If satisfactory, proceed to connect the signal generator or multivibrator from GND terminal to the LONG ANT terminal on the loop frame.
3. Turn the band switch to BC, and set the dial to about 600 kc.
4. If a multivibrator is used, adjust the loop trimmer C6 for maximum output. If a signal generator is used, tune in the signal at about 600 kc. and adjust C6 for maximum output.
5. Turn to 1500 kc. and tune in a signal.
6. Adjust trimmers C7 and C4 for maximum outnut.
7. Go back to 600 kc. and disconnect the signal generator or multivibrator from the LONG ANT terminal, but leave the wire from the signal source in the vicinity of the antenna terminals. Turn up the signal source outnut so that the signal can be heard and readjust C6 for maximum outnut.
8. Reconnect the lead from the signal source to the SHORT ANT terminal through a 600 ohm resistor.
9. Turn the band switch to SW and the dial to 15 mc. Tune in a signal from the signal source at this noint. (Be sure you have the correct signal and not an image.)
10. Adjust trimmers C2 and C3 for maximum output, "rocking" the tuning control as you do so.

The receiver is now in alignment for reception with the loop antenna. If an external antenna is used, the loop trimmer C6 must be realigned with the actual antenna connected as described in the installation instructions.

Complete R.F. Alignment Procedure: It is strongly recommended that the receiver be returned to the factory for any repairs involving replacement or any adjustment of the gang condenser-oscillator assembly (tuner assembly) other than adjustment of trimmers C4 and C7. If, however, it has been necessary to replace the gang condenser-oscillator assembly or capacitors C18, C19, C13, or C14 in the field, the alignment procedure is as follows:

1. Set the dial pointer so that it lines up exactly with the left hand and mark when the gang is fully closed.
2. Connect the output meter. Turn the volume control to its maximum and the bandswitch to BC. Feed in the signal generator on the grid of the 6SA7 (pin 8 to ground).
3. Check the I.F. alignment. Set the signal generator to 1000 kc. and check the generator calibration against a broadcast signal in place of the generator. Adjust C19 so that the receiver is on calibration at this point.
4. Throw the bandswitch to SW. Set the signal generator to 12 mc. and adjust C18 so that the correct signal (the one which comes in at the higher frequency on the receiver dial) is right on the 12 mc. mark.
5. From here on, follow the shortened procedure until the alignment of the receiver is complete.

SUPPLEMENT FM OPERATION

FM Band -- 88 to 108 megacycles: Turn the radio on by turning the volume control knob to the right. Turn the Frequency Modulation tuner on by turning the "FM On-Off" switch to the right. Wait a few seconds for the tubes to heat. Turn the tone control knob clockwise until a click is heard. The receiver will now be set for FM reception.

FM Tuning Knob: Turn the FM tuning knob until the station is heard. Rotate the knob slowly back and forth across the station desired. The station may be heard in three positions -- the correct position is the center one in which the signal is the clearest and strongest. If the signal is too strong, reduce it by means of the VOLUME CONTROL.

Antenna: For reception of distant stations, and improved results in locations unfavorable to FM reception, install an outside FM dipole antenna, equipped with a 300 ohm flat lead-in. Disconnect the built-in antenna by removing the wires from terminals #1 and #3 on the tuner chassis. Connect the lead-in wires of the outside antenna to the same terminals.

FM Tuner: If your radio does not have an FM band, an FM tuner may be installed.

ALIGNMENT PROCEDURE

PRELIMINARY:

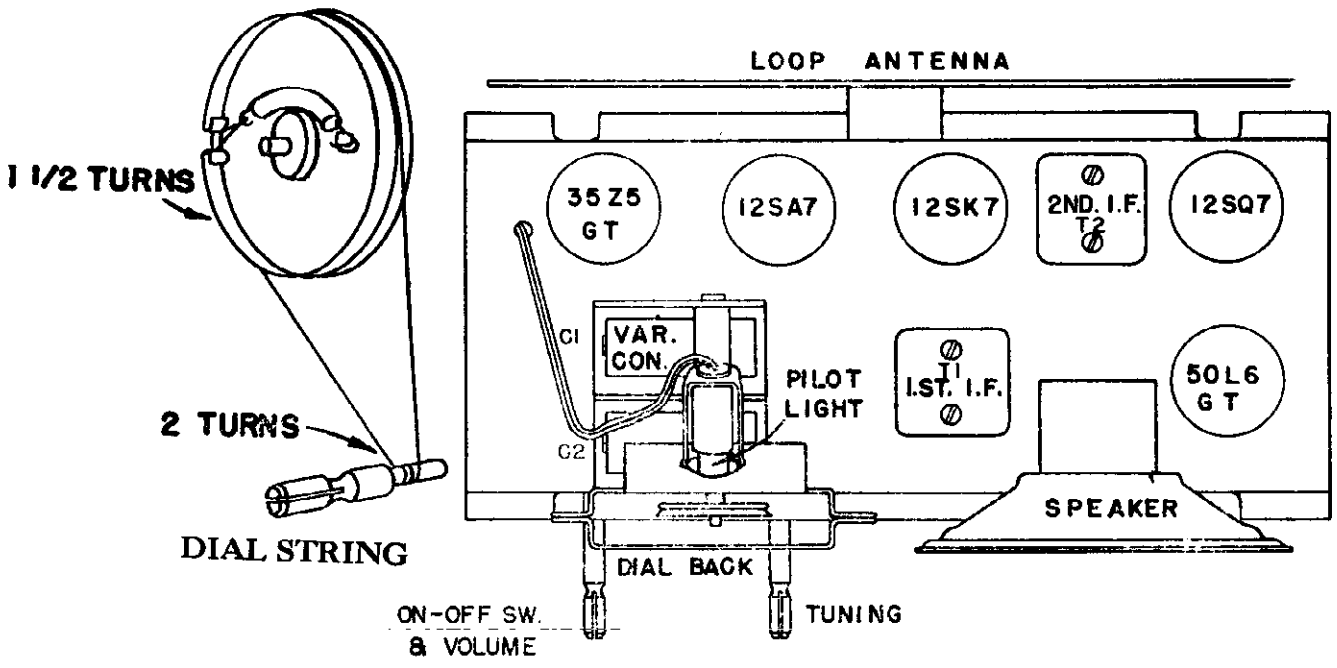
Output meter connection	Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output)	.8 volts
Dummy antenna value to be used in series with generator output	See chart below
Connection of generator output lead	See chart below
Connection of generator ground lead	Floating ground
Generator modulation	30% 400 cycles
Position of volume control	Fully clockwise
Position of dial pointer with variable fully closed	Last mark at left end of dial

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers Adjusted in Order Shown for Maximum Output	Function of Trimmer
Open	455	.05 mfd.	12SA7 Grid (Stator of C1)	Top of 2nd & 1st IF trans. T2 & T1	IF
1400	1400		*Test Loop	C2; C1, Trimmers on Variable Condenser	Osc. Ant.
600	600		*Test Loop	Check Point	

*Standard Hazeltine Test Loop Model 1150 or 3 turns of wire about 6" in diameter, placed about one foot from the set loop.

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

TUBE LAYOUT



This receiver is designed to operate without a ground connection and no attempt should be made to use one.

Models 152-T and 153-T are identical except for cabinets. Model 152-T is in a walnut cabinet. Model 153-T is in an ivory cabinet.

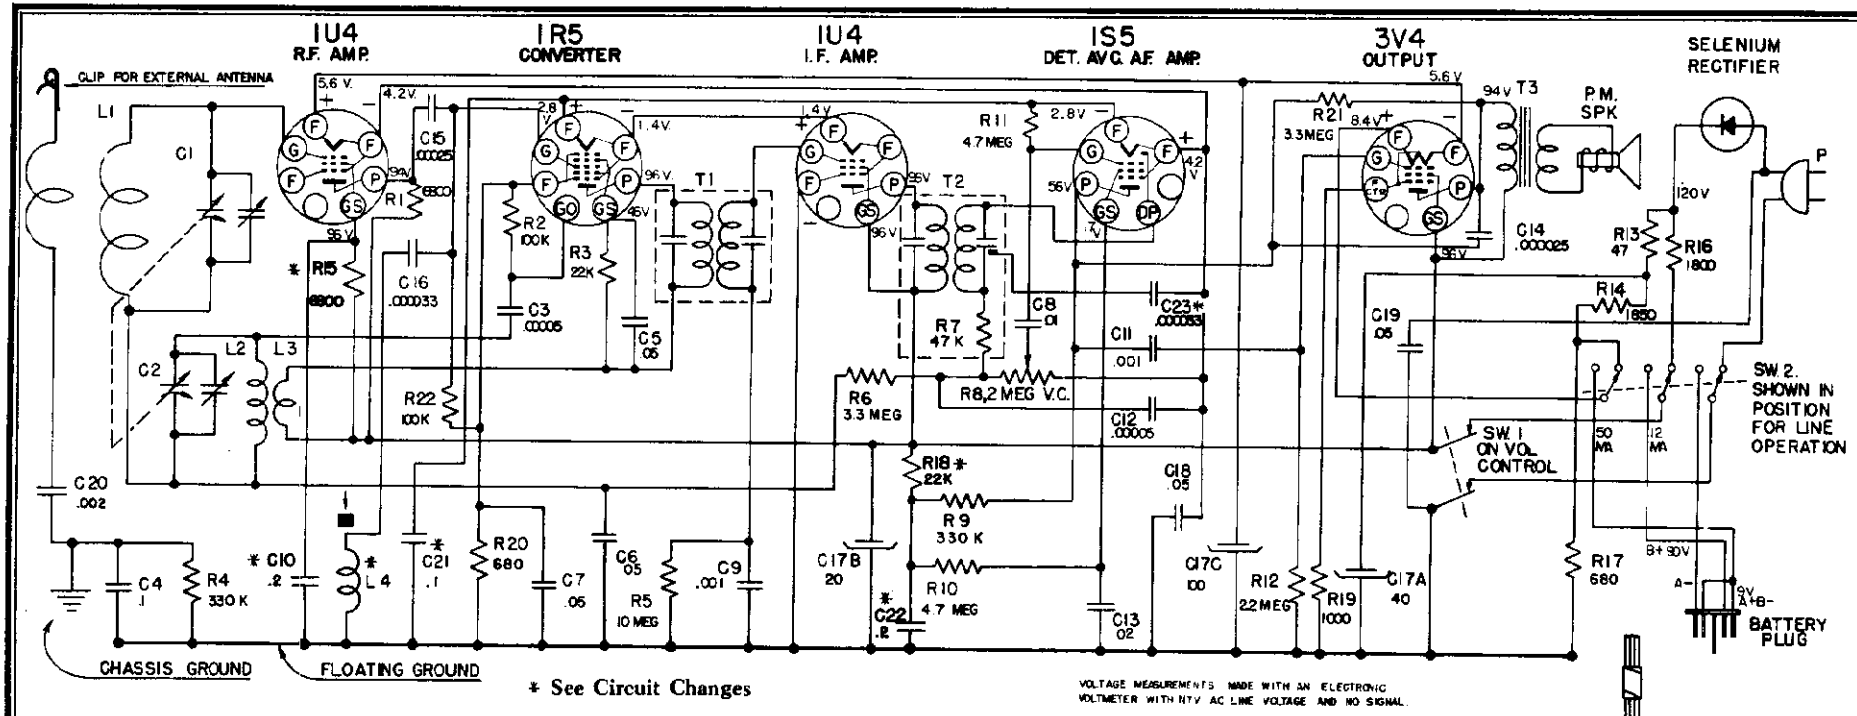
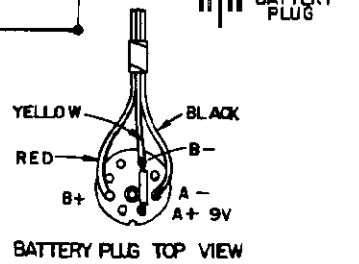
LOCATION OF PARTS UNDER CHASSIS

CIRCUIT CHANGES

Some sets were made with a 330 Ohm instead of a 150 Ohm resistor in shunt with the dial light, and th 15 ohm resistor R7 in the plate circuit of the 35Z5 tube instead of the Cathode Circuit.



On battery operation, the B+ voltage measured to floating ground should be the sum of the A & B battery voltages or approximately 99 Volts with new batteries.



BATTERY PLUG TOP VIEW

SERVICE HINTS AND CIRCUITS CHANGES:

*Any of the following battery packs can be used: General 60A-6F6-5; Eveready 753; Ray-O-Vac AB994; Burgess F6A60.

The following changes were made after a pilot run of 100 sets. The schematic and parts location drawing in this bulletin are for the sets produced after the changes were made:

1. R15 – Resistor, 680 Ohms, 1/4 Watt, added in series with B+ lead to converter and RF Amp. tubes (across lugs 3 & 4 on RF Amp. socket).
2. C10 – Condenser, .1 uf., 400 Volts added from B+ to floating ground.
3. C21 – Condenser, 10 uf., 150 Volts added from RF Amp. B+ to floating ground.
4. L4 – Connection changed from AVC to floating ground.
5. R22 – Resistor connection changed from AVC to filament lug of 1R5 tube socket.

The folliwing changes were made to reduce hum and hum modulation after a quantity of sets had been produced:

1. C10 – .2 uf., 200 V. connected from the screen grid of RF amplifier tube to floating ground, was .1 uf., 400 V. and was connected from B+ to floating ground.
2. C21 – .1 uf., 400 V. connected from positive side of filament of converter tube to floating ground was 10., 150 V. connected from B Supply of RF and converter tubes to floating ground.
3. R 15 – 6800 ohm resistor connected from screen grid of RF amplifier tube to B Supply was 680 ohms connected in B supply to RF amp. and converter tubes.
4. R18 – 22,000 ohm resistor and C22, .2 uf., 200 V. condenser; were added in the audio amplifier circuit.

At the same time, C23, .000033 uf., 500 V. condenser was added in the diode filter circuit to improve the high frequency response.

SPECIFICATIONS

POWER SUPPLY
115 Volts, AC-DC, 16 Watts (or)
*90V, B, 9V, A, Battery Pack
Approx. Current Drain 12 MA "B" 50 MA "A"

POWER OUTPUT
Undistorted ..... .25 Watts
Maximum ..... .32 Watts
Plate load ..... 10,000 Ohms

FREQUENCY RANGE
Broadcast ..... 540-1600 kc
IF ..... 455 kc

LOUD SPEAKER
Type: Permanent magnet
Size: 5 Inch
Voice coil impedance ..... 3.2 Ohms

ALIGNMENT.

A. Connect to 117 V., AC line and turn set on with volume control at full volume.

B. With variable condenser closed, set pointer to end mark on dial.

C. Connect signal generator high side through .05 uf or larger condenser to high side of loop or variabl condenser. Connect low side of signal generator to floating ground. Connect output meter across speake voice coil.

D. Open variable condenser.

E. With signal generator set at 455 Kc, increase output of generator until output is heard in speaker. Adj st all (4) IF trimmers until maximum output meter reading is obtained, reducing signal generator output a adjustment progresses so that final adjustment is made with lowest input consistent with good signal t noise ratio.

NOTE: If no signal can be heard with signal generator connected as at C above, connect high generato lead to terminal 6 of IR5 tube, through condenser asat C, and proceed as before.

E. With signal generator at 455 Kc and connected as in C above, adjust I. F. trap until output mete reading is a minimum. Final adjustment is to be made with high signal input so that an accurate adjust ment can be made.

F. With signal generator connected to radiating loop and set to 1620 Kc adjust oscillator trimmers (C2) o variable condenser until output is maximum. Variable Condenser is to be fully opened during this adjust- ment.

G. Set signal generator to 1400 Kc and rotate variable condenser until output is maximum. Adjust R. F. trimmer (C1) on variable condenser until output increases to a new maximum. Rotate variable condenser slightly to obtain another maximum output. Re-adjust trimmer until output is again a maximum. Repeat this cycle until no further increase in output can be obtained. Final adjustment to be made with a signal generator output at lowest level consistent with good signal to noise ratio.

H. Set signal generator to 1000 Kc and tune radio to maximum output. Adjust variable condenser plate for maximum output.

I. Set signal generator to 600 Kc and proceed as in H above.

J. Set signal generator to 540 Kc and make sure that radio will tune to maximum output slightly befor variable condenser is fully closed.

K. Recheck alignment and calibration at 1400, 1000, and 600 Kc, making any necessary readjustments.

L. Tune the variable Condenser through its entire range to make sure it is not shorted at any point.

NOTE: When ordering cabinets, parts for cabinets, dial backing plates, and pointers be sure to specify the color.

NOBLITT-SPARKS INDUSTRIES, INC.

MODEL 240P
CHASSIS RE-24

ALIGNMENT PROCEDURE

PRELIMINARY:

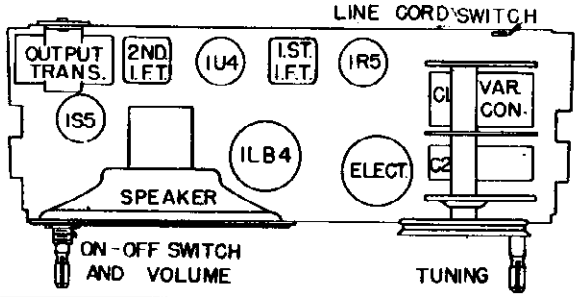
Output meter connection ---------- Across loudspeaker voice coil
Output meter reading to indicate 50 MW (Standard Output) ---------- .4 volt
Dummy antenna value to be used in series with generator output ---------- See chart below
Connection of generator output lead ---------- See chart below
Connection of generator ground lead ---------- Floating ground
Generator modulation ---------- 30% 400 cycles
Position of volume control ---------- Fully clockwise

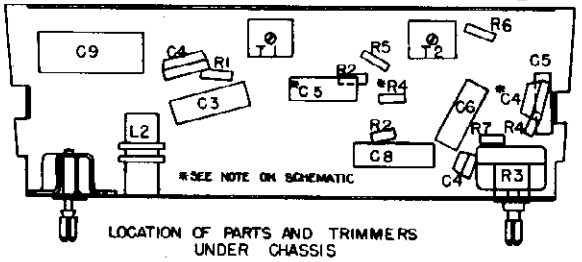
With variable condeser closed, place top edge of pointer across center of top hole on dial backing plate.
When adjusting C1, place the set loop the same distance from and in the same position with respect to the chassis and batteries as it would be when mounted in the cabinet.

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers Adjusted in Order Shown for Maximum Output	Function of Trimmer
Open	455	.05 mfd.	1R5 Grid (Stator of C1)	Top & Bottom of IF Trans. T2 & T1.	IF
1400	1400		*Test Loop	C2; C1, Trimmers on Variable Condenser	Oscillator Antenna
600	600		*Test Loop	**Check Point	

* Standard Hazeltine Test Loop Model 1150 or 3 turns of wire about 6" diameter, placed about one foot from the set loop.
**If weak, adjust variable condenser plates for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.





LOCATION OF PARTS AND TRIMMERS UNDER CHASSIS

FREQUENCY RANGE

Broadcast ---------- 540-1600 kc
IF ---------- 455 kc

TUBES AND FUNCTIONS

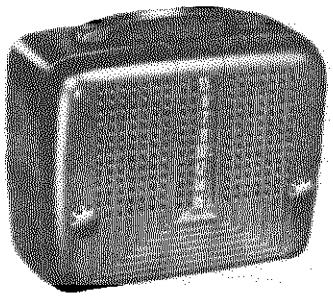
1R5 ---------- Mixer-oscillator
1U4 ---------- IF Amp.
1S5 ---------- DET-AVC AF Amp.
1LB4 ---------- Output

POWER SUPPLY

1. 67½ V. B Battery, Eveready Minimax, No. 467 or Equal.
3. 1½ V. D Size Flashlight Cells

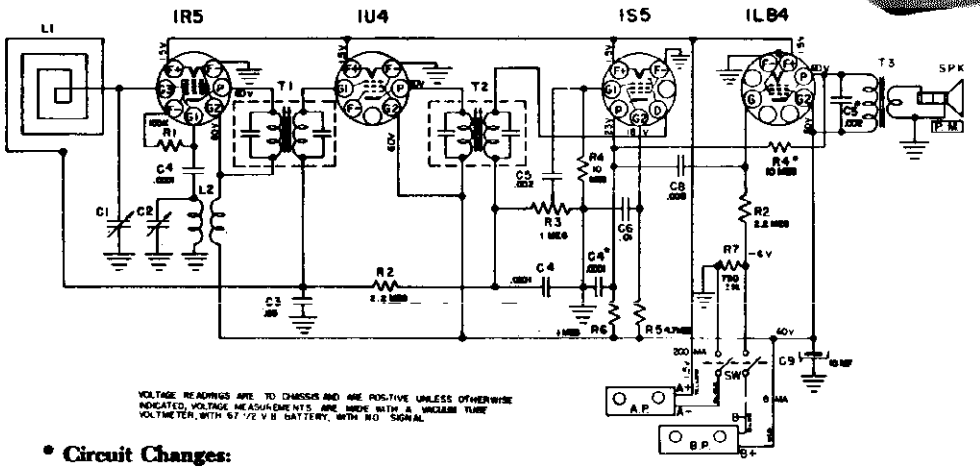
POWER OUTPUT

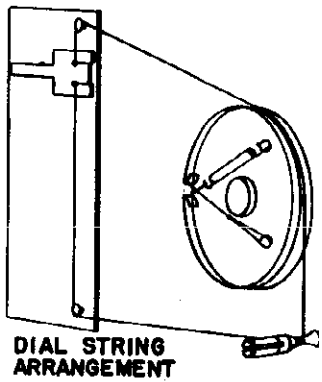
Undistorted ---------- .05 Watts
Maximum ---------- .1 Watts
Plate Load ---------- 14,000 ohms



LOUD SPEAKER

Type: Permanent magnet ---------- .68 Oz.
Size: 4 Inch
Voice coil impedance ---------- 3.2 Ohms



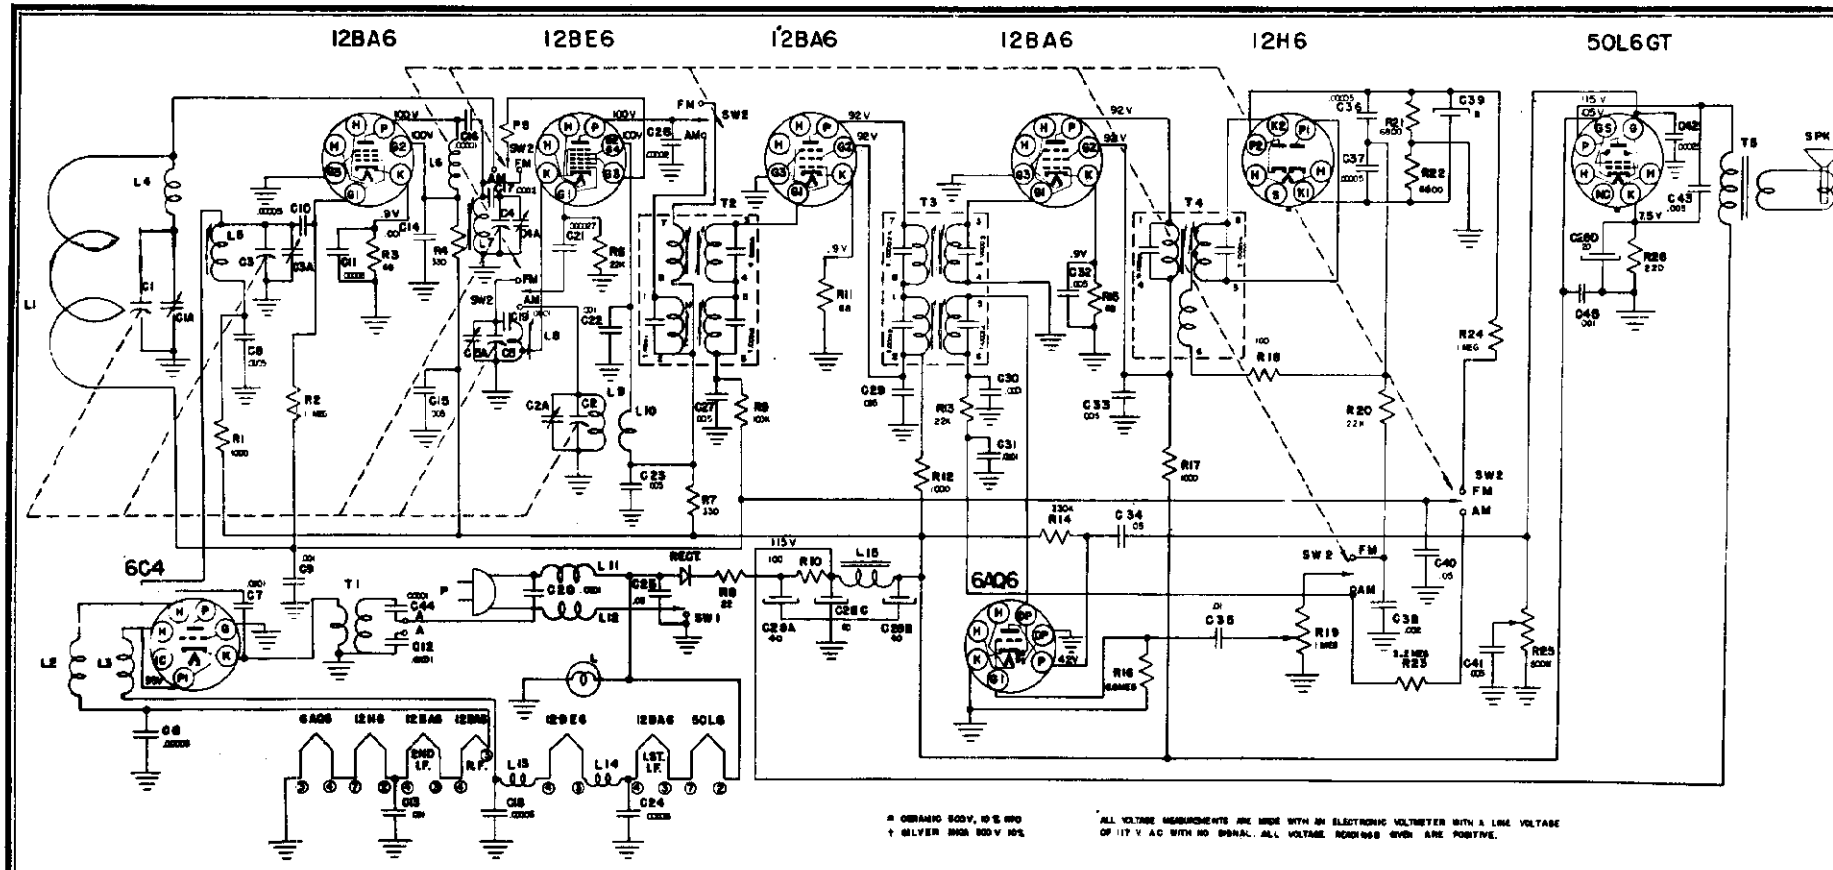


DIAL STRING ARRANGEMENT

* **Circuit Changes:**

The following circuit changes were made to improve the tone quality, after the first 7,000 sets were produced

1. **C4 Condenser, .0001 uf., from the plate of the 1S5 tube to ground was C7, .00005 uf.**
2. **C5 Condenser, .002 uf from plate to screen grid of the 1LB4 tube was C10, .001 uf.**
3. **R4 Resistor, 10 megohm, was added from the plate of the 1LB4 tube to the plate of the 1S5 tube.**



DIFFERENCE IN MODELS

280TFM has a Mahogany cabinet, 281TFM has a bleached Mahogany cabinet.

THE ANTENNA

This set has a loop antenna for AM Broadcast reception. For local FM reception, a built-in (line cord) antenna is provided. An external antenna connection is provided for areas where reception is difficult. To connect the external antenna, remove the green wire from the antenna terminal on the back of the set, and connect a dipole antenna to the antenna terminals. When the line cord antenna is used, the green wire must be connected to the outside terminal on the antenna terminal board.

GROUND

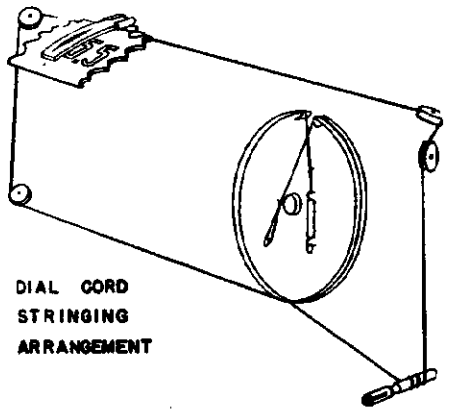
This set is designed to operate without a ground connection and no attempt should be made to use one.

CAUTION

The chassis of this receiver is connected to one side of the power line. Therefore, to prevent a shock hazard, all control shafts, mounting screws and exposed rivets have been insulated from the chassis. When servicing this set and replacing parts, be sure all the necessary insulators are in place to isolate the chassis from all exposed metal parts.

IF & DETECTOR TRANSFORMER REPLACEMENTS

To insure properly matched units for best performance, it is recommended that the IF transformers and FM detector transformer be replaced as complete assemblies, rather than attempt to repair or replace parts of these assemblies.



DIAL CORD STRINGING ARRANGEMENT

ALIGNMENT PROCEDURE

A—IF ALIGNMENT—AM

1. Turn the band switch to AM (To the left).
2. Connect the signal generator output lead to the converter grid, with an .05 uf. dummy and the generator ground lead to the receiver chassis.
3. Connect output meter across the speaker voice coil.
4. Tune the signal generator to 455 KC and adjust 455 KC IF slugs (1)-(2)-(3)-(4) for maximum output.

B—IF ALIGNMENT—FM

1. Turn the band switch to FM (To the right).
*2. Connect 10.7 megacycle FM signal generator output lead to 2nd IF grid and the generator ground lead to receiver chassis.
3. Connect a D. C. vacuum tube volt meter to the A. V. C. line and adjust slug no. (5) (primary, bottom of detector transformer) for maximum A. V. C. Voltage.
4. Connect the D. C. V. T. V. M. to the audio output of detector (high side of volume control) and adjust slug no. (6) (secondary, top of detector transformer), for zero voltage
5. Connect 10.7 megacycle FM signal generator to the converter grid.
6. Connect D. C. V. T. V. M. to the A. V. C. line and adjust the 10.7 IF slugs (7)-(8)-(9)-(10) for maximum A. V. C. voltage.

C—RF ALIGNMENT—AM

1. Turn band switch to AM (To the left).
2. Connect signal generator to a standard Hazeltine test loop, Model 1150, placed 2' from the set loop, or three turns of wire about six inches in diameter placed about one foot from the set loop.
3. Tune the generator to 1620 KC and tune the receiver to the high frequency end of the dial.
4. Connect output meter across the speaker voice coil.
5. Adjust oscillator trimmer (11) on variable condenser for maximum output.
6. Tune signal generator to 1400 KC, and tune receiver to pick up this signal.
7. Adjust antenna trimmer (12) on variable condenser for maximum output.
8. Check tracking at 1000 KC and 600 KC.

D—RF ALIGNMENT—FM

1. Turn band switch to FM (To the right).
2. Connect FM signal generator to FM antenna terminals through a 220 ohm dummy.
3. Set signal generator to 88 megacycles, using 23 KC deviation.
4. Set receiver dial to 88 megacycles.
5. Adjust FM oscillator slug (13) for maximum signal.
6. Set signal generator to 108 M. C.
7. Set receiver dial to 108 M. C.
8. Adjust the FM oscillator trimmer (14) for maximum signal.
9. Repeat 3 to 8; check and recheck until proper coverage is obtained.
10. Set signal generator to 91 M. C., and adjust RF slugs (15) & (16) for maximum signal.
11. Set signal generator to 105 M. C. and adjust RF trimmers (17) & (18) for maximum signal.
12. Repeat 10 & 11 until proper tracking is obtained.

*If a 10.7 MC.-F. M. generator is not available, an unmodulated signal of 10.7 M. C. from an accurately calibrated conventional AM type generator may be used.

All voltage readings are positive unless otherwise indicated.

All voltage measurements are made with an electronic voltmeter with a line voltage of 117V. AC.

*No reading given here, due to the wide variations in readings which would be obtained, due to the electrolytic condensers in the B+ circuit.

**G3,0; G1 Varies from approx. -1.5V to -4V, depending on the setting of the variable condenser, variations in tubes coils, etc.

***G3,0; G1, Voltage varies from approx. -5V with variable condenser closed to approx. -7.5V with variable condenser open.

APPROXIMATE DC RESISTANCE OF COILS AND TRANSFORMERS

NORTHERN RADIO CO. TYPE N600, MODELS AJ BJ, CJ, EDJ

TYPE N600 TWO BAND COMMUNICATIONS RECEIVERS

DESCRIPTION OF EQUIPMENT

Type N600 Receivers of the J Series are available in four different models for either direct or alternating current operation. Model AJ - 6 Volt DC Receiver and Model BJ - 12 Volt DC Receiver are designed for operation from storage batteries, where other sources of power are not available. Model CJ - 32 Volt DC Receiver is designed especially for operation from a ship's battery without the use of a built-in power supply. Model EDJ - 115 Volt AC-DC Receiver is designed for operation from either source, as implied, and is equally suited for marine or land installations.

The characteristics of the four models are similar, with the exception of the audio frequency system and power supply. The radio frequency components and controls are identical, thus the operation, alignment, servicing, etc., are the same. The following data is pertinent to the four models, describing them collectively where they are similar and individually where they are at variance.

One radio frequency stage of amplification employing a 6K7 eliminates the image frequency signal and insures an effective signal to noise ratio.

A separate oscillator employing a 6J5 reduces frequency drift to a minimum and improves the general stability of the receiver.

A 6L7 mixer converts the incoming signal to the intermediate frequency, where it is amplified by a second 6K7. By the use of iron core intermediate transformers sufficient gain and selectivity are obtained with a single stage.

Detection is accomplished by means of the diode in a type 6Q7 The rectified voltage is filtered and applied to the grids of the previous stages to provide automatic volume control.

The triode section of the 6Q7 amplifies the diode output, functioning as the first audio stage. In the Model AJ - 6 Volt DC Receiver and the Model BJ - 12 Volt DC Receiver the power amplifier is a 6F6G, which is driven directly by the first audio stage. The Model CJ - 32 Volt DC Receiver incorporates a 25L6G driver stage. This driver is excited by the first audio stage and, in turn, excites the power amplifier which consists of four 25L6G's connected in push-pull parallel. A single 25L6G power amplifier, driven directly by the first audio stage, is used in the Model EDJ - 115 Volt AC-DC Receiver.

A power output of approximately 2½ watts is obtained from the 6F6G power amplifier in the Model AJ - 6 Volt DC Receiver and the Model BJ - 12 Volt DC Receiver. The 25L6G push-pull parallel power amplifier in the Model CJ - 32 Volt DC Receiver has an output of approximately ½ watt, which provides ample volume from the built-in speaker. In the EDJ - 115 Volt AC-DC Receiver, an output of approximately 2 watts is obtained from the 25L6G power amplifier. The built-in speaker is of the permanent magnet dynamic type.

Plate power for the Model AJ - 6 Volt DC Receiver and the Model BJ - 12 Volt DC Receiver is obtained from a built-in power supply of the vibrator type. The Model CJ - 32 Volt DC Receiver has no built-in power supply, all power being obtained directly from the ship's battery. In the Model EDJ - 115 Volt AC-DC Receiver, plate power is obtained from a half-wave rectifier - filter system using a 25Z6G tube.

Controls

(1) Power switch marked "POWER". This switch functions as the Off-On control for the receiver.

(2) Band switch marked "BAND A-B". In position "A" the receiver is tuneable over the range between 1550 and 4200 kilocycles. In position "B" the receiver is tuneable between 550 and 1600 kilocycles.

(3) Receiver tuning. A semi-circular dial with a five-to-one reduction drive mechanism is employed as the tuning control. The band A scale is calibrated in kilocycles and the band B scale in megacycles. The dial is illuminated from the rear. A vernier dial with 100 divisions is provided for accurate station logging.

(4) Radio frequency gain control marked "SENSITIVITY". This control serves to limit the maximum sensitivity of the receiver.

(5) Audio frequency gain control marked "VOLUME". This controls the audio amplification after detection and functions as the volume control for the receiver.

(6) Tone control marked "TONE". This control reduces the high frequency response of the audio system and is used in receiving thru sharp high pitched noise.

(7) Speaker - handset switch marked "SPEAKER" and "HANDSET". This switch connects the audio output of the receiver to the built-in speaker or to the receiver portion of the handset, as indicated.

