Model 48-250, Code 122, is identical to Model 48-250, Code 121, with the following exceptions:

1. The permanent-magnet speaker (LS200), Part No. 36-1615, was replaced by an electrodynamic speaker, Part No. 36-1591.
2. Resistor R101 was removed.
3. Resistor R102 was removed.
4. Condenser C101 was replaced by a 2-section electrolytic condenser, 20-20 mf., Part No. 30-2547.*
5. Resistors R101 and R102 were replaced by the 500-ohm field coil of the speaker.

Circuit Description

The Philco Radio, Model 48-250, is a five-tube, table-model superheterodyne, providing reception in the standard-broadcast band.

The high-impedance loop aerial normally provides adequate signal pickup. Provisions are made for the connection of an external aerial.

The loop is coupled to the 7A8 converter. Variable condenser tuning is employed; the oscillator rotor-section plates are properly shaped to obtain tracking, thus eliminating the necessary for a series padding condenser.

The 7A8 is transformer-coupled to the 14A7 i-f amplifier, which is also transformer-coupled to the diodes of the 14B6 second detector—first audio-frequency amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance-coupled to the 50B5 output stage. The output tube is transformer-coupled to the permanent-magnet dynamic speaker.

D-c operating voltages are obtained from the 35Y4 half-wave rectifier, the output of which is filtered by a two-section resistor-condenser filter.

Condenser C302 in Section 3 is a special condenser, inductively wound with wire to form a series-tuned circuit, resonant at the intermediate frequency. This special condenser offers less impedance at this frequency than a conventional condenser, thus permitting higher i-f gain, with no tendency towards instability. The inductive effect at audio frequencies is negligible. Since the tuning gang is connected to the chassis, by-passing at broadcast frequencies is adequate.

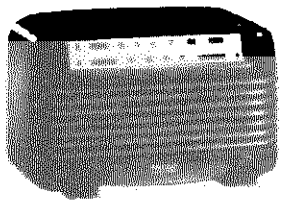
Resistor R100, the 150,000-ohm resistor in Section 1, prevents hum which might otherwise occur under conditions of high humidity.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section without going through the entire test procedure.

Failure to obtain "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.



MODEL 48-250 (Walnut)
MODEL 48-250-I (Ivory)

SPECIFICATIONS

CABINET	Plastic (ivory or walnut)
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Loop fastened to cabinet; terminal also provided for outside aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	7A8, 14A7, 14B6, 50B5, 35Y4

TP-2670

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube-electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power.

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 7 of the 35Y4 rectifier) and B— (test point B). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condenser C101A, C101B, and C101C for leakage or shorts.

The resistance value, which is must lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

Section 1 TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohm-per-volt meter, at a line voltage of 117 volts, a-c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

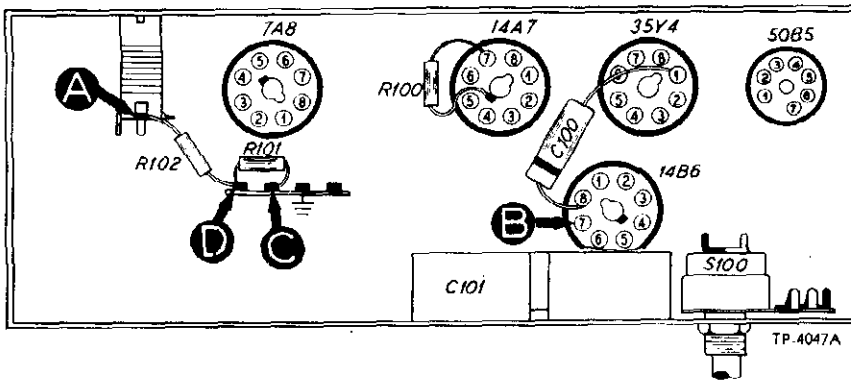


FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	107v		Trouble within this section. Isolate by the following tests.
2	C	130v	No voltage Low voltage High voltage	Defective: 35Y4, S100, W100. Shorted: C101A. Defective: 35Y4. Open: C101A, I100. Leaky: C101A. Open: R101, R102, R203*, T200*.
3	D	120v	No voltage Low voltage High voltage	Shorted: C101B. Open: R101. Shorted: C203*. Leaky: C101B, C203*. Open: R102, R203*, T200*.
4	A	107v	No voltage Low voltage High voltage	Shorted: C101C. Leaky: C101C. Open: R203*.
Listening Test: Abnormal hum may be caused by open C101B, C101C, or R100.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio signal generator. Connect the ground lead of the generator to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3. If not, isolate and correct the trouble in this section.

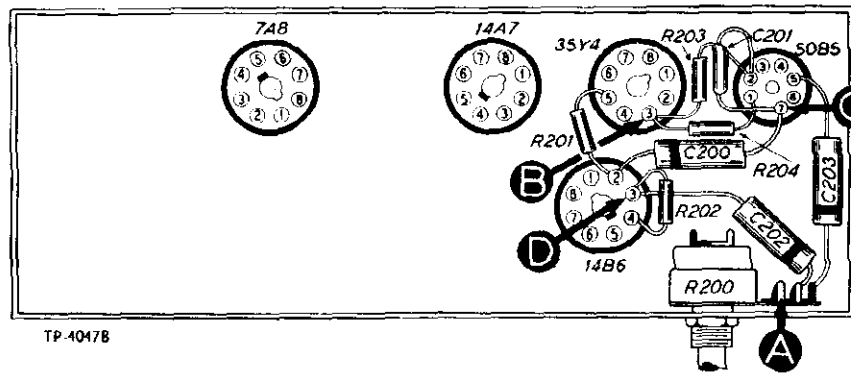

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	No signal—Open or shorted: LS200, T200. Shorted: C201, C203. Open: R203. Defective: 50B5.
3	D	Same as step 1.	Open: R201, R202, R204. Open, shorted, or leaky: C200. Defective: 14B6.
4	A	Same as step 1.	Defective: R200((rotate through entire range). Open, shorted or leaky: C202. Shorted: C301D*

* This part, located in another section, may cause trouble in this section.

Section 3 TROUBLE SHOOTING

For the tests in this section use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests in Section 4; if not, isolate and correct the trouble in this section.

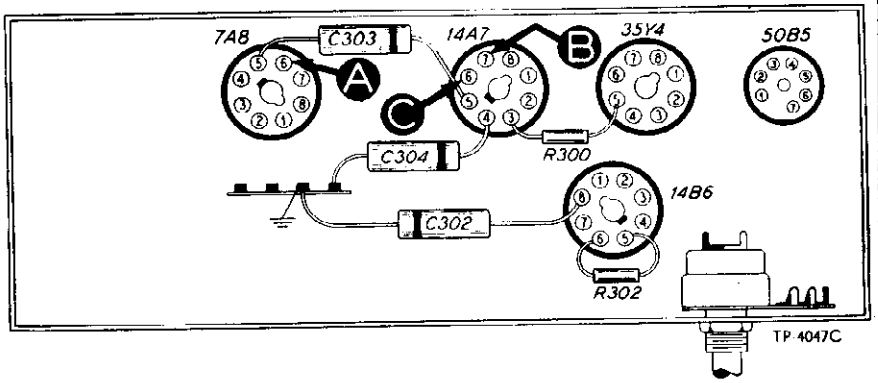

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with moderate signal input.	Defective or misaligned: Z301. Defective: 14B6 (diode section), 14A7. Open: R300, C302. Shorted, leaky, or open: C303.
3	A	Same as step 1.	Defective or misaligned: Z300. Defective: 7A8*. Open: C302, LA400*.

* This part, located in another section, may cause trouble in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

Set the radio and signal-generator dials as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section.

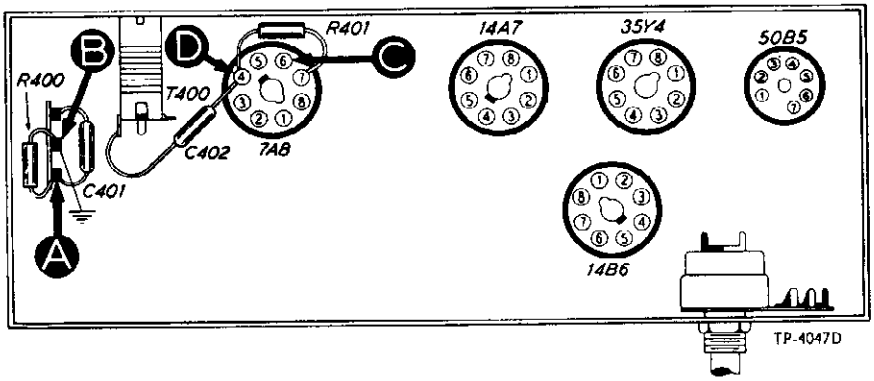

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO

ALIGNM

TURN ON THE RADIO, AND

DIAL—Turn tuning condensers to full-mesh position. Set dial pointer to coincide with index mark, located to the left of "550."

OUTPUT METER—Connect to left (output) lug center (chassis) lug of terminal panel, shown in ure 6.

STEP	SIGNAL GENERATOR		RADIO		ADJ
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B—; output lead through a .1-mf. condenser to test point C of Section 4.	455 kc.	540 kc.	Turn C300B (copper screw) fully tight, then adjust trimmers, in order given, for maximum output.	
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum.	
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	

NOTE: Make up a six-to-eight-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loud-speaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.

200-series components are in Section 2—the audio circuits.

300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.

400-series components are in Section 4—the aerial, r-f, and oscillator circuits.

A suffix letter identifies the part as a non-replaceable component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

Circuit Description

Philco Model 48-300 is a 5-tube, portable superheterodyne radio, designed to operate on a self-contained battery or a standard source of a.c. or d.c. The frequency range is 540—1620 kc. The built-in loop (high impedance) is adequate in most localities; however, where signal strength is low, an external aerial may be used.

The converter stage employs a type 1R5. The i-f stage, using a 1T4, operates at 455 kc. A 3-mmf. condenser (C305) and the socket capacity of the 1T4 socket are used to neutralize the inter-electrode capacitance of the 1T4, thus preventing oscillation.

The diode section of the 1U5 provides detection and a.v.c. The pentode section functions as the first audio stage; this stage is resistance-coupled to the 3V4 output amplifier.

For a-c or d-c power-line operation, plate, screen, and filament power is supplied through the 117Z3 rectifier.

By leaving the cathode bias resistor (R207) unbypassed, degeneration is developed in the output stage to improve the frequency response.