(8) Headphone jack marked "PHONES". When the phones are plugged into the jack, the built-in speaker is disconnected from the circuit.

(9) Dial light switch marked "LIGHTS". This switch functions as the Off-On control for the dial lights, and is provided so that the lights may be turned off when it is necessary to darken the pilot house

TYPE N600;MODELS AJ, BJ,CJ,EDJ

NORTHERN RADIO CO.

INSTALLATION

The receiver is usually mounted in the transmitter cabinet, or housed in a separate cabinet which is bolted to the transmitter to form a compact communication unit. When separately housed, the receiver may be mounted in any desired location.

Connections

(1) Power & Control. Power for the receiver is obtained thru the cable or cables at the rear of the chassis. When used in conjunction with a transmitter the proper cables are provided for connection to the power and receiver control circuits in that particular transmitter. If the receiver is used separately, wires may be connected to the cable terminal points for power and external control. If external control is not required, the plate supply line "B break" circuit must be closed and the voice coil line returned to ground on the panel. Refer to drawings for circuit data.

(2) Ground. The receiver is grounded in the usual installation thru connection to the transmitter and between cabinets. If used separately the ground should be connected to the cabinet. The receiver chassis is insulated from the panel and cabinet to permit a positive or negative ground in the D.C. Models, consequently a direct ground must not be connected to the chassis.

(3) Antenna. The regular receiver antenna connection is made thru the control cable and transmitter. If the receiver is used separately, connection may be made to the cable terminal marked "ANT". Refer to drawings for circuit data.

OPERATION

The operation of the receiver is similar to any regular communications receiver with similar capabilities. The following suggestions will aid in obtaining the most satisfactory results.

Place the receiver in operating condition as follows: Throw the POWER switch to the On (up) position. Set the BAND switch to the band A or B position in which the desired frequency is located. Throw the SPEAKER-HANDSET switch to the SPEAKER position. Throw the LIGHTS switch to the On (up) position. Set the SENSITIVITY control for maximum sensitivity by turning in a clockwise direction to the end of the 270 degree rotation. Then adjust the VOLUME control until some noise is heard. The receiver is now ready for operation.

General Procedure

When tuning for a station it is necessary to tune slowly past the point where the station is expected. After having found the station tune on both sides of the best point in order to make sure its location. Operation to one side of the correct spot will result in distorted signals.

During periods when no phone signals are being received the AVC (Automatic Volume Control) will increase the volume to maximum (if the SENSITIVITY control is full on) and some noise will result. The incoming signal, however, reduces the amplification through the AVC action and consequently the noise level. If the prevailing noise level is high the SENSITIVITY control may be turned down to limit the maximum sensitivity of the receiver, or it may be similarly used to prevent very strong local signals from blocking the receiver.

The control to use for setting the signal volume at a comfortable room level is the VOLUME control. If the SENSITIVITY control is used for this purpose the AVC will not function properly.

Note: Data relative to the operation of any controls not mentioned in this section will be found under "Controls".

MAINTENANCE

Receiver Alignment

(1) Before proceeding with the alignment, the #6 pin on the 7 prong control cable socket or plug must be connected to the panel to complete the voice coil circuit. It will also be necessary to provide a connection between the #4 and #5 pins to close the B break circuit.

(2) A signal generator set to 456 kilocycles should be used in aligning the intermediate frequency amplifier. Remove the grid clip from the 6L7 and connect the signal generator between grid and ground. If a signal generator is not available, tune in some convenient signal that is not too strong.

(3) For indication of correct tuning, an output meter or high resistance a.c. voltmeter should be connected between the power amplifier plate and chassis. A blocking condenser (.1 uf. or more) must be connected in series with the hot lead to the plate. If a low range meter (15 v. or less) is available, it may be plugged into the phone jack.

(4) Tune the trimmers on top of the I.F. transformers for maximum output meter deflection. It will be found best to experiment with the input level which gives the best indication.

(5) After having tuned the intermediate amplifier, the grid clip should be replaced on the 6L7, the band switch set for band A and a signal of approximately 3500 kilocycles applied to the antenna input. This can be the signal from a distant station or a standard signal generator. Adjust the oscillator trimmer (top right hole in osc. shield can) so the signal is properly tuned in. Then adjust the R.F. and Detector trimmers for maximum signal. These are accessible through the top right holes in the next two shield cans. Refer to drawings for parts location.

(6) The above procedure should be followed with the band switch set for band B and an input signal of 1400 kilocycles applied to the antenna input. The trimmers for this band are located in the bottom right side of the shield cans directly below the band A trimmers.

(7) The signal should now be set to 1800 kilocycles for band A or 600 kilocycles for band B and the receiver tuned to this frequency. The padding condenser for the band being aligned should be adjusted to give maximum output while rocking the tuning condenser slightly to locate the most favorable position. It is advisable to return to the aligning point and repeat the adjustments given for best results. Refer to drawings for parts location.

Servicing

Complete schematic circuit and parts layout drawings are included at the end of this circular, together with a parts list which corresponds with the drawings. Thus the function, location and value of any part may be readily found.

When the receiver has been removed from the cabinet for servicing, the #6 pin on the 7 pin control cable socket or plug must be connected to the panel to complete the voice coil circuit. It will also be necessary to provide a connection between the #4 and #5 pins to close the B break circuit.

First the power source should be checked to make sure that all tubes are receiving correct filament and plate voltages, then the tubes should be suspected and replaced with the spares one at a time as a check on their operation.

After checking tubes, testing should progress from the receiver output to the input stage by stage eliminating each as it is found to operate properly. Listening in the loud speaker while testing will help greatly. The usual voltmeter and/or ohmmeter tests should be used in isolating the trouble. It is always best to test each stage in a logical definite order, in order to determine the location of the defect. After having found the location of the trouble, it can be quickly eliminated.

CAUTION: The negative side of the power line is common to the chassis in the D.C. Models, but the chassis is insulated from ground (panel and cabinet) to permit operation from a power source with either a negative or positive ground. Consequently, if the positive side of the power line is grounded, the chassis becomes Hot to ground and care must be used when removing same to avoid contact with the cabinet or a blown receiver fuse (F1) will result. Opening both sides of the incoming power line before removing the chassis will prevent this. In this connection it should be noted that all control shafts have an insulating washer between shaft, knob and panel which must not be removed in the event of knob replacement. If the negative side of the power line is grounded, no care need be used. Refer to drawings for circuit data.

Type N600 Receiver

Test Readings

Model BJ -12 Volts, DC

The following test readings indicate average normal operating conditions:

Stage	Tubes	Plate Volts	Screen Volts	Grid Volts	Cath. Volts	Fil. Volts
R.F.A.	6K7	185	145	*Var.	1.1	6
Mixer	6L7	184	145	x10 av.	1.6	6
Osc.	6J5	148	---	x19 av.	0	6
I.F.A.	6K7	168	145	*Var.	1.3	6
Det. &	6Q7	*Var.	---	---	0	6
1st A.F.	Same	50	---	0	0	Same
A.F.P.A.	6V6GT	171	185	0	8.0	6

Input voltage during test - 12 Volts.
Total filament and vibrapack current - 2.6 Amps.
Total plate current - 60 Ma.

*Variable - dependent on signal and avc voltage. This also applied to the mixer (detector) control grid not listed above.

xAverage - mixer injection and oscillator grid voltages read with a VTVM having a d.c. input resistance of 11 megohms. These voltages vary over the frequency range.

Note: Normal readings may vary plus or minus 6% from the values given. The maximum variation should not exceed 10%. Readings are taken with the vibrapack voltage change switch set in the No. 1 (normal) position and with the SENSITIVITY (r.f. gain) control set at maximum. All voltages, except filament, are read between the circuit points and chassis. The meter should have a resistance of 1000 ohms per volt and a 300 volt (or higher) scale should be used where there is much resistance in the circuit, if comparative readings are to be obtained. Current values may be computed by dividing the voltage across resistors by their resistance. Refer to drawings and "Parts List" for data.

Test Readings

The following test readings indicate average normal operating conditions:

Stage	Tubes	Plate Volts	Screen Volts	Grid Volts	Cath. Volts	°Fil. Volts
R.F.A.	6K7	30.0	30.0	*Var.	0.6	6
Mixer	6L7	29.5	30.0	x1.5 av.	0.1	6
Osc.	6J5	30.0	--	x2.8 av.	0	6
I.F.A.	6K7	29.5	30.0	*Var.	0.6	6
Det. &	6Q7	*Var.	--	--	0	6
1st A.F.	Same	5.5	--	0	0	Same
2nd A.F.	25L6GT	22.5	30.5	0	3.0	24
A.F.P.A.	4-25L6GT	30.5	32.0	0	2.8	24

Input voltage during test - 32 volts
Total filament current - 1.7 Amps.
Total plate current - 36 Ma.

*Variable - dependent on signal and avc voltage. This also applies to the mixer (detector) control grid not listed above.

xAverage - mixer injection and oscillator grid voltages read with a VTVM having a d.c. input resistance of 11 megohms. These voltages vary over the frequency range.

°Filament voltage readings taken with dropping resistor R23 adjusted for 30 volts across the series - parallel filament circuit.

Note: Normal readings may vary plus or minus 6% from the values given. The maximum variation should not exceed 10%. Readings are taken with the SENSITIVITY (r.f. gain) control set at maximum. All voltages, except filament, are read between the circuit points and chassis. The meter should have a resistance of 1000 ohms per volt and a 50 or 60 volt scale should be used, if comparative readings are to be obtained. Current values may be computed by dividing the voltage across resistors by their resistance. Refer to drawings and "Parts List" for data.

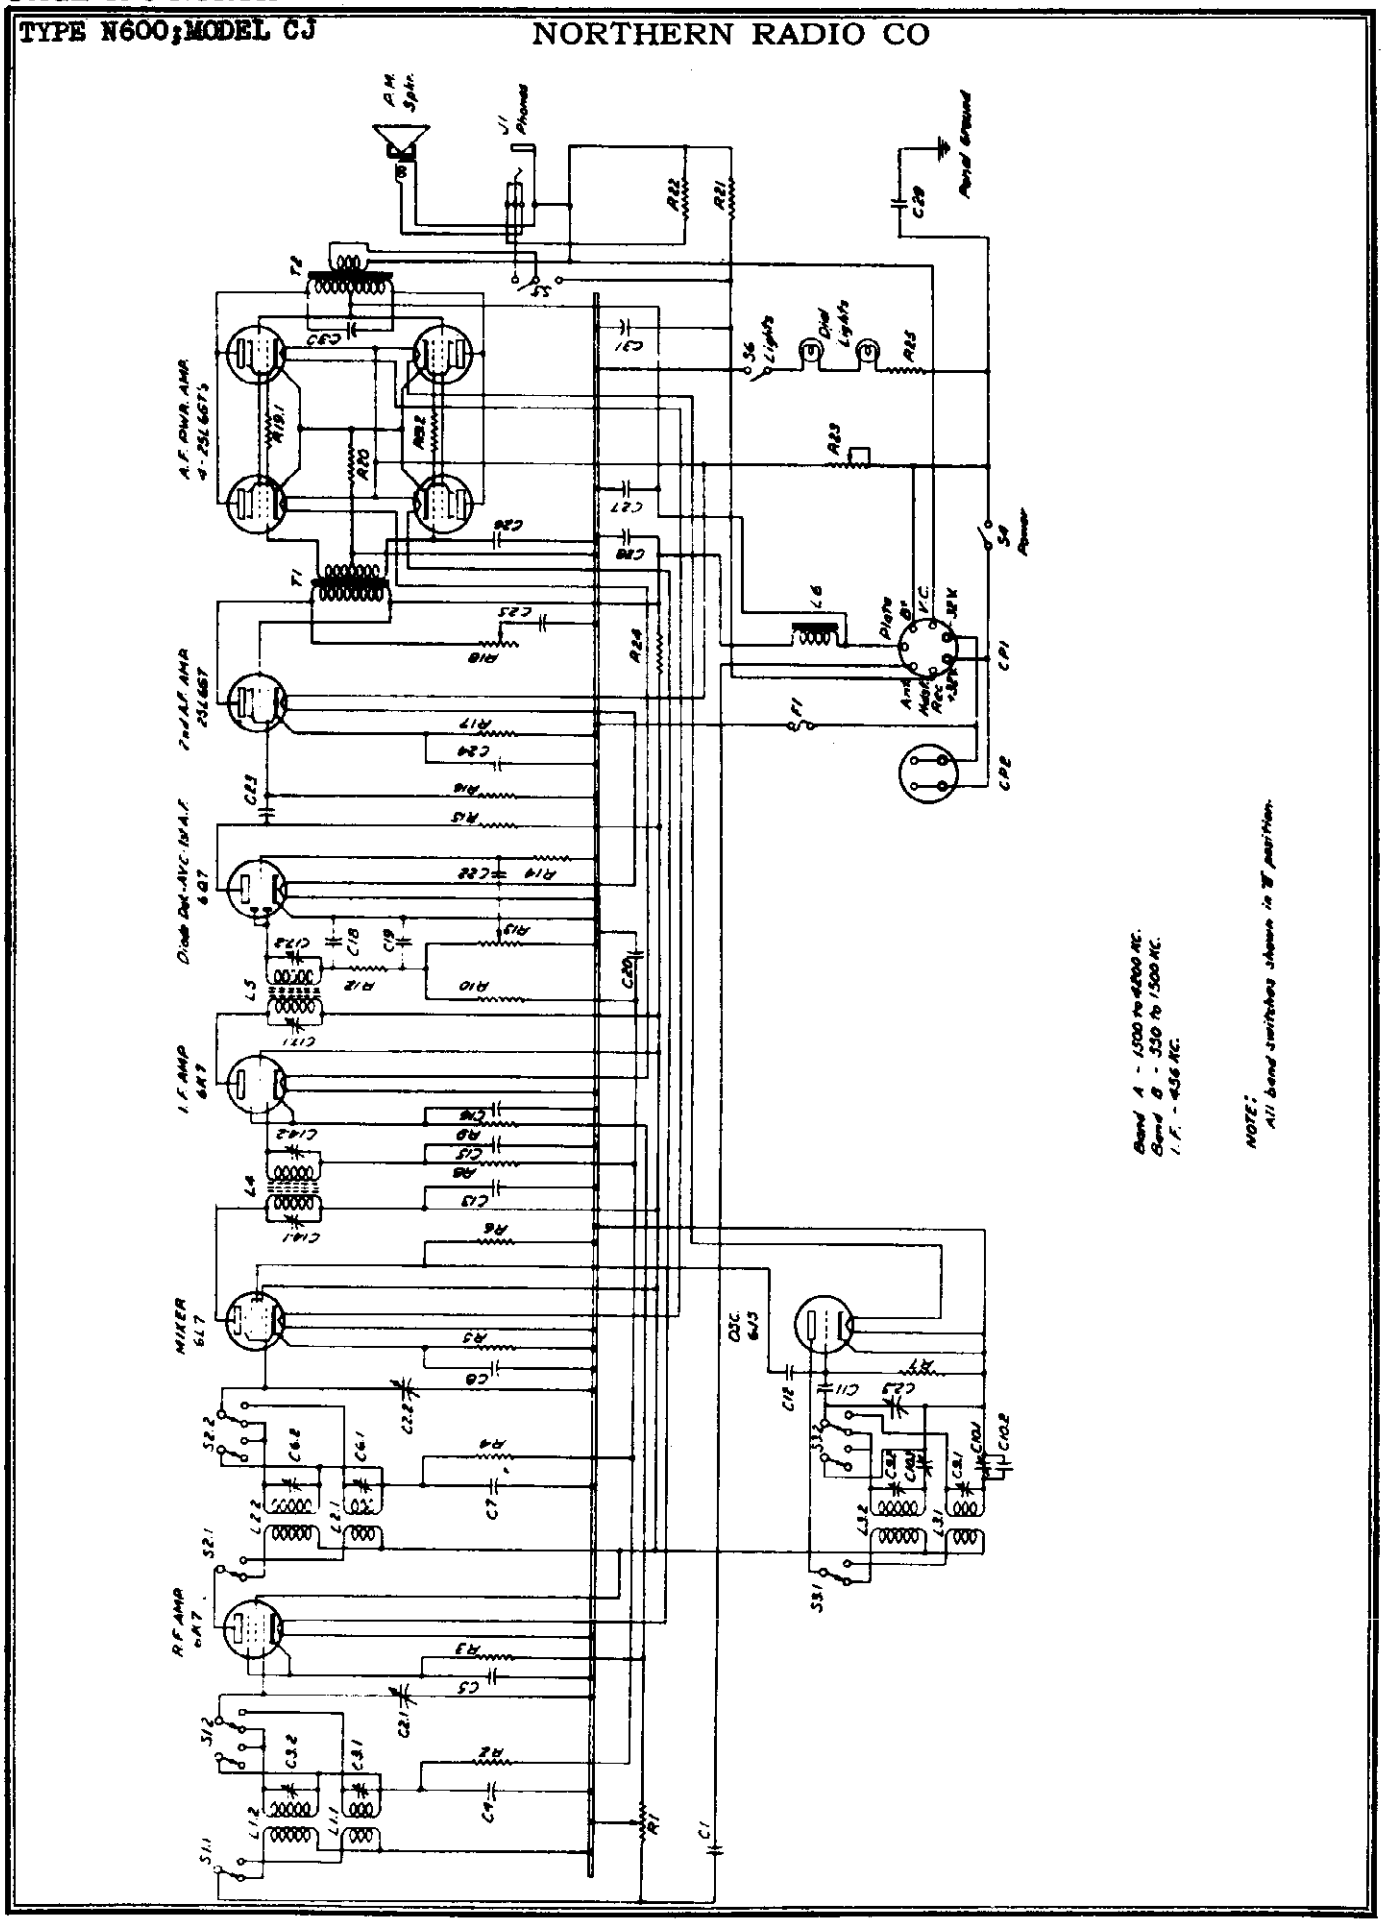
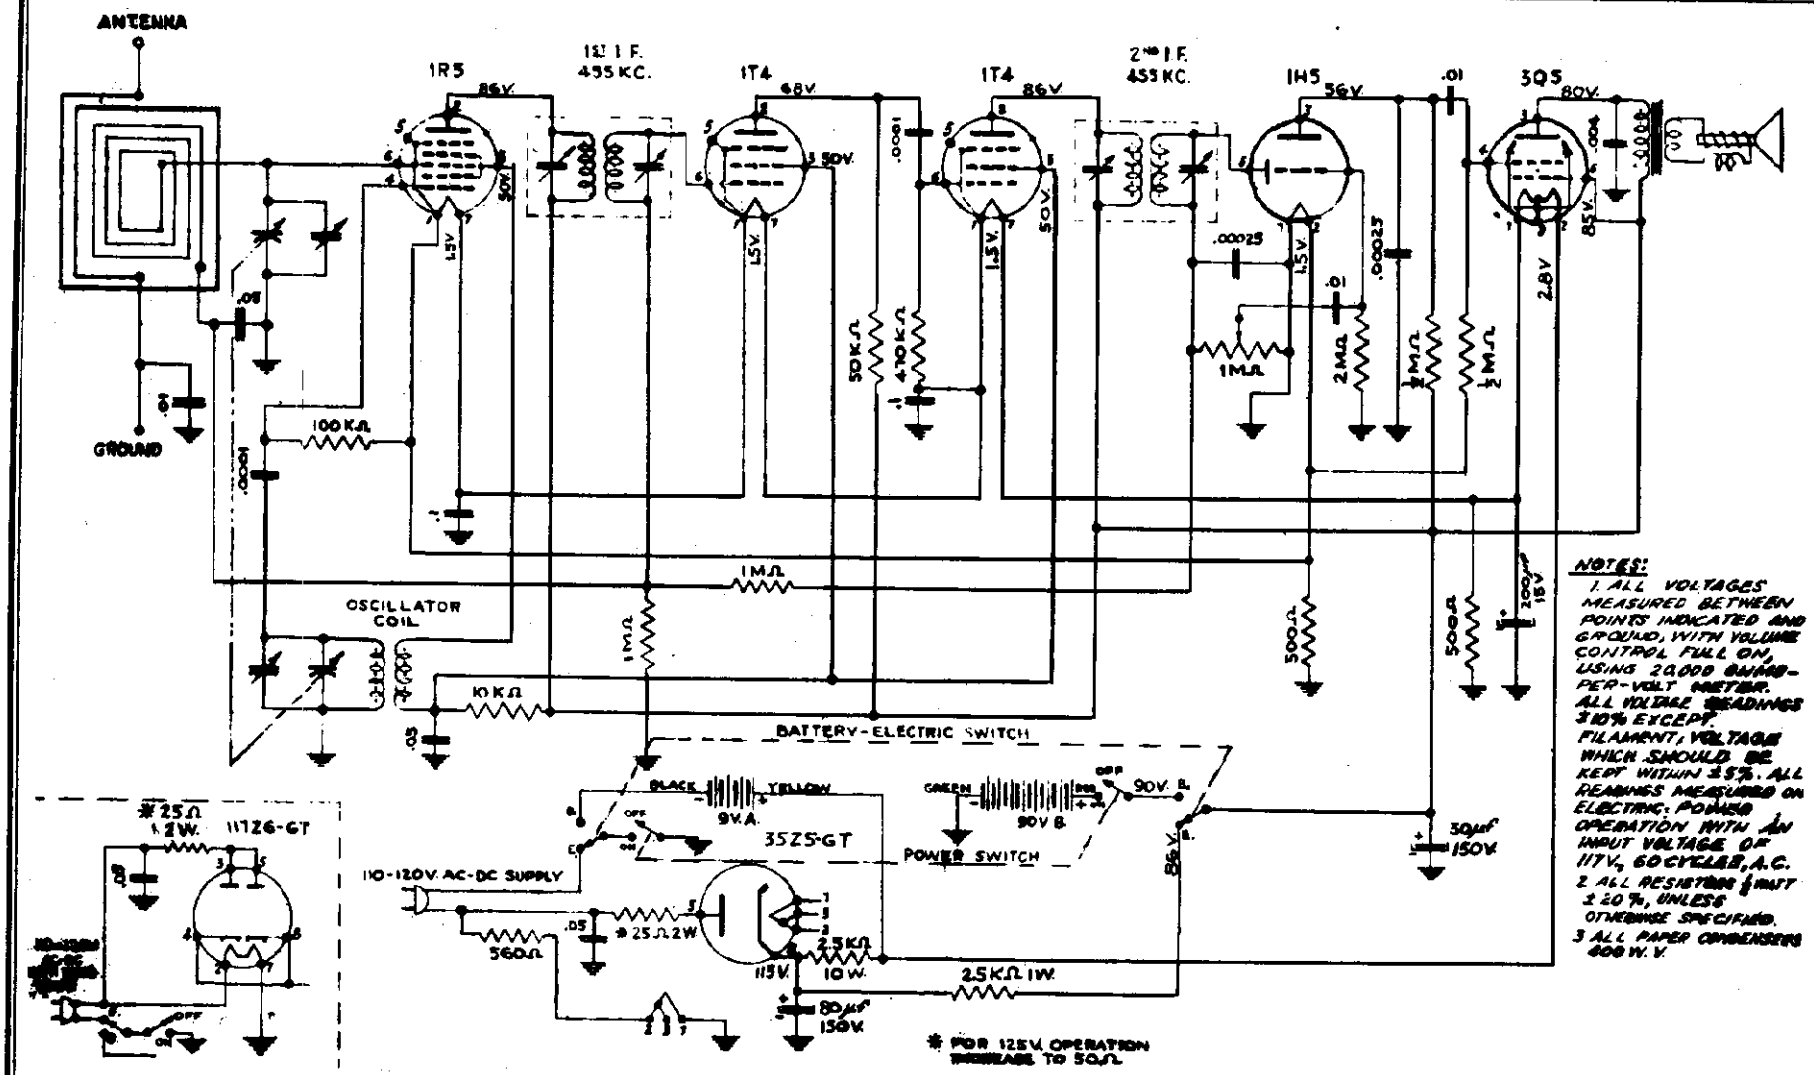
NORTHERN RADIO CO. TYPE N600;MODEL C

NORTHERN PAGE 1

TYPE N600; MODEL CJ

NORTHERN RADIO CO





NOTES:
1. ALL VOLTAGES MEASURED BETWEEN POINTS INDICATED AND GROUND, WITH VOLUME CONTROL FULL ON, USING 20,000 OHMS-PER-VOLT METER. ALL VOLTAGE READINGS ±10% EXCEPT FILAMENT VOLTAGE WHICH SHOULD BE KEPT WITHIN ±5%. ALL READINGS MEASURED ON ELECTRIC POWER OPERATION WITH AN INPUT VOLTAGE OF 117V, 60 CYCLES, A.C.
2. ALL RESISTORS ½ WATT ±20%, UNLESS OTHERWISE SPECIFIED.
3. ALL PAPER CONDENSERS 400 W.V.

This portable receiver is designed for AC, DC or battery operation, and is provided with a self-contained loop which permits reception without the use of an external aerial. It will operate on 10[illegible]-125 volts 40-60 cycles AC or DC or on 9 V A and 90 V B battery supply.

The line cord used with this receiver is of special construction and should not under any condition be shortened, lengthened, or tampered with. Should this cord at any time be too short to reach the line receptacle it may be extended with an ordinary extension cord. While in operation on electric power, the cord will get warm. This is a normal characteristic, and in order to dissipate the heat into the surroundings, it is advisable to stretch out the cord to its entire length.

MODEL PQ61 OLYMPIC RADIO & TELEV. INC.
MODELS 7-421V, 7-421W, 7-421X

MODEL PQ61

The intermediate frequency of this receiver is 455KC and should re-alignment be required, it will be necessary to slide the shelf (holding the chassis) partly out of the cabinet so that the trimmer screws can be reached. To do so, remove the two "push-on" type of knobs at the front and the two wood screws holding the shelf to the corner glueblocks.

Alignment: Set the signal generator to 455 kilocycles and connect the output via a .05 condenser to the grid of the 1R5 tube (connecting to the grid connection at the RF section of the variable will be found more convenient) and via a similar condenser to the chassis. Feed in this signal and adjust the four trimmer screws at the top of the IF transformers until maximum output is obtained, which may be indicated by an output meter connected directly across the voice coil.

Before aligning the antenna and oscillator trimmers rotate the station selector knob clockwise and when the condenser is at maximum capacity, note that the pointer is in a horizontal position.

Now couple the output of the signal generator to the terminals of a dummy loop about 6" dia. consisting of one turn of wire and placed about one foot away from the receiver loop and feeda 1500 KC signal from the generator. Adjust both the oscillator trimmer and antenna trimmer until maximum signal is obtained with minimum input of generator signal. During this alignment the volume control should be at maximum volume position.

ELECTRIC OPERATION:
When operating this receiver on electric power it will be necessary to remove the plug from its battery operating position on the chassis and insert same into the electric socket receptacle. This disconnects the receiver from its battery position and automatically adjusts all internal connections for electric operation.

BATTERIES:
The batteries recommended for this receiver are two #746 Eveready 4-1/2V and two 462 Eveready #45V batteries.

Before replacing batteries remove the loop by unscrewing the round head screw holding the loop to the receiver bracket.

ANTENNA:

This receiver will operate satisfactorily in most locations without an aerial. However, in certain remote locations it may be necessary to provide additional pickup by connecting an aerial and ground to the two short leads soldered to the loop.

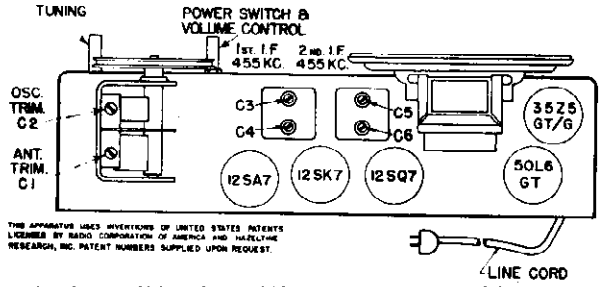
TUBE LAYOUT



Note:

In case of dial light failure, replace the lamp (Mazda #47) as soon as possible to prevent damage to the 35Z5 tube

ALIGNMENT PROCEDURE CHART

STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO -	SET SIGNAL GENERATOR TO -	TURN RECEIVER DIAL TO -	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE)
1	ANTENNA SECTION TUNING CONDENSER IN SERIES WITH .1 MFD. COND.	455 KC.	FULL CLOCKWISE POSITION. (CONDENSER PLATES FULLY OPEN)	C6, C5, C4, C3 AND REPEAT IN SAME ORDER (1ST. AND 2ND. I.F. TRANSFORMERS)
2	ANTENNA TERMINAL OF ANTENNA LOOP IN SERIES WITH 50 MMFD. COND.	1700 KC.	1700 KC. (170 ON DIAL)	C 2 (OSCILLATOR)
3		1400 KC.	MAXIMUM SIGNAL (APPROX. 140 ON DIAL)	C1 (ANTENNA)
4		REPEAT STEPS 2 AND 3		

ALIGNMENT INSTRUCTIONS

Equipment Required:

Modulated R.F. signal generator; output meter; insulated screw-driver; two .1 mfd 400 volt condensers.

To insure proper alignment a radiated signal will be required during part of the alignment procedure. To radiate a signal connect a loop of about 6" to 8" diameter (one turn of #14 or #12 wire) across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned at a distance of about 8" or 10".

To align the receiver it is necessary to remove the chassis from the cabinet, check that the pointer is horizontal and coincides with the two horizontal reference lines on the dial. In this position the condenser should be completely closed. Connect the output meter and signal generator as follows:

Output meter — Connect across voice coil and turn volume control to maximum.
Signal generator — Connect the low side of the signal generator to the common B-bus thru a .1 mfd condenser and keep the output as low as possible, then proceed in the sequence shown on the alignment chart.

3		600 KC.	RESONANCE	CHECK THAT POINTER EDGE AT RESONANCE COINCIDES WITH 600 KC. CALIBRATION POINT. IF DEVIATION IS TOO LARGE REPEAT STEP 2.

MODEL 6-507 OLYMPIC RADIO & TELEV INC.

SERVICE AND ALIGNMENT INSTRUCTIONS

To service this receiver it is first necessary to remove the motorboard with the record changer and then remove the chassis through the top opening of the cabinet. To lift the entire motorboard with the changer, unfasten the six screws holding the motorboard in place, disconnect motor and pick-up plugs from chassis, and lift up. It is unnecessary to remove the screws holding the metal-shield in front. CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION WHEREBY THE CHANGER MECHANISM WILL NOT BE DAMAGED.

ALIGNMENT

Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; one .1 mfd 400 volts and one 50 mmfd 400 volts condenser.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to chassis; turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the pointer slide bar (see drawing).

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that pointer carriage coincides with the "reference line" on the pointer slide bar.

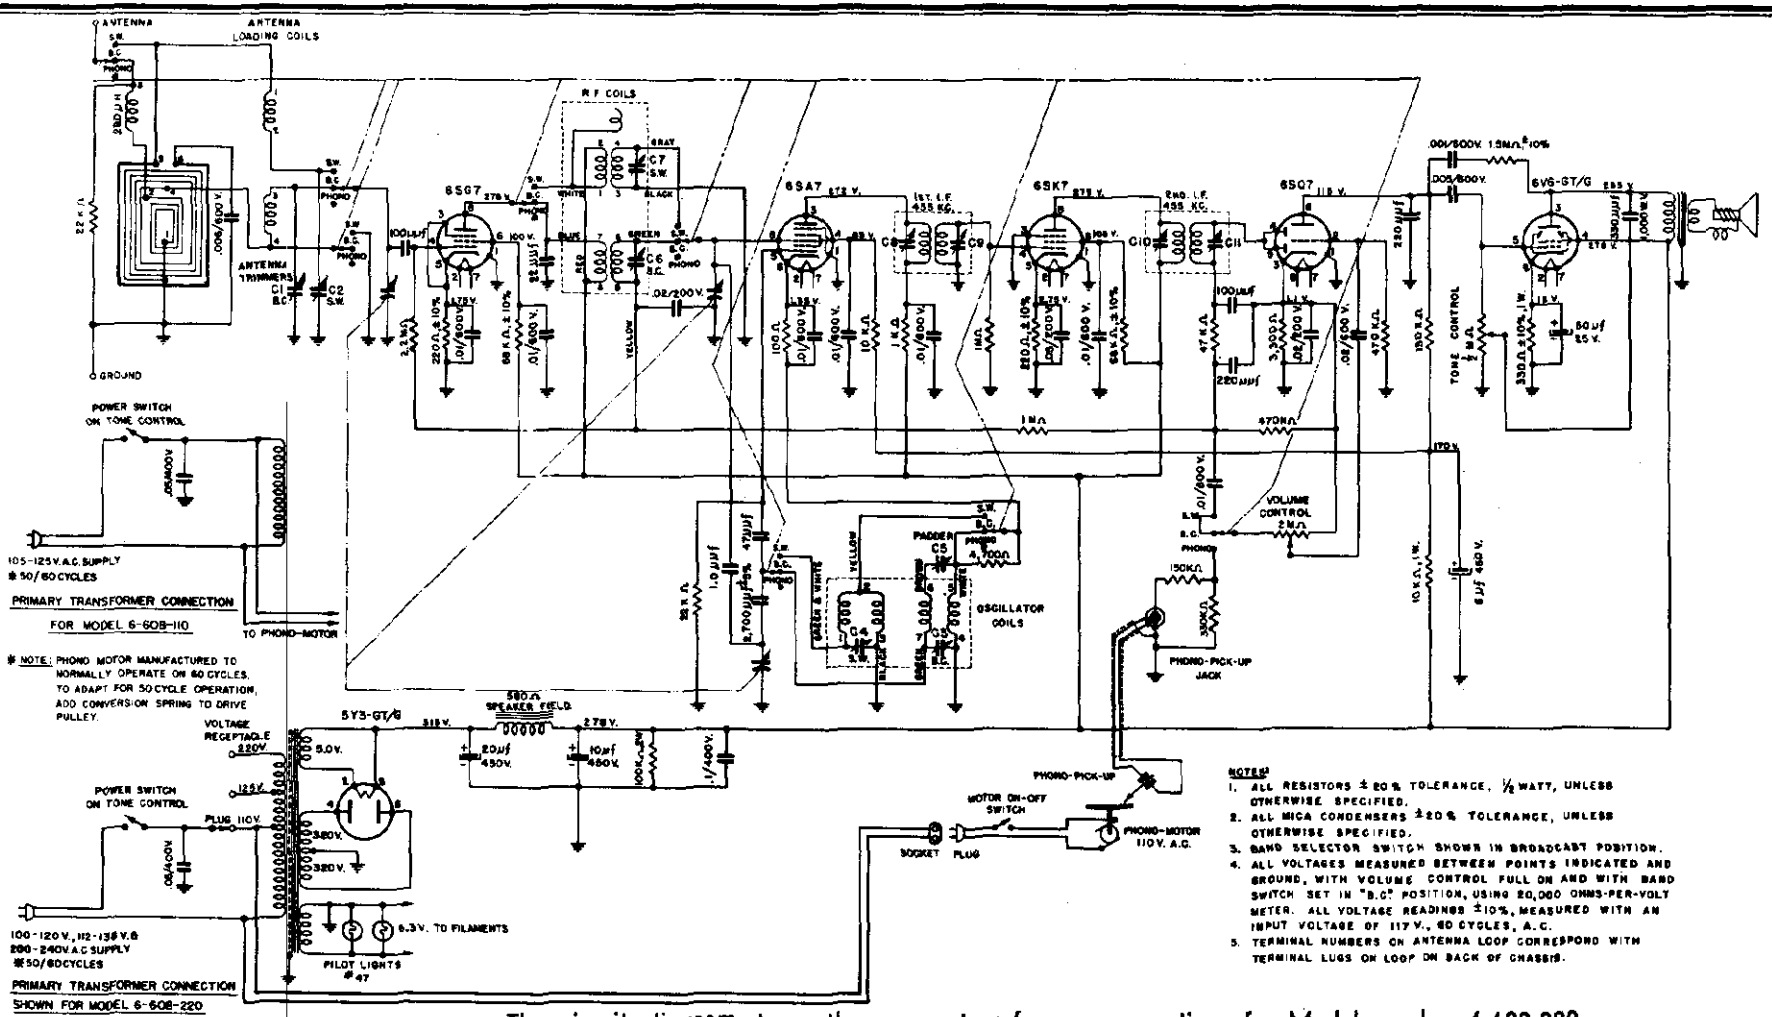
Note: Dial lights may, in case of failure, be replaced without removing chassis from cabinet. Remove the three bronze plated screws which hold the metal-front-shield to the motorboard and lift the shield. The two sockets holding the pilot lights will then be accessible for replacement of the bulbs.

The pick-up is of the low pressure crystal type and is equipped with a permanent type needle which will give about 4,000 playings before requiring replacement. When first used a pronounced needle scratch will be heard which will be greatly reduced after about twenty playings. This "breaking-in-period" is essential on all needles of the permanent type in order to permit the point to become polished.



The circuit diagram shows the power transformer connections for Model number 6-608-220. A separate drawing shows transformer connections for model number 6-608-110. The taps on the transformer drawing correspond to the various points on the voltage connector socket as shown.

Be sure your voltage selector socket connection corresponds to the prevailing line voltage before servicing.
To insure proper alignment, it is suggested to use a radiated signal. To radiate a signal connect a loop of about 6" to 8"" diameter 1 turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned at a distance of about 8" or 10".

To service this receiver it is first necessary to remove the motorboard with the record changer and then remove the chassis through the top opening of the cabinet. To lift the entire motorboard with the changer, unfasten the six screws holding the motorboard in place, disconnect motor and pick-up plugs from chassis, and lift up. It is unnecessary to remove the

ALIGNMENT

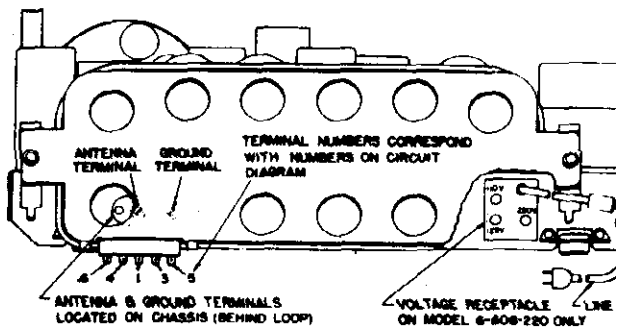
Equipment Required: Modulated r-f signal generator; output meter; insulated screwdriver; one .1 mfd 400 volts and one 50 mmfd 400 volts condenser.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to chassis; turn volume control fully on and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the pointer slide bar (see drawing).

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that pointer carriage coincides with the "reference line" on the pointer slide bar.

REAR VIEW OF RECEIVER CHASSIS WITH CABINET BACK REMOVED



Frequency Range: 535-1700 kc and 5.7 18.4

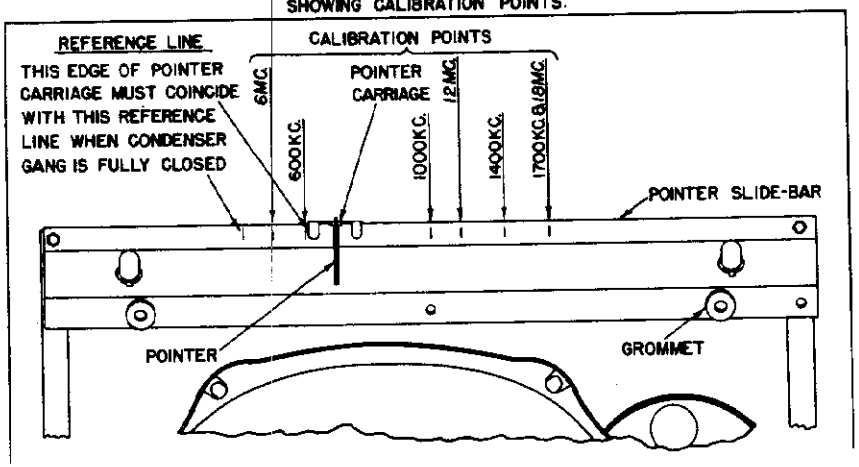
Power Requirement: for Model 6-608-11
105-125 Volts a-c 50 or 60 cycle
for Model 6-608-220 100-120 Vol
or 112-130 Volts or 200-240 Volts a-c 50 or 60 cy

Power Consumption: Receiver 70 Watts
Record Changer 85 Watts

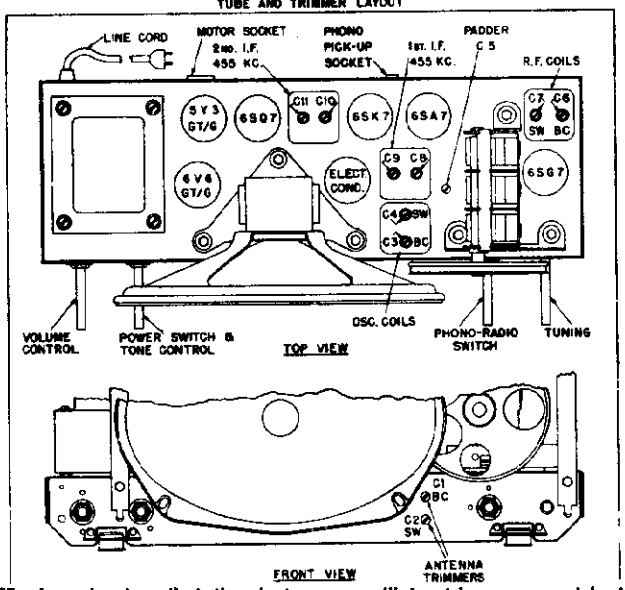
ALIGNMENT PROCEDURE CHART

STEP	SET BAND SWITCH ON	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO-	SET SIGNAL GENERATOR TO-	TURN POINTER TO-	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT. (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE).
1	B.C.	R.F. SECTION OF VARIABLE CONDENSER OR PIN 4 OF THE 6SK7 TUBE IN SERIES WITH A .1 MFD, 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	C11 AND C10 (2nd. I.F. TRANSFORMER)
2	B.C.	R.F. SECTION OF VARIABLE CONDENSER OR PIN 8 OF THE 6SA7 TUBE IN SERIES WITH A .1 MFD, 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	C9 AND C8 (1st. I.F. TRANSFORMER)
3	B.C.	REPEAT STEPS 1 AND 2			
4	B.C.	USE RADIATED SIGNAL (CONNECT BOTH SIDES OF SIGNAL GENERATOR TO RADIATION LOOP).	1700 KC.	1700 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C3 (OSCILLATOR TRIMMER)
5	B.C.		1400 KC.	RESONANCE, APPROXIMATELY 1400 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C6 AND C1 (R.F. AND ANTENNA TRIMMERS)
6	B.C.		600 KC.	RESONANCE, APPROXIMATELY 600 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C5 (PADDER) ROCK VARIABLE FOR MAXIMUM SIGNAL
7	B.C.	REPEAT STEPS 4, 5 AND 6			
8	S.W.		18 MC.	18 MC. CALIBRATION POINT ON DIFFUSER PLATE	C4 (OSCILLATOR TRIMMER) SECOND PEAK FROM TIGHT POSITION. C7 (R.F. TRIMMER) FIRST PEAK FROM TIGHT POSITION. C2 (ANTENNA TRIMMER)
9	S.W.		6 MC.	RESONANCE	CHECK THAT POINTER (AT RESONANCE) COINCIDES WITH 6 MC. CALIBRATION POINT. IF NOT REPEAT STEP 8.
10	S.W.	REPEAT STEPS 8 AND 9			

FRONT VIEW OF DIAL BACK-PLATE SHOWING CALIBRATION POINTS.



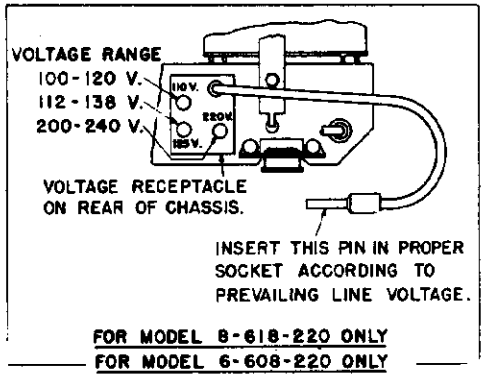
TUBE AND TRIMMER LAYOUT



NOTE: In order to adjust the short wave oscillator trimmer accurately to the fundamental frequency and not to the image signal, turn the trimmer first to the maximum capacity position (fully tight). From this position loosen the trimmer through one peak indication on the output meter until a second peak is obtained. Adjust for maximum output on this second peak.

To check whether this procedure has been accurately performed, ascertain that an image signal can be received (much weaker) by tuning the signal generator to a frequency 910 kilocycles above the alignment frequency.

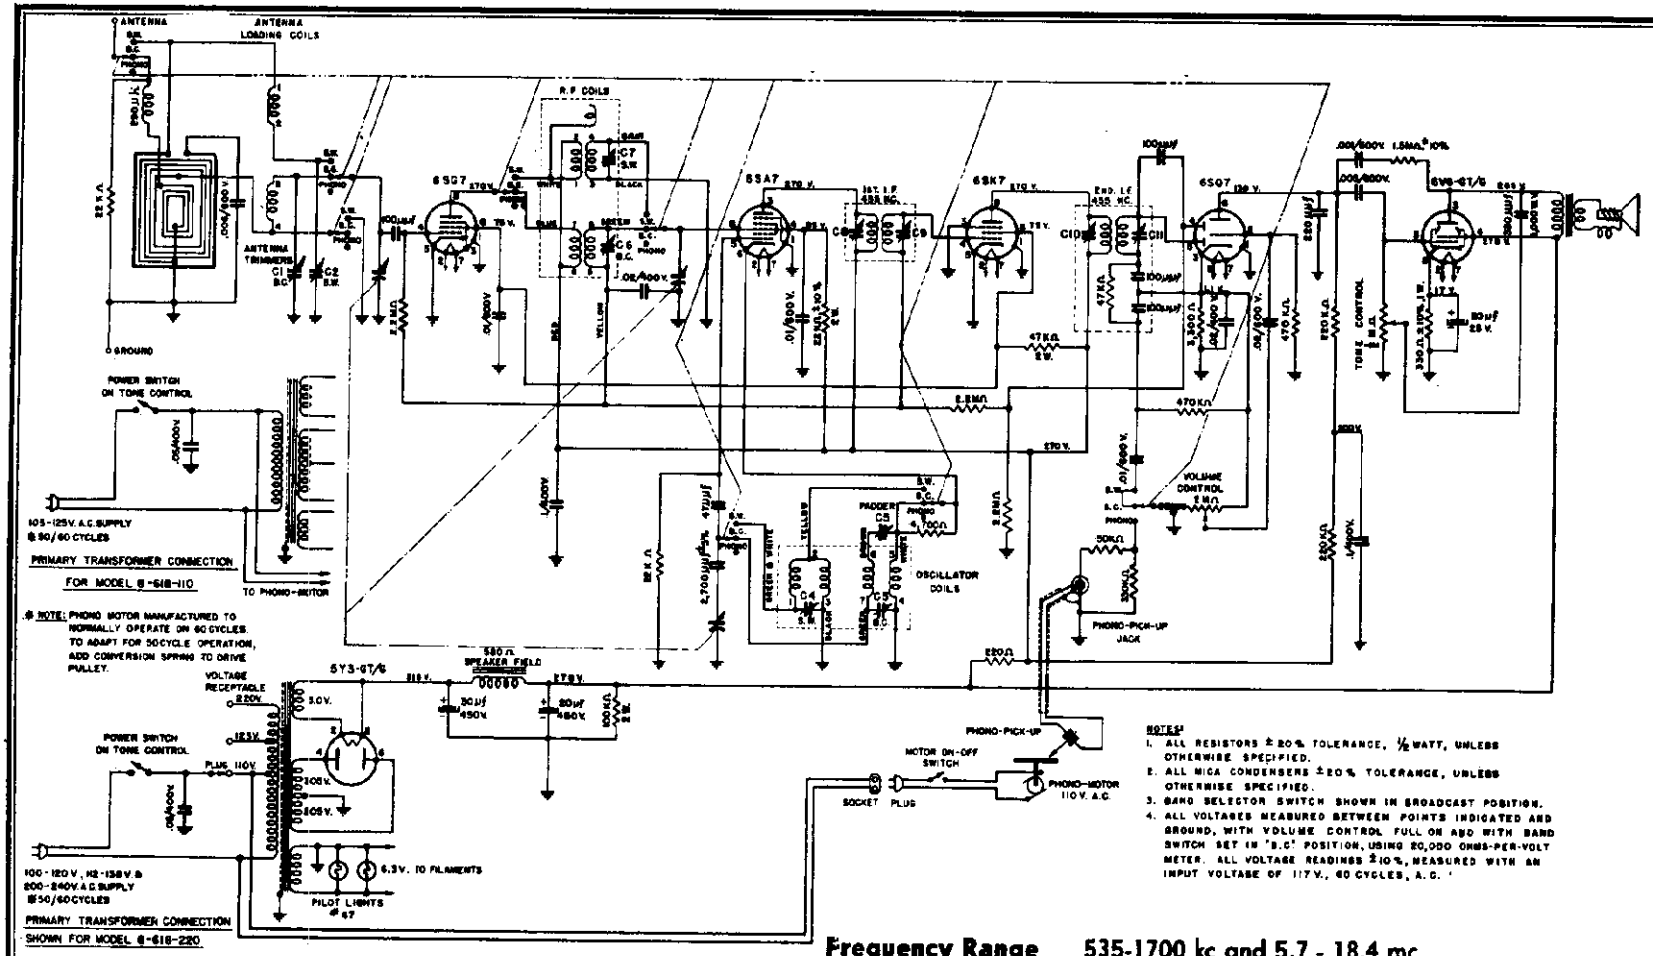
REAR VIEW OF CHASSIS SHOWING VOLTAGE RECEPTACLE



FOR MODEL 8-618-220 ONLY
FOR MODEL 6-608-220 ONLY

Note: Dial lights may, in case of failure, be replaced without removing chassis from cabinet. Remove the three bronze plated screws which hold the metal-front-shield to the motorboard and lift the shield. The two sockets holding the pilot lights will then be accessible for replacement of the bulbs.

The pick-up is of the low pressure crystal type and is equipped with a permanent type needle which will give about 4,000 playings before requiring replacement. When first used a pronounced needle scratch will be heard which will be greatly reduced after about twenty playings. This "breaking in period" is essential on all needles of the permanent type in order to permit the point to become polished.



NOTES:
1. ALL RESISTORS ±20% TOLERANCE, ½ WATT, UNLESS OTHERWISE SPECIFIED.
2. ALL MICA CONDENSERS ±20% TOLERANCE, UNLESS OTHERWISE SPECIFIED.
3. BAND SELECTOR SWITCH SHOWN IN BROADCAST POSITION.
4. ALL VOLTAGES MEASURED BETWEEN POINTS INDICATED AND GROUND, WITH VOLUME CONTROL FULL ON AND WITH BAND SWITCH SET IN "B.C." POSITION, USING 20,000 OHMS-PER-VOLT METER. ALL VOLTAGE READINGS ±10%, MEASURED WITH AN INPUT VOLTAGE OF 117 V., 60 CYCLES, A.C.

Frequency Range 535-1700 kc and 5.7 - 18.4 mc.

Power Requirement 105-125 volts 60 cycles a-c.

Power Consumption Receiver—70 watts. Receiver with Record Changer—85 watts.

ALIGNMENT

Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; one .1 mfd 400 volt condenser; one 400 ohm resistor, and one radiation loop.

With the receiver removed from the cabinet, connect output meter across voice coil. Connect ground side of the signal generator to chassis; turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the pointer slide bar (see drawing).

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that pointer carriage

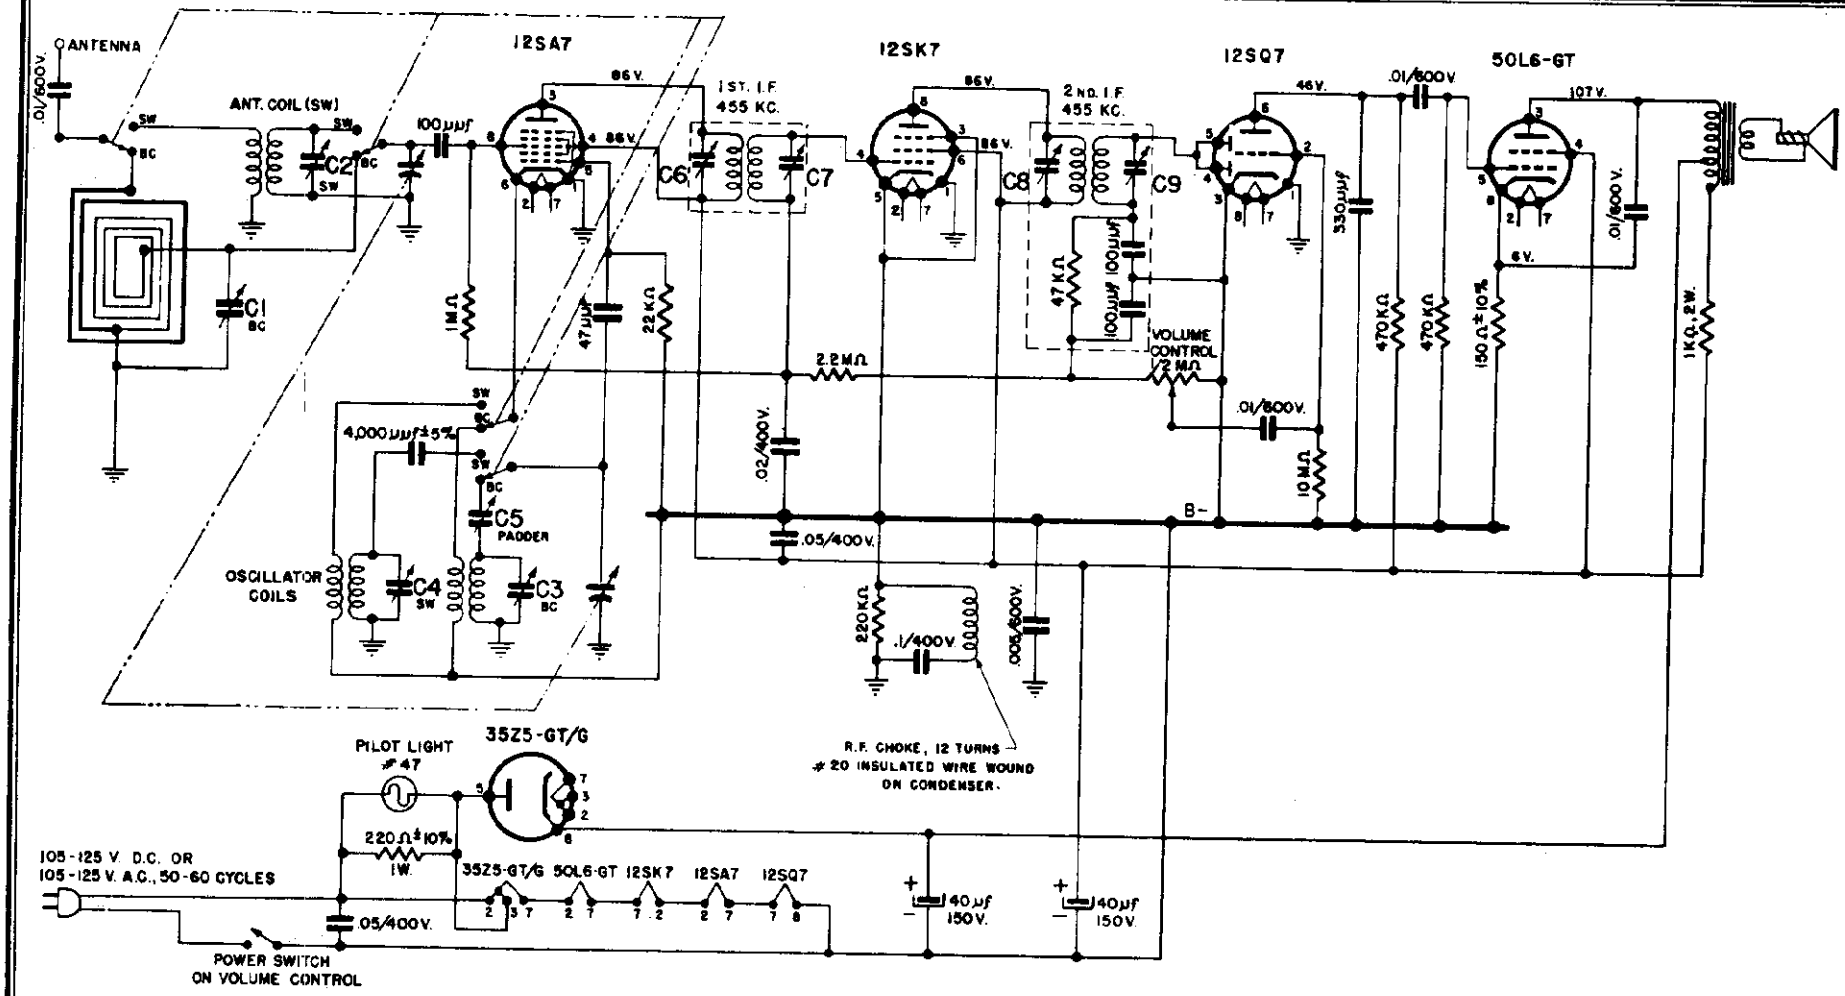
SERVICE AND ALIGNMENT INSTRUCTIONS

To insure proper alignment a radiated signal will be required during part of the alignment procedure. To radiate a signal connect a loop of about 6" to 8" diameter 1 turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned at a distance of about 8" or 10".

To service this receiver it is first necessary to remove the motorboard with the record changer and then remove the chassis through the top opening of the cabinet. To lift the entire motorboard with the changer, unfasten the six screws holding the motorboard in place, disconnect motor and pick-up plugs from chassis, and lift up.

CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION WHEREBY THE CHANGER MECHANISM WILL NOT BE DAMAGED.



LEGEND

⏚ CHASSIS GROUND

FOR 230 V. D.C. OR 230 V. 50-60 CYCLES A.C. OPERATION, USE LINE ADAPTER CORD, PART LC-550.

NOTES:

1. ALL RESISTORS ± 20% TOLERANCE, 1/2 WATT, UNLESS OTHERWISE SPECIFIED.
2. ALL MICA CONDENSERS ± 20% TOLERANCE, UNLESS OTHERWISE SPECIFIED.
3. ALL VOLTAGES MEASURED BETWEEN POINTS INDICATED AND B-, WITH VOLUME CONTROL FULL ON, AND WITH BAND SWITCH SET IN "BC" POSITION, USING 20,000 OHMS-PER-VOLT METER. ALL READINGS ± 10%, MEASURED WITH INPUT VOLTAGE OF 117 V., 60 CYCLES A.C.

MODELS 7-435W (Walnut)—7-435V (Ivory)

Frequency Range Broadcast 540 k-c to 1610 k-c—Shortwave 4.75 m-c to 16.1 m-c

Power Requirement 105-125 Volts d-c or 50 to 60 cycles a-c

Power Consumption 30 watts

ALIGNMENT PROCEDURE CHART

9	S.W.		5.5 MC.	RESONANCE (APPROX. 5.5 ON DIAL)	CHECK THAT POINTER (AT RESONANCE) COINCIDES WITH 5.5 MC. CALIBRATION POINT ON DIAL. IF NOT REPEAT STEP 8.

ALIGNMENT INSTRUCTIONS

Equipment required: Modulated r-f signal generator, output meter, insulated screw driver, two .1mfd. 400 V. Condensers, one 400 ohms resistor.

To align the receiver it is necessary to remove the chassis from the cabinet, check that the pointer is horizontal and coincides with the two horizontal reference lines on the dial. In this position the condenser should be completely closed. Turn volume control to maximum and connect the output meter across the voice coil.

Then connect the low side of the signal generator to the receiver chassis through a .1 mfd. condenser and keeping the output as low as possible proceed in the sequence as shown on the alignment chart.

To insure alignment a radiated signal will be required during part of the alignment procedure. To radiate a signal connect a loop of about 6" to 8" diameter, (one turn of #14 or #12 wire) across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 8" or 10".

Line Voltage . . . . . 110–120 volts, 50–60 cycles, A.C.
Power Consumption . . . 67 watts

Tuning Frequency Range:
540 to 1620 KC

Intermediate Frequency:
455 KC

Electrical Power Output:
Undistorted . . . . . 3.0 watts
Maximum . . . . . 5.0 watts

Loudspeaker:
Type . . . . . Permanent Magnet
Outside Cone Diameter . . 10"
Voice Coil Impedance . . 3.2 ohms at 400 cycles
Magnet Rating . . . . . 4.64 Oz. Alnico V

Tubes:

Tube	No.	Function
6SK7	V-1	R.F. Amplifier
6SA7	V-2	Frequency Converter
6SK7	V-3	I.F. Amplifier
6J5	V-4	Oscillator
6SK7	V-5	A. F. Amplifier
6V6/GT	V-6	Power Amplifier
6J5	V-7	Detector
5Y3/GT	V-8	Rectifier

GENERAL INFORMATION

This model is a console radio-phonograph combination with a Webster model 56 changer and a Shure P-30 "Silentronic" crystal pickup. The set is housed in a bleached modern, walnut or mahogany period cabinet.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements:

Measurements taken with volume and tone controls ma mum. Switch in Radio position. AVC shorted out.
Standard Output . . . . . 50.0 milliwatts
Dummy Antenna . . . . . 200.0 Mmf.

Antenna to R.F. Grid . . . . . 6X at 1000 KC
R.F. Grid to Converter Grid . . . 7X at 1000 KC
Converter Grid to 1st I.F. Grid . . 46X at 455 KC
1st I.F. Grid to 2nd Detector . . . 62X at 455 KC
Overall Audio Gain . . . 320X at 0.5 watts, 400 cycle

Oscillator Cathode Voltages:

Measured at 117 volts A.C. line voltage with an A.C. ty vacuum tube voltmeter, input impedance above 10 megohm
1500 KC . . . . . 1.0 volts A.C.
1000 KC . . . . . 1.0 volts A.C.
800 KC . . . . . 1.1 volts A.C.
600 KC . . . . . 1.1 volts A.C.

D.C. Resistance Measurements:

1st and 2nd I.F. Coils
Primary . . . . . 17.0 ohms
Secondary . . . . . 17.0 ohms*

*NOTE: To obtain the true reading of the secondary of t second I.F. coil, it is necessary to remove it from t can. This is due to the 47K resistor inside the ca

Oscillator Coil
Primary . . . . . 1.0 ohms
Secondary . . . . . 6.0 ohms

Antenna Coils
Start to Finish . 12.2 ohms
Start to Tap . 10.5 ohms

R.F. Coil
Primary . . . . . 58.0 ohms
Secondary . . . . . 4.2 ohms

NOTE: Due to the variation in winding methods, the D.C. r sistance on all coils is subject to a 20% tolerance.

Socket Voltages:

All D.C. voltages measured with a vacuum tube voltmet from socket contacts to chassis.—A.C. voltages measured wi a 1000 ohms per volt A.C. meter from socket contacts to chassi Volume and tone controls maximum.—Switch in Radio pos tion.—No signal.—117 volts A.C. line.

All voltages shown are positive D.C. unless otherwise note

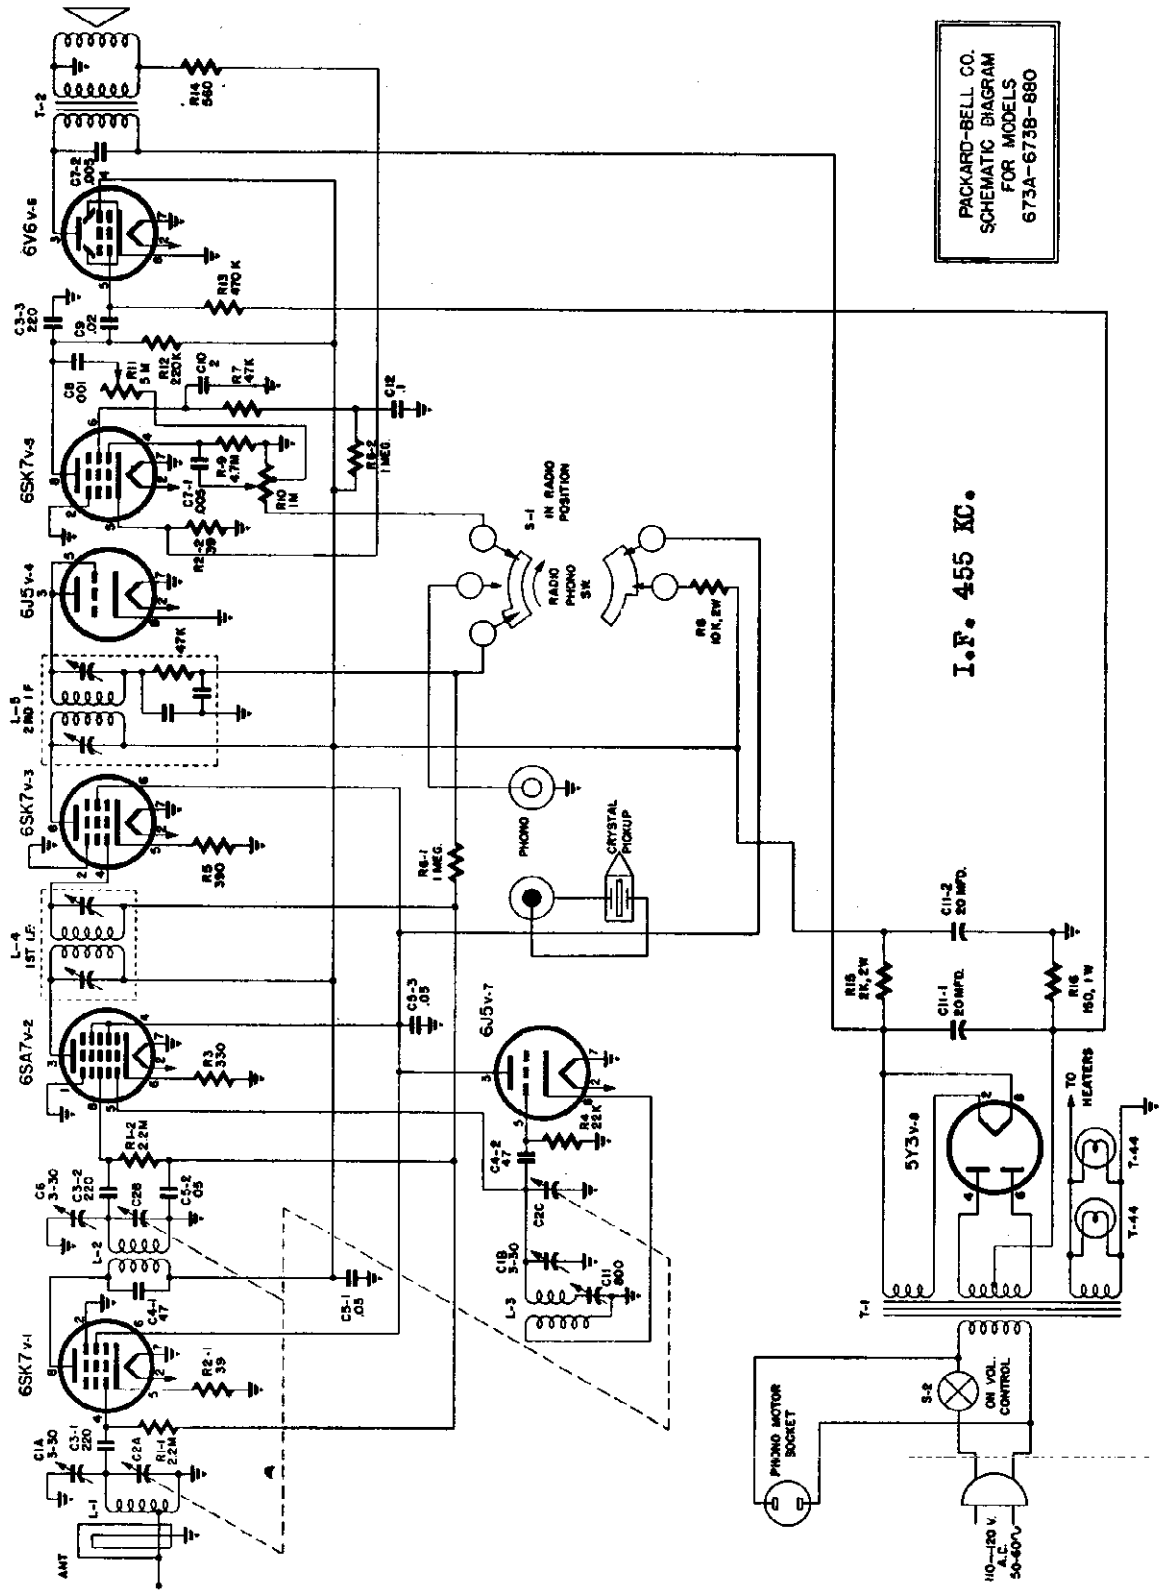
MODELS 673A, 673B, 880 PACKARD-BELL COMPANY



ALIGNMENT PROCEDURE

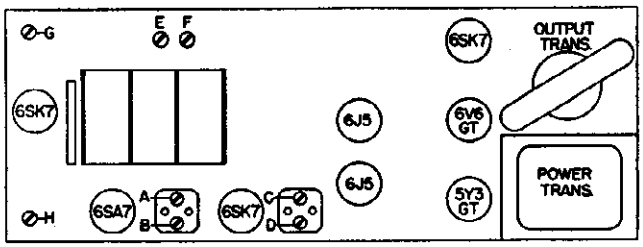
Alignment procedure consists of the steps outlined in the Alignment Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completion of this step, "Rock" the variable condenser to assure that the I.F.'s have been aligned to the correct frequency, not the image frequency.

Use the Hazeltine Standard Test Loop No. 1150, or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

It will be noted that all trimmers are accessable without removing the chassis from the cabinet.

IMPORTANT NOTICE: Make certain that each alignment step is done with a minimum input signal.



TRIMMER LOCATIONS

A—I.F. Trimmer	E—Osc. Trimmer
B—I.F. Trimmer	F—R.F. Trimmer
C—I.F. Trimmer	G—Ant. Trimmer

Electrical Rating:

Line Voltage	110–120 volts, 50–60 cycle A.C.
Power Consumption	56 watts

GENERAL INFORMATION

Model 771 is a table model, two band superheterodyne receiver. This model employs six tubes, plus a rectifier and a permanent magnet speaker. Listed below are the features contained in this set.

1. Two bands; Standard Broadcast and Short Wave.
2. Export version (771X) may be used on either 120 or 240 volts A.C. by the removal of a plate and manipulating a switch on the back of the chassis.
3. Built-in high impedance loop antenna which gives excellent signal pickup while rejecting a large part of the noise.

ALIGNMENT PROCEDURE

Alignment consists of the steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground, in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completion of this step, "Rock" the variable condenser to assure that the I.F.'s have been aligned to the correct frequency, not the image frequency.

Use a Hazeltine Standard Test Loop No. 1150, or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

IMPORTANT NOTICE: Make certain that each alignment step is done with a minimum input signal.

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT

SPECIAL SERVICE INFORMATION

Stage Gain Measurements—Broadcast Band:

Measurements taken with volume and tone controls maximum. Switch in Broadcast position. AVC shorted out.

Standard Output	50.0 milliwatts
Dummy Antenna	200.0 Mmf.
Antenna to R.F. Grid	10X at 1000 KC
R.F. Grid to Converter Grid	5X at 1000 KC
Converter Grid to 1st I.F. Grid	50X at 455 KC
1st I.F. Grid to 2nd Detector	60X at 455 KC
Overall Audio Gain	0.1 volt audio input for 1.0 watt, 400 cycles

Stage Gain Measurements—Short Wave Band:

Measurements taken with volume and tone controls maximum. Switch in Short Wave position. AVC shorted out.

Standard Output	50.0 milliwatts
Dummy Antenna	400 ohms
Antenna to R.F. Grid	2.0X at 10.0 MC
R.F. Grid at Converter Grid	4.0X at 10.0 MC
Converter Grid to I.F. Grid	45.0X at 10.0 MC

Oscillator Cathode Voltages—Broadcast Band:

Measured at 117 volts A.C. line voltage with an A.C. type Vacuum Tube Voltmeter, input impedance above 10 megohms.

1500 KC	5.8 volts A.C.
1000 KC	4.9 volts A.C.
600 KC	4.2 volts A.C.

Oscillator Cathode Voltages—Short Wave Band:

Measured at 117 volts A.C. line voltage with an A.C. type Vacuum Tube. Voltmeter, input impedance above 10 megohms.