The 150,000-ohm leakage resistor (R102) prevents hum under conditions of high humidity.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated on the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the location of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power:

MODEL 48-300

SPECIFICATIONS

CABINET	Leatherette-covered wood
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
AUDIO OUTPUT	160 milliwatts
OPERATING VOLTAGES	Battery pack: "B", 90 volts; "A", 7.5 volts A.c./d.c.: 105—120 volts
POWER CONSUMPTION	Battery: "B", 13ma. at 90 volts; "A", 50 ma. at 7.5 volts A.c./d.c.: 25 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	1R5, 1T4, 1U5, 3V4, 117Z3
BATTERY TYPE	Philco P-841A

TP-3980

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Check the total filament resistance, with the power switch turned on, the plug disconnected from the battery, and the change-over switch in the battery position (power cord plug inserted in receptacle on rear of chassis). If the resistance between the A+ and A- pins on the battery-cable plug is higher than 100 ohms, one of the tube filaments is probably open. NOTE: If the 3V4 filament is open, check C101D before replacing with a new tube.

3. Measure the resistance between B+ (pin 6 of the 117Z3 rectifier tube) and B-, test point B (see figure 1). When the ohmmeter test leads are connected in the correct polarity, the highest resistance reading will be obtained. If the reading is lower than 1040 ohms, check condensers C101A and C101B for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

Section 1

POWER SUPPLY

Make the tests in this section with a d-c voltmeter connecting the leads between B–, test point B, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

With the power-cord plug connected to a source of power (a.c. or d.c.), turn on the power, and set the volume control to minimum (clockwise).

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

TROUBLE SHOOTIN

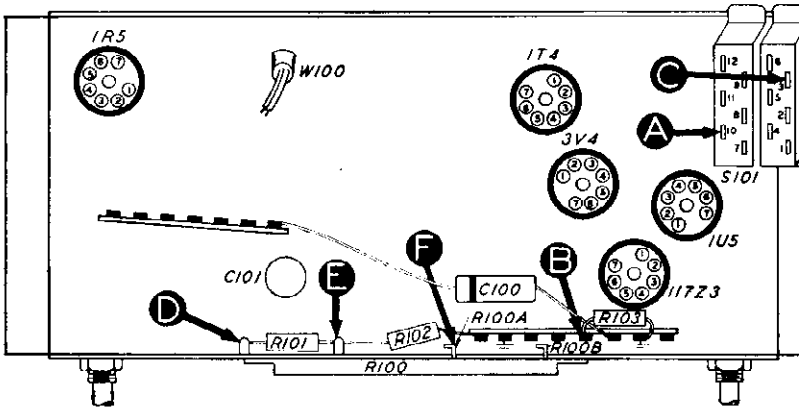

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS TP-4099

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A C	7.5v 80v		Trouble in this section. Isolate by the following tests.
2	D	107v	Low voltage No voltage	Defective: 117Z3. Open C101A. Defective: 117Z3. Open: S100, S101.
3	E	103v	Low voltage No voltage	Changed Resistance: R101. Leaky: G101A. Open: R101. Shorted: C101A.
4	F	55v	Low voltage No voltage	Changed Resistance: R100A. Leaky: C101B. Open: R100A. Shorted: C101B.
5	A	7.5v	Low voltage High voltage No voltage	Changed Resistance: R100A. Open: filament of one or more tubes. Open: R100A.
6	C	80v	Low voltage High voltage No voltage	Changed Resistance: R102. Leaky: C101C. Open: R207*, T200*. Open: R102. Shorted: C101C.
Listening Test: Hum may be caused by open C101B, C101C, C100, or R103.				

* This part, located in another section, may cause abnormal indication in this section.

BATTERY VOLTAGE: Replace battery when (with radio turned on) "B" voltage falls below 66 volts, or "A" voltage falls below 6 volts.

Section 2

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

With the power-cord plug connected to a source of power (a.c. or d.c.), set the volume control to maximum (counterclockwise). Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

TROUBLE SHOOTIN

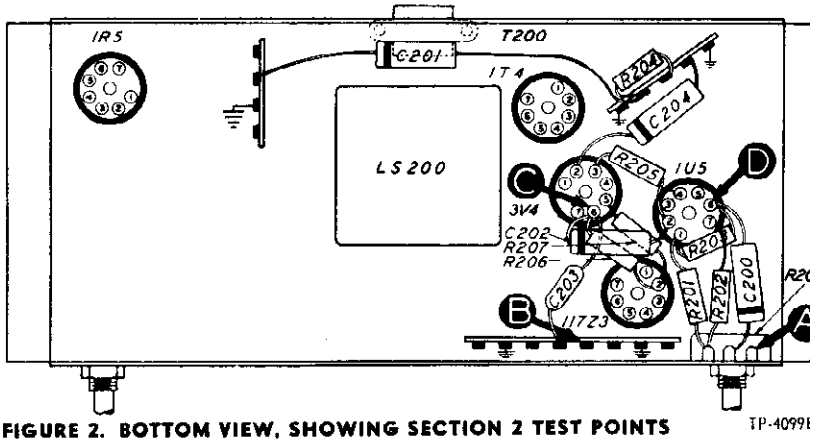

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS TP-4099

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 3V4, LS200. Open: R206, R207, T200. Shorted or leaky: C202, C203, C204, T200.
3	D	Same as step 1.	Defective: 1U5. Open: R204, R205. Shorted or leaky: C201, C203.
4	A	Same as step 1.	Open: R200 (rotate through range), R201, R202, C200, R203, C304*.
Listening Test: If speech or music is distorted (with section 1 operating normally), check R203, R201, and R202 for opens, and C200 for leakage.			

* This part located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 3

I-F, DETECTOR, AND A-V-C CIRCUITS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

With the power-cord plug connected to a source of power (a.c. or d.c.), set the volume control to maximum (counterclockwise).

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

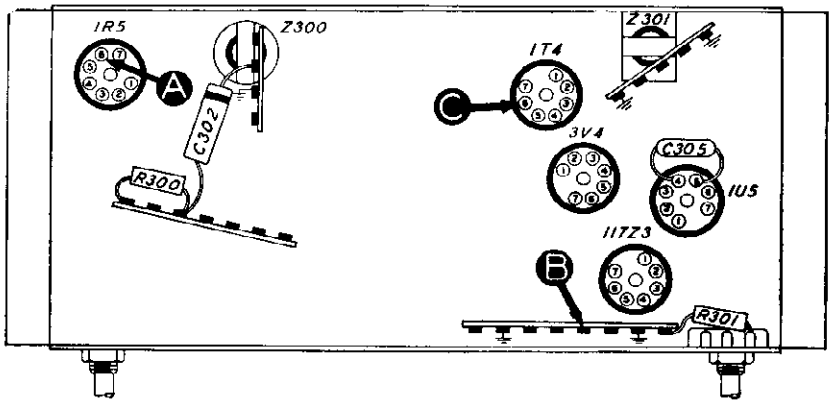

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS TP-4099C

Since the circuit location of test point A for this section is the same as that of test point C for section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear signal with moderate signal input.	Defective: 1T4. Open: R300, Z301 pri. or sec., R302. Shorted: C300B, C301A, C303, C302.
3	A	Same as step 1.	Defective: 1R5*. Shorted: C400*, C400A*, C300A, C300B. Open: Z300* pri. or sec., T400*.
Listening Test: Oscillation or instability may be caused by open C305.			

* This part located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 4

R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator, with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum (counterclockwise).

Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.

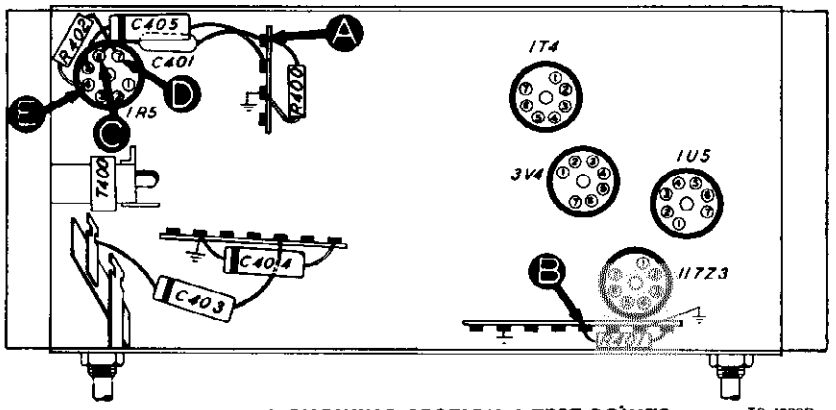

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS TP-4099D

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	1000 kc.	Tune to signal.	Same as step 1.	Shorted: C400, C400A, C405, C402. Trouble in oscillator circuit (step 3).
3	E to D (Osc. test; see note below.)		Rotate through range.	Negative 7 to 9 volts.	Defective: 1R5. Open: R402, T400. Shorted: C400, C400B.
4	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C401, L400, LA400, R401.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the 1R5 positive filament terminal, pin 7 (test point D); connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the 1R5 oscillator grid, pin 4 (test point E). Use a suitable meter range, such as 0—10 volts. Absence of negative grid voltage throughout the tuning range indicates that the oscillator is not operating. The normal grid voltage given in the chart was measured with a 20,000-ohms-per-volt meter.

ALIGNMENT

OUTPUT METER—Connect between chassis and voice-coil terminal of output transformer T200.

VOLUME CONTROL—Set to maximum (counterclockwise).

OUTPUT LEVEL—Input signal should be attenuated, as alignment progresses, to hold output-meter readi low 1 volt.

SIGNAL GENERATOR—Connect as indicated in chart.

STEP	SIGNAL GENERATOR		RADIO		AI
	CONNECTIONS TO RADIO	DIAL	DIAL	SPECIAL INSTRUCTIONS	
1	Ground lead to B-; output to external aerial lead (disconnected from chassis).	455 kc.	Gang fully meshed.	Adjust trimmers, in order given, for maximum output (chassis out of cabinet).	C301A- C300B- C300A-
2	Install chassis in cabinet, and adjust dial pointer.				
3	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum.	C400B-
4	Same as step 3.	1600 kc.	1600 kc.	Adjust for maximum.	C400A-

RADIATING LOOP: Make up a coil of insulated wire, consisting of 6 to 8 turns, about 6" in diameter. Connect coil to signal-generator leads, and suspend coil near radio loop.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the section of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loud-speaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.
400-series components are in Section 4—the r-f and converter circuits.

A suffix letter identifies the part as a component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

MODEL 48-360 PHILCO CORP.