16.0 MC	6.8 volts A.C.
10.0 MC	4.5 volts A.C.
6.0 MC	1.9 volts A.C.

D.C. Resistance Measurements:

1st and 2nd I.F. Coils
Primary . . . 17 ohms
Secondary . . 17 ohms*

*NOTE: To obtain the true reading of the secondary of the 2nd I.F. coil, it must be removed from the can. This is due to the 47K resistor inside the can.

Oscillator Coils

Broadcast		Short Wave	
Primary	1.0 ohms	Start to Finish	4.0 ohms
Secondary	6.0 ohms	Start to Tap	2.0 ohms

Antenna Coils

Broadcast		Short Wave	
Start to Finish	12.2 ohms	Start to Finish	0.25 ohms
Start to Tap	10.5 ohms	Start to Tap	0.20 ohms

R.F. Coils

Broadcast		Short Wave	
Primary	75.0 ohms	Primary	5.5 ohms
Secondary	6.5 ohms	Secondary	0.2 ohms

NOTE: Due to a variation in winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

Socket Voltages:

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.—A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis.

Volume and tone controls maximum.—Switch in Broadcast position.—No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.

Tuning Frequency Range:
540 to 1620 KC

Intermediate Frequency:
455 KC

GENERAL INFORMATION

Model 881 is a PhonOcord console employing 8 tubes and a ten-inch permanent magnet speaker.

Listed below are features contained in this model.

1. Superheterodyne receiver.
2. Automatic Home Recording with Public Address System.
3. Phonograph with automatic record changer.
4. Specially designed low impedance loop antenna.

To service tubes, reach through the hole in left back

Electrical Rating:

Line Voltage	110–120 volts, 50–60 cycle A.C.
Power Consumption	80 Watts

Electrical Power Output:

Undistorted	3 Watts
Maximum	5 Watts

Loudspeaker

Type	Permanent Magnet
Outside Cone Diameter	10"
Voice Coil Impedance	3.2 ohms at 400 cycles

Tubes:

Tube	Function
6SK7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SF7	1st Audio Amplifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier
6H6	Compressor Rectifier

ALIGNMENT PROCEDURE

Alignment Procedure consists of the 5 steps outlined in the Alignment Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completion of this step "Rock" the variable condenser to assure that the I.F.'s have been aligned to the correct frequency. Output should remain constant for any setting of the variable condenser.

Use the Hazeltine Test Loop No. 1150 or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

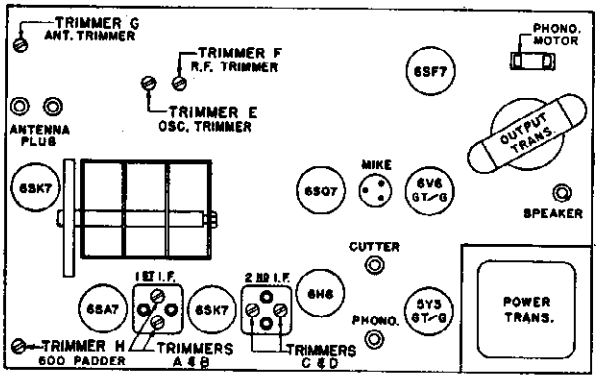
It will be noted that all alignment trimmers are accessible without removing the chassis from the cabinet.

IMPORTANT NOTICE: Make certain that each alignment step is done with a minimum input signal.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Grd. (.01 Mfd Cap.)	455 KC	540 KC	Trimmers A, B, C, & D
2	Standard Test Loop*	1620 KC	1620 KC	Trimmer E to 1620 KC
3	Standard Test Loop*	600 KC	Rock Variable	Trimmer H to 600 KC
4	Standard Test Loop*	1500 KC	1500 KC	Trimmers F & H
5	Repeat Steps 2, 3 & 4			

*NOTE: Hazeltine Test Loop No. 1150 (or reasonable substitute).



TRIMMER LOCATION

RECORDING HEAD PRESSURE

The proper recording head pressure is 1¼ oz. Adjustment of this pressure is made by turning the small screw on the top of the recording arm. This adjustment is very critical and should be made in quarter turns. TURN THE SCREW CLOCKWISE TO INCREASE THE CUTTING DEPTH and COUNTERCLOCKWISE TO DECREASE THE CUTTING DEPTH.

This adjustment is made at the factory with an ordinary postal scale, consequently, field adjustments should be made in a like manner.

HOW TO CHECK COMPRESSION VOLTAGE

Turn the Selector Switch to Radio Record position. Feed a 1 volt (RMS) 1000 cycle signal into the diode return of the 2nd I.F. (brown lead). Connect the leads of a vacuum tube voltmeter to the point indicated on Figure 4, Schematic Diagram, and ground. The voltage at this point should be approximately a minus 2.25 volts.

BRIEF DESCRIPTION OF COMPRESSION CIRCUIT

One diode section of the 6H6 serves as the compressor rectifier. The compression system is automatic, and is in the circuit on both record positions. A portion of the output voltage is rectified by the 6H6 and varies grid bias of the first audio, 6SF7.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements:

Measurements taken with volume and tone controls maximum.—AVC shorted out.

Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.

Antenna post to R.F. grid	7X at 1000 KC
R.F. grid to Converter grid	7.5X at 1000 KC
Converter grid to 1st I.F. grid	56X at 455 KC
1st I.F. grid to 2nd Detector	57X at 455 KC
Overall Audio Gain	320X at .5 watts 400 cycles

OSCILLATOR CATHODE VOLTAGES:

Measured at 117 volts AC line voltage with AC vacuum tube voltmeter, input loading above 10 megohms.

1600 KC . . . . . 2.15 volts AC
1000 KC . . . . . 2.0 volts AC
600 KC . . . . . 2.2 volts AC

D.C. RESISTANCE MEASUREMENTS:

1st and 2nd I.F. Coils:
Primary . . . . . 17 ohms
Secondary . . . . . 17 ohms*

*NOTE: To obtain the true reading of the secondary of the 2nd I.F. Coil, it must be removed from the can. This is because of the 47K resistor inside the can.

Oscillator Coil:
Primary . . . . . 1 ohm
Secondary . . . . . 6 ohms

Antenna Coil:
Start to finish . . . . 12.2 ohms
Start to tap . . . . . 10.5 ohms

R.F. Coil:
Primary . . . . . 58 ohms
Secondary . . . . . 4.2 ohms

NOTICE: The D.C. Resistance measurements on all coils are subject to a 20% tolerance due to the variation of winding methods.

SOCKET VOLTAGES

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.—A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. —Volume and tone controls maximum.—Switch in Radio Receive position. No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.

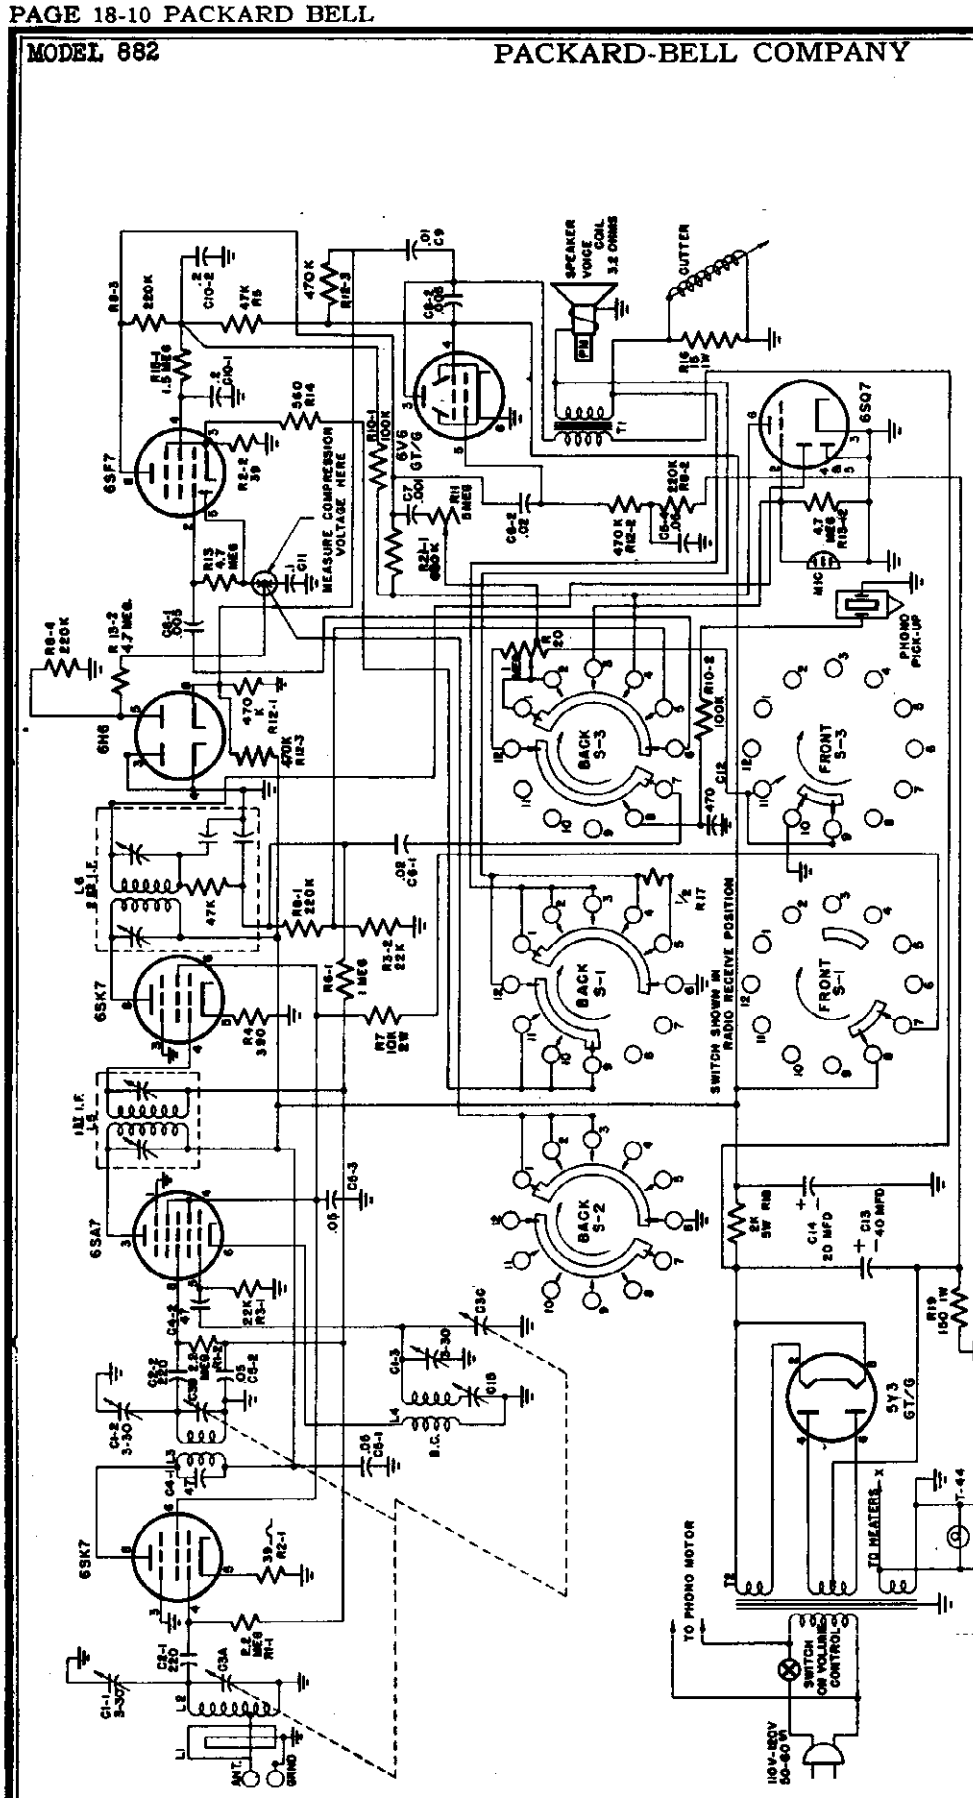
MODEL 882

PACKARD-BELL COMPANY



Loudspeaker

Type	Permanent Magnet
Outside Cone Diameter	12"
Voice Coil Impedance	3.2 ohms at 400 cycles
Magnet Rating	6.8 Oz. Alnico V

Tubes:

Tube	Function
6SK7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SF7	1st Audio Amplifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier
6H6	Compressor Rectifier
6SQ7	Microphone Amplifier, 2nd Detector

Electrical Rating:

Line Voltage	110–120 volts, 50–60 cycle A.C.
Power Consumption	80 Watts

Tuning Frequency Range:
540 to 1620 KC

Intermediate Frequency:
455 KC

Electrical Power Output:

Undistorted	3 Watts
Maximum	5 Watts

GENERAL INFORMATION

Model 882 is a PhonOcord console employing 8 tubes and a twelve-inch permanent magnet speaker.
Listed below are features contained in this model.

1. Superheterodyne receiver.
2. Automatic Home Recording with Public Address System.
3. Phonograph with automatic record changer.
4. Specially designed low impedance loop antenna.

To service tubes, remove plate in record changer compartment.

ALIGNMENT PROCEDURE

Alignment Procedure consists of the 5 steps outlined in the Alignment Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completion of this step "Rock" the variable condenser to assure that the I.F.'s have been aligned to the correct frequency. Output should remain constant for any setting of the variable condenser.

Use the Hazeltine Test Loop No. 1150 or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

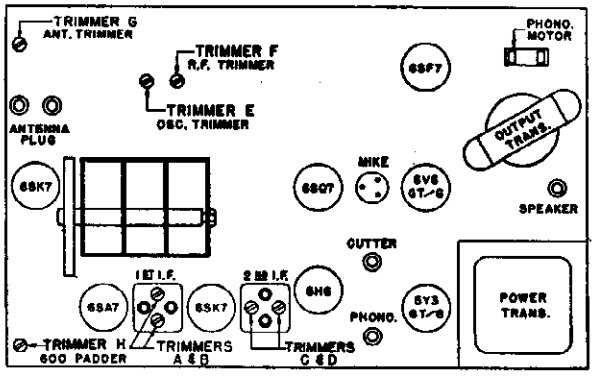
It will be noted that all alignment trimmers are accessible without removing the chassis from the cabinet.

IMPORTANT NOTICE: Make certain that each alignment step is done with a minimum input signal.

ALIGNMENT CHART

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Grd. (.01 Mfd Cap.)	455 KC	540 KC	Trimmers A, B, C, & D
2	Standard Test Loop*	1620 KC	1620 KC	Trimmer E to 1620 KC
3	Standard Test Loop*	600 KC	Rock Variable	Trimmer H to 600 KC
4	Standard Test Loop*	1500 KC	1500 KC	Trimmers F & H
5	Repeat Steps 2, 3 & 4			

*NOTE: Hazeltine Test Loop No. 1150 (or reasonable substitute).



TRIMMER LOCATION

RECORDING HEAD PRESSURE

The proper recording head pressure is 1¼ oz. Adjustment of this pressure is made by turning the small screw on the top of the recording arm. This adjustment is very critical and should be made in quarter turns. TURN THE SCREW CLOCKWISE TO INCREASE THE CUTTING DEPTH and COUNTERCLOCKWISE TO DECREASE THE CUTTING DEPTH.

This adjustment is made at the factory with an ordinary postal scale, consequently, field adjustments should be made in a like manner.

BRIEF DESCRIPTION OF COMPRESSION CIRCUIT

One diode section of the 6H6 serves as the compressor rectifier. The compression system is automatic, and is in the circuit on both record positions. A portion of the output voltage is rectified by the 6H6 and varies grid bias of the first audio, 6SF7.

HOW TO CHECK COMPRESSION VOLTAGE

Turn the Selector Switch to Radio Record position. Feed a 1 volt (RMS) 1000 cycle signal into the diode return of the 2nd I.F. (brown lead). Connect the leads of a vacuum tube voltmeter to the point indicated on Figure 4, Schematic Diagram, and ground. The voltage at this point should be approximately a minus 2.25 volts.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements:

Measurements taken with volume and tone controls maximum.—AVC shorted out.

Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.

Antenna post to R.F. grid	7X at 1000 KC
R.F. grid to Converter grid	7.5X at 1000 KC
Converter grid to 1st I.F. grid	56X at 455 KC
1st I.F. grid to 2nd Detector	57X at 455 KC
Overall Audio Gain	320X at 0.5 watt 400 cycles

OSCILLATOR CATHODE VOLTAGES:

Measured at 117 volts AC line voltage with AC vacuum tube voltmeter, input loading above 10 megohms.

1600 KC . . . . . 2.15 volts AC
1000 KC . . . . . 2.0 volts AC
600 KC . . . . . 2.2 volts AC

D.C. RESISTANCE MEASUREMENTS:

1st and 2nd I.F. Coils:
Primary . . . . . 17 ohms
Secondary . . . . . 17 ohms*

*NOTE: To obtain the true reading of the secondary of the 2nd I.F. Coil, it must be removed from the can. This is because of the 47K resistor inside the can.

Oscillator Coil:
Primary . . . . . 1 ohm
Secondary . . . . . 6 ohms

Antenna Coil:
Start to finish . . . . 12.2 ohms
Start to tap . . . . . 10.5 ohms

R.F. Coil:
Primary . . . . . 58 ohms
Secondary . . . . . 4.2 ohms

NOTICE: The D.C. Resistance measurements on all coils are subject to a 20% tolerance due to the variation of winding methods.

SOCKET VOLTAGES

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.—A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. —Volume and tone controls maximum.—Switch in Radio Receive position. No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.

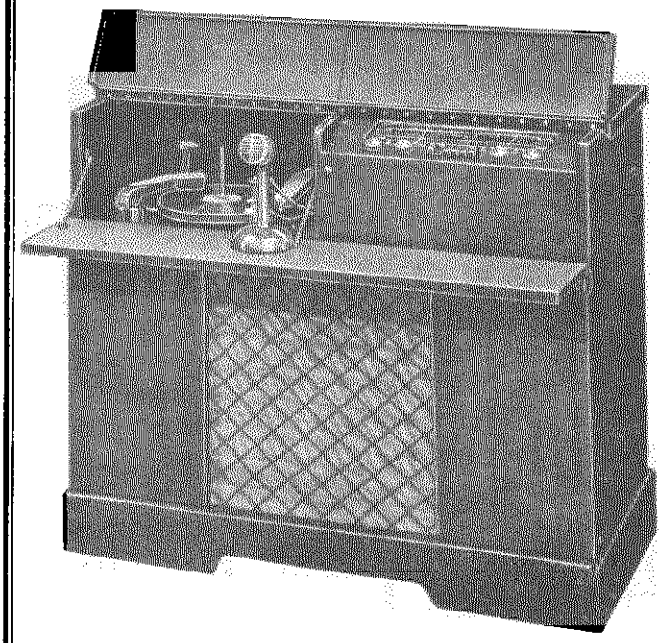
ISOMETRIC VIEW OF DIAL CABLING



GENERAL INFORMATION

Model 1063 is a PhoOcord console with a two band superheterodyne receiver. This model employs ten tubes and a permanent magnet speaker.

Listed below are some of the features contained in this Model PhonOcord.

1. Two band superheterodyne receiver.
2. Automatic Home Recording with Public Address System.
3. Phonograph with automatic record changer.
4. Volume Expansion.
5. Volume Compression for Home Recording.
6. Low Level Dynamic Bass Boost.

The output of the microphone and radio on Mixed Program Record may be regulated by varying the controls on the top of the chassis. (See Figure 2, Trimmer Location).

An early run of this model utilized a 20 Mfd. filter (C18) in the input voltage instead of a 40 Mfd.

Electrical Rating:

Line Voltage . . . 110-120 volts 50-60 cycle AC
Power Consumption . . . 106 watts

Tuning Frequency Range:

Standard Broadcast . . . 540 to 1620 KC
Short Wave . . . 6 to 18 MC

Intermediate Frequency:

455 KC

Electrical Power Output:

Undistorted . . . 3.5 watts
Maximum . . . 6 watts

Loudspeaker:

Type . . . Permanent Magnet
Outside Cone Diameter . . . 10"
Voice Coil Impedance . . . 3.2 ohms at 400 cycles
Magnet Rating . . . 6.8 Oz. Alnico 5

Tubes:

Tube	Function
6SK7	R.F. Amplifier
6SA7	Frequency Converter
6SK7	I.F. Amplifier
6SF7	2nd Detector & Expansion Amplifier
6H6	Expansion Rectifier & Delayed Auc AVC
6SQ7	Microphone Amplifier
6SF7	1st Audio Amplifier
6H6	Compression Rectifier
6V6-GT/G	Power Amplifier
5Y3-GT/G	Rectifier

SPECIAL SERVICE INFORMATION

STAGE GAIN MEASUREMENTS:

Measurements taken with volume and tone controls ma imum. — Band Switch in Standard Broadcast positio — Push Button Switch in Radio Receive position. — AV shorted out.

Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.
Antenna Grid to R.F. Grid . . 6X at 1000 KC
R.F. Grid to Converter Grid . . . 12.5X at 1000 K
Converter Grid to 1st I.F. Grid . . . 61X at 455 K
1st .F. Grid to 2nd Detector . . . 120X at 455 KC
Overall Audio Gain . . . 620X at 1 watt 400 cycles

OSCILLATOR CATHODE VOLTAGES:

Measured at 117 Volts AC line voltage with AC vacuu tube voltmeter input loading above 10 megohms.

1620 KC . . . 3.4 volts AC
1300 KC . . . 3.2 volts AC
750 KC . . . 3.2 volts AC
550 KC . . . 3.7 volts AC

D.C. RESISTANCE MEASUREMENTS:

I.F. COILS

1st I.F.		2nd I.F.	
Primary	. . . 17 ohms	Primary	. . . 17 ohms
Secondary	. . . 17 ohms	Secondary	. . 17 ohms

*NOTE: To obtain the true reading of the secondary the 2nd I.F. coil it must be removed from the ca This is so because of the 56,000 ohm resistor series with the AVC lead inside the can.

OSCILLATOR COILS

Broadcast		Short Wave	
Primary	. . . 1 ohm	Start to Finish	. . 4 ohm
Secondary	. . . 6 ohms	Start to Tap	. . . 2 ohm

ANTENNA COILS

Broadcast		Short Wave	
Start to Finish	. . 12.2 ohms	Start to Finish	. . .25 ohm
Start to Tap	. . . 10.5 ohms	Start to Tap	. . . . .20 ohm

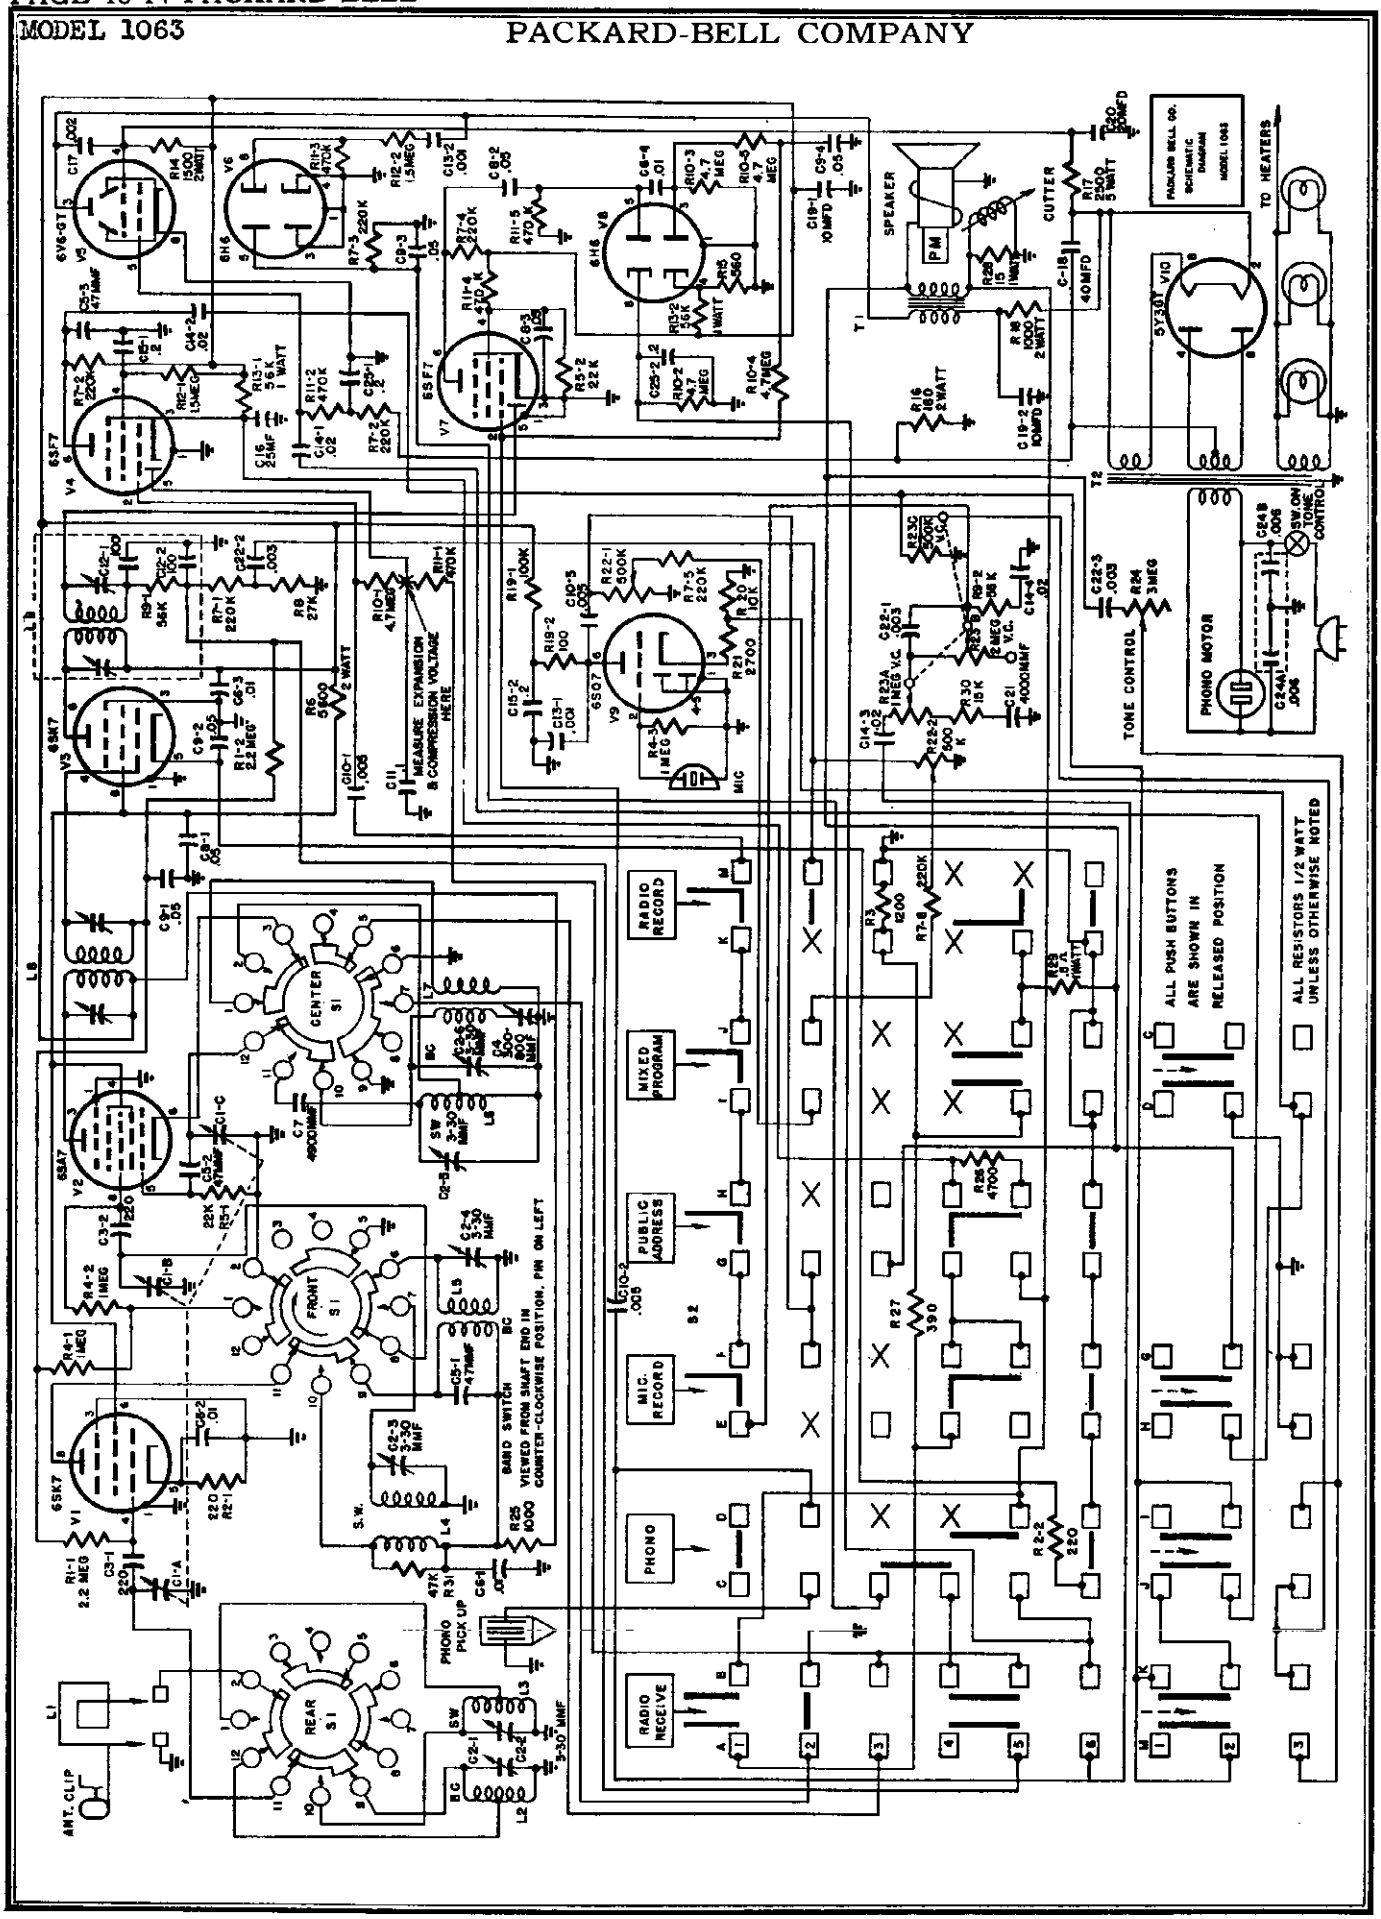
R.F. COILS

Broadcast		Short Wave	
Primary	. . . 5 8 ohms	Primary	. . . 5.5 ohm
Secondary	. . . 4.2 ohms	Secondary	. . . .2 ohm

NOTE: Due to the variation of winding methods, the D.C resistance on all coils is subject to a 20% tolerance.

MODEL 1063

PACKARD-BELL COMPANY



ALIGNMENT PROCEDURE

Alignment procedure consists of the 7 steps outlined in the Alignment Procedure Chart.

Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. capacitor (dummy load) for step No. 1, I.F. Alignment. Upon completing this step "Rock" the variable condenser to assure that the I.F.s have been aligned to the correct frequency. Output should remain constant at any setting of the variable condenser.

Use the Hazeltine Test Loop or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

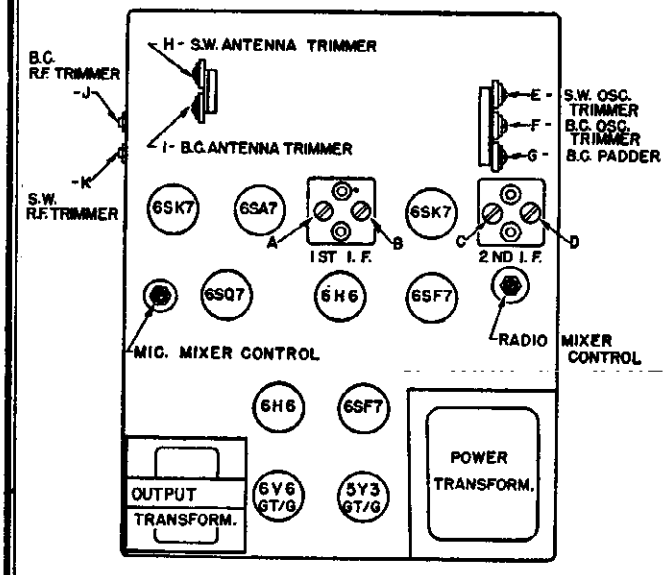
It will be noted that all trimmers are accessable without removing the chassis from the cabinet.

IMPORTANT NOTICE: Make certain that each alignment step is done with a minimum input signal.

ALIGNMENT CHART

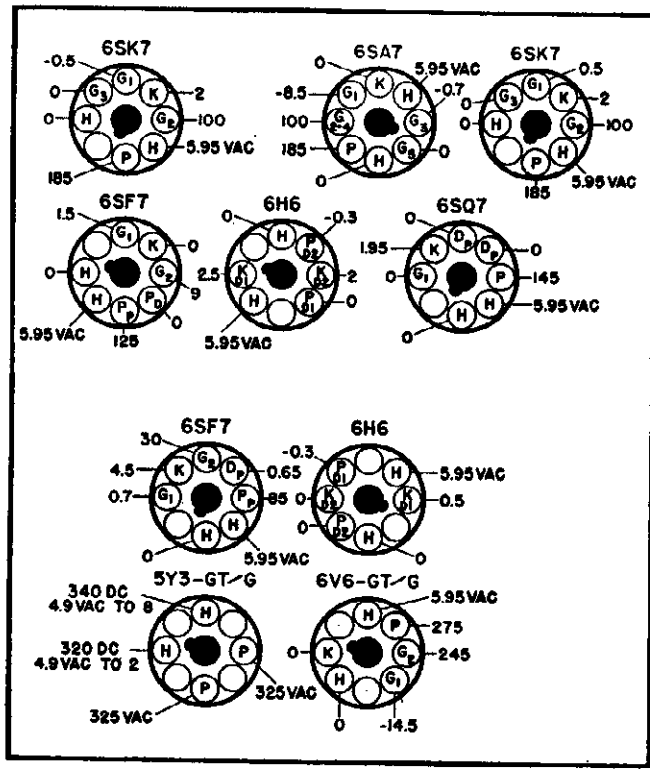
	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
STEP 1	Mixer Grid & Grd.	455 KC	540 KC	Trimmers A, B, C & D
2	Standard* Test Loop	1620 KC	1620 KC	Trimmer F to 1620 KC
3	Standard* Test Loop	600 KC	600 KC	Trimmer G to 600 KC
4	Standard* Test Loop	1500 KC	1500 KC	Trimmers I & J
5	REPEAT STEPS 2, 3, & 4			
6	Standard* Test Loop	18 MC	18 MC	Trimmer E to 18 MC
7	Standard* Test Loop	15 MC	15 MC	Trimmers K & H

*NOTE: Hazeltine Standard Test Loop No. 1150 or a reasonable substitute.



Trimmer Location

No signal.
117 volts A.C. line voltage.
Band switch in standard broadcast position.
All voltages shown are positive D.C. unless otherwis noted.
All voltages measured from socket contacts to chassis D.C. voltages measured with a vacuum tube voltmeter A.C. voltages measured with a 1000 ohm per volt A.C meter.
Volume and tone controls maximum.



Socket Voltages

BRIEF DESCRIPTON OF EXPANDER AND COMPRESSOR CIRCUITS:

V7, 6SF7 and V6, 6H6 embrace the expansion circuit Referring to Figure 3, Schematic Diagram, it will be noted that expansion is in the circuit only when the "Phono" o "Radio Receive" buttons are depressed. V7, 6SF7, serves as the 2nd detector and expansion amplifier. V6, 6H functions as the expansion rectifier in one diode section and furnishes delayed audio AVC in the other diode section V8, 6H6, functions as the compressor rectifier.

HOW TO CHECK EXPANSION VOLTAGE:

Feed a 1 volt (RMS) 400 cycle signal into the phono input plug. Make certain the Phono Button is depressed Connect the leads of a vacuum tube voltmeter* to the location indicated on Figure 3, Schematic Diagram, and ground. The voltage at this point should be between 3 and 4 volts positive D.C. As a cross check measure the cathode voltage of V4, 6SF, which should read about 5 volts D.C The expansion voltage should be about 1 volt less.

HOW TO CHECK COMPRESSION VOLTAGE:

Depress the "Radio Record" button. Feed a 1 volt (RMS) 400 cycle signal into the diode return of the 2nd I.F. (brown lead). In the same manner outlined in the preceeding paragraph, measure the compression voltage, which should be a minus 2 to 3 volts.