Circuit Description

Philco Model 48-360 is a six-tube, portable, superheterodyne radio, operating on a self-contained battery or a standard power source of a.c. or d.c. High sensitivity, selectivity, and power output are outstanding features. The frequency range is 540—1600 kc. The built-in loop aerial is adequate in most localities. Where signal strength is low, an external aerial may be used.

The tuned r-f stage, using a 1T4, provides a high signal-to-noise ratio. The converter employs a type 1R5 pentagrid converter.

The i-f stage, using another 1T4, has double-tuned transformers operating at 265 kc.; the voltage gain of this stage is increased considerably by positive screen feedback taken from the tertiary winding of the second i-f transformer.

The diode section of the 1U5 provides detection and a-v-c voltage. The pentode section functions as the first audio stage; this stage is resistance-coupled to the 3LF4 output amplifier. The speaker is a permanent-magnet dynamic type.

For a-c or d-c power-line operation, plate, screen, and filament power is supplied through the 117Z3 rectifier.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and components of that section.

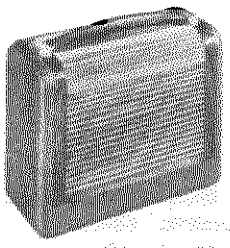
In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:



MODEL 48-360

SPECIFICATIONS

CABINET	Fabrikoid finish, wood trim
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	160 milliwatts
OPERATING VOLTAGES	Battery: "B," 90 volts; "A," 9 volts. A.c./d.c.: 105—120 volts
POWER CONSUMPTION	Battery: "B," 12 ma. at 90 volts; "A," 50 ma. at 9 volts. A.c./d.c.: 25 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	265 kc.
PHILCO TUBES (6)	1T4 (2), 1R5, 1U5, 3LF4, 117Z3
BATTERY TYPE	Philco P-841A

TP-1584

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Check the total filament resistance by measuring between the A+ and A− pins on the battery-cable plug (disconnected from battery) while holding down the change-over switch, S100. If the resistance is higher than 100 ohms, one of the tube filaments is probably open.

3. With the change-over switch in the a.c./d.c. position, measure the resistance between B+ (pin 6 of the 117Z3 rectifier) and B−, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1100 ohms, check condensers C100A, C100B, and C100C for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

Section 1 TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.•

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

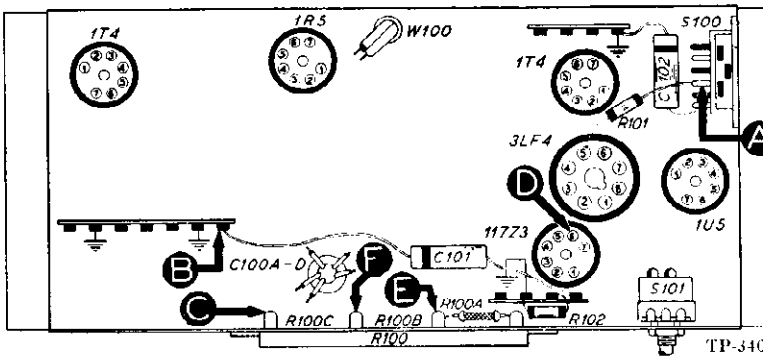


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A C	80 volts 8.5 volts		Trouble in this section. Isolate by the following tests.
2	D	105 volts	High voltage Low voltage No voltage	Open: R100A, R100B, R100C, R101, T200*. Defective: S100, S101. Defective: 117Z3. Leaky: C100A. Leaky or shorted: C100B, C100C, C100D. Defective: 117Z3, S100, S101, W100.
3	E	99 volts	Low voltage No voltage	Defective: R100A. Leaky: C100A. Shorted: C100B, C100C, C100D. Open: R100A. Shorted: C100A.
4	F	55 volts	Low voltage No voltage	Defective: R100B. Shorted: C100C, C100D. Leaky: C100B Open: R100B. Shorted: C100B.
5	A	80 volts	Low voltage No voltage	Defective: R101. Leaky: C100C. Open: R101. Shorted: C100C.
6	C	8.5 volts	High voltage Low voltage No voltage	Defective: Any tube, R207*, S100, S101. Leaky: C100D. Defective: R100C. Open: R100C. Shorted: C100D.
Listening Test: Distortion or abnormal hum may be caused by open C100B, C100C, or C100D.				
*This part, located in another section, may cause abnormal indication in this section.				
BATTERY VOLTAGE: Replace battery when (with radio turned on) "B" voltage falls below 60 volts, or "A" voltag falls below 7.2 volts.				

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.

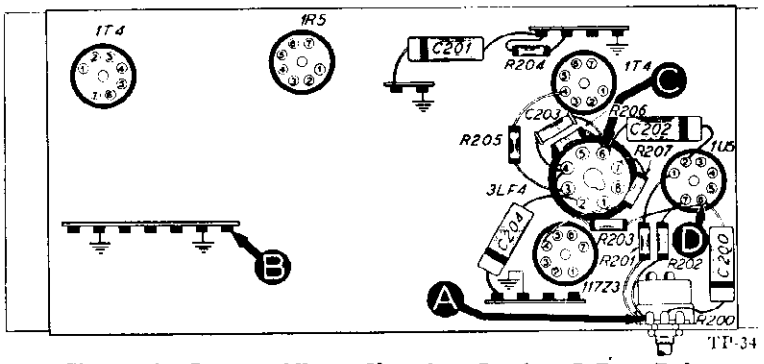

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 3LF4, LS200, T200. Shorted: C203, C204.
3	D	Loud, clear signal with weak signal input.	Defective: 1U5. Open: C202, C201, R205, R204. Shorted or leaky: C202, C201.
4	A	Loud, clear signal with weak signal input.	Defective: R200. Open: C200, R201, R202.
Listening Test: Distortion on strong signals may be caused by shorted or leaky C200.			

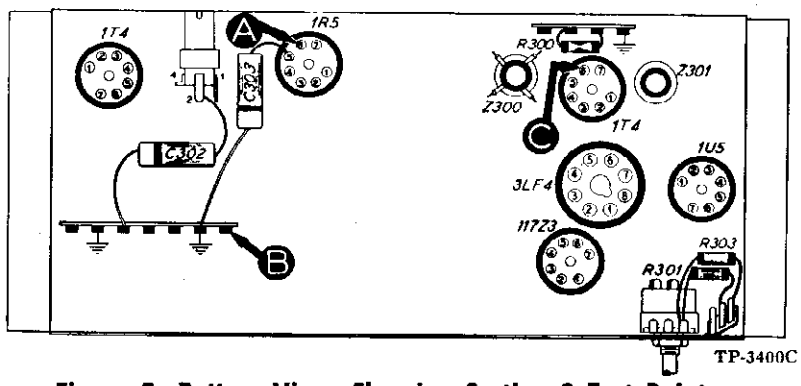
Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 265 kc. Connect the generator ground lead to B−, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."



TP-3400C

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 1T4, Z301. Misaligned: Z301. Open: R300, C302. Shorted or leaky: C302.
3	A	Loud, clear signal with weak signal input.	Defective: 1R5*, Z300. Misaligned: Z300. Shorted: C406*.

* This part, located in another section, may cause abnormal indication in this section.

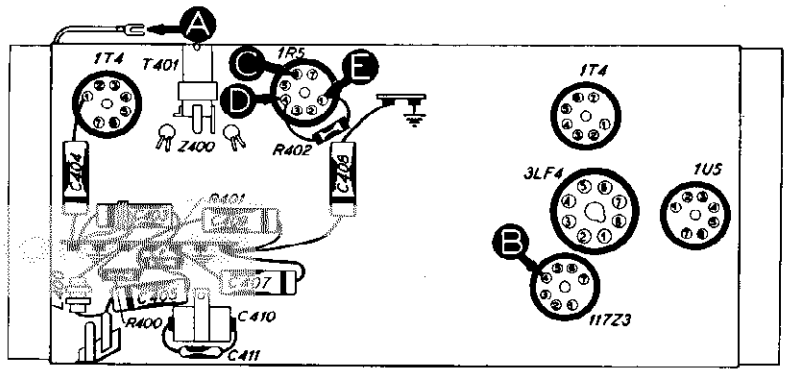
Section 4 TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B−, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

Set the radio and signal-generator dials as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.



TP-3400D

Figure 4. Bottom View, Showing Section 4 Test Points (Locations of C402 and T400 shown in figure 6.)

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	1000 kc.	1000 kc.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	1000 kc.	1000 kc.	Clear signal with strong signal input.	Defective: 1R5. Open: C407, C408. Trouble in oscillator circuit.
3	E to D (Osc. test; see note below.)		Rotate tuning control	Negative 2 to 4 volts.	Defective: 1R5 (osc. section), T401. Open: R402. Shorted: C410, C410A, C400, C400C.
4	A	1000 kc.	1000 kc.	Loud, clear signal with weak signal input.	Defective: 1T4, T400, Z400. Shorted: C400, C400A, C400B. Open: R400, R401.

OSCILLATOR-TEST NOTE: Connect positive lead of high-resistance voltmeter to 1R5 filament, test point E; connect prod end of negative lead through 100,000-ohm isolating resistor to 1R5 oscillator grid, test point D. Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage of 2 to 4 volts (measured with 20,000-ohms-per-volt meter) throughout range of tuning control.

ALIGNMEN

THE ALIGNMENT SHOULD BE MADE WITH THE RADIO

DIAL—Turn tuning condensers to full-mesh position. Set dial pointer to coincide with index mark at low-frequency end of dial.

OUTPUT METER—Connect between chassis and coil terminal on output transformer, T200.

STEP	SIGNAL GENERATOR		RADIO		ADJ
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to lug on T400 (see figure 6); output lead to ext. aerial lug.	265 kc.	Set at index mark.	Turn C300B fully tight, then adjust trimmers, in order given, for maximum output.	C3 C3 C3 C3
2	Radiating loop (see Note below).	1600 kc.	1600 kc.	Adjust for maximum.	C40
3	Same as step 2.	580 kc.	580 kc.	Adjust for maximum while rocking tuning control.	C4
4	Same as step 2.	1600 kc.	1600 kc.	Adjust for maximum.	C40
5	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	C400
6	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	C400
7	Repeat steps 3, 4, 5, and 6 until no further improvement is obtained.				

NOTE: Make up a six-to-eight-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and l near radio loop.

SYMBOLIZATION

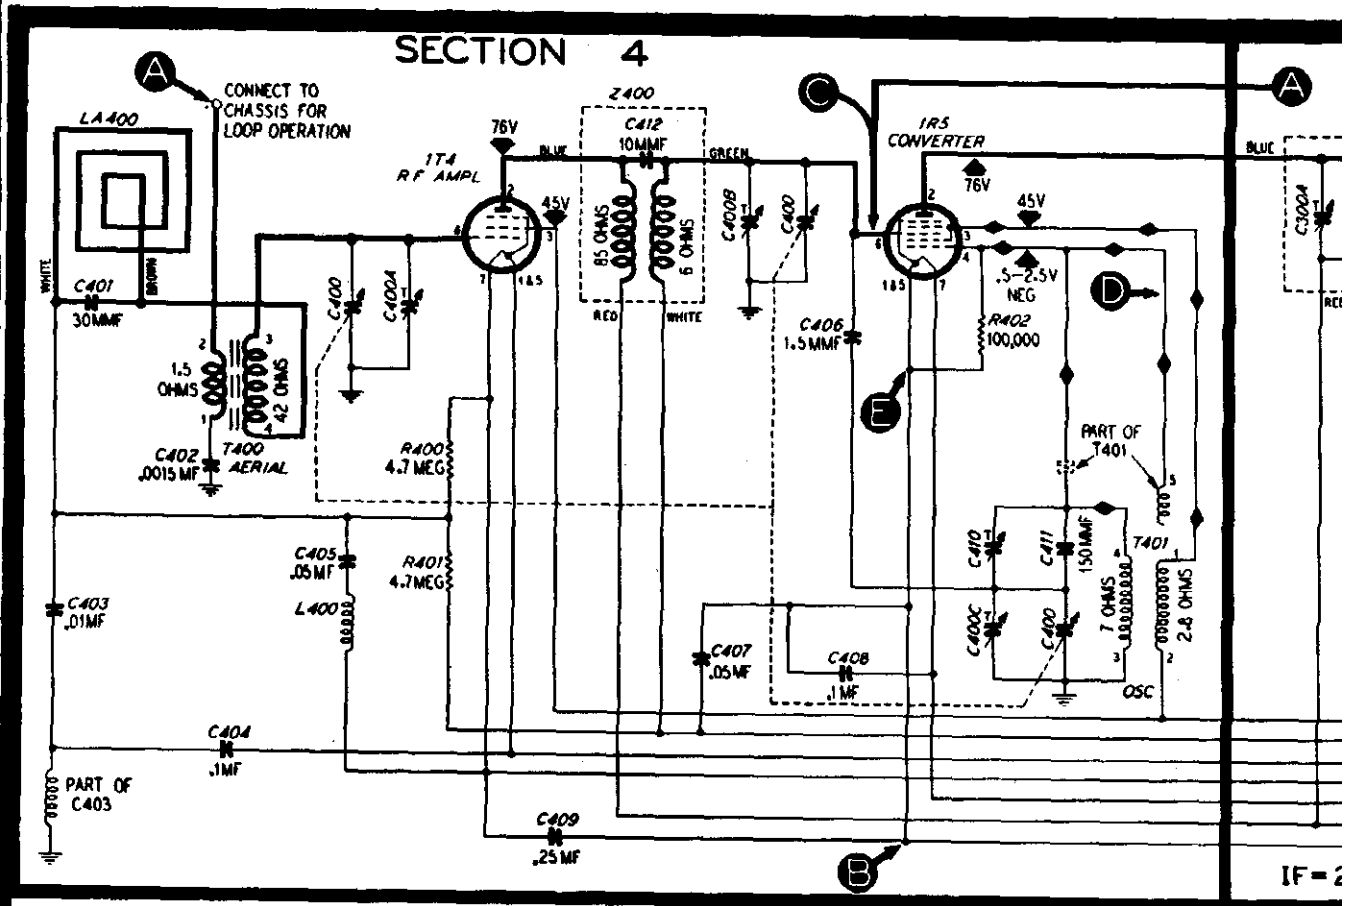
The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

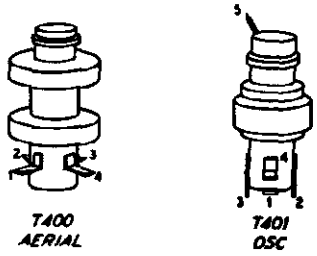
C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
Z—electrical assembly

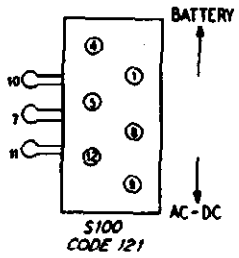
The number of the symbol designates the section in which the part is located, as follows:

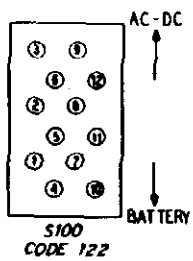
100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f amplifier, detector and a-v-c circuits.
400-series components are in Section 4—the aerial, r-f, and oscillator circuits.

A suffix letter identifies the part as a non-replaceable component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.









CODES 121 AND 122 ARE FUNDAMENTALLY THE SAME. THE MAIN EXCEPTION BEING THE POWER CHANGE-OVER SWITCH, S100 WHICH IS 3 POLE FOR CODE 121 AND 4 POLE FOR CODE 122. THE TERMINAL LAYOUT OF EACH SWITCH IS SHOWN IN THE SKETCH ABOVE. CONNECTIONS PECULIAR TO CODE 122 ARE SHOWN BY DOTTED LINES IN SECTION 1 OF THE SCHEMATIC.

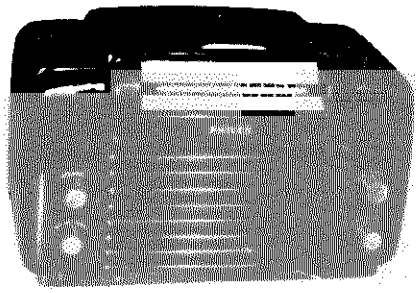
MODEL 48-464 PHILCO CORP.



MODEL 48-464

SPECIFICATIONS

CABINET	Bakelite, brown
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540 — 1720 kc
Short wave	9 — 15.5 mc
AUDIO OUTPUT	1 watt
OPERATING VOLTAGE	115 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc
SPEAKER	Dynamic, permanent magnet, 4" x 6"; voice-coil impedance, 3.4 ohms
PHILCO TUBES (6)	14AF7, 7B7 (2), 7C6, 50A5, 35Y4

Circuit Description

Philco Model 48-464 is a six-tube, manually tuned superheterodyne radio, providing reception in the standard-broadcast band, 540—1720 kc, and the short-wave range between 9 mc and 15.5 mc. A low-impedance loop within the cabinet provides adequate signal pickup in most areas. Where additional pickup is required, an external aerial may be used. Do not use a ground. The tube complement is as follows: 14AF7, converter; two 7B7's, i-f amplifiers; 7C6, det. — a.v.c. — 1st audio; 50A5, output; 35Y4, rectifier.

The choke-and-condenser combinations C305/L300 and C306/L301 form series-tuned circuits, resonant at frequencies relative to the i.f. The former is resonant at 455 kc; the latter is resonant at 910 kc (i-f second harmonic); the combination formed by all the above components is resonant at 1365 kc (i-f third harmonic). The impedance of any of these combinations at resonance is much lower than that of a conventional by-pass condenser at the same frequency. By providing high-efficiency by-passing between the chassis and B–, these combinations function to prevent instability of the high-gain i-f amplifiers and to minimize signal interference and beat notes.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure. Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

The following preliminary checks should be made before turning on the radio:

1. Carefully inspect both the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of 35Y4 rectifier) and B–. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101, C102A, C102B, C102C, and C203 for leakage or shorts.

Section 1 TROUBLE SHOOTING

Make tests for this section with d-c voltmeter; connect negative lead to test point B–, and positive lead to test points indicated in chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Set wafer switch to broadcast position; turn volume control to minimum, and tone control to nearly "off" position.

Follow steps in sequence; if the "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 2; if not, isolate and correct the trouble in this section.

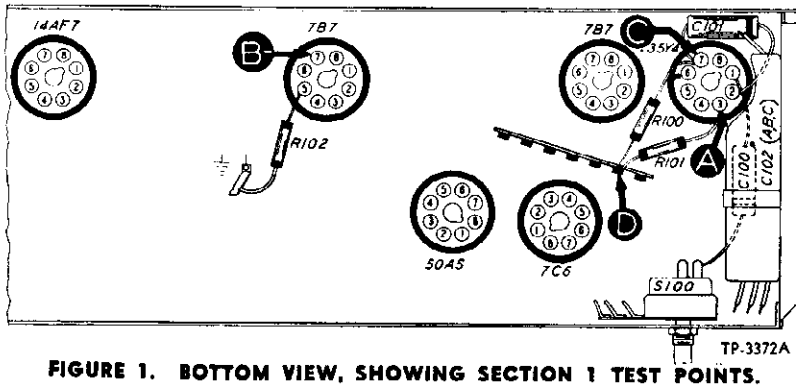


FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS.

It will be noted that certain parts in other sections of the radio are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION", since th may cause abnormal voltage readings in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	92v		Trouble in this section. Isolate by the following tests.
2	C	128v	No Voltage Low Voltage High Voltage	Defective 35Y4, S100, or W100. Shorted C101, C102A, or C100. Defective 35Y4. Leaky C101, C102A, C102B, or C102C. Open R100 or C102A. Open R100.
3	D	110v	No Voltage Low Voltage High Voltage	Open R100. Shorted C102B. Defective R100. Leaky C102B or C102C. Shorted or leaky C203. Open R101, T200, or R204.
4	A	92v	No Voltage Low Voltage	Defective R101. Shorted C102C. Defective R101. Leaky C102C.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect generator ground lead to test point B–; connect output lead through .1-mf condenser to test points indicated in chart.

Set radio volume control to maximum, and tone control to nearly "off" position. Adjust signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.

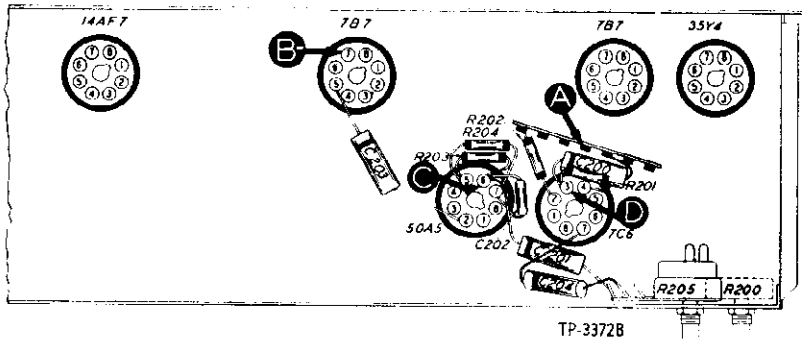

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Moderate, clear signal with strong signal input.	Defective 50A5, T200, LS200, R203, or R204. Shorted or leaky C203 or C202.
3	D	Loud, clear signal with weak signal input.	Defective 7C6. Open R202. Shorted C201 or C204 (rotate tone control).
4	A	Loud, clear signal with weak signal input.	Defective R200, C200, or R201.
Listening Test: Distortion may be caused by leaky C200, C201, or C202; hum may be caused by open R201 or R203.			