*VTVM: Input loading above 10 megohms.

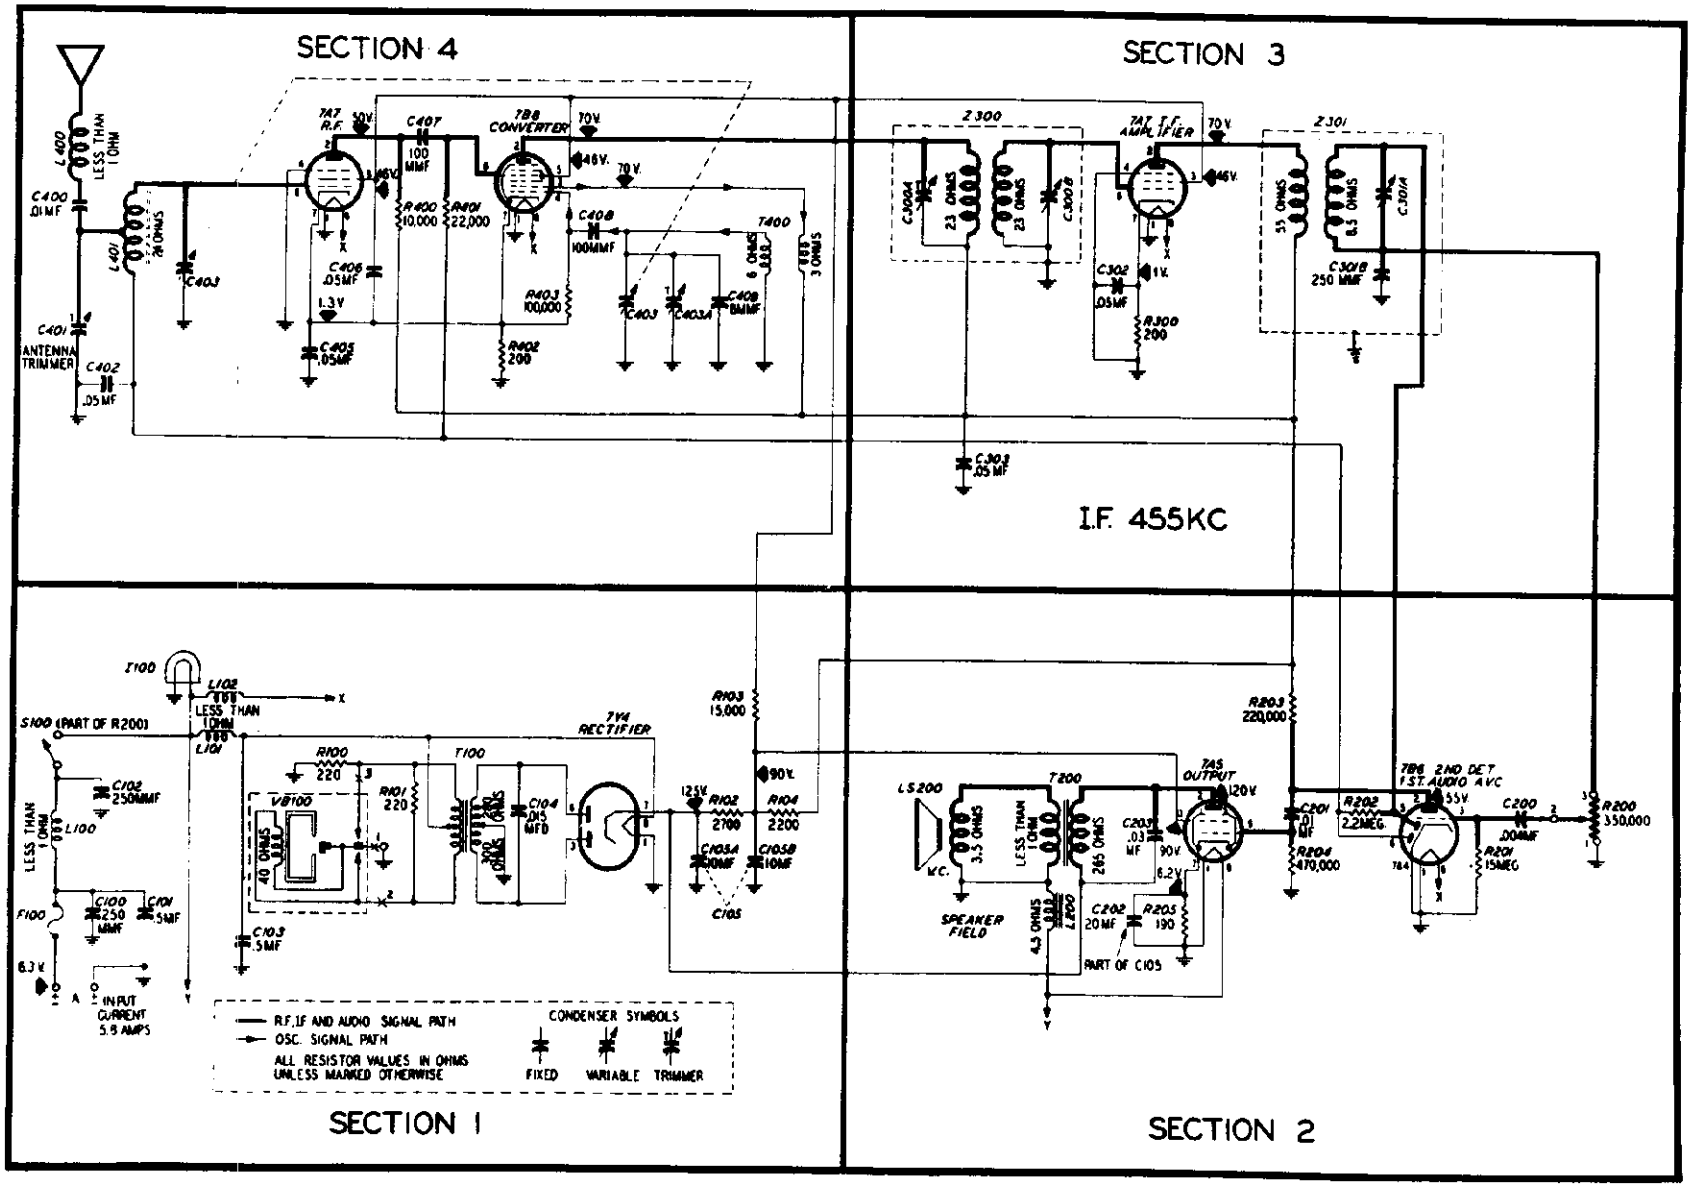
89006E	T2	Transformer, power
89015		Transformer, step down



NOTE: All voltage, capacity, and resistance values shown are average. The voltages were measured between the points indicated and the receiver chassis (B–), using a 20,000-ohms-per-volt meter, with 6.3 volts d-c input to the receiver power supply; the volume control was set at minimum, and the tuning condenser at 550 kc.

ALIGNMENT PROCEDURE

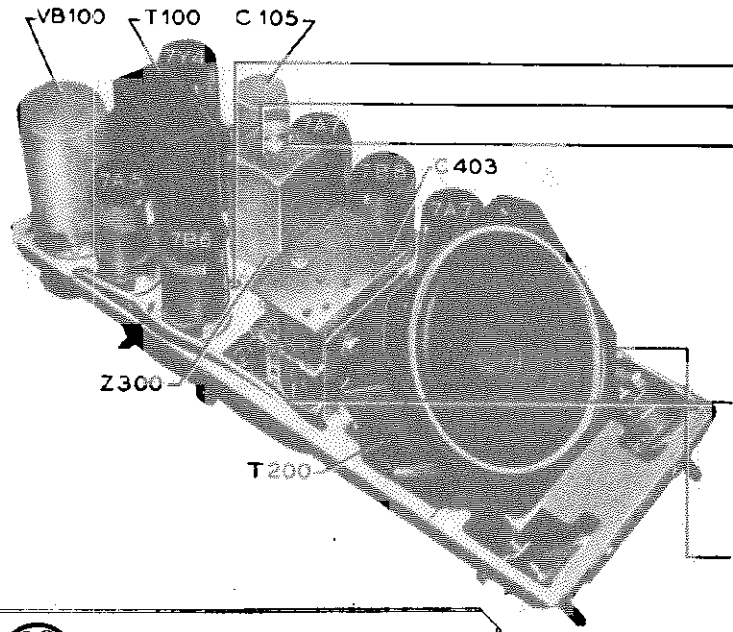
CONNECT THE SIGNAL-GENERATOR output lead as follows:

For the i-f alignment (steps 1 and 2 in the chart), apply the modulated r-f signal through a .05-mf. condenser to the aerial receptacle.

For the r-f alignment (steps 3 and 4), inject the modulated r-f signal through a 30-mmf. condenser in series with an aerial lead (Part No. 95-0185) plugged into the aerial receptacle. If an aerial lead is not available, inject the signal through the 30-mmf. condenser alone, and connect a second 30-mmf. condenser from the aerial receptacle to the receiver chassis.

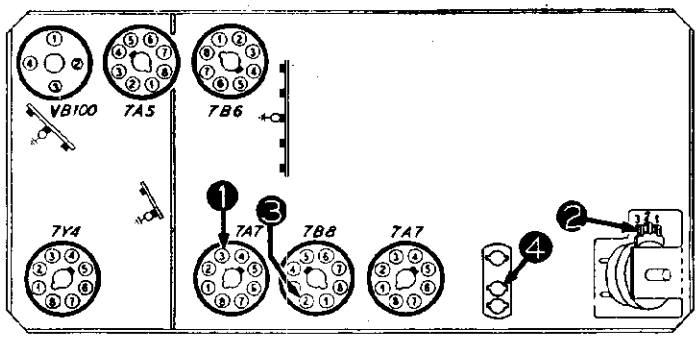
CONNECT THE OUTPUT METER across the speaker voice-coil terminals. **SET THE DIAL POINTER** to coincide with the index dot at the low-frequency end of the scale, when the tuning-condenser plates are fully meshed.

SET THE RECEIVER VOLUME CONTROL at maximum. Using the lowest range on the output meter, adjust the signal-generator output, as alignment progresses, to keep the meter needle near center scale.

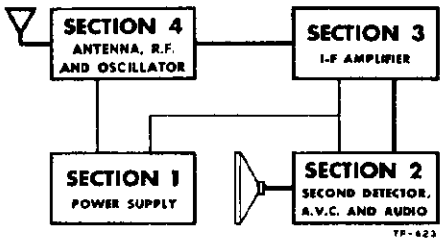


Top view, showing trimmer-condenser locations.

ADJUST IN ORDER	SPECIAL INSTRUCTIONS	DIAL SETTINGS SIG. GEN.	DIAL SETTINGS RECEIVER
C301A C300B C300A	1. Ground the oscillator grid (pin 4) of the 7B8 converter. Adjust the i-f trimmers for maximum in the order listed.	455 kc.	550 kc.
	2. Repeat step 1. Then remove the ground from pin 4 of the 7B8.		
C403A	3. Adjust for maximum.	1600 kc.	1600 kc.
C401	4. Adjust for maximum. Final adjustment to be made after the receiver has been reinstalled in the car, with the aerial connected.	1400 kc.	1400 kc.



Bottom view, showing test points.



Block diagram (Heavy lines indicate signal path.)

TROUBLE-SHOOTING PROCEDURE

In this manual, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, as shown in figure 2. Normal indications, secured when checking these points, eliminate the section under test as a source of trouble. Isolation of the faulty part is accomplished by testing in the order shown in the sectional test charts. A high-quality signal generator and volt-ohmmeter and a 6.3-volt d-c power source are required. The voltage readings shown were taken with a 20,000-ohms-per-volt meter.

To localize trouble, connect the receiver to the 6.3-volt d-c power source, and turn the receiver volume control to maximum; see that all tube filaments are lighted; then proceed in the order given in the following chart. When abnormal indications appear, make voltage and resistance checks of the circuit under test. Remedy any defect encountered before proceeding with the next step.

IMPORTANT

The aerial and aerial lead-in form part of the r-f tuning circuit. When testing or aligning this receiver on the bench it is important that an aerial dummy load of equal capacity be used.

TESTS TO LOCALIZE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESULTS
1	Measure voltage between point 1 and chassis (B—).	46 volts.
2	Apply audio signal between point 2 and chassis, through a condenser (.01 to .25 mf.).	Loud, clear signal from speaker.
3	Apply a modulated r-f signal (455 kc.) between point 3 and chassis, through a condenser (.01 to .25 mf.).	Loud, clear signal.
4	Turn tuning condenser to half-meshed position. Apply a modulated r-f signal between point 4 and chassis, through a condenser (.01 to .25 mf.). Tune signal generator until the signal is heard in the speaker.	Loud, clear signal.

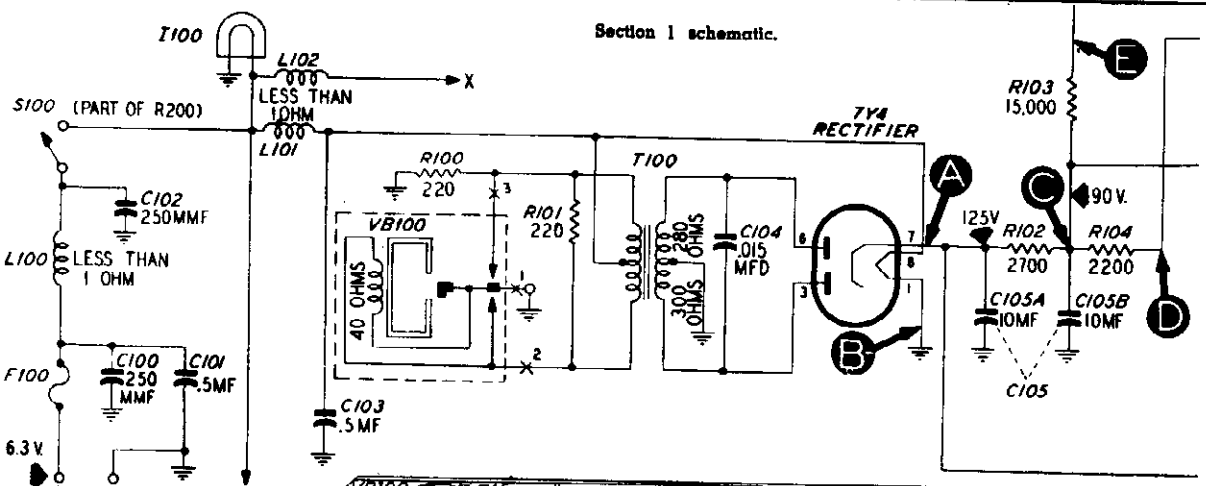
TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

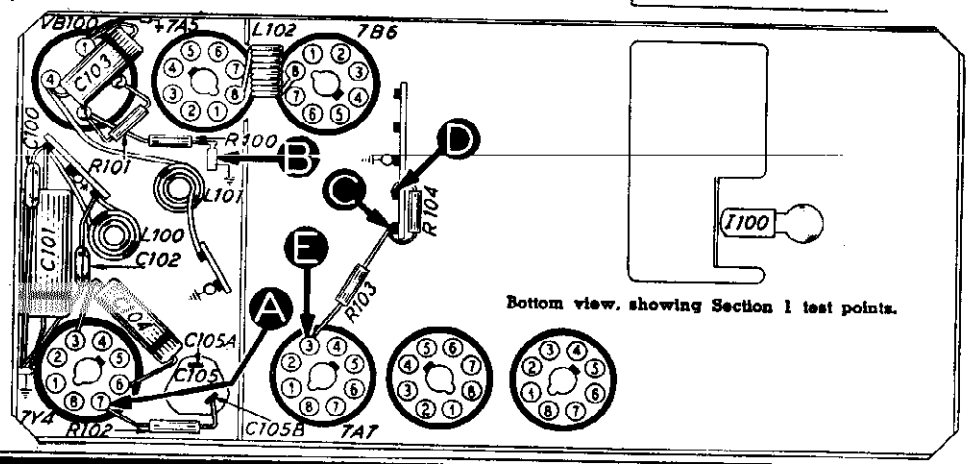
Make all measurements for this section with a volt-ohmmeter, using the applicable d-c range. All voltages given in this manual are average, and were taken with 6.3 volts d-c input to the power supply; the volume control was set at minimum, and the tuning-condenser plates were fully meshed.

WARNING: If the 7Y4 rectifier is found to be defective, check the main filter condenser, C105, for shorts before inserting a new tube. If the vibrator is found to be defective, check C104 for a short before inserting a new vibrator.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
A to B—	125 volts	Defective 7Y4, VB100, T100, C104, or C105A.
C to B—	90 volts	Defective C105B or R102.
D to B—	70 volts	Defective R104 or C303 (shown in Section 3).
E to B—	46 volts	Defective R103 or C406 (shown in Section 4).

Section 1 schematic.



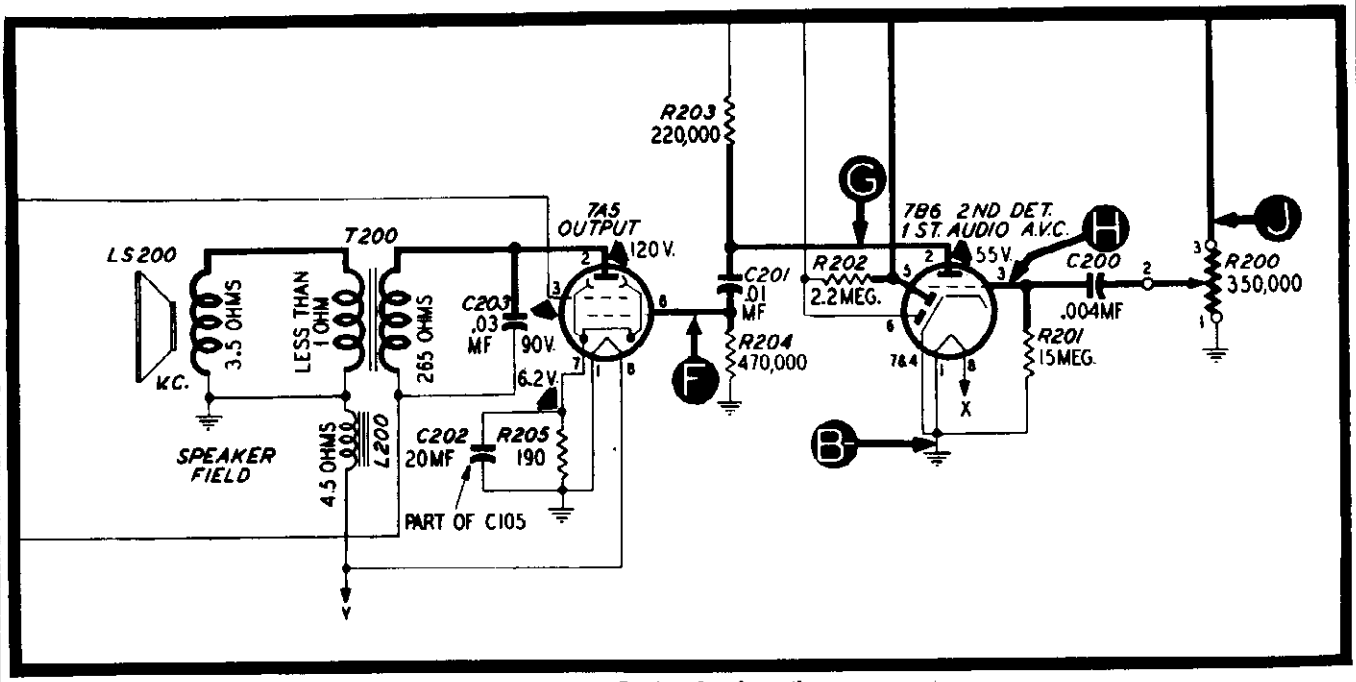


Bottom view, showing Section 1 test points.

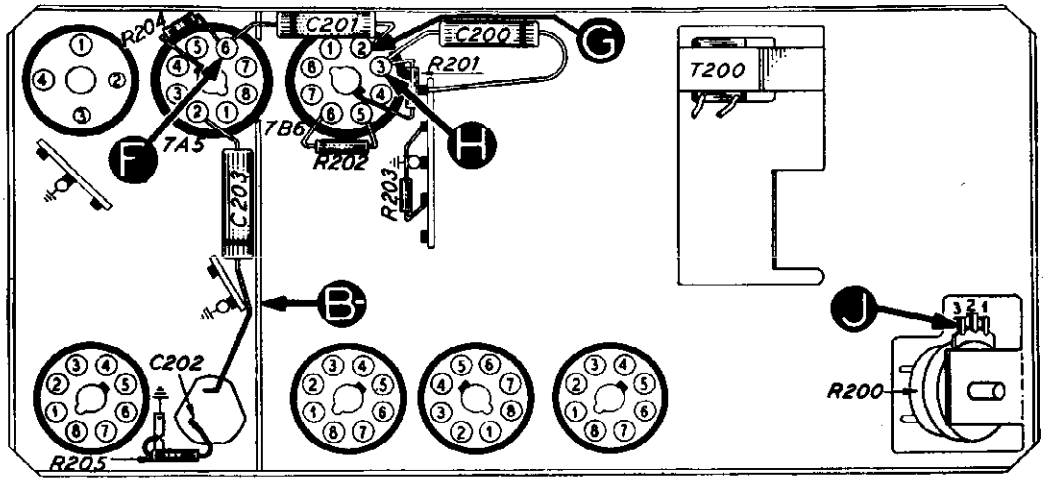
TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use an audio signal. Connect the generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B—). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
F to B—	Loud, clear signal.	Defective 7A5, T200, LS200, C201, C202, C203, R204, or R205.
G to B—	Loud, clear signal.	Open C201.
H to B—	Clear signal, much louder than preceding test.	Defective 7B6, R201, or R203.
J to B—	Loud, clear signal.	Defective C200, R200 (rotate R200 through its entire range for complete check) or Z301 (shown in section 3).



Section 2 schematic.

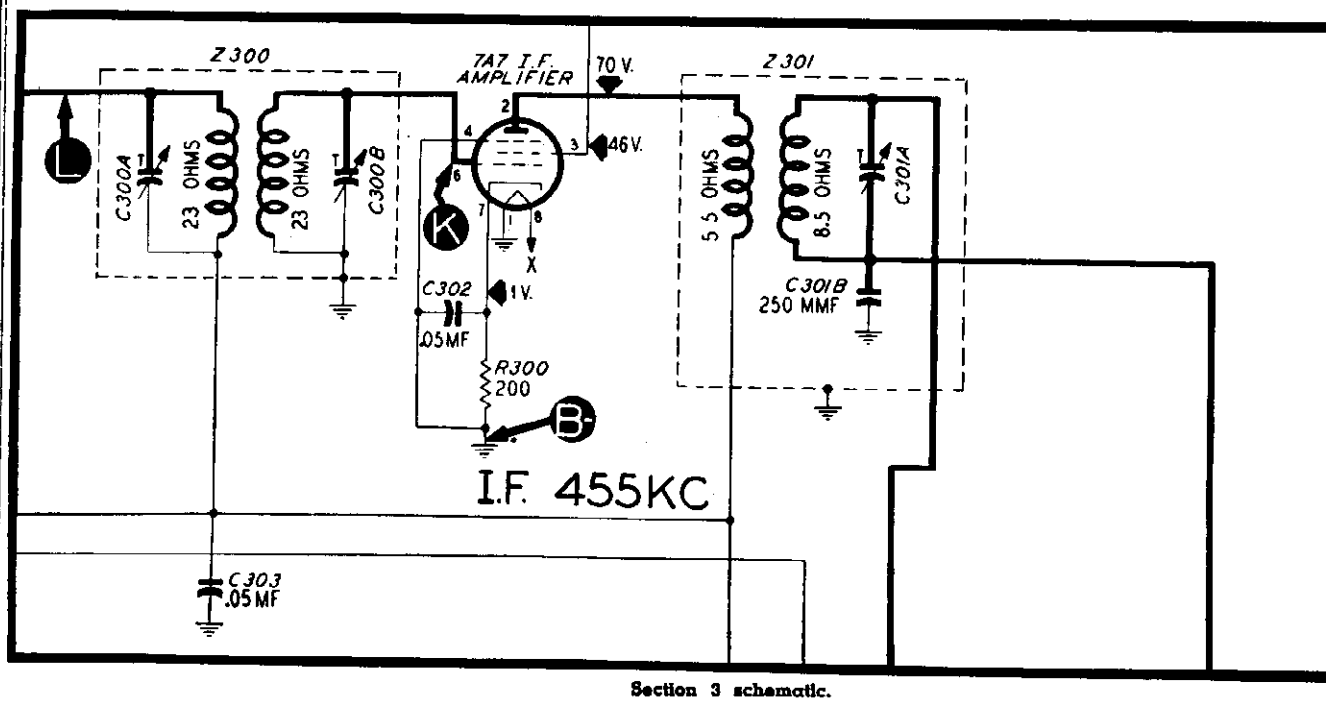


Bottom view, showing Section 2 test points.

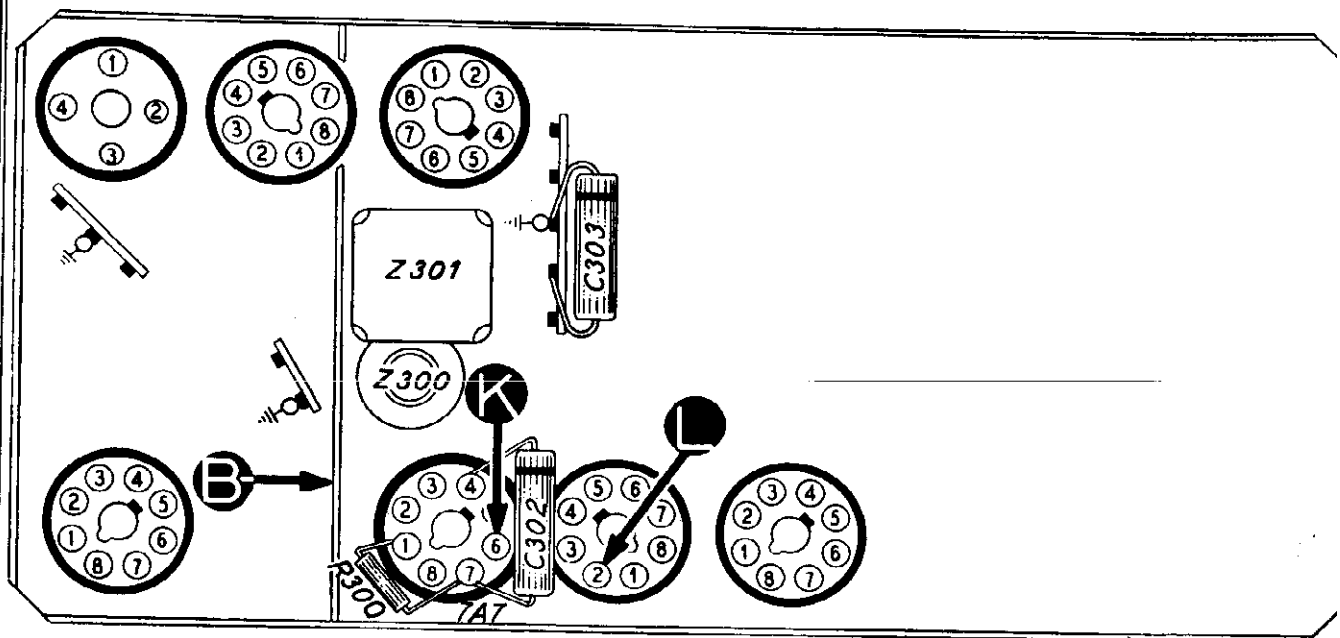
TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For all tests in this section, use a modulated 455-kc. signal. Connect the generator output lead through a condenser (.01 to mf.) to the points indicated; connect the ground lead to the receiver chassis (B–). Set the receiver volume control at maximum. adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
K to B–	Loud, clear signal.	Defective 7A7, Z301, C302, R300, or C406 (shown in Section 4).
L to B–	Loud, clear signal.	Defective or misaligned Z300.



Section 3 schematic.



Bottom view, showing Section 3 test points.

TP1275D

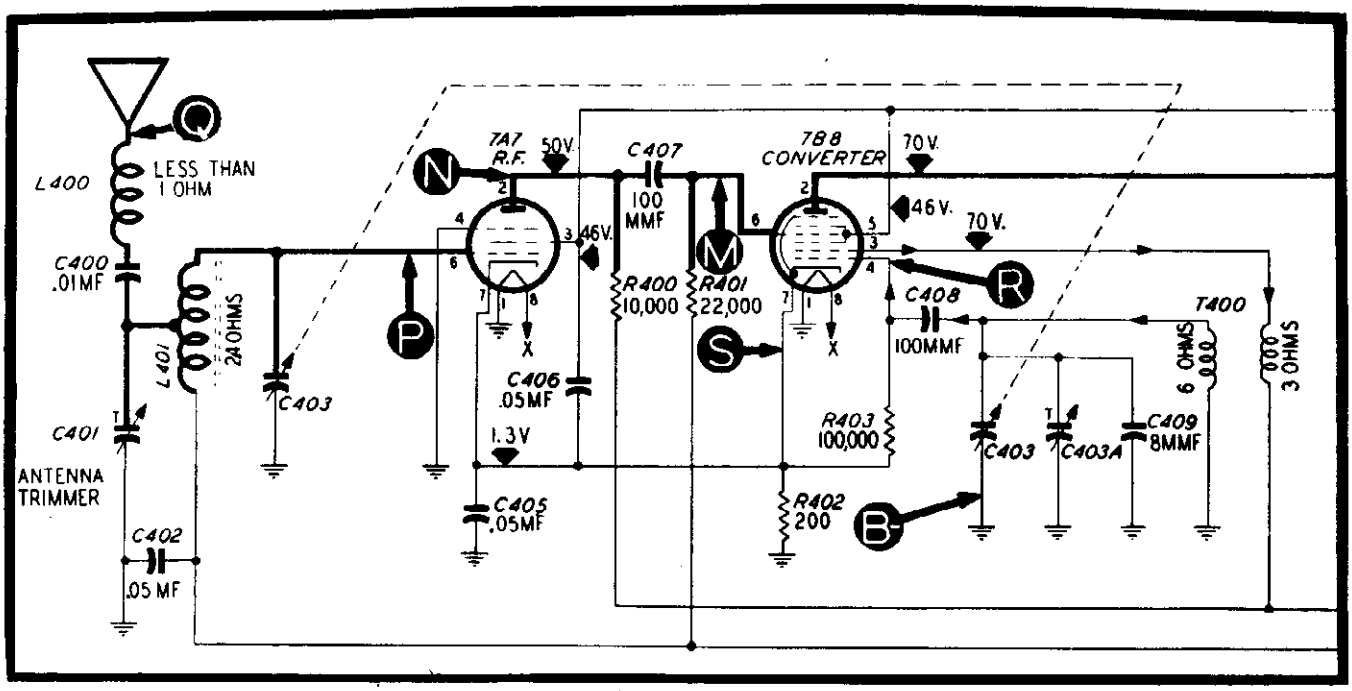
TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

1. Set the volume control at maximum. Rotate the tuning condenser through its entire range. Any scraping noise from the speaker indicates bent plates, or dirt between plates or on wiper contacts. Remedy such conditions before proceeding further.

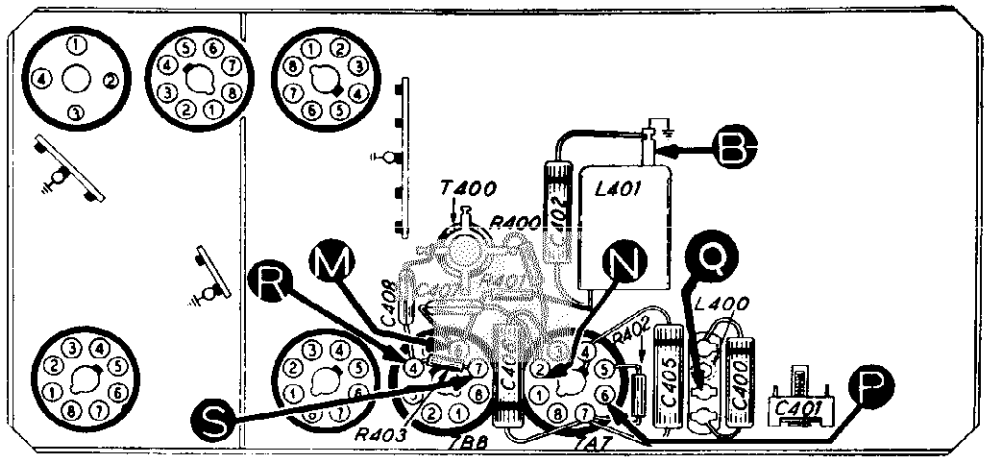
2. Attach the positive lead of a 20,000-ohms-per-volt meter to point S, and the prod end of the negative lead through a 50,000-ohm resistor to point R. Set the meter on a 10-volt or similar range, and rotate the tuning condenser through its entire range. Absence of voltage at any point indicates that the oscillator is not functioning. If this is the case, check the components listed in the first test below.

3. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the points indicated; connect the ground lead to the receiver chassis. Using a modulated signal, tune the generator and receiver to 1000-kc., and proceed as below.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
M to B—	Loud, clear signal.	Defective 7B8, T400, C403, C403A, C405, C407, C408, C409, R401, R402, or R403.
N to B—	Loud, clear signal.	Open C407.
P to B—	Clear signal, louder than preceding test.	Defective 7A7, L401, C403, or R400.
Q to B—	Loud, clear signal.	Defective L400, L401, C400, C401, or C402.



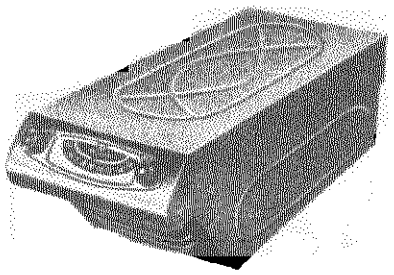
Section 4 schematic.



Bottom view, showing Section 4 test points.

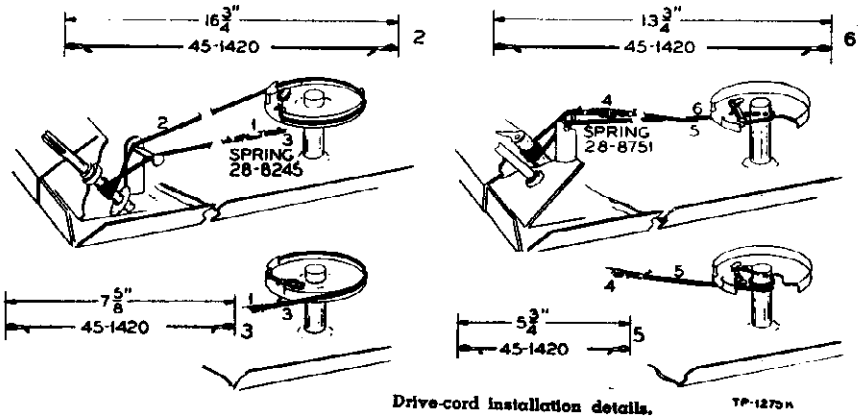
PHILCO CORP.

MODEL UN6-1



SPECIFICATIONS

CIRCUIT	Six-tube, superheterodyne
FREQUENCY RANGE	550 to 1600 kc.
INTERMEDIATE FREQUENCY	455 kc.
POWER INPUT	6.3 volts, 5.8 amperes, d.c.
PHILCO TUBES USED	7A7(2), 7B8, 7B6, 7A5, 7Y4
AERIAL	Philco universal auto radio type



Drive-cord installation details. TP-1270-A

Symbol designations used in the schematics and parts list are as follows:

C—condenser
F—fuse
I—pilot lamp
L—choke or coil
LS—loud speaker
R—resistor
S—switch
T—transformer
VB—vibrator
Z—electrical assembly

NOTE: Parts marked with an asterisk (*) are general replacement items, and the part numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown in the parts list when ordering replacements.

REPLACEMENT PARTS LIST

SECTION 1

Reference No.	Description	Service Part No.
C100	Condenser, 250 mmf.	60-10245307*

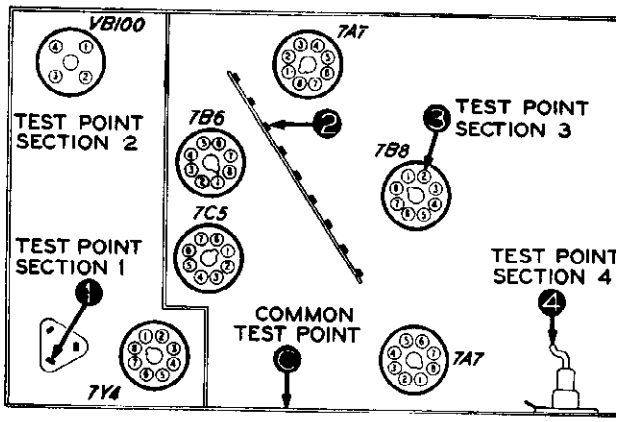
(Heavy lines indicate signal path)



Bottom view, showing test points.

TROUBLE-SHOOTING PROCEDURE

In this manual, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, as shown in figure 2. Normal indications, secured when checking at these points, eliminate the section under test as a source of trouble. Isolation of the faulty part is accomplished by testing in the order shown in the sectional test charts. A high-quality signal generator, volt-ohmmeter, ammeter (0 to 30 amps., d.c.), and a source of 6.3 volts d.c. are required. The voltage readings shown were taken with a 20,000-ohms-per-volt meter.

To localize trouble, connect the receiver to the power supply; turn the receiver volume control to maximum; see that all tube filaments are lighted; then proceed in the order given in following chart. Remedy any defect encountered before proce ing to next check.

When using the signal generator, always connect a conden (.01 to .25 mf.) in series with the output lead.

IMPORTANT

The aerial and aerial lead-in form part of the r-f tuning circ When testing or aligning this receiver on the bench it is import that an aerial dummy load of equal capacity be used.

TESTS TO LOCALIZE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESUL
1	Place ammeter in series with power source, and measure current drain of set. Measure voltage between test point 1 and chassis (C).	Approx. 8.3 am 220 volts
2	Apply audio signal between point 2 and chassis (C).	Loud, clear sign from speaker.
3	Apply weak, modulated 455-kc. signal between point 3 and C.	Loud, clear sign
4	Apply weak, modulated, r-f signal (approx. 1000 kc.) between point 4 and C. Set selector switch to "DIAL".* and tuning cond. to half-meshed; tune sig. gen. until a signal is heard. Test also in "AUTOMATIC" positions 1—5 inclusive.	Loud, clear sign

*To set the selector switch in "DIAL" position, unscrew the locking screw (see figure 11, page 6) until it protrudes ½" from the outside of the case. Then rotate the selector switch until it locks. This will be the "DIAL" position, and the "AUTOMATIC" positions 1 to 5 may be found by releasing the lock and rot the switch clockwise, while watching the rotor arm contac the rear of the switch wafer nearest the side of the chassis.

MODEL UN6-550 PHILCO CORP.

ALIGNMENT PROCEDURE

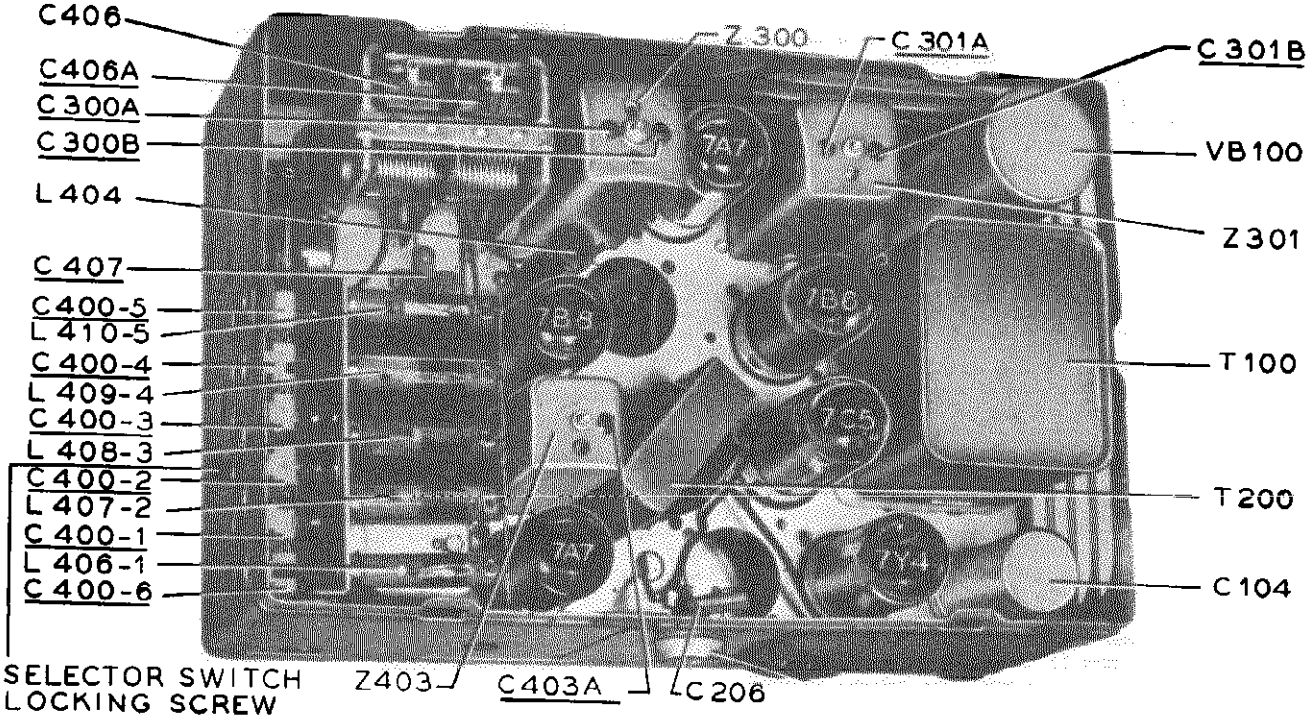
OUTPUT METER: Connect to the voice-coil lugs on the speaker. **SIGNAL GENERATOR:** Connect the output lead as indicated in the chart below; connect the ground lead to the receiver chassis. Set the receiver volume control at maximum. Then adjust the signal-generator output to give a readable deflection on the output meter, using the meter range that best indicates small changes in output. Reduce the signal-generator output as alignment progresses, to prevent the meter needle from going off scale.

DIAL CALIBRATION: When the radio is re-installed in the car, the dial pointer must be set to coincide with the index dot at the low-frequency end of the dial, with the tuning condenser fully meshed.

NOTE: Instructions for setting up the automatic push-button tuning control may be found in the UN6-550 Operating and Installation Instructions, Philco Part No. 39-7882.

ALIGNMENT CHART

SIGNAL GENERATOR			RECEIVER		
	Connections to Receiver	Dial Setting	Tuning-Condenser Setting	Special Instructions	Adjust Trimmers
1	Through .05 mf. to the antenna receptacle.	455 kc.	Fully meshed.	Preset C403A fully tight.	C403A (fully tight)
				Lock station-selector switch in "DIAL" position (see instructions at bottom of page 1); ground stator of oscillator section of gang. Adjust for maximum in given order; then repeat procedure.	C301B C301A C300B C300A
2	Same as 1.	455 kc.	Fully meshed.	Adjust for minimum; then remove ground from oscillator section of gang.	C403A
3	Through 30 mmf. in series with antenna lead, Philco Part No. 85-0185 to the antenna receptacle.	1580 kc.	Fully open.	Adjust for maximum.	C406A
4	Same as 3.	1400 kc.	Tune to maximum signal.	Adjust for maximum. Final adjustment must be made after radio has been re-installed in car with antenna connected.	C400-6
5	Same as 3.	580 kc.	Tune to maximum signal.	Adjust while rocking tuning gang.	C407
6	Same as 3.			Repeat steps 3, 4, and 5.	



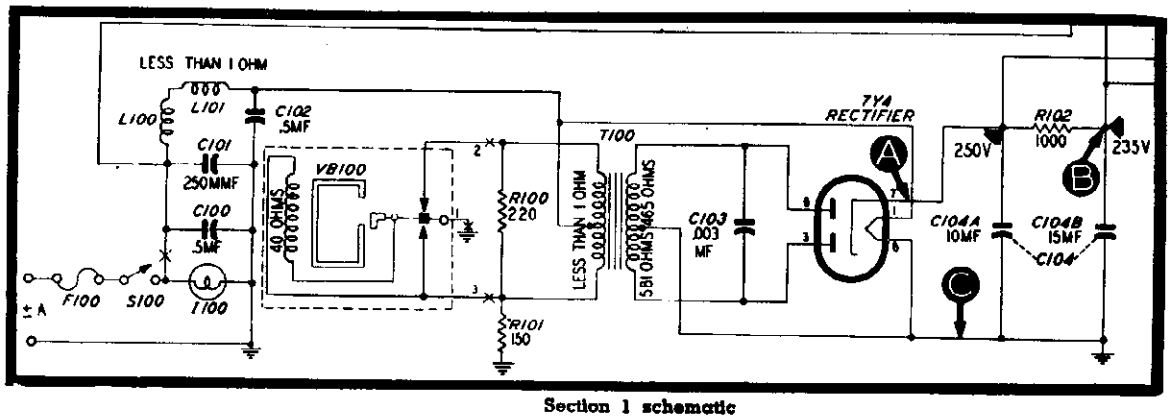
Top view, showing trimmer-condenser locations.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

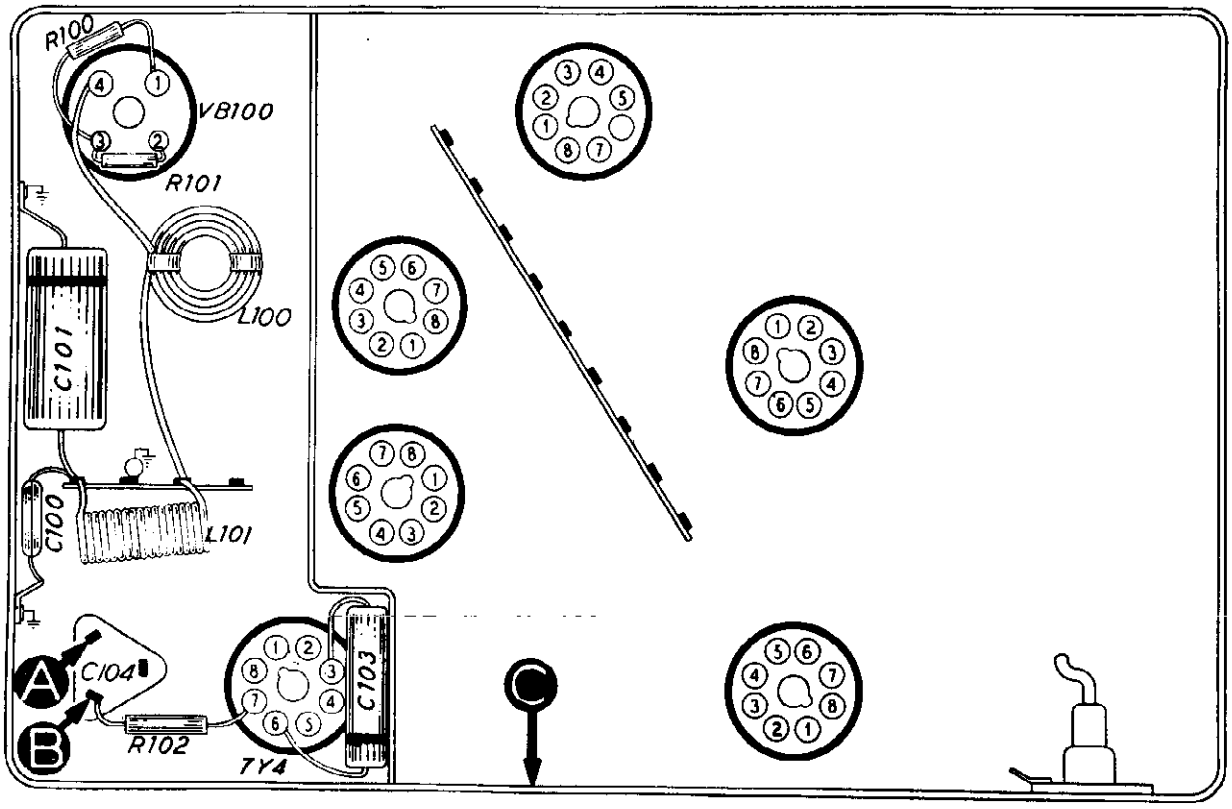
With the exception of the first test, all measurements in this section should be made with a volt-ohmmeter, using the applicable d-c range. The voltages given were measured with the volume control at minimum, and with 6.3 volts d-c input to the receiver power supply.

NOTE: If the 7Y4 is found to be defective, check C104A C104B for shorts before inserting a new tube. If the vibrato found to be defective, check C103 for a short before insertin new vibrator.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
Ammeter in series with power source.	8.3 amps.	Excessively high or low current indicates defective VB100, T100, C103, or 7Y4
A to C	240 volts	Defective 7Y4, C104A, or C104B.
B to C	220 volts	Defective R102, C104B, C302, or C304 (see Section 3 for location).



Section 1 schematic



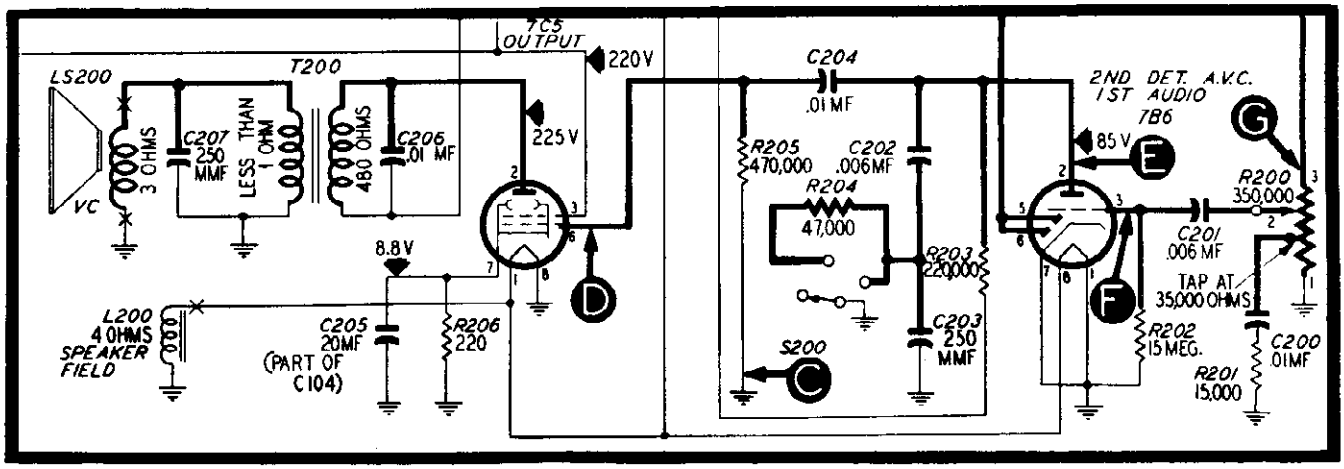
Bottom view, showing Section 1 test points.

MODEL UN6-550 PHILCO CORP.

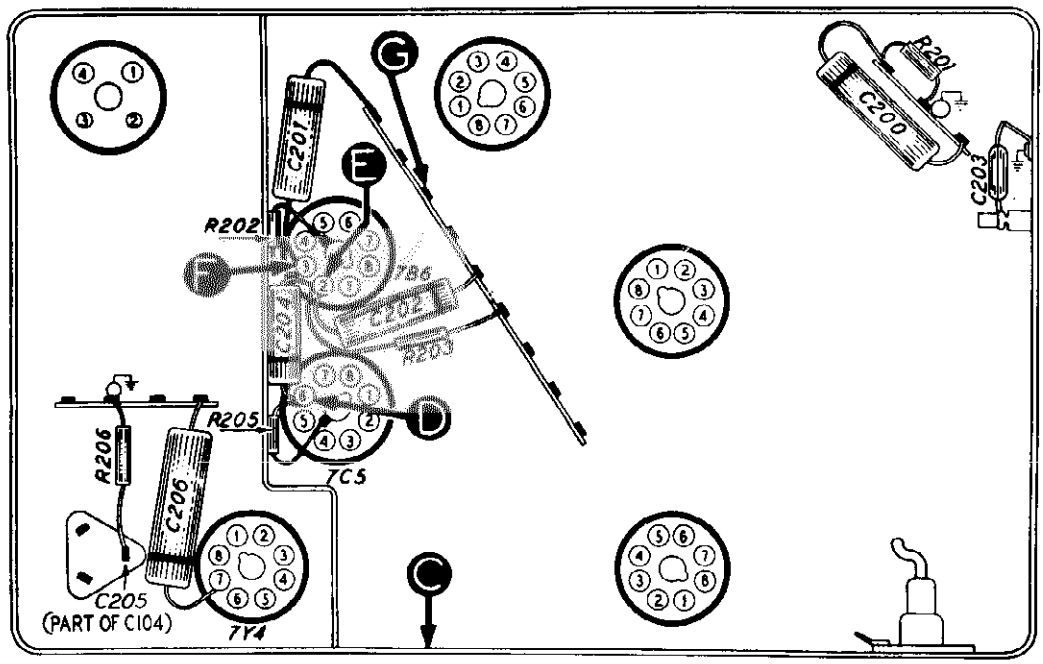
TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use an audio signal. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (C). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
D to C	Loud, clear signal from speaker.	Defective 7C5, T200, LS200, C204, C205, C206, C207, or R206.
E to C	Loud, clear signal.	Open C204.
F to C (Short out C203)	Clear signal, noticeably louder than preceding test.	Defective 7B6, open R202, R203, R303, or shorted C202.
G to C (Remove short from C203)	Loud, clear signal.	Defective C201 or R200 (Rotate R200 through its entire range for complete check).



Section 2 schematic.

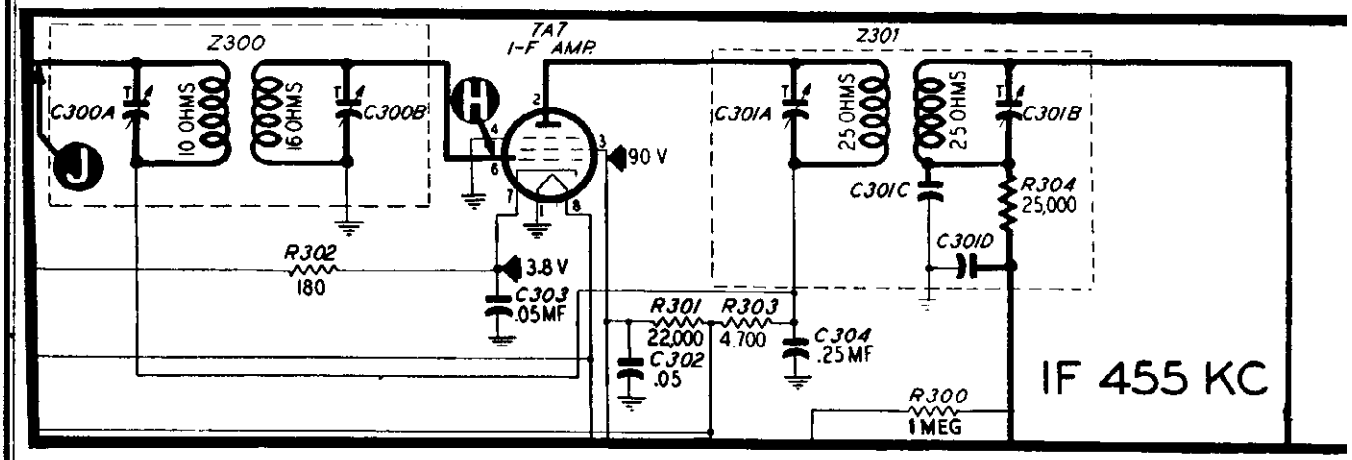


Bottom view, showing Section 2 test points.

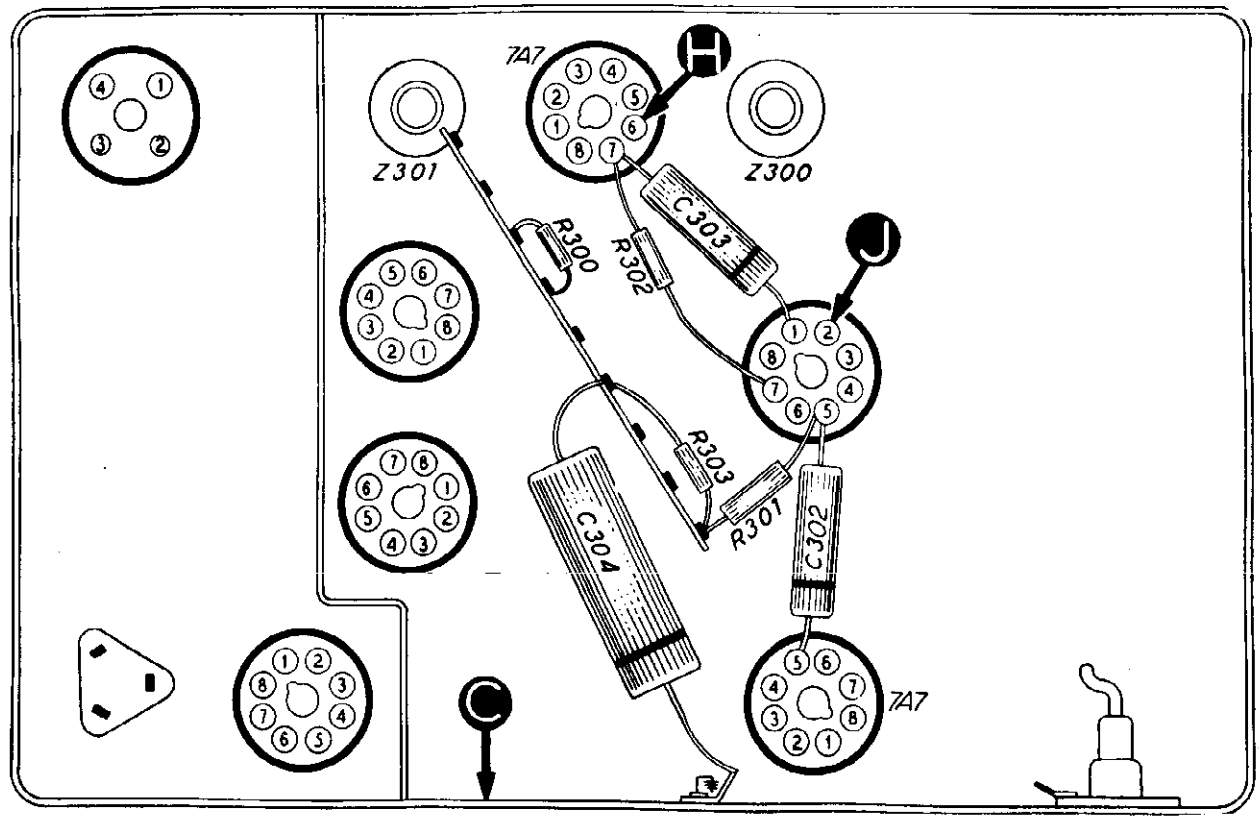
TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For all tests in this section, set the signal generator at 455 kc., with modulation on. Connect the generator output lead through condenser (.01 to .25 mf.) to the points indicated; connect the generator ground lead to the receiver chassis (C). Set the receiver volu control at maximum, and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
H to C	Loud, clear signal from speaker.	Defective 7A7, Z301, C302, C303, C304, R301, R302, R303, or R405 (see Section 4 for location).
J to C	Loud, clear signal.	Defective Z300.



Section 3 schematic.



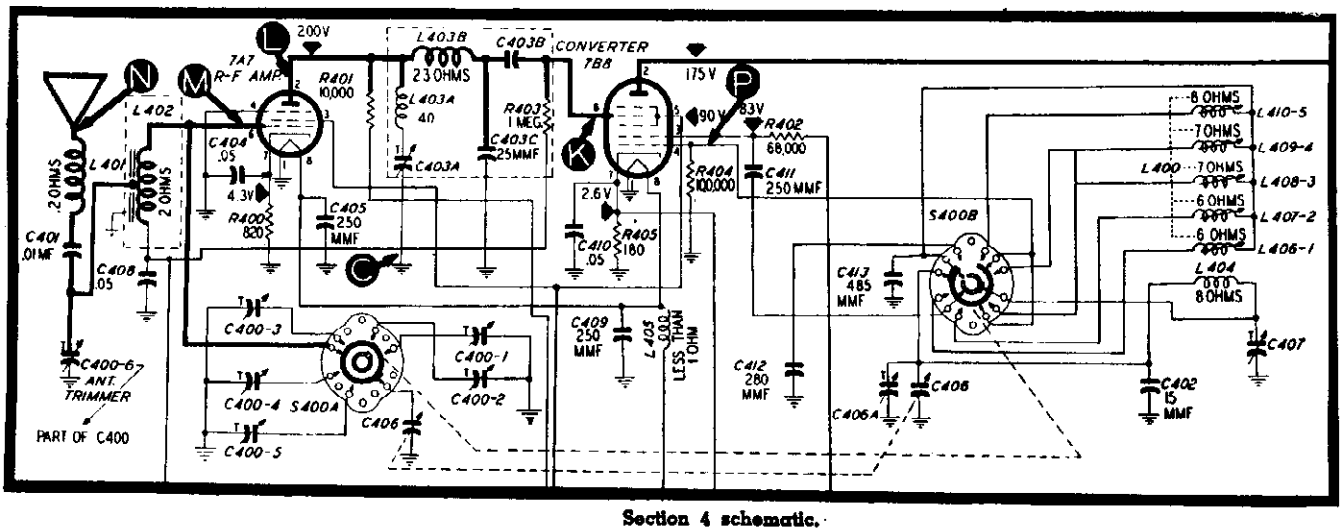
Bottom view, showing Section 3 test points.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

1. Attach the positive lead of a 20,000-ohms-per-volt meter to the receiver chassis, and the prod end of the negative lead through a 50,000-ohm-resistor to point P. Set the meter on a 10-volt or similar range, and rotate the tuning condenser through its entire range on each position of the band switch. Absence of voltage indicates that the oscillator is not functioning. If this is the case, check the components indicated in column 3 of the first test below, in the order listed.

2. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated. Connect the ground lead to the receiver chassis, set the receiver volume control at maximum, and proceed as below. The normal indication in each case will be a loud, clear signal, when the signal generator is tuned to the same frequency as the receiver, with modulation on.

1. TEST POINTS	2. SELECTOR SWITCH	3. POSSIBLE CAUSE OF ABNORMAL INDICATION
K to C (chassis)	Dial (see note, bottom of page 1).	Defective 7B8, R402, R405, C402, C406, C406A, C407, C410, C411, L404, or S400B.
K to C	Automatic Positions 1—5.	Defective L406-1, L407-2, L408-3, L409-4, L410-5, or S400B.
L to C	Dial	Defective Z403 (shown in Figure 11, page 6).
M to C	Dial	Defective 7A7, R400, R401, C404, C406, or S400A.
N to C	Dial	Defective L401, L402, or C401.
N to C	Automatic Positions 1—5.	Defective C400-1, C400-2, C400-3, C400-4, C400-5, or S400A.



Section 4 schematic.

REPLACEMENT PARTS LIST

Symbol designations used in the schematics and parts list are as follows:

C—condenser
F—fuse
I—pilot lamp
L—choke or coil
LS—loud speaker
R—resistor
S—switch
T—transformer
VB—vibrator
Z—electrical assembly

NOTE: All parts marked with an asterisk (*) are general replacement items, and the part numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown in this parts list when ordering replacements

SECTION 1

Reference	Description	Service Part No.
C100	Condenser, 250 mmf.	60-10245307*
C101	Condenser, .5 mf.	61-0137*
C102	Condenser, .5 mf.	61-0137*
C103	Condenser, .003 mf.	61-0115*
C104	Condenser, electrolytic, 10-15-20 mf.	61-0089*
	C104A: condenser, 10 mf.	Part of C104
	C104B: condenser, 15 mf.	Part of C104
F100	Fuse	45-2559*
I100	Lamp, pilot	34-2039*
L100	Choke, vibrator	65-0433
L101	Choke, "A"	65-0037
R100	Resistor, 150 ohms	66-1153340*
R101	Resistor, 220 ohms	66-1223340*
R102	Resistor, 1,000 ohms	66-2104340*
S100	Switch, power	85-0112*
T100	Transformer, power	65-0234*
VB100	Vibrator	83-0026*

SECTION 2

C200	Condenser, .01 mf.	61-0120*
C201	Condenser, .006 mf.	45-3500-7*
C202	Condenser, .006 mf.	45-3500-7*
C203	Condenser, 250 mmf.	60-10245307*
C204	Condenser, .01 mf.	61-0120*
C205	Condenser, 20 mf.	Part of C104
C206	Condenser, .01 mf.	61-0124*
C207	Condenser, 250 mmf.	60-10245307*
L200	Field, speaker	Part of LS200
LS200	Speaker	73-0047*
R200	Control, volume, 350,000 ohms	67-0032*
R201	Resistor, 15,000 ohms	66-3153340*
R202	Resistor, 15 megs.	66-6153340*
R203	Resistor, 220,000 ohms	66-4223340*
R204	Resistor, 47,000 ohms	66-3473340*
R205	Resistor, 470,000 ohms	66-4473340*
R206	Resistor, 220 ohms	66-1224340*
S200	Switch, tone-control	77-0733*
T200	Transformer, output	65-0408*

SECTION 3

C302	Condenser, .05 mf.	61-0122*
C303	Condenser, .05 mf.	61-0122*
C304	Condenser, .25 mf.	61-0125*
R300	Resistor, 1 meg.	66-5103340*
R301	Resistor, 22,000 ohms	66-3224340*
R302	Resistor, 180 ohms	66-1183340*
R303	Resistor, 4,700 ohms	66-2473340*
R304	Resistor, 25,000 ohms	66-3253340*
Z300	Transformer, 1st i-f	65-0319
	C300A: condenser, trimmer	Part of Z300
	C300B: condenser, trimmer	Part of Z300
Z301	Transformer, 2nd i-f	65-0320
	C301A: condenser, trimmer	Part of Z301
	C301B: condenser, trimmer	Part of Z301
	C301C: condenser	Part of Z301
	C301D: condenser	Part of Z301
	R304: resistor, 25,000 ohms (Part of Z301)	66-3253340*

SECTION 4

C400	Trimmer-condenser assembly	77-1187
	C400-1: condenser, push-button trimmer	Part of C400
	C400-2: condenser, push-button trimmer	Part of C400
	C400-3: condenser, push-button trimmer	Part of C400
	C400-4: condenser, push-button trimmer	Part of C400
	C400-5: condenser, push-button trimmer	Part of C400
	C400-6: condenser, antenna-trimmer	Part of C400
C401	Condenser, .01 mf.	61-0120*
C402	Condenser, 15 mmf.	60-00155407*
C404	Condenser, .05 mf.	61-0122*
C405	Condenser, 250 mmf.	60-10245307*
C406	Condenser, tuning	63-0077
	C406A: condenser, oscillator-trimmer	Part of C406
C407	Condenser, oscillator-padder	63-0048
C408	Condenser, .05 mf.	61-0122*
C409	Condenser, 250 mmf.	60-10245307*
C410	Condenser, .05 mf.	61-0122*
C411	Condenser, 250 mmf.	60-10245307*
C412	Condenser, 280 mmf.	30-1220-8*
C413	Condenser, 485 mmf.	30-1220-23*

SECTION 4 (Continued)

Reference	Description	Service Part
L401	Choke, antenna	65-01
L402	Coil, antenna	65-03
L404	Coil, manual-oscillator	65-04
L405	Choke, "A"	65-04
L406-1	Coil, push-button oscillator	65-04
L407-2	Coil, push-button oscillator	65-04
L408-3	Coil, push-button oscillator	65-04
L409-4	Coil, push-button oscillator	65-04
L410-5	Coil, push-button oscillator	65-04
R400	Resistor, 820 ohms	66-18233
R401	Resistor, 10,000 ohms	66-31033
R402	Resistor, 68,000 ohms	66-36833

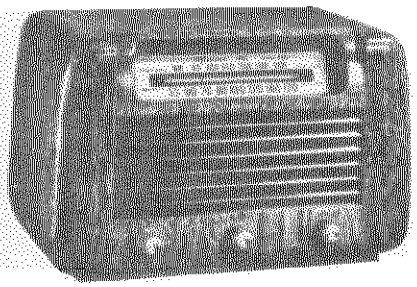
MODEL 46-427 PHILCO CORP.



Model 46-427

SPECIFICATIONS

CABINET	Model 46-427 (Wood, walnut finish)
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	Broadcast—540 to 1700 kc. Short-wave—9.5 to 15.0 mc.
POWER INPUT	105 to 120 volts—A.C. or D.C.
POWER CONSUMPTION	32 watts
ANTENNA	Built-in loop or external
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES USED	14AF7/XXD, 7B7 (2), 7C6, 50L6GT, 35Z5GT/G
PILOT LAMP	6 to 8-volt, bayonet base, brown bead, Part No. 34-2068

PHILCO TROUBLE-SHOOTING PROCEDURE

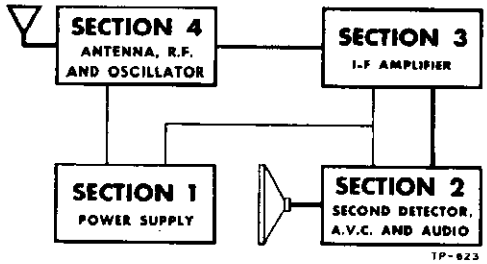


Figure 1. Block diagram (Heavy lines indicate signal path).

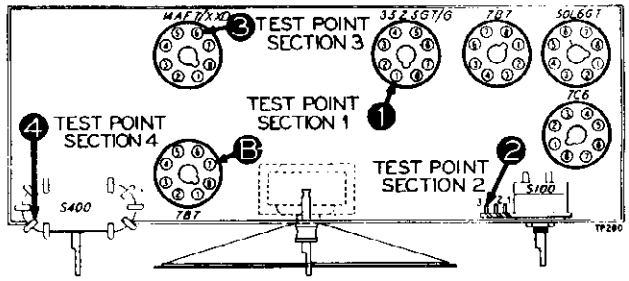

Figure 2. Bottom view, showing test points.

In this manual, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, as shown in figure 2. Abnormal indications, secured when checking at these test points, localize trouble to the section under test. After localization, isolation of the faulty part is accomplished by testing in the order shown in the sectional test charts. A high-quality signal generator and a volt-ohmmeter are required. Voltage readings shown were taken with a 20,000-ohms-per-volt meter. To localize trouble, connect the receiver to the power line; turn receiver volume control full on; see that all tube filaments are lighted; then proceed in the order given in the following chart. When applying a signal, connect the signal-generator output lead through a condenser (.01 to .25 mf.). Remedy any defect encountered before proceeding to the next check.

TESTS TO ISOLATE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESULTS
1	Measure voltage between point 1 (+) and B–.	*85 volts
2	Apply an audio signal through a condenser (.01 to .25 mf.) between point 2 and B–.	Loud, clear signal
3	Apply a weak modulated r-f signal (455 kc.) through a condenser (.01 to .25 mf.) between point 3 and B–.	Loud, clear signal
4	Apply a weak modulated r-f signal (1,000 kc.) through a condenser (.01 to .25 mf.) between point 4 and B–. (Band switch in "Broadcast" position.) Repeat this test at 12.0 mc. with band switch in "Shortwave" position.	Loud, clear signal

* For 117-volt a-c input. When operating on d-c line and no voltage can be measured, reverse power plug.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

Make all tests for this section with a volt-ohmmeter, using the 0-250v. d-c range. See figures 3 and 4 for location of test points.

TESTS POINTS	NORMAL READING	POSSIBLE CAUSE OF ABNORMAL READING
A to B–	112v.	No voltage indicates defective 35Z5, or shorted C-101. Low voltage indicates defective 35Z5, leaky or open C-101, or shorted C-200. (Refer to Section 2 for location.)
C to B–	85v.	No voltage indicates open speaker field. Low voltage indicates leaky C-101 or C-200. (Refer to Section 2 for location.)