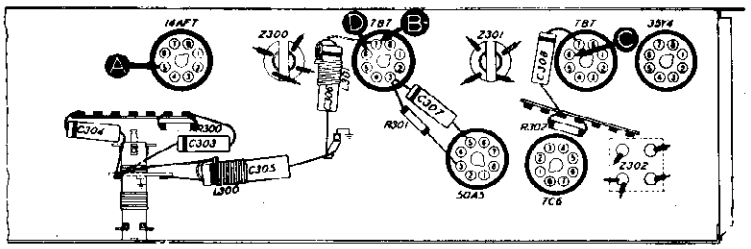
Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator with modulated output, set at 455 kc. Connect generator ground lead to test point B–; connect output lead through .1-mf condenser to test points indicated in chart.

Set wafer switch to broadcast position.

Set radio volume control to maximum, and tone control to nearly "off" position.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.



TP-3572C

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS.

It will be noted that for this section the circuit location of the test point for step 1 (the master check), and also for step 4, is the same as for test point C in Section 4; therefore, certain components in Section 4 may cause an abnormal indication. These components are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION".

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective 7C6 or 7B7 (2nd i.f.). Open R301 or R302. Shorted C307. Defective or misaligned Z302.
3	D	Loud, clear signal with moderate signal input.	Defective 7B7 (1st i.f.). Defective or misaligned Z301.
4	A	Loud, clear signal with weak signal input.	Defective 14AF7. Open R401, R403, or R300. Shorted C303. Defective or misaligned Z300.

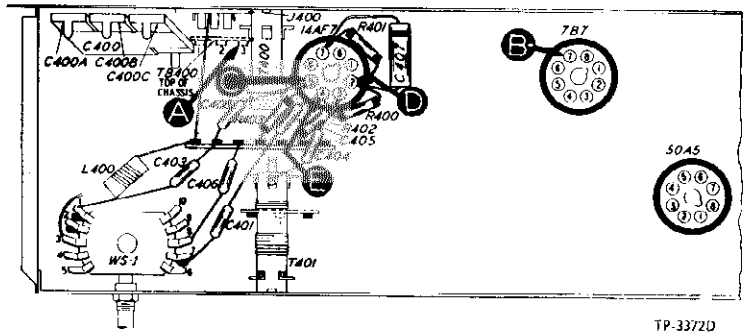
Section 4 TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator tests (steps 3 and 6), use an r-f signal generator with modulated output. Connect generator ground lead to test point B–; connect output lead through .1-mf condenser to test points indicated in chart.

Set radio volume control to maximum, and tone control to nearly "off" position.

Set wafer switch, tuning control, and signal-generator frequency as indicated in chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by proceeding with the remaining steps.



TP-3372D

STEP	TEST POINT	SIG. GEN. DIAL SETTING	WAFER SWITCH	RADIO DIAL SETTING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc	BC	1000 kc	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	1000 kc	BC	1000 kc	Loud, clear signal with weak signal input.	Open C407. Trouble in oscillator circuit.
3	E to D (Osc. test; see Note below.)		BC	Turn tuning control through range.	Negative 1 to 2 volts.	Defective 14AF7, T401, or WS1 (R). Open or shorted C404 or C405. Open R400, R402, or C400. Shorted plates of tuning condenser (osc. section).
4	A	1000 kc	BC	1000 kc	Loud, clear signal with weak signal input.	Open C408. Defective WS1 or T400.
5	A	15 mc	SW	15 mc	Loud, clear signal with weak signal input.	Defective 14AF7 or WS1. Open C403, L400, or C401. Shorted C400A.
6	E to D Osc. test (see Note below.)		SW	Turn tuning control through range.	Negative 1 to 2 volts.	Defective 14AF7, T401, or WS1 (R). Open C406.

NOTE: For oscillator tests (BC in step 3 and SW in step 6), connect positive lead of high-resistance, d-c voltmeter to test point D (14AF7 osc. cathode); connect prod end of negative lead through 100,000-ohm isolating resistor to test point E (14AF7 osc. grid). Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage throughout range of tuning condenser.

ALIGNMI

NOTE: Make ali

DIAL — Alignment points should be marked on the dial backplate. Measurements for these points are shown in the composite dial-and-backplate photo, figure 6. With tuning condensers fully meshed, set dial pointer to index mark.

OUTPUT METER — Connect to terminals in figure 7.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No.".

Circuit Description

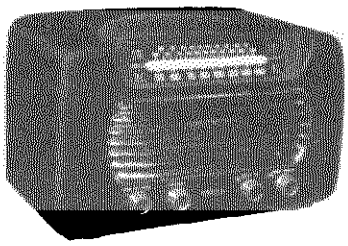
Philco Radio Model 48-472, Code 122, is an eight-tube superheterodyne, which provides reception on the standard-broadcast band and on the FM band. A built-in high-impedance loop is used as the aerial on the broadcast band and the line cord is used as the aerial on the FM band. These aerials normally provide adequate signal pickup; if additional pickup is required, Philco Dipole Aerial, Part No. 45-1462 may be used. When connecting the dipole aerial, disconnect the black lead from terminal 2 of TB400, and attach it to pin 1 of the dipole-aerial plug which fits into J400. No additional coupler is required.

To eliminate complicated switching and to provide greater stability and gain on both bands, separate converter tubes are used for broadcast and FM reception. A 12AU6 high-gain pentode is used as a tuned r-f amplifier on the FM band. The output of this stage is fed to a 14F8 dual triode which functions as the converter for the FM signal. A 12AU7 dual triode is used as the converter for the broadcast signal. Band switching is accomplished by means of a single-wafer switch, which connects the B+ voltage to the proper mixer plate.

6BJ6 type tubes are used in the two i-f-amplifier stages. Two sets of i-f transformers are used; one set is tuned to 455 kc. for standard broadcast, and the other set is turned to 9.1 mc. for FM. The use of two sets of transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated.

Two diode sections of the 19T8 triple-diode-triode are used in a ratio detector circuit for detection of FM signals. The other diode section is used in a half-wave rectifier circuit for detection of standard-broadcast signals and to provide a-v-c voltage.

The triode section of the 19T8 is employed as the first audio amplifier, and is resistance-coupled to the 50A5 output tube, which supplies an audio output of approximately one watt to the permanent-magnet dynamic speaker.



MODEL 48-472

SPECIFICATIONS

CABINET	Plastic, walnut finish
CIRCUIT	Eight-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1620 kc.
FM	88—108 mc.
AUDIO OUTPUT	1 watt
OPERATING VOLTAGES	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	40 watts
AERIALS	Built-in loop and FM line cord; provisions for connection of external aerial
INTERMEDIATE FREQUENCIES	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (8)	12AU6, 12AU7, 14F8, 6BJ6-(2), 19T8, 50A5, 117Z3

TP-4880

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between the B+, pin 6 of the 117Z3, and B–, test point B. When the ohmmeter leads are connected in the proper polarity, the highe resistance reading will be obtained. If the reading lower than 1250 ohms, check condensers C102, C103A C103B, and C103C for leakage or shorts. This resi tance value, which is much lower than normal, do not represent a quality check of these condensers; it the lowest value which will permit the rectifier to ope ate safely while the voltage checks of Section 1 (pow supply) are performed.

3. If the 50A5 tube or the 6BJ6 (2nd i-f amplifie tube is burned out, check condenser C314 for a sho before installing a new tube.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

Section 1 TROUBLE SHOOTING

POWER SUPPLY

Make the tests for this section with a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, turn the tone control fully clockwise, and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

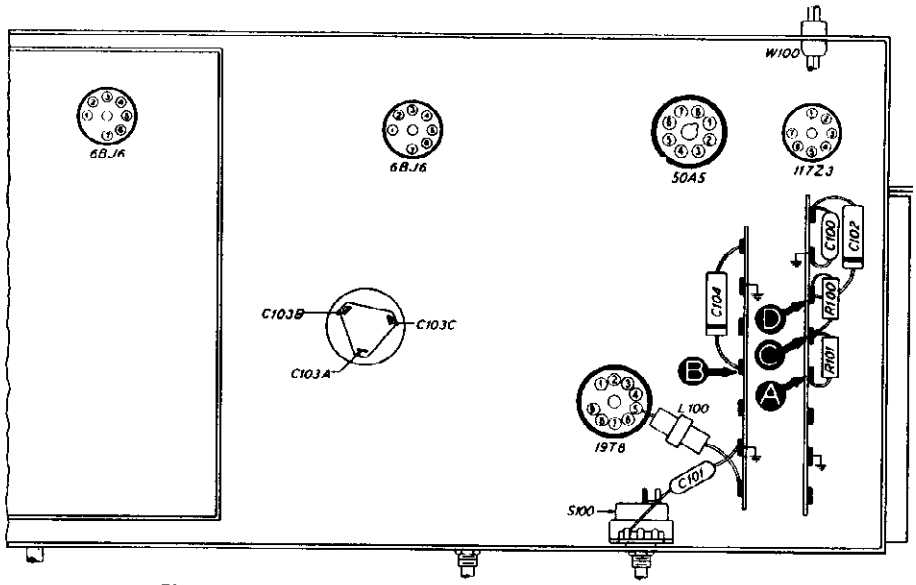


Figure 1. Bottom View, Showing Section 1 Test Points TP-5398A

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	95v		Trouble in this section. Isolate by the following tests.
2	C	100v	No voltage	Defective: 117Z3. Open: W100, S100. Shorted: C103A, C103B, C102.
			Low voltage	Defective: 117Z3. Leaky: C103A, C103B, C103C. Shorted: C103C.
			High Voltage	Open: R100, R101, T200*, R204*.
3	D	118v	No voltage	Open: R100. Shorted: C103B.
			Low voltage	Increased value: R100. Leaky: C103B. Shorted: C103C.
			High Voltage	Open: R101, T200*, R204*.
4	A	95v	No voltage	Open: R101. Shorted: C103C.
			Low voltage	Leaky: C103C. Increased value: R101. Shorted: C312*, C311*, C317*, C419*, C406*, C315*, C318*, C411*.
Listening Test: Abnormal hum may be caused by open C103A, C103B, or C103C.				

This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section. use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 50A5. Shorted: LS200, T200. Open: R203, R204, C205, LS200, T200. Shorted or leaky: C202, C204, C205, C206, C207.
3	D	Loud, clear output with moderate input.	Defective: 19T8. Open: R205, R202, C202. Shorted or leaky: C202, C203 (rotate R201 through range).
4	A	Loud, clear output with moderate input.	Open: R200 (rotate through range), C200, C201. Shorted or leaky: C200, C201.
Listening Test: Distortion may be caused by leaky C200, C201, or C202.			

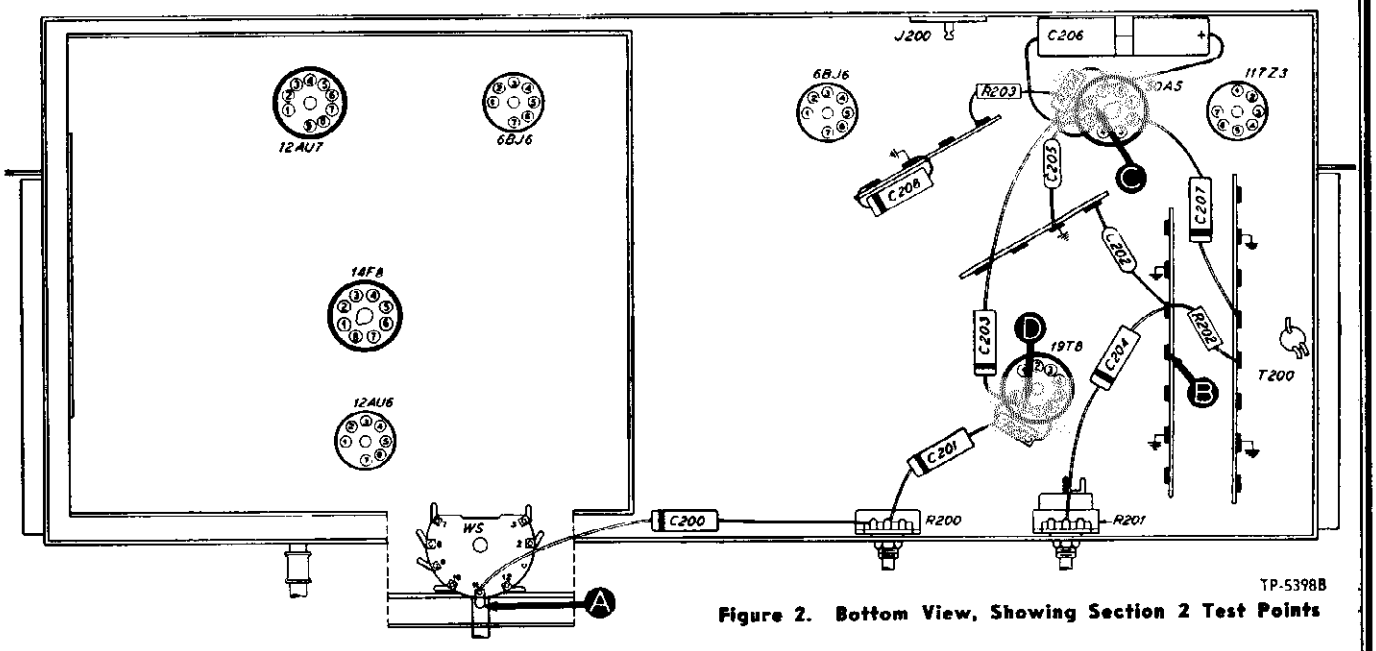

Figure 2. Bottom View, Showing Section 2 Test Points

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM Circuits

For the tests of the AM circuits, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control fully counterclockwise. Set the band switch to the broadcast position, and rotate the tuning control until the tuning gang is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits; if not, isolate and correct the trouble in the AM circuits.

Since test point A for the AM circuits is placed at the grid of the 12AU7 mixer in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

Section 3—Cont. TROUBLE SHOOTING

AM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	D	Loud, clear output with moderately strong input.	Defective: 19T8, 6BJ6 (2nd i-f amplifier). Open: R307, R308, R309, R311, R312, L305B, C317, L305A, L304A, WS. Shorted or leaky: C316, C317, C315. Shorted: L305A, L305B, WS.
3	E	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Open: R301, R302, R303, R304, R305, R306, C311, C313, L302A, L302B, L303A, L303B. Shorted or leaky: C311, C312, C313, C308. Shorted: L303A, L303B.
4	A	Loud, clear output with weak input.	Defective: 12AU7*. Open: R411*, R413*, R409*, L300A, L300B, L301A, L301B, WS. Shorted or leaky: C424*, C410*. Shorted: L301A, L301B, L301C, WS.
Listening Test: Hum and distortion may be caused by shorted or leaky C309, C310, C314, C321, C320, C307, C420*, C421*, C422*, C423*, C100*, C101*.			

* This part, located in another section, may cause abnormal indication in this section.

FM Circuits

For the tests of the FM circuits, use an r-f signal generator, set at 9.1 mc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Detune the generator frequency to one side or the other until a satisfactory test signal is obtained.

Set the band switch to the FM position; set the other radio controls as directed under AM CIRCUITS.

The parts which were found to be satisfactory for AM operation, with the exception of those indicated in the chart, will usually be satisfactory for FM operation.

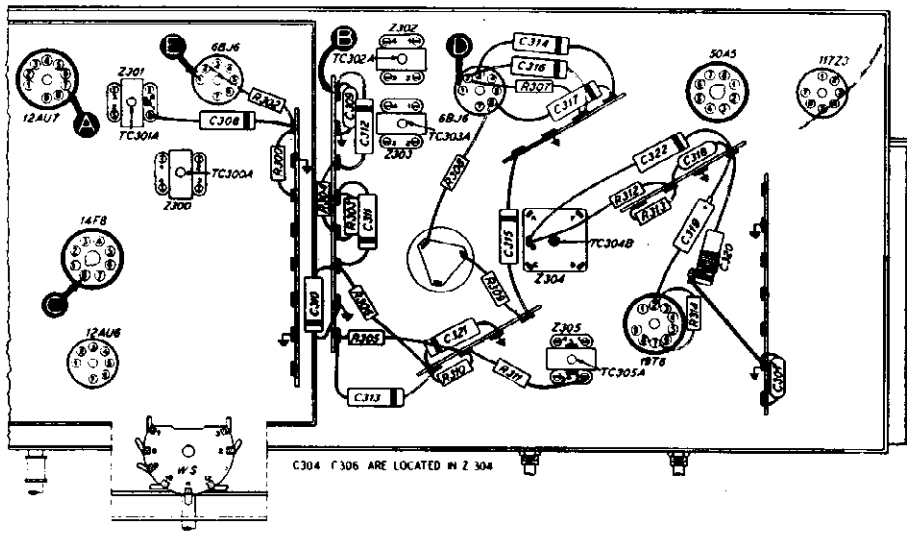

Figure 3. Bottom View, Showing Section 3 Test Points TP-5398C

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 10).

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits of this section.

Since test point C for the FM circuits is placed at the grid of the 14F8 mixer in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

FM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	C	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	D	Loud, clear output with strong input.	Defective: 6BJ6 (2nd i-f amplifier), Z304, 19T8, WS. Misaligned: Z304. Open: R312, R313, R314, C320, C319, C318, C304, C306. Shorted or leaky: C319, C320, C304, C306.
3	E	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Misaligned: Z302. Shorted: L302A, L302B.
4	C	Loud, clear output with weak input.	Defective: 14F8*. Open: R300, R406, R407*, R405*, L404*, L300A, WS. Shorted or leaky: C418*, C419*. Shorted: L300A, L300B, WS.

* This part, located in another section, may cause abnormal indication in this section.

MODEL 48-472, Code 122 PHILCO CORP.

Section 4 TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

AM Circuits

For the tests of the AM circuits, use an r-f signal generator, with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, turn the tone control fully counterclockwise, and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits; if not, isolate and correct the trouble in the AM circuits.

FM Circuits

Before proceeding with the tests for the FM circuits, set the band switch to the FM position.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in the FM circuits. If the trouble is not revealed by the tests for the FM circuits, check the alignment.

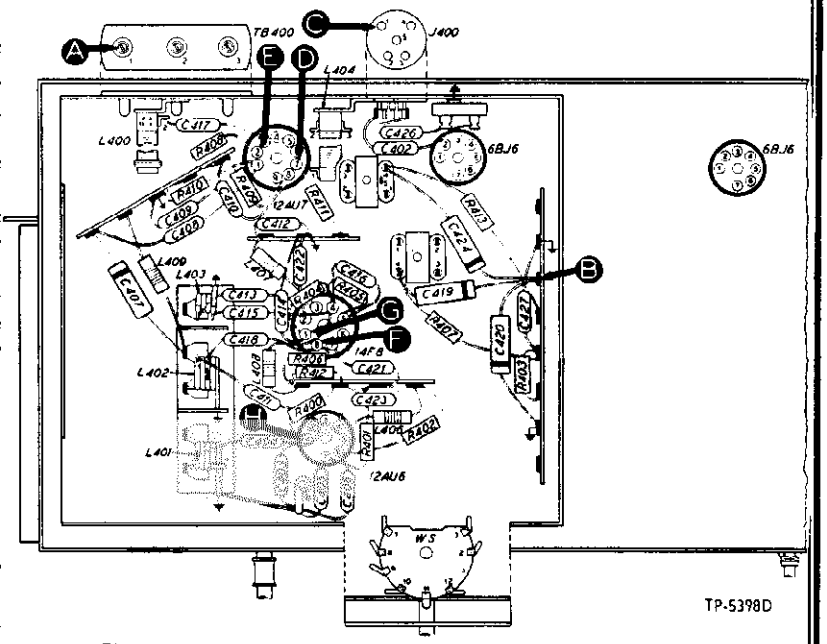

Figure 4. Bottom View, Showing Section 4 Test Points

AM Chart

STEP	TEST POINT	SIG. GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	D	1000 kc.	1000 kc.	Loud, clear output with moderate input.	Defective: 12AU7, oscillator circuits. Shorted: C424, C410, WS. Open: R409, R411, R413, WS.
3	E to B (Osc. test; see note below.)		Rotate through range.	Negative 2 to 4 volts.	Defective: 12AU7. Open: R408, L404, C408, R410, C407. Shorted or leaky: C408, C409, C400, C401B.
4	A	1000 kc.	1000 kc.	Same as step 1.	Open: L400, C417, L405. Shorted: C400, C401A, C425.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2 of 12AU7), test point E. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

FM Chart

STEP	TEST POINT	SIG. GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	C	95 mc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	F	95 mc.	Tune to signal.	Loud, clear output with moderate input.	Defective: oscillator circuits, 14F8. Open: C418, R406, R407, R405, L408, L402. Shorted: C418, C400, C400B, C419, C416, L402.
3	G to B (Osc. test; see note below.)		Tune through range.	Negative 1 to 2.5 volts.	Defective: 14F8. Open: R404, L408, L407, R403, C413, C415, L403. Shorted: C400, C400C, C413, C415, C414, C412, L403, L407.
4	H	95 mc.	Tune to signal.	Loud, clear output with weak input.	Defective: 12AU6. Open: L406, R402, R401, R400, C411, C406, C418, R412, L402. Shorted: C405, C406, C411, C400, C400B, C404, L402.
5	C	95 mc.	Tune to signal.	Loud, clear output with weak input.	Open: C402, C404, R412, L402. Shorted: C404, C400, C400A, L402.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1 of 14F8), test point G. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT OF AM CIRCUITS

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignmer is made.