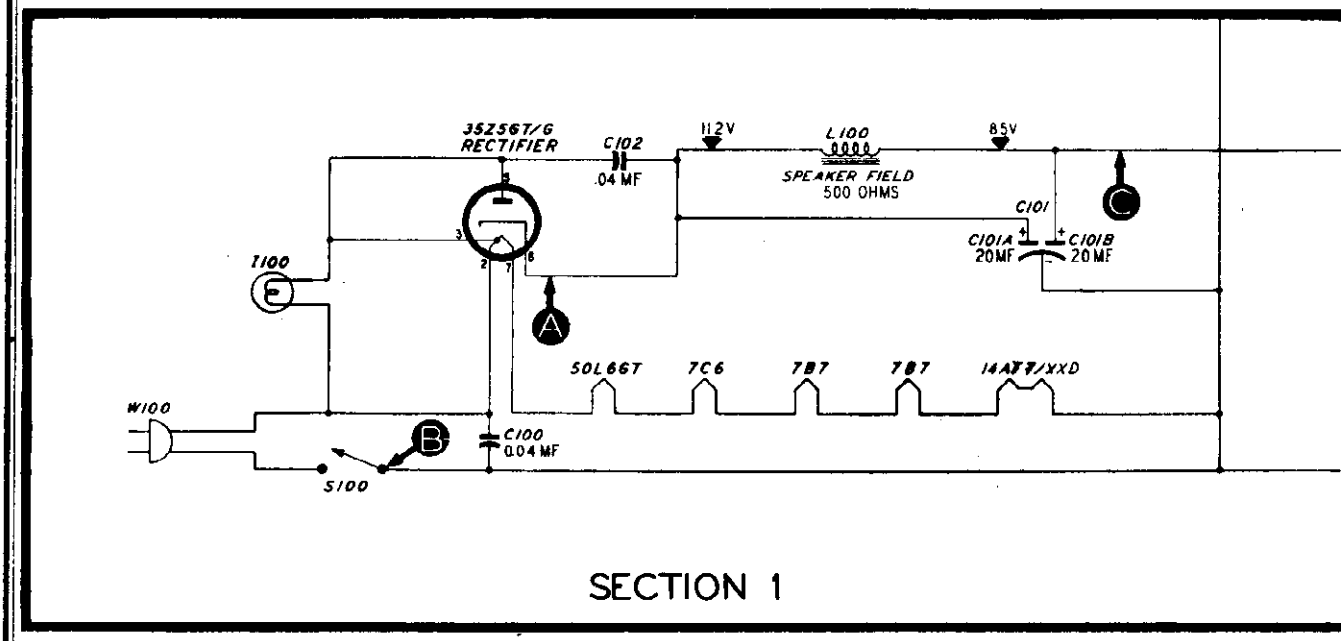

Figure 3. Section 1 schematic.

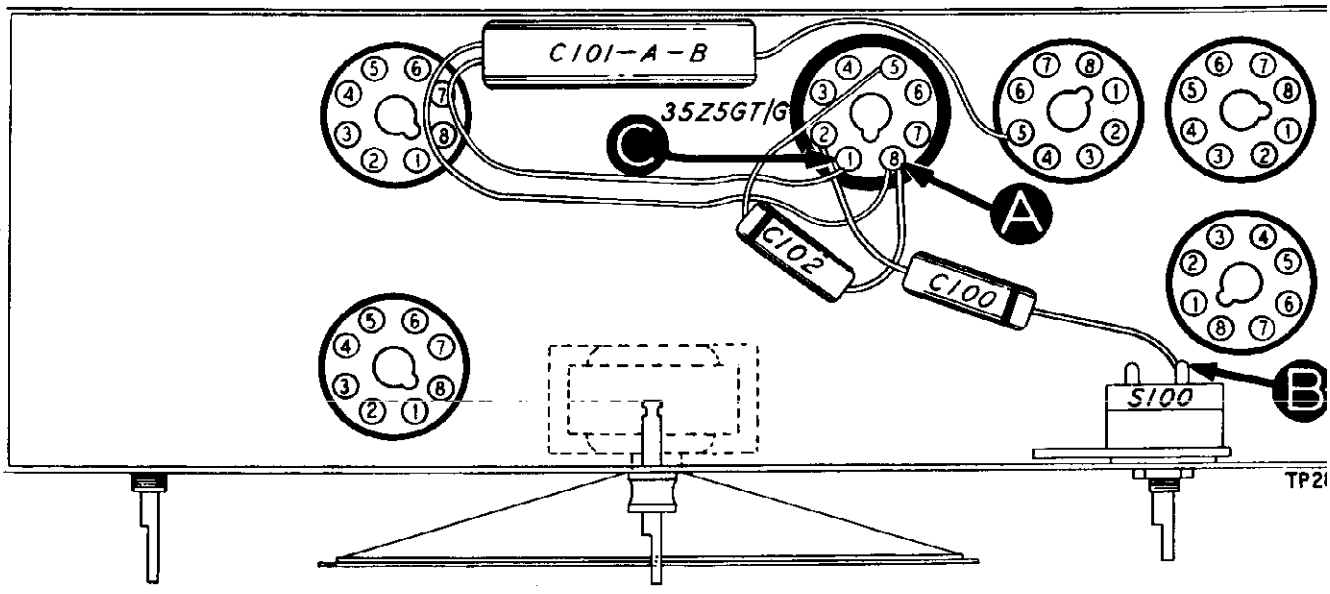

Figure 4. Bottom view, showing section 1 test points.

MODEL 46-427 PHILCO CORP.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use the audio range of the signal generator. Connect the output lead through a condenser (.01 to .25 mf.) to the point indicated, and the ground lead to B–. Adjust signal generator output for a clear, audible signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
D to B–	Clear, audible signal from speaker.	No signal, weak, or distorted signal indicates defective 50L6, output transformer T-200, or speaker LS-200, shorted condenser C-201, leaky condenser C-202, or open resistor R-204.
E to B–	Clear, audible signal, same as preceding test.	No signal indicates open condenser C-202.
F to B–	Clear, audible signal, noticeably louder than preceding test.	No signal, or weak signal, indicates defective 7C6, or open resistor R-202.
G to B–	Clear, audible signal, same as preceding test.	No signal indicates open condenser C-203. Hum, noise, or distortion indicates defective volume control.*

* In making this test, the volume control should be rotated throughout its range. Noise, or distortion indicates a defective control.

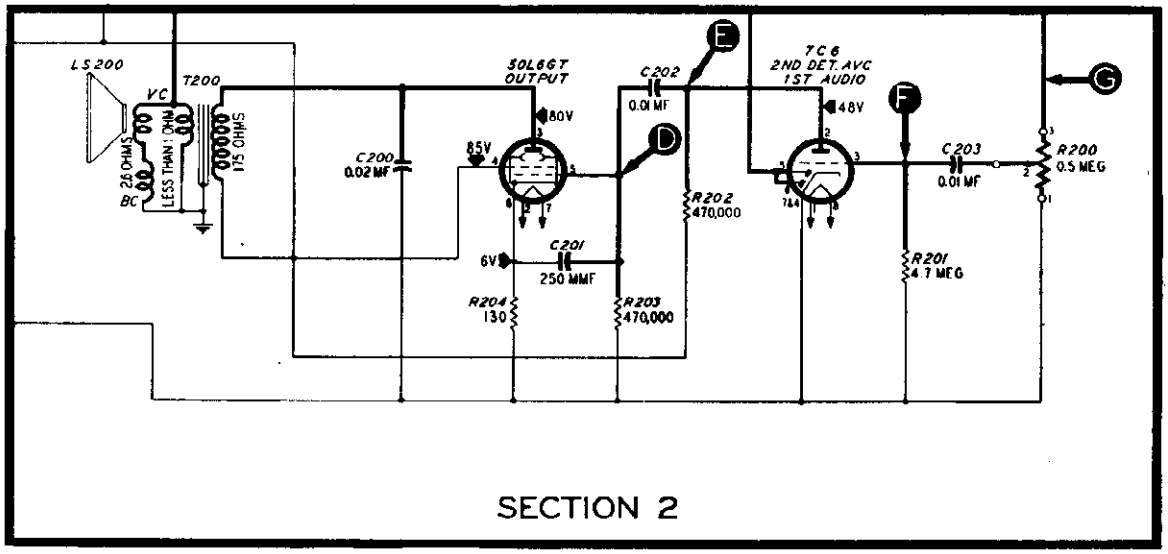

Figure 5. Section 2 schematic.

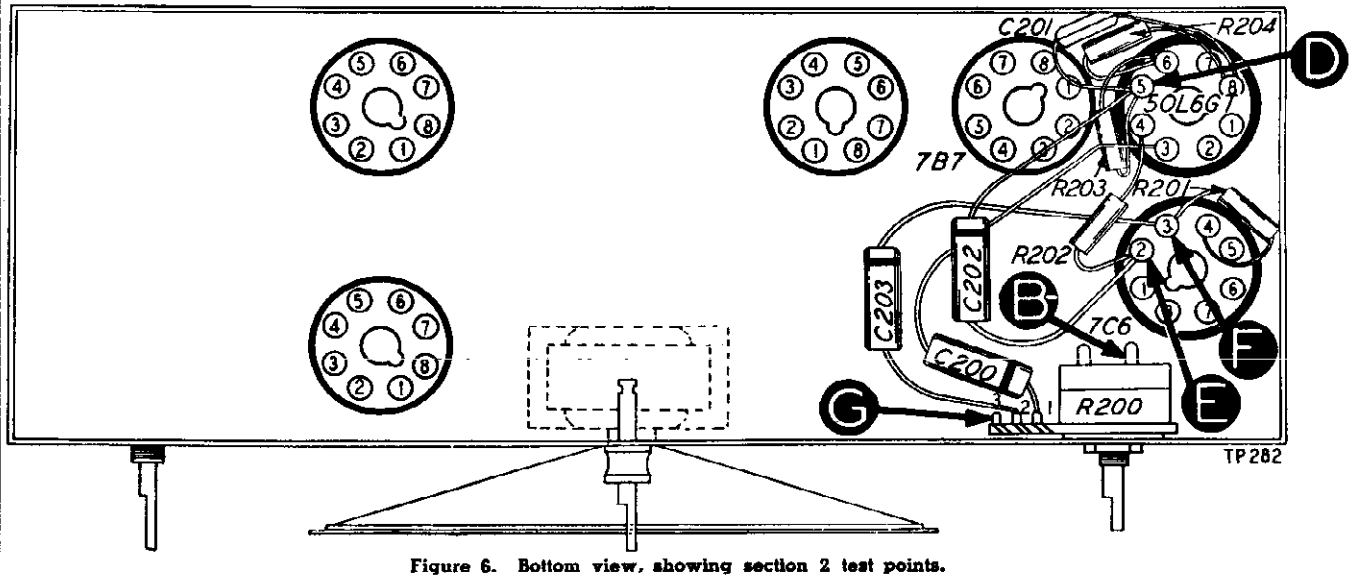

Figure 6. Bottom view, showing section 2 test points.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For all tests in this section, set signal generator at 455 kc., modulation ON. Connect output lead through a condenser (.01 to mfd.) to point indicated, and ground lead to point B–. Adjust signal generator output for clear, audible signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
H to B–	Audible signal from speaker.	No signal indicates defective 7B7, i-f transformer Z-302, shorted condenser C-303 open resistor R-301, or defective diode section of 7C6 (Section 2).
J to B–	Audible signal from speaker, louder than preceding test.	No signal indicates defective 7B7, or i-f transformer Z-301.
K to B–	Audible signal from speaker, same as preceding test.	No signal indicates defective i-f transformer Z-300, or open resistor R-300.

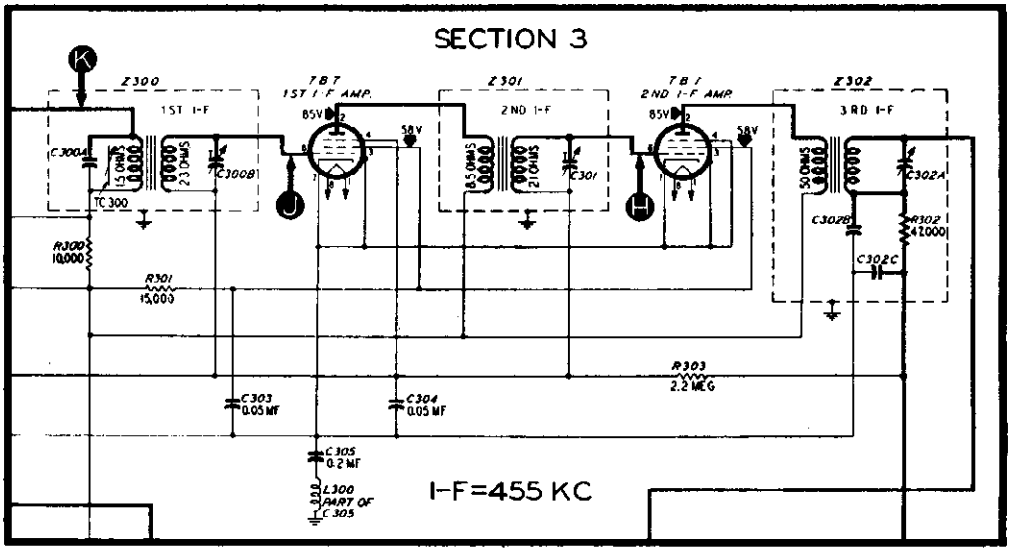

Figure 7. Section 3 schematic.

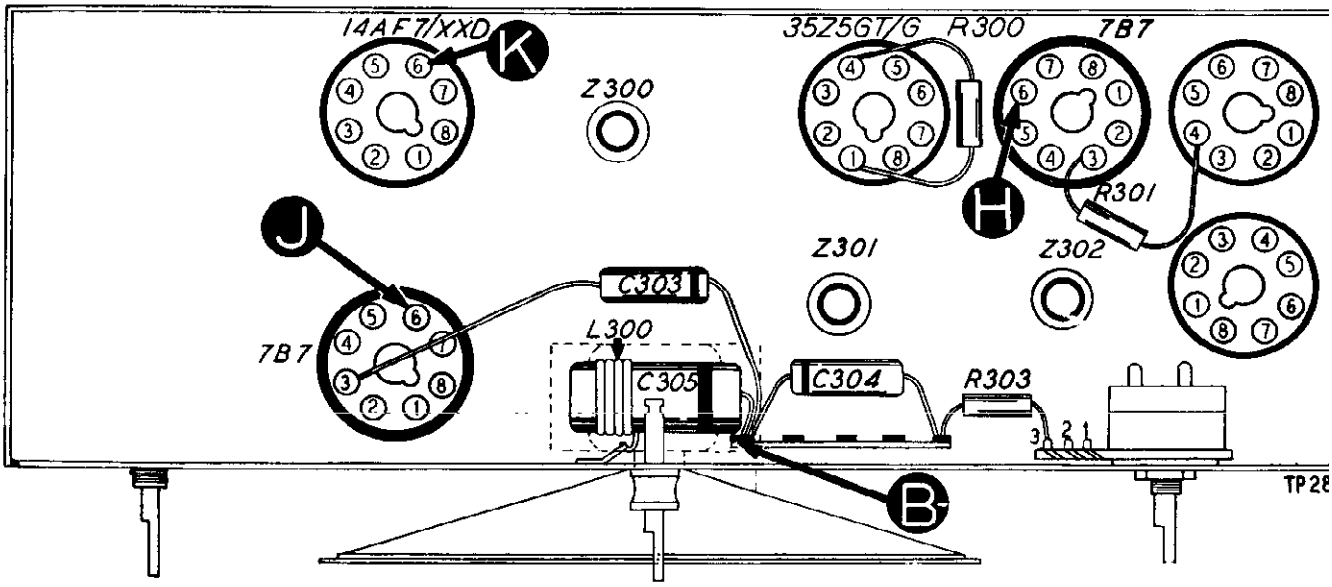

Figure 8. Bottom view, showing section 3 test points.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

NOTE: As a preliminary test, the tuning control should be rotated throughout its range. Any scraping noise heard in the speaker indicates bent plates, dirty wiper contacts, or dirt between the plates.

To fully check this section, all tests should first be made with the receiver and signal generator set at 540 kc., and then repeated at 1700 kc.

This procedure should also be followed in testing the short-wave band, with the receiver and signal generator set at 9.5 mc.; and then at 15 mc.

Connect the signal-generator output through a condenser (.01 to .25 mfd.) to the point indicated, and the ground lead to B–. Adjust the signal-generator output control for a clear, audible signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
L to B–	Clear, audible signal from speaker.	No signal indicates defective 14AF7 or transformer T-401, open resistor R-402, or shorted condenser C-409. †(For supplementary oscillator test see footnote below.)
M to B–	Clear, audible signal from speaker.	No signal indicates defective coil L-400 (Broadcast) or T-400 (Short-wave).

OSCILLATOR GRID BIAS VOLTAGE

† Attach the positive lead of a 20,000-ohms-per-volt meter to point P, and the prod end of the negative lead, through a 50,000-ohm resistor, to point N. Set the meter on 10-volt or similar range and rotate the tuning condenser through its entire range on each position of the band switch. Absence of voltage at any point indicates that the oscillator is not functioning. If so, check the components listed in the first test in the chart above.

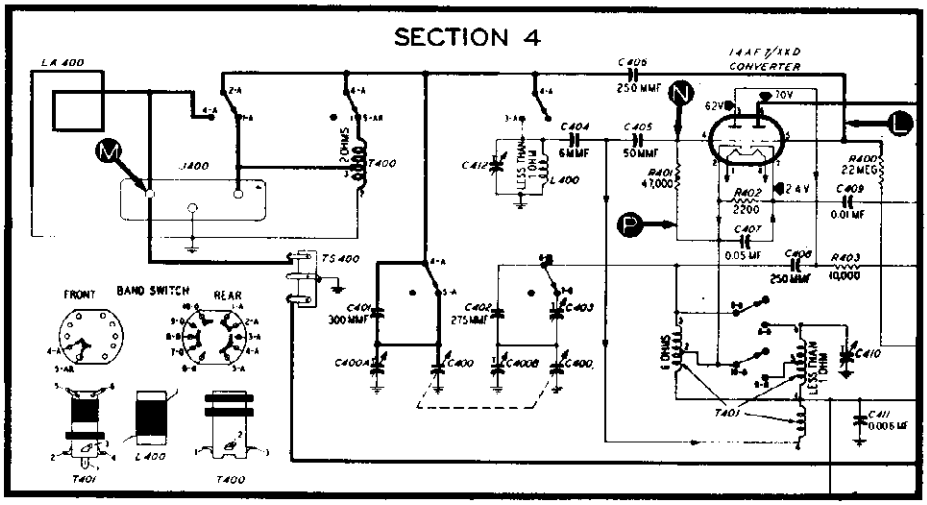

Figure 9. Section 4 schematic.

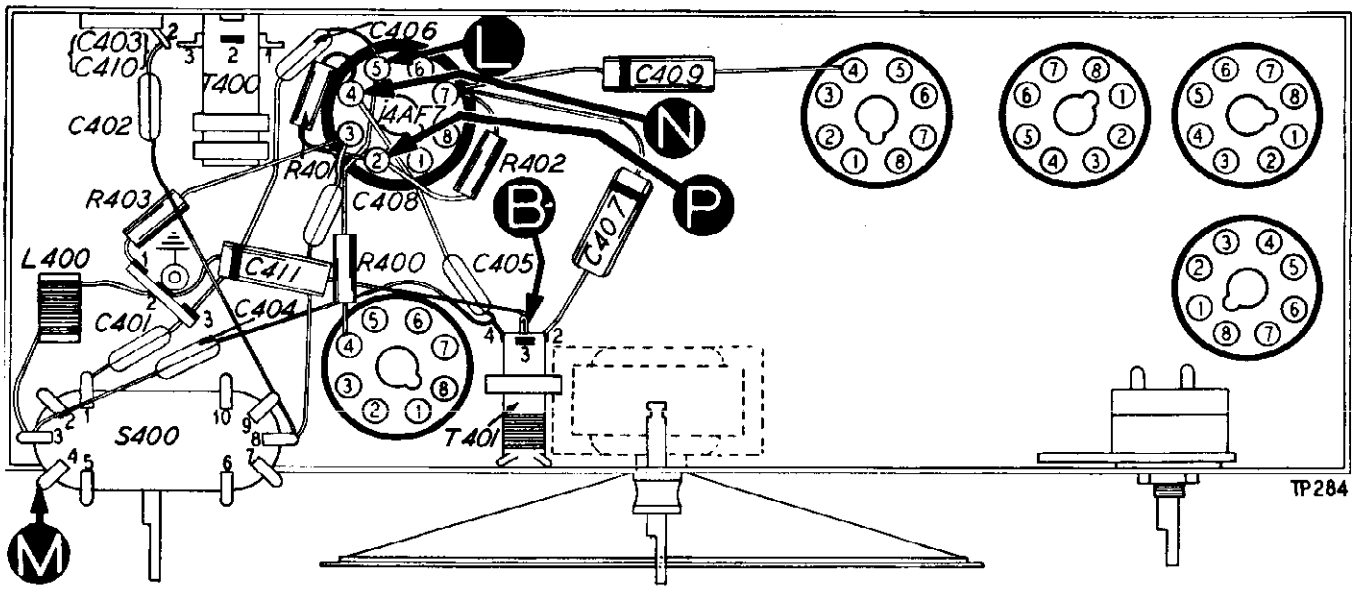

Figure 10. Bottom view, showing section 4 test points.

CONNECTING ALIGNING EQUIPMENT

Output Meter: Connect between output (left hand) and ground (center) lugs of terminal strip TS-400 on rear of chassis, shown in figure 11.

Signal Generator: Connect output lead through a .05 mfd. condenser to indicated test point and ground lead to B–.

Adjust generator output to give a readable deflection on the output meter, using meter range that best indicates small changes in output. Reduce generator output as alignment progresses to prevent meter needle from going off scale.

Turn receiver volume control to maximum and adjust all trimmers, in the order listed, for maximum output.

ALIGNMENT CHART

SIGNAL GENERATOR			RECEIVER			
	Connections to Receiver	Dial Setting Kc.	Band Switch Position	Dial Setting Kc.	Special Instructions	Adjust Trimmers in Order Given
1	Stator terminal of antenna section of tuning condenser.	455	Broadcast	Plates fully meshed	Set pointer to index mark on back plate. Preset C-300-B by turning down tight; then adjust all 4 i-f trimmers for maximum, in the order listed.	C-302 C-301 TC-300 C-300B
2	Antenna connection of TS-400.	1700	Broadcast	1700	Preset C-403 by turning down tight, then backing off 1/3 turn.	C-400B
3	Same as 2	1500	Broadcast		Tune receiver to signal generator.	C-400A
4	Same as 2	1700	Broadcast	1700		C-400B
5	Same as 2	1500	Broadcast		Repeat adjustment in step 3.	C-400A
6	Same as 2	15.0 mc.	Short Wave	15.0 mc.		C-410 C-412
7	Same as 2	9.5 mc.	Short Wave	9.5 mc.		C-403

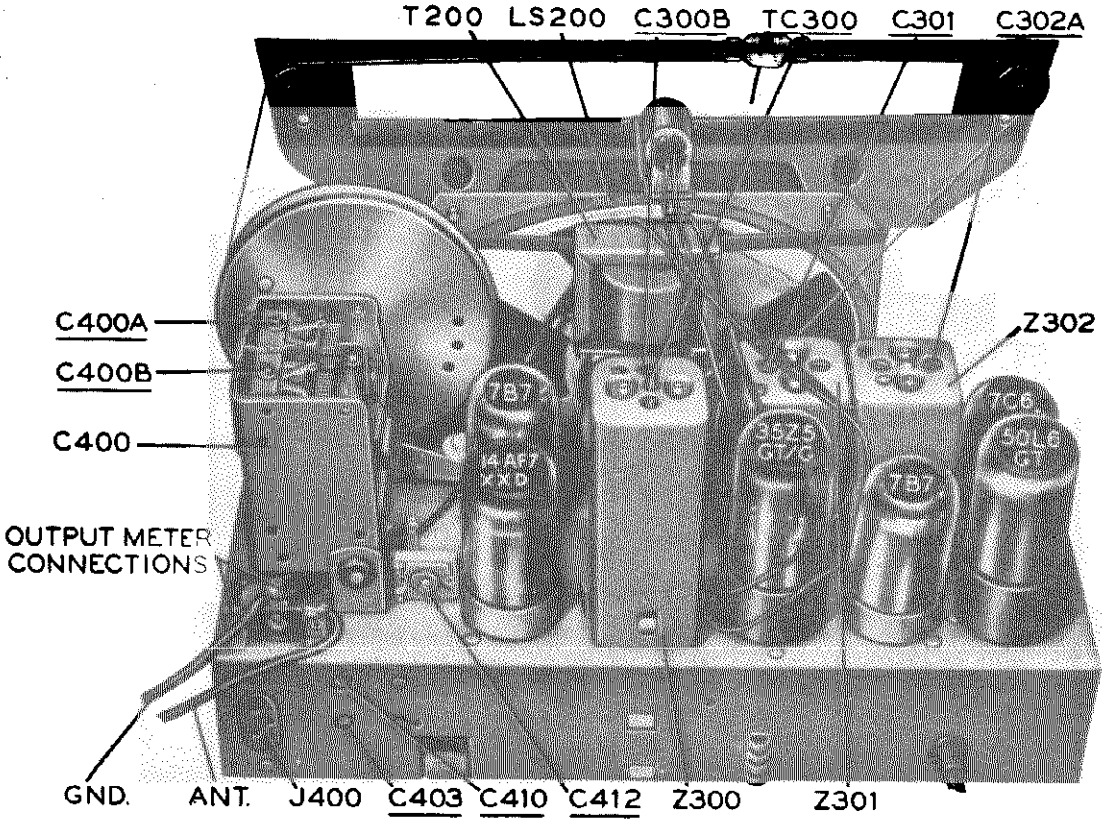

Figure 11. Top view, showing trimmer condenser locations.

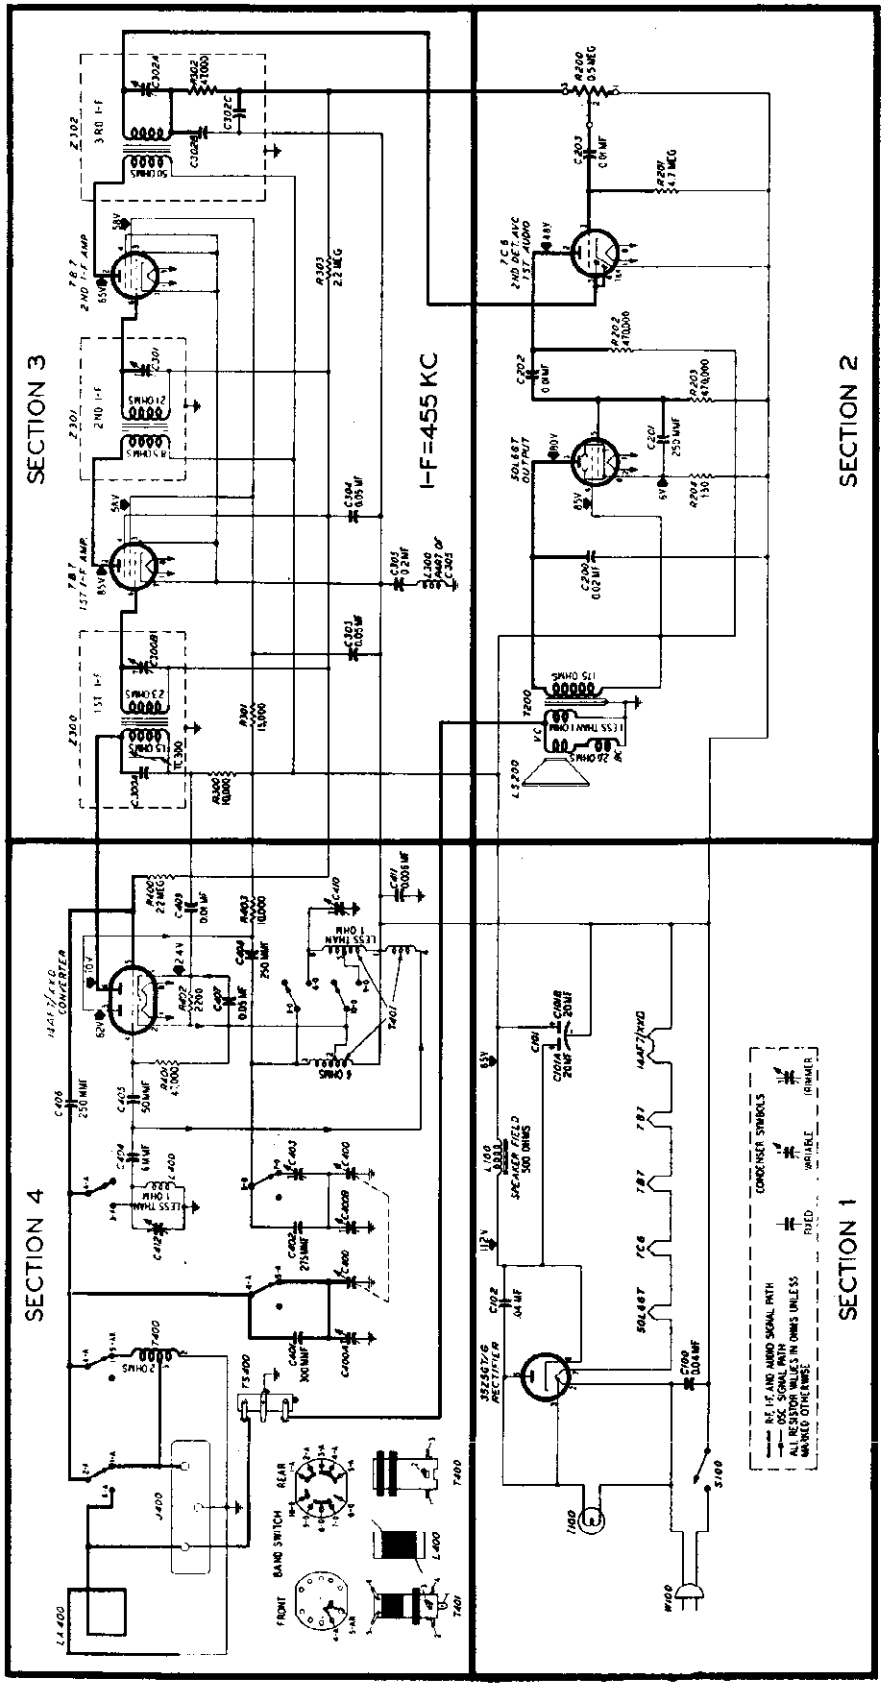

Figure 12. Complete Schematic.

NOTE: All voltage, capacity, and resistance values shown are average. The voltages shown were measured with a 20,000-ohms-per-volt meter between the indicated test points and B– (negative return of power supply).

Symbol designations used in the schematics and parts list are as follows:

C—condenser
I—pilot lamp
LA—loop antenna
LS—loudspeaker
R—resistor
S—switch
T—transformer
W—power cord and plug
Z—i-f transformer assembly

NOTE: Parts marked with an asterisk (*) are general replacement items, and the part numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown below when ordering replacements.

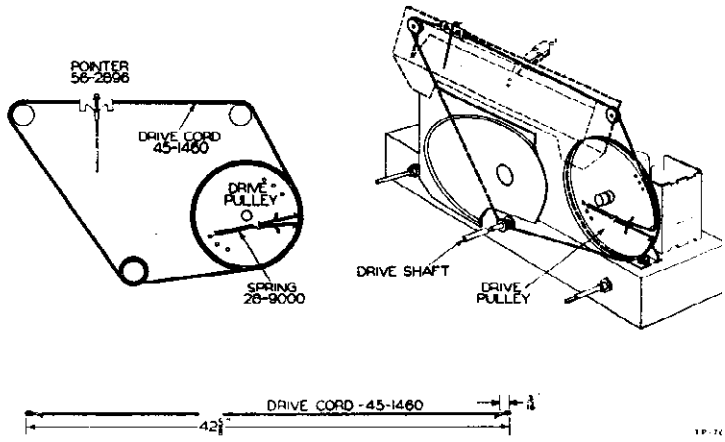

Figure 13. Drive cord installation details.

REPLACEMENT PARTS LIST

SECTION 1

Reference Number	Description	Service Part No.
C100	Condenser, .04 mf.	30-4119
C101	Condenser, electrolytic, 20-20 mf.	30-2541
C101A	Condenser, 20 mf.	Part of C101
C101B	Condenser, 20 mf.	Part of C101
C102	Condenser, .04 mf.	30-4119
I100	Lamp, pilot	34-2068
L100	Coil, field	Part of LS200
S100	Switch, a-c	Part of R200
W100	Cord, line	L3199

SECTION 2

C200	Condenser, .02 mf.	30-4599*
C201	Condenser, 250 mmf.	60-10245407*
C202	Condenser, .01 mf.	61-0120*
C203	Condenser, .01 mf.	61-0120*
LS200	Speaker	36-1533*
R200	Volume control, .5 meg.	33-5458
R201	Resistor, 4.7 megs.	66-5473340*
R202	Resistor, 470,000 ohms	66-4473340*
R203	Resistor, 470,000 ohms	66-4473540*
R204	Resistor, 130 ohms	66-1133340*
T200	Transformer, output (mounted on speaker)	Part of LS200

SECTION 3

C300A	Condenser	Part of Z300
C300B	Condenser, trimmer	Part of Z300
C301	Condenser, trimmer	Part of Z301
C302A	Condenser, trimmer	Part of Z302
C302B	Condenser	Part of Z302
C302C	Condenser	Part of Z302
C303	Condenser, .05 mf.	30-4518*
C304	Condenser, .05 mf.	30-4518*
C305	Condenser-and-choke assembly	76-1161
L300	Choke	Part of C305

MODELS 48-141, 48-145 PHILCO CORP.

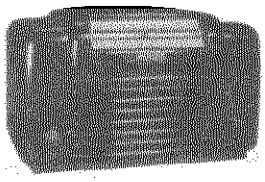
Circuit Description

Philco Models 48-141 and 48-145 are four-tube, battery-operated superheterodynes, providing reception on the standard broadcast band, 540–1720 kc. Manual tuning is employed. Both models are identical except for the cabinets, knobs, and dial scales, as indicated in the parts list. A 100-foot (over-all), outdoor aerial, such as Philco Part No. 45-1469, is recommended.

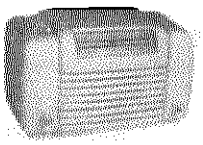
The converter stage employs a type 1LA6 pentagrid converter tube; in this tube, the oscillator signal is fed to the mixer section through the electron stream within the tube.

A type 1LN5 pentode tube is used in the i-f amplifier stage. The diode section of the 1LH4 tube provides detection and a-v-c voltage, and the triode section functions as the first audio amplifier.

The first audio stage is resistance-coupled to the type 3LF4 output tube, which drives the permanent-magnet dynamic loud-speaker.



MODEL 48-141



MODEL 48-145

SPECIFICATIONS

CABINET	
Model 48-141	Plastic, walnut finish
Model 48-145	Plastic, ivory finish
CIRCUIT	Four-tube superheterodyne
FREQUENCY RANGE	540–1720 kc.
AUDIO OUTPUT	220 mw.
POWER SUPPLY	Battery pack, Philco P-60B-6L
PLATE VOLTAGE AND CURRENT	90 volts, 10 ma.
FILAMENT VOLTAGE AND CURRENT,	1.5 volts, .25 amp.
POWER CONSUMPTION (total, plate and filament)	1 watt
AERIAL	External, Philco Part No. 45-1469
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (4)	1LA6, 1LN5, 1LH4, 3LF4

TP-3128 & TP-933

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

The following preliminary checks should be made before turning on the radio:

1. Carefully inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Disconnect the battery, and measure the resistance between B+ (red lead of battery plug) and chassis, with the ohmmeter polarity such that the highest resistance reading is obtained. If this reading is lower than 10,000 ohms, check condensers C100, C203, and C404 for leakage or shorts.