DIAL POINTER—With tuning condenser fully meshed, adjust dial pointer to coincide with index mark at low-frequency en of dial. See "CALIBRATING DIAL BACKPLATE" for method of measuring backplate for index and calibration marks.

OUTPUT METER—Connect between terminal 3 (voice-coil connection) of aerial terminal panel and TB400 and chassis.

AM SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, signal-generator output must be attenuated to maintain radio output below 1.25 volts, read on output meter.

CONTROLS—Set volume control to maximum, turn tone control fully counterclockwise, and set band switch to broadcast positio

ALIGNMENT OF FM CIRCUITS

Align the AM Circuits first

OUTPUT METER—Connect between terminal 3 (voice-coil connection) of aerial terminal panel TB400 and chassis.

ALIGNMENT INDICATOR—Connect negative lead of a 20,000-ohms-per-volt, d-c voltmeter to pin 2 of 19T8 tube; conne positive lead to B–, test point B in Section 2. Use 10-volt range.

AM SIGNAL GENERATOR—Generator must have sufficient output to give a reading of at least 8.5 volts on alignment indicato Connect generator ground lead to B–, test point B; connect output lead as indicated in chart. Use modulated output.

CONTROLS—Same as for alignment of AM circuits, except set band switch to FM position. Allow radio and signal generat to warm up for at least 15 minutes before making alignment.

NOTE: Check resonance of coils L401, L402, and L403 by inserting each end of a powdered-iron tuning core, such as Phil Part No. 56-6100, in the coils. If the signal strength increases when the iron end is inserted, compress the turns slightly. If t signal strength increases when the threaded brass end is inserted, spread the turns slightly. If the signal strength decreases wh either the iron or the brass end is inserted, no further adjustment is necessary. Do not spread or compress turns of coil e cessively; only a small change is required at these high frequencies.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part as follows:

C —condenser	LS—loud-speaker	W —line cord
I —pilot lamp	R —resistor	WS—wafer switch
J —socket	S —switch	Z —electrical assembly
L —choke or coil	T —transformer	
LA—loop aerial	TB—terminal panel	

The number of the symbol, except when the number is less than 100, designates the section in which the part is located, as follows:

100-series components are in Section 1, the power supply
200-series components are in Section 2, the audio circuits
300-series components are in Section 3, the i-f, detector, and a-v-c circuits
400-series components are in Section 4, the r-f and converter circuits

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer.

The method of measuring for these points is illustrated in figure 7. Hold a ruler against the dial backplate, with the start of the ruler at the reference line shown, and mark pen dots at the proper points for the required frequency setting

After installation of the chassis in the cabinet, the d pointer should be moved to coincide with the index mark the dial. Coincidence of the pointer and index mark shou occur with the tuning condenser fully meshed.

FM	9.1 mc
PHILCO TUBES USED (9)	7W7, 7F8, 7H7 (2), 7B7, 6SQ7GT, FM1000, 6V6GT, 5Y3GT
PILOT LAMPS (2)	6—8-volt, Part No. 34-2040

PRELIMINARY CHECKS

Before starting the trouble-shooting procedure, the following steps are recommended:

1. Before connecting the radio to a source of power, inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin No. 2 of 5Y3GT rectifier tube) and the radio chassis. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If this reading is lower than 50,000 ohms, check condensers C104, C102C, C105, C102A, C102B, C103, and C416 for leakage or shorts.

SETTING PUSH BUTTONS

1. Connect the output meter between terminal No. 3 on aerial terminal panel and radio chassis.

2. Turn the radio volume control about halfway on, bass tone control fully counterclockwise, and treble tone control fully clockwise.

3. Couple the signal generator loosely through a coil of wire to the radio loop aerial (see NOTE under AM alignment chart).

4. Turn on the power, and allow the radio to warm up for 15 minutes before starting the adjustments.

5. Starting with the lowest frequency desired, set the signal generator (modulation on) to the desired frequency, push the left-hand station-selector button, and adjust the associated oscillator tuning core and aerial trimmer condenser (marked on rear of chassis) for maximum indication on the output meter. Reset the signal-generator frequency, and repeat the procedure for each remaining station-selector button.

6. Turn off the signal generator and make a final adjustment of all tuning cores and trimmer condensers while listening to the stations for which the adjustments are being made.

CIRCUIT DESCRIPTION

Philco Radio, Model 48-482, is a nine-tube superheterodyne radio, providing reception on the standard-broadcast band, 540 to 1720 kc., the short-wave range between 9.3 and 15.5 mc., and the FM band, 88 to 108 mc.

There are ten push buttons; six for instant tuning of stations in the standard-broadcast band, three for selecting standard broadcast, short wave, or FM band, and one for power OFF (any one of the other nine buttons turns on the radio power).

A low-impedance loop within the cabinet is used for the standard-broadcast and short-wave bands, and a built-in a-c-line aerial is provided for the FM band. In areas where FM signals are weak, an outdoor dipole aerial (Philco Part No. 45-1462) will provide additional pickup.

A tuned r-f amplifier stage, using a type 7W7 high-frequency pentode tube, is provided for FM reception. A 7F8 high-frequency double-triode tube is employed as a converter.

Three transformer-coupled i-f stages are used. The first, third, and fourth i-f transformers have two sets of windings; one set is tuned to 455 kc. for AM operation, and the other to 9.1 mc. for FM operation. The second i-f transformer uses an untuned-primary, tuned-secondary combination for AM operation, to prevent instability; the single primary winding is tuned to 9.1 mc., one secondary is tuned to 9.1 mc., and the other to 455 kc. Switching of the windings, to attenuate undesired beat-frequencies, is necessary only in the first i-f transformer. One 7B7 and two 7H7 high-transconductance pentodes are used in the i-f stages.

The new Philco advanced FM detector circuit, employing the new FM1000 tube of special design, is used for FM reception.

One diode of the 6SQ7GT tube provides detection and a-v-c action for AM reception; the other diode develops a-v-c voltage for FM operation. The high-mu-triode section of this tube functions as the first audio stage; this stage is resistance-coupled to the 6V6GT beam-pentode output tube. The output stage is transformer-coupled to a five-by-seven inch, oval, electrodynamic speaker. Inverse feedback is obtained by connecting the secondary of the output transformer through resistor R208 to the junction of the volume control, R200, and the 4.7-ohm resistor R201.

SECTION 1 – TROUBLE SHOOTING

CAUTION

Do not turn on radio power with speaker disconnected, as this will cause damage to the set.

With the BC push button depressed, check the voltage between the chassis (test point C) and each of the remaining test points indicated in the chart. The voltages given were measured with a 20,000-ohms-per-volt meter, using a power source of 117 volts, 60 cycles, a.c. Any voltage may be considered normal if it is within ±10% of the indicated value.

STEP	TEST POINTS	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	B to C D to C E to C F to C	200 volts 187 volts Negative 13 volts Negative 1.1 volts	Error greater than 10%	Trouble within this section. Isolate by following tests.
2	A to C	250 volts	No voltage Low voltage High voltage	Defective 5Y3GT tube or T100. Shorted C104, C102C, C103, C105, or C416. Defective 5Y3GT tube or T100. Leaky C104, C102C, C103, C105, or C416. Shorted C102A, C102B, or C106. Open L100. Shorted L100. Open R103, R104, or T200.
3	B to C	200 volts	No voltage Low voltage High voltage	Shorted C102A. Open R100. Leaky C102A. Off-value R100. Off-value R100.
4	D to C	187 volts	No voltage Low voltage High voltage	Shorted C102B. Open R101. Leaky C102B. Off-value R101. Off-value R101.
5	E to C	Negative 13 volts	Error greater than 10%	Shorted or leaky C106. Open or off-value R102, R103, or R104. Open, shorted, or partially shorted L100.
6	F to C	Negative 1.1 volts	Error greater than 10%	Open or off-value R104.

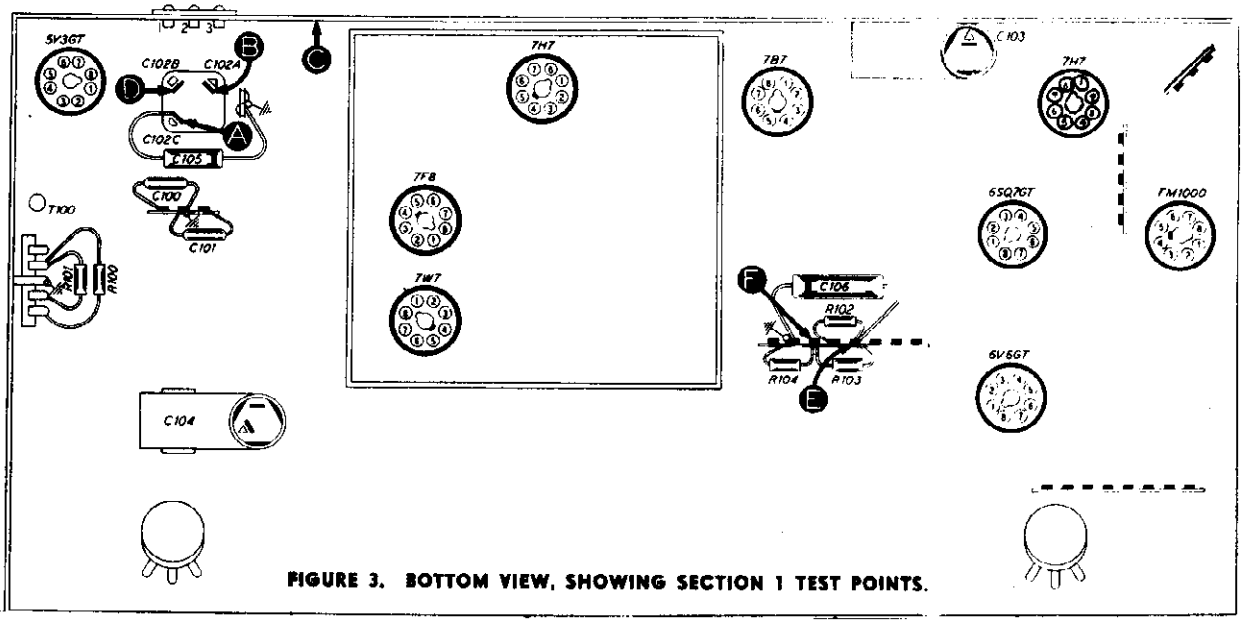

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS.