TROUBLE SHOOTING

Section 1

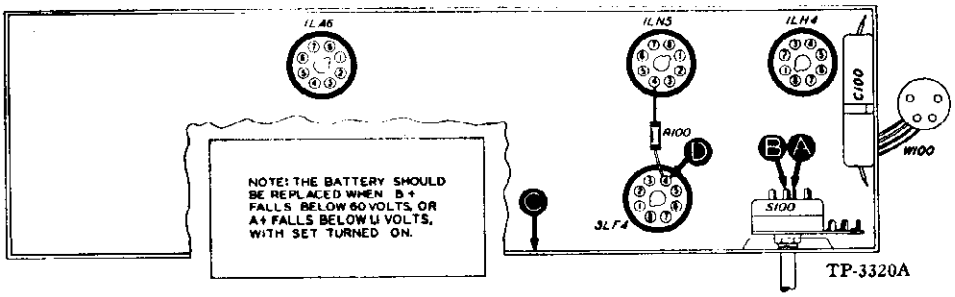


Figure 1. Bottom View, Showing Section 1 Test Points

For the tests in this section, use a d-c voltmeter, connecting the leads between the chassis, test point C, and the test points indicated in the chart. The voltages indicated were obtained from a fresh battery pack, and were measured with a 20,000-ohms-per-volt meter, with the radio turned on.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B D	85 volts 1.5 volts Negative 5 volts		Trouble within this section. Isolate by the following tests.
2	A	85 volts	No voltage Low voltage	Open battery cable. Defective S100. Open R100. Shorted C100. Weak battery. Change in value of R100. Leaky C100. Excessive current drain in Sections 2, 3, or 4.
3	B	1.5 volts	No voltage Low voltage	Open battery cable. Defective S100. Weak battery.
4	D	Negative 5 volts		Change in value of R100. Open R100. Excessive current drain in Sections 2, 3, or 4.

TROUBLE SHOOTING

Section 2

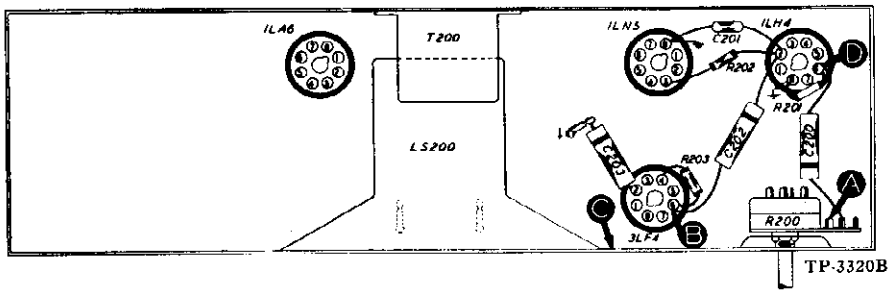

Figure 2. Bottom View, Showing Section 2 Test Points

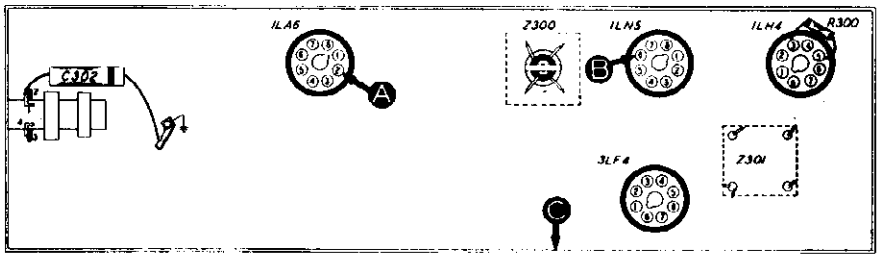
For the tests in this section, use an audio signal. Connect the signal-generator ground lead to the radio chassis, test point C; connect the output lead through .1-mf. condenser to the test point indicated in the chart. Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble within this section. Isolate by the following tests.
2	B	Normal, clear signal with strong signal input.	Defective 3LF4 tube, T200, or LS200. Shorted or leaky C203 or C201.
3	D	Loud, clear signal with moderate signal input.	Defective 1LH4 tube. Open R202 or C202.
4	A	Loud, clear signal with moderate signal input.	Defective R200. Shorted C301D. Open C200.

Listening Test: Distortion may be caused by leaky C201, C202, C203, or C200, or by open R203 or R201.

TROUBLE SHOOTING *Section 3*



TP-3320C

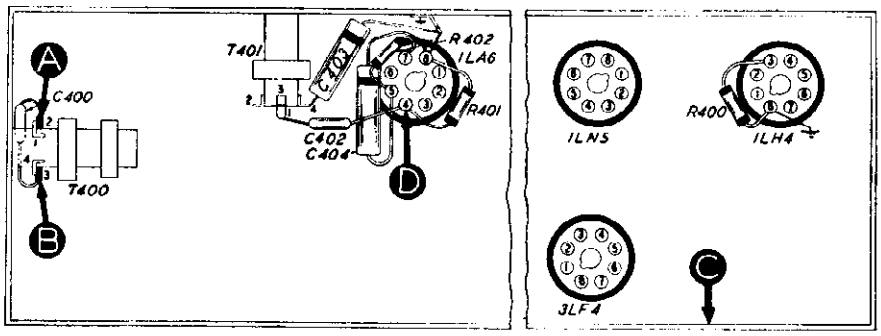
Figure 3. Bottom View, Showing Section 3 Test Points

For the tests in this section, use an r-f signal generator with frequency set at 455 kc. (modulated output). Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble within this section. Isolate by the following tests.
2	B	Loud, clear signal with moderate signal input.	Defective 1LN5 or 1LH4 (diode section) tube. Defective or misaligned Z301. Open C302.
3	A	Loud, clear signal with moderate signal input.	Defective or misaligned Z300.

TROUBLE SHOOTING *Section 4*



TP-3320D

Figure 4. Bottom View, Showing Section 4 Test Points

For the tests in this section, use an r-f signal generator with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator and radio dials as noted in the chart.

Inspect the tuning condensers for bent plates, dirt, or poor wiper contacts; any of these conditions will cause noise.

If the "NORMAL INDICATION" is not obtained in the first step, isolate the trouble by following the remaining steps.

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Loud, clear signal with low signal input.	Trouble within this section. Isolate by the following tests.
2	B	540 kc.	540 kc.	Loud, clear signal with moderate signal input.	Defective 1LA6 tube, C401, C401A, or oscillator circuit. Shorted C404. Misaligned Z300.
3	D Osc. test (See Note below.)		540 to 1720 kc.	Negative voltage (at least 1.5 volts) over complete range.	Defective 1LA6 tube, T401, C401, or C401B. Open R401, R402, C402, or C403. Shorted or leaky C402 or C403.
4	A	540 kc.	540 kc.	Loud, clear signal with low signal input.	Defective T400 or C401.

NOTE: Connect positive lead of 20,000-ohms-per-volt meter to the chassis, test point C; connect prod end of negative lead through 100,000-ohm isolating resistor to test point D (oscillator grid, pin 4 of 1LA6 tube).

ALIGNME

TURN ON RADIO POWER,

DIAL—Alignment points should be marked on the dial backplate. Measurements for these points are shown in the composite dial-and-backplate photo, figure 8. With tuning condensers fully meshed, set dial pointer to index mark.

OUTPUT METER—Connect across speaker voic

STEP	SIGNAL GENERATOR		RADIO	
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS
1	Through .1-mf. condenser to stator of aerial tuning condenser.	455 kc.	Tuning condenser fully meshed.	Adjust trimmers, in order given, for maximum output.
2	Through 200-mmf. condenser to external aerial connector.	1700 kc.	1700 kc.	Adjust for maximum output.
3	Same as Step 2.	1500 kc.	1500 kc. (approx.)	Tune radio to generator signal, and adjust trimmer for maximum output.

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuit are symbolized and located as follows:

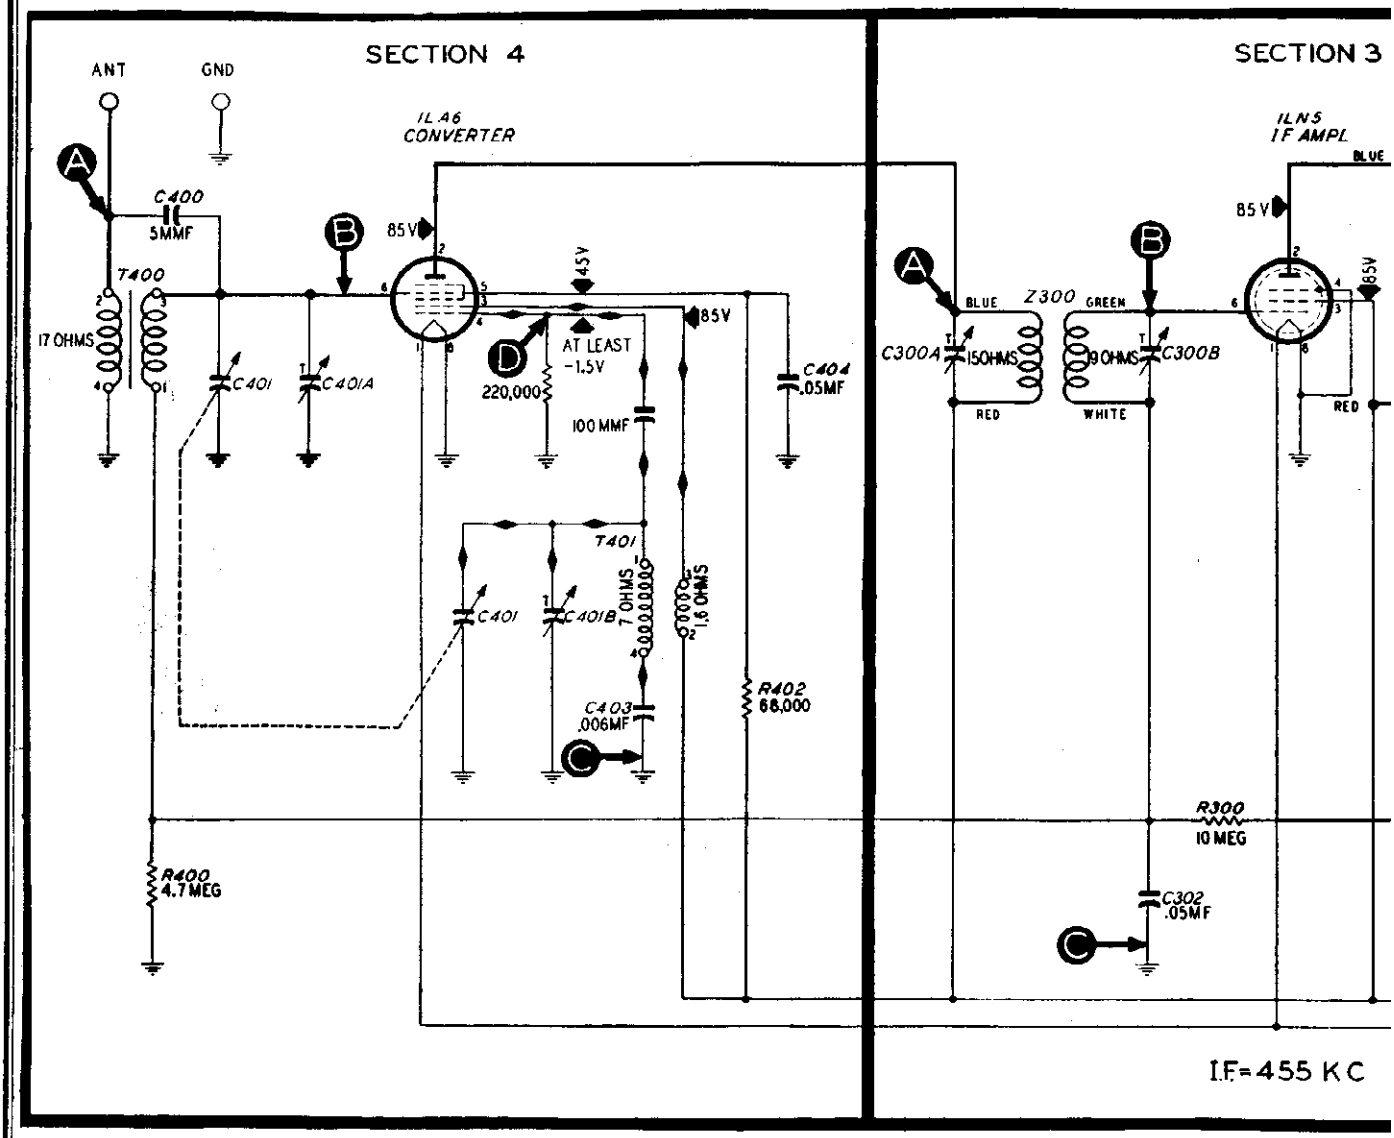
C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
Z—electrical assembly

100-series components are in Section 1—the power supply.

200-series components are in Section 2—the audio amplifier.

300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.

400-series components are in Section 4—the aerial and oscillator circuits.



NOTE: THE VOLTAGES INDICATED ON THE SCHEMATIC DIAGRAM ARE AVERAGE VALUES. THE VOLTAGES WERE MEASURED BETWEEN THE POINTS INDICATED AND THE CHASSIS, USING A 20,000-OHMS PER-VOLT METER, WITH A FRESH BATTERY.

OSCILLATOR GRID VOLTAGE WAS MEASURED BETWEEN THE CHASSIS AND OSC. GRID (PIN 4) OF THE 1LA6 TUBE, USING A 100,000-OHM ISOLATING RESISTOR IN SERIES WITH THE PROD END OF THE NEGATIVE VOLTMETER LEAD.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) in the following parts list are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

SECTION 1

Reference Symbol	Description	Service Part No.
BA100	Battery pack	P-60B-6L

MODEL 48-150 PHILCO CORP.

Circuit Description

Philco Model 48-150 is a five-tube, battery-operated, superheterodyne radio providing reception on the standard broadcast band, 540 to 1720 kc. For best performance, the radio should be operated with an external aerial, such as Philco Part No. 45-1469.

A type 1LG5 pentode is used as the r-f amplifier and a type 1LA6 pentagrid converter as the mixer and oscillator, to provide high sensitivity and high signal-to-noise ratio. The r-f stage is coupled to the mixer by a transformer, and the oscillator is coupled to the mixer by the electron stream within the converter tube.

The 455-kc., i-f amplifier stage employs a type 1LN5 pentode. This stage is coupled to the output of the mixer by a double-tuned i-f transformer, and is coupled to the detector-diode section of the 1LH4 diode-triode by a single-tuned i-f transformer. The diode circuit of the 1LH4 rectifies the i-f signal and produces the audio signal and a-v-c voltage.

Two a-v-c filter circuits are used; one circuit couples the a-v-c voltage to the r-f amplifier; the other couples the a-v-c voltage to the mixer.

The audio output of the detector is resistance-coupled to the triode section of the 1LH4, which, in turn, is resistance-coupled to the type 3LF4 beam-tetrode output stage. Fixed bias is supplied to the output stage from a resistor in series with the negative return to the battery plug. The permanent-magnet, dynamic loud-speaker is transformer-coupled to the output stage.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble-shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis, showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure. Failure to obtain "NORMAL INDICATION" in any given step indicates trouble within the circuit under test. After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

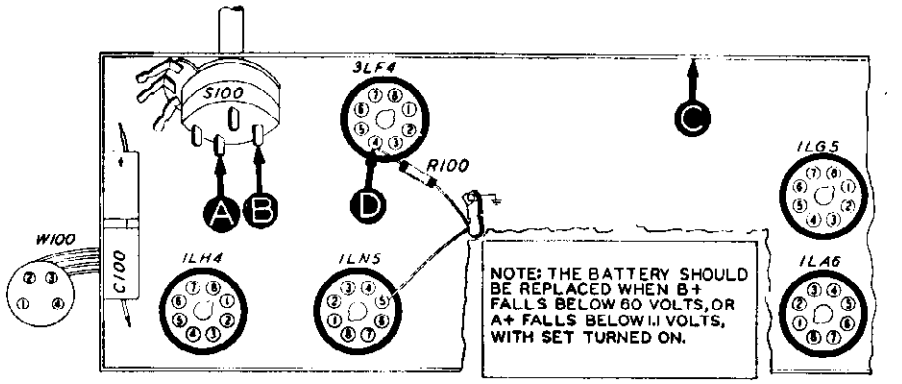
The following preliminary checks should be made before turning on the radio:

1. Carefully inspect the top and bottom of the chassis. Be sure that all tubes are securely mounted in the proper sockets. Look for bad connections burned resistors, or other obvious signs of trouble.

2. Disconnect the battery and measure the resistance between B+ (red lead of battery plug) and chassis. Use the ohmmeter polarity that gives the highest reading. If the resistance is lower than 10,000 ohms, check condensers C100, C203, C201, and C403 for leakage or shorts.

TROUBLE SHOOTING

Section



TP-3363A

Figure 1. Bottom View, Showing Section 1 Test Points

Make the tests for this sectio with a d-c voltmeter. The vol ages indicated in the chart we measured with a 20,000-ohm per-volt meter, with a fresh ba tery pack installed, and with th radio turned on. Set the volum control to minimum and the di pointer to 540 kc. Connect th meter between the radio chass test point C, and the test poin indicated in the chart.

If the "NORMAL INDICA TION" is obtained in step 1, pr ceed with the tests for Section if not, isolate and correct th trouble within this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B D	85 volts 1.5 volts Negative 5.5 volts		Trouble within this section; isolate by the following tests.
2	A	85 volts	No voltage Low voltage	Open battery cable or R100. Defective S100. Shorted C100. Weak battery. Change in value of R100. Leaky C100. Excessive current drain in Sections 2, 3, or 4.
3	B	1.5 volts	No voltage Low voltage	Open battery cable. Defective S100. Weak battery.
4	D	Negative 5.5 volts		Change in value of R100. Open R100. Excessive current drain in Sections 2, 3, or 4.

TROUBLE SHOOTING

TROUBLE SHOOTING *Section 3*

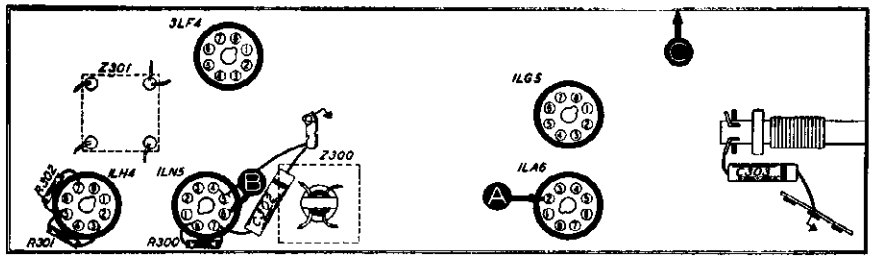

Figure 3. Bottom View, Showing Section 3 Test Points

Make the tests for this section with an r-f signal generator (modulated output); set the generator to 455 kc. Connect the ground lead to the radio chassis, test point C, and the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the volume control to maximum. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble within this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble in this section; isolate by the following tests.
2	B	Same as step 1.	Defective 1LN5 or 1LH4 (diode section). Defective or misaligned Z301.
3	A	Same as step 1.	Defective or misaligned Z300.

TROUBLE SHOOTING *Section 4*

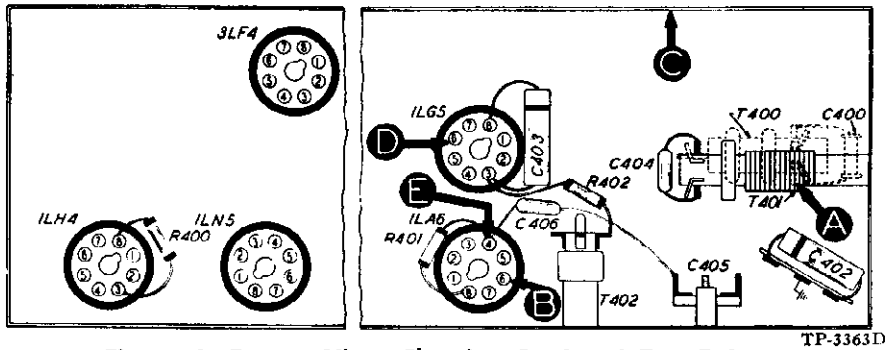

Figure 4. Bottom View, Showing Section 4 Test Points

Make the tests for this section with an r-f signal generator (modulated output); set the frequency as noted in the chart. Connect the generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Inspect the tuning condensers for bent plates, dirt, or poor wiper contacts; any of these conditions will cause noise. If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble within this section.

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Loud, clear signal with low signal input.	Trouble in this section; isolate by the following tests.
2	E Osc. test (See note below.)		540 to 1720 kc.	Negative voltage (at least 1.5 volts) over complete range.	Defective 1LA6, T402, R401, R402 or C405. Shorted C403 or osc. section of C401.
3	B	540 kc.	540 kc.	Same as step 1.	Same as step 2.
4	D	540 kc.	540 kc.	Same as step 1.	Defective 1LG5 or T401. Shorted ant. or r-f section of C401.
5	A	540 kc.	540 kc.	Same as step 1.	Defective T400. Open C402.

NOTE: Connect positive lead of a 20,000-ohms-per-volt meter to radio chassis, test point C; connect prod end of negative lead through a 100,000-ohm isolating resistor to test point E (osc. grid, pin 4 of 1LA6).

ALIGNME

TURN ON RADIO ANI

DIAL—Alignment points should be marked on the dial backplate as shown in figure 8. Turn tuning gang until fully meshed, and set dial pointer to index mark.

OUTPUT METER—Connect meter to voice-coil l loud-speaker. Set meter to 2.5-volt or similar

STEP	SIGNAL GENERATOR		RADIO	
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS
1	Through .1-mf. condenser to stator of aerial tuning condenser.	455 kc.	Tuning condenser fully meshed.	Turn C300B fully clockwise. Adjust trimmers, in order given, for maximum output.
2	Through 200-mmf. condenser to aerial lead.	600 kc.	600 kc.	Adjust for maximum output.
3	Same as step 2.	1700 kc.	1700 kc.	Same as step 2.
4	Same as step 2.	1500 kc.	1500 kc. (approx.)	Tune radio to generator signal and adjust trimmers for maximum output.
5	Same as step 2.	600 kc.	600 kc. (approx.)	Adjust trimmers for maximum output while rocking tuning control.
6	Repeat steps 3 and 5 until no further increase in output is noted.			

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuit are symbolized and located as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
Z—electrical assembly

100-series components are in Section 1—the power supply.

200-series components are in Section 2—the audio amplifier.

300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.

400-series components are in Section 4—the aerial, r-f, and oscillator circuits.

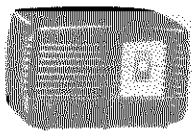
MODELS 48-200, 48-200-I, 48-214, PHILCO CORP.
Code 125

Codes 121 of these models use oscillator transformer part number 32-3880. Codes 122 use oscillator transformer part number 32-4263.

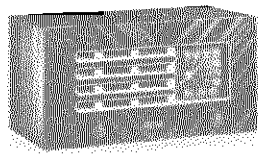
Code 121 of each of these three models is identical to Code 125 of each model, with the following exceptions:

1. The type 35Y4 rectifier tube was replaced by a type 35Z5GT tube.
2. The type 50L6GT output tube was replaced by a type 50A5 tube.



MODEL 48-200 (Walnut)
MODEL 48-200-I (Ivory)

MODEL 48-214



Circuit Description

The Philco Models 48-200, 48-200-I and 48-214 are 5-tube, table-model superheterodyne radios, providing reception in the standard broadcast band. The three models, which started in factory production as Code 125, are identical, except for cabinet and dial parts, as indicated in the parts list.

The high-impedance loop aerial normally provides adequate signal pickup. An external aerial may be connected, if desired, by detaching the aerial lead (shown in figure 6) from the chassis, and connecting the lead to an external aerial lead-in. Do not use a ground.

The loop is coupled to the 7A8 converter tube. Variable-condenser tuning is employed, the oscillator rotor-section plates being shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 is transformer coupled to the 14A7 i-f amplifier, which is also transformer coupled to the diodes of the 14B6 second detector—first audio-frequency amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance coupled to the 50L6GT output tube. The output tube is transformer coupled to a permanent-magnet dynamic speaker.

D-c operating voltages are obtained from a 35Y4 half-wave rectifier, the output of which is filtered by a two-section resistor—condenser filter.

Condenser C304 in Section 3, figures 3 and 5, is a special condenser, inductively wound to form a series-tuned circuit, resonant at the intermediate frequency. This special condenser offers less impedance at this frequency than a conventional condenser, thus permitting higher i-f gain, with no tendency toward instability. Since the tuning gang is connected to the chassis, by-passing at broadcast and short-wave frequencies is adequate. The inductive effect is negligible at audio frequencies.

The 150,000-ohm resistor, R100, in Section 1, prevents hum which might otherwise occur under conditions of high humidity.

SPECIFICATIONS

CABINET:
Models 48-200 and 48-200-I ..... Bakelite
Model 48-214 ..... Wood
CIRCUIT ..... Five-tube superheterodyne
FREQUENCY RANGE ..... 540 to 1620 kc.
OPERATING VOLTAGE .. 105 to 120 volts, a.c. or d.c.
POWER CONSUMPTION ..... 30 watts
AERIAL .... Loop fastened to cabinet; terminal also provided for outside aerial
INTERMEDIATE FREQUENCY ..... 455 kc
PHILCO TUBES (5), 7A8, 14A7, 14B6, 50L6GT, 35Y4
PANEL LAMP, 6—8-volt, bayonet base, Part No. 34-2068

Philco TROUBLE-SHOOTING Procedure

In this manual, the schematic diagram is divided into four sections, with a chassis layout for each section, showing components and test points for each section. The test points are also indicated on the schematic diagram in the corresponding section. A simplified trouble-shooting procedure is given in a chart for each section. The first step in each chart is a master check, indicating whether trouble exists in that section. Failure to obtain the "NORMAL INDICATION" in a given step indicates trouble, which should be located by voltage, resistance, or capacitance checks of parts indicated in the step, and remedied before testing further.

Preliminary Checks

The following preliminary checks are recommended before turning on the radio:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets (see figure 6), and look for bad connections, burnt resistors, or other obvious sources of trouble.

2. Measure the resistance between B plus and B minus (test points C and B— in figure 1), using the ohmmeter polarity giving the highest resistance reading; if the reading is lower than 50,000 ohms, check C101A, C101B, and C101C, for leakage or shorts.

TROUBLE SHOOTING

Section

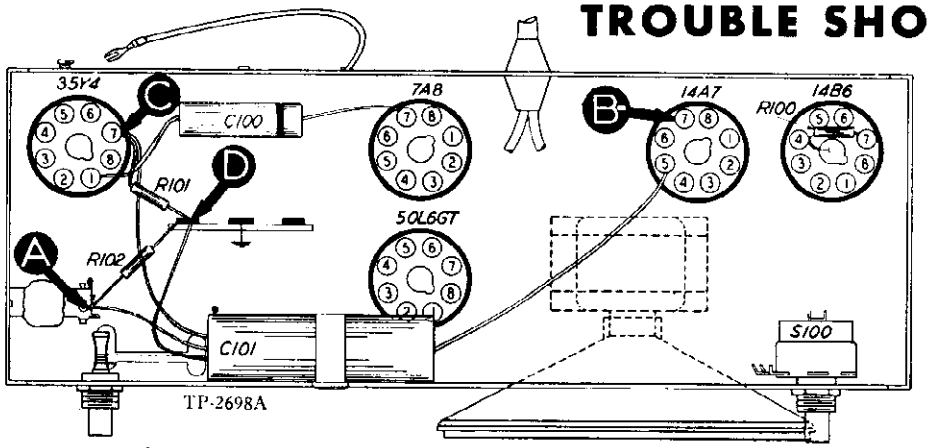


Figure 1. Bottom View, Showing Section 1 Test Points

Make the tests for this sectic with a d-c voltmeter, connecti the leads to the test points ind cated in the chart. The voltag shown were taken with a 20,00 ohms-per-volt meter at a line vol age of 117 volts, 60 cycles.

Turn the volume control minimum, and set the dial point at 540 kc.

Follow steps in sequence. "NORMAL INDICATION" is ol tained in step 1, proceed wi tests for Section 2; if not, isola and correct t..e trouble within th section.

STEP	TEST POINTS	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A to B—	90v		Trouble within this section; isolate by the following tests.
2	C to B—	115v	No voltage	Defective 35Y4 tube. Shorted C101A.
			Low voltage	Defective 35Y4 tube. Open C101A or 1100. Leaky C101A.
			High voltage	Open R101.
3	D to B—	105v	No voltage	Shorted C101B.
			Low voltage	Open C101B. Leaky C'01B or C203.
			High voltage	Open R102, T200, or R204.
4	A to B—	90v	No voltage	Shorted C101C.
			Low voltage	Leaky C101C.
			High voltage	Open R204.

Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.

TROUBLE SHOOTING

Section 2

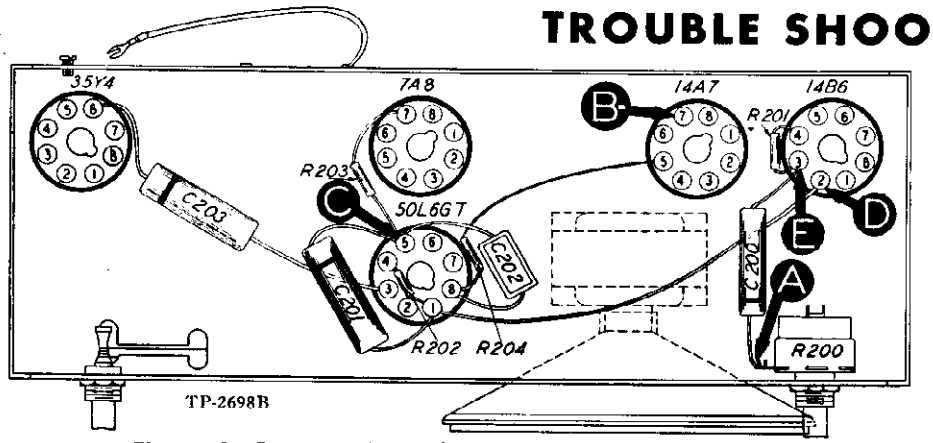

Figure 2. Bottom View, Showing Section 2 Test Points

Make tests for this section b using an audio signal. Connec ground lead of signal generator t B—; connect output lead throug a .1-mf condenser to the te points indicated in the chart. Se the volume control at maximun If "NORMAL INDICATION" obtained in step 1, proceed wit tests for Section 3; if not, isolat and correct the trouble withi this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with low signal-generator output	Trouble within this section; isolate by the following tests.
2	C	Clear signal with high signal-generator output	No signal: Open or shorted LS200 or T200. Shorted C203. Open R204. Defective 50L6GT tube. Weak or distorted signal: Defective 50L6GT tube, or LS200. Leaky C202 or C201. Open R203. Shorted R204.
3	D	Same as step 2	No signal: Open C201. Weak or distorted signal: Leaky C201.
4	E	Same as step 1	No signal: Open R202. Defective 14B6 tube. Weak or distorted signal: Shorted C200. Open R201. Defective 14B6 tube.
5	A	Same as step 1 Note: Rotate R200 through range	No signal: Open C200. Shorted C300D. Weak or distorted signal: Defective R200.

MODELS 48-200, 48-200-I, 48-214, PHILCO CORP
Codes 121, 122, 125

TROUBLE SHOOTING — Section 3

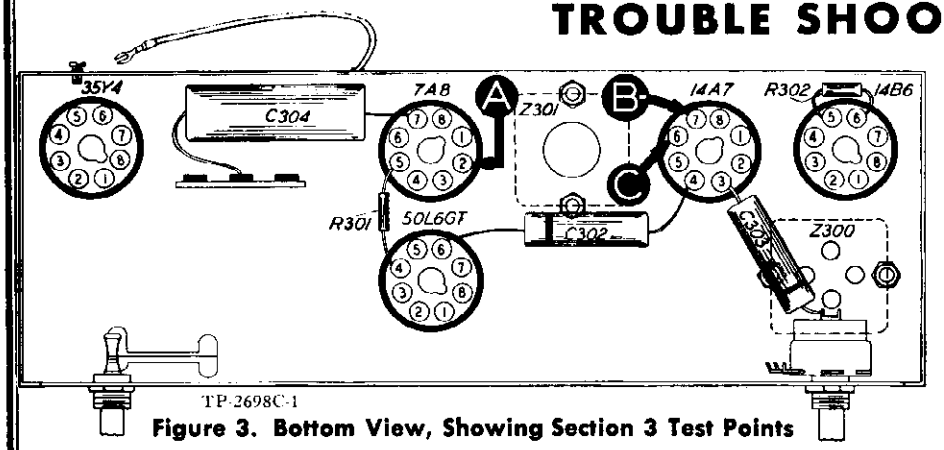

Figure 3. Bottom View, Showing Section 3 Test Points

Make tests for this section by using an r-f signal generator with modulated output. Set generator frequency to 455 kc. Connect ground lead of signal generator to B—; connect output lead through a .1-mf condenser to the test points indicated in the chart. Set the volume control at maximum. If "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 4; if not, isolate and correct the trouble within this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Clear signal with low signal-generator output	Trouble within this section; isolate by the following tests.
2	C	Same as step 1	No signal: Open or shorted Z300. Defective 14B6 or 14A7 tube. Open R301. Shorted C303. Weak or distorted signal: Leaky C303. Open C303 or C304. Defective 14B6 or 14A7 tube. Misaligned Z300. Leaky or open C302.
3	A	Same as step 1	No signal: Open or shorted Z301. Weak or distorted signal: Misaligned Z301.

TROUBLE SHOOTING — Section 4

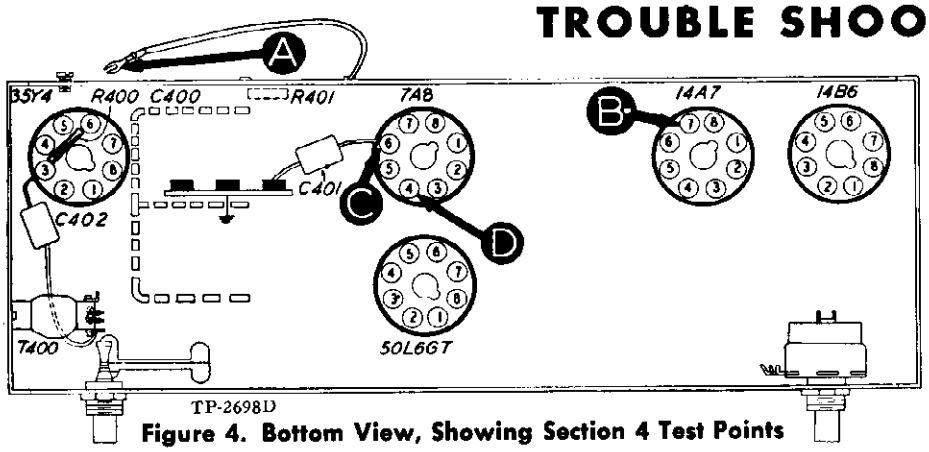

Figure 4. Bottom View, Showing Section 4 Test Points

Make tests for this section by using an r-f signal generator with modulated output. Set frequency as noted in chart. Connect generator ground lead to B—; connect output lead through a .1-mf condenser to the test points indicated in the chart.

Inspect tuning condensers for bent plates, dirt, or poor wiper contacts; any or all of these will cause noise. If "NORMAL INDICATION" is not obtained in step 1, isolate trouble by following the remaining steps.

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc	540 kc	Clear signal with low signal-generator output	Trouble within this section; isolate by the following tests.
2	Osc. Test (see Note below)		540 to 1620 kc	Negative voltage	Open or shorted T400, C402, or R400. Shorted C400 or C400B. Defective 7A8 tube.
3	C	540 kc	540 kc	Same as step 1	No signal: Open or shorted Z301. Shorted C400 or C400A. Defective 7A8 tube. Weak or distorted signal: Shorted or open LA400. Defective 7A8 tube.
4	A	540 kc	540 kc	Same as step 1	Weak signal: Open C401.

NOTE: Oscillator test.—Connect positive lead of a 20,000-ohms-per-volt meter to B—; prod end of negative lead through a 100,000-ohm isolating resistor to test point D. Proper operation of oscillator is indicated by a negative voltage of 9 to 12 volts throughout range of tuning condenser.

ALIGNMEN

TURN ON THE RADIO POWER, A

DIAL POINTER—Turn tuning condensers to full-mesh position. Set dial pointer to index dot, located to the left of "55."

OUTPUT METER—Connect to left (output) l and center (chassis) lug of terminal pan shown in figure 6.

STEP	SIGNAL GENERATOR		RADIO	
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS
1				Turn C301B (copper screw) down tight.
2	Through .1-mf. condenser to test-point C of Section 4.	455 kc.	540 kc.	Adjust trimmers, in the order given, for maximum output.
3	Through 100-mmf. condenser to external aerial connector.	1600 kc.	1600 kc.	Disconnect external aerial lug from chassis. Adjust trimmer for maximum output.
4	Same.	1500 kc.	1500 kc.	Adjust for maximum output.

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuits are symbolized and located as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loudspeaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

100-series components are in Section 1—the power supply.

200-series components are in Section 2—the second detector, a-v-c, and audio circuits.

300-series components are in Section 3—the i-f amplifier.

400-series components are in Section 4—the aerial, r-f, and oscillator circuits.