SECTION 2 – TROUBLE SHOOTING

For all tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf condenser to the test points indicated.

Set the volume control at maximum, treble tone control clockwise, and bass tone control counterclockwise; depress the BC push button. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in the first step, proceed to the tests in Section 3; if not, isolate and remedy the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	D	Loud, clear signal with weak signal input	Trouble within this section. Isolate by following tests.
2	A	Loud, clear signal with strong signal input	Defective 6V6GT tube or LS200. Shorted or leaky C205. Open or shorted T200. Open R205 or C204. Shorted or leaky C200 or C201.
3	B	Loud, clear signal with weak signal input	Defective 6SQ7GT (triode section). Open R204 or R202. Leaky or shorted C200.
4	D	Same as step 3	Open or off-value R200. Open C202.

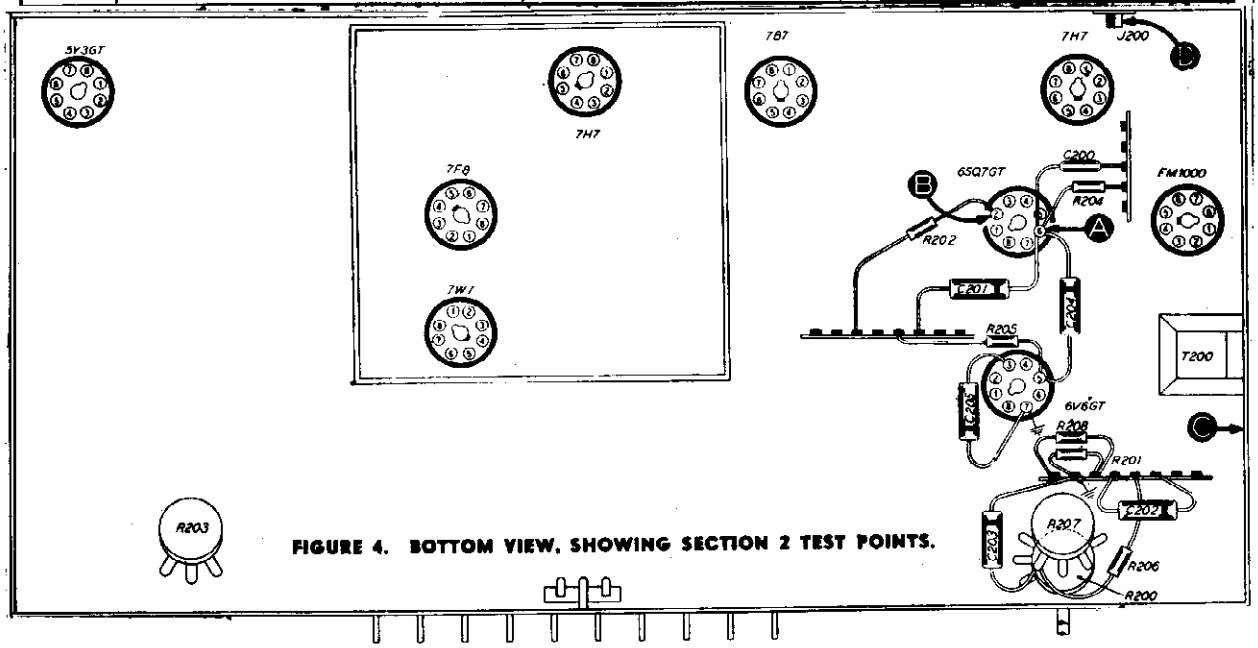

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS.

SECTION 3 – TROUBLE SHOOTING (FM DETECTOR)

The tests in this section are made with an audio-frequency generator, an AM r-f signal generator, and a 20,000-ohms-per-volt voltmeter. Use a .1-mf condenser in series with the output lead of each generator.

In Step 1, unmodulated r-f signals, together with d-c voltage readings, are used to check the response of the detector circuit to FM by observing the voltage drops across the audio-load resistor R302 for different input frequencies within the i-f range of the detector. In Step 3, the oscillator section of the FM detector is made inoperative, thereby converting the circuit to an AM detector, and making it possible to check certain components with an AM signal.

The tests in this section will not indicate the condition of alignment of the detector unless the circuit is extremely misaligned.

NOTE: In Steps 1 and 3, the AM signal-generator output must be at least .5 volt. If the output is below this value, instead of connecting to test point D, the generator lead may be connected in Section 4, to test point A or B, depending upon the maximum output of the generator used. The tests made from these points will be effective if the last i-f stages are trouble free. If abnormal indications are obtained in BOTH Steps 1 and 3, the i-f stages may be at fault.

Set the radio controls as follows: Volume control at maximum; bass control fully counterclockwise; treble control fully clockwise; FM push button depressed.

If the "NORMAL INDICATION" is obtained in the first test, proceed to the tests for Section 4; if not, isolate and remedy the trouble in this section.

SECTION 3 – (Continued)

STEP	PROCEDURE	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	Connect positive d-c voltmeter lead to test point A, negative lead to test point B, with meter on 50-volt range. Connect AM generator to test point D; turn off modulation and adjust generator output to approximately .5 volt (see NOTE above). Swing generator frequency from approximately 80 kc above to 80 kc below 9.1 mc.	Approximately 15 volts for 9.1-mc signal (or no signal); 8 volts for 80 kc above 9.1 mc; 23 volts for 80 kc below 9.1 mc.	Trouble within this section. Isolate by the following tests.
2	Connect audio-signal generator to test point E; adjust for high generator output.	Loud, clear signal output from radio.	Defective Z300, FM1000, or PB 10. Shorted C305. Open C304 or R303.
3	Short test point F (pin No. 2, FM1000) to chassis. Connect r-f generator output to test point D (see NOTE above). Use modulated signal. Set generator for 9.1 mc and maximum output.	Loud, clear signal output from radio.	Defective FM1000 tube. Shorted or leaky C306 or C307. Open R304, L300, or R302.
4	Remove short from test point F. Connect negative lead of d-c voltmeter to test point F through a 50,000-ohm isolating resistor; connect positive lead to test point C (chassis). Set meter to 10-volt range.	Approximately 2.5 volts negative (osc. grid voltage).	Defective FM1000 tube, or Z300. Open L300 or C301. Shorted or leaky C303. Open R306. Open or off-value R305 or R301.

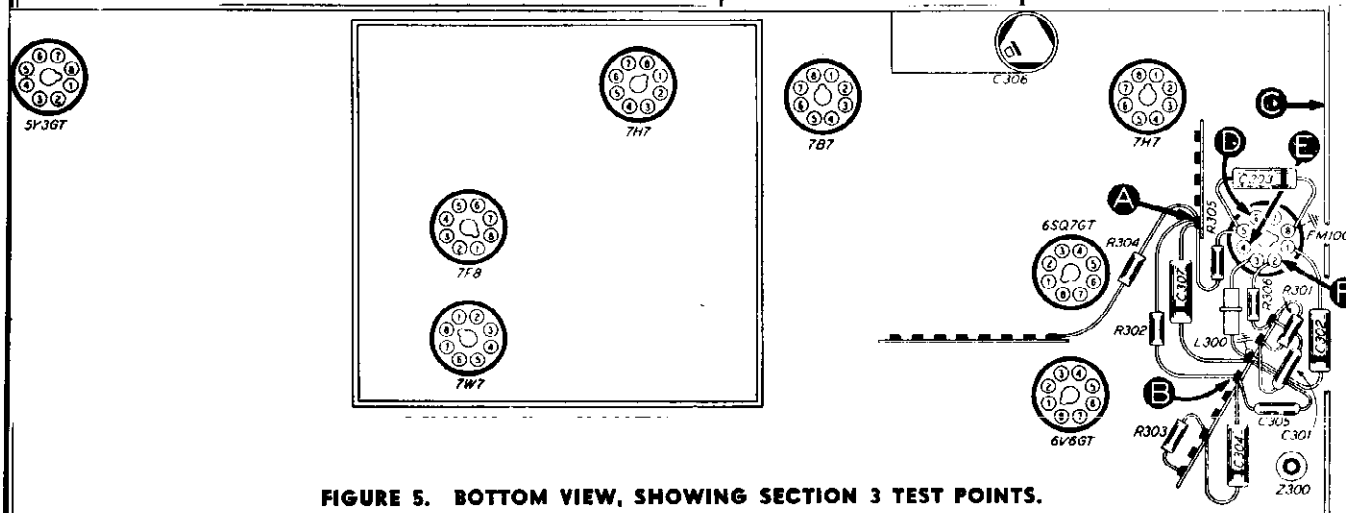

FIGURE 5. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS.

SECTION 4 – TROUBLE SHOOTING

AM CIRCUITS

For the AM circuit tests in this section, use an AM r-f signal generator with frequency set to 455 kc. Connect the signal-generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf condenser to the test points indicated. Depress the BC push button (PB 8), set the radio volume control at maximum, the bass tone control fully counterclockwise, and the treble control fully clockwise. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in the first step, proceed to the tests for FM CIRCUITS in this section, or to Section 5; if not, isolate and remedy the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	Clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	A	Clear signal with strong signal input.	Defective or misaligned Z403. Open R416, R418, R419, R411, R414, R415, or C424. Defective 6SQ7GT or 7H7 tube. Shorted, open, or leaky C418, C419 or C420. Shorted C425.
3	B	Clear signal, louder than step 2.	Defective or misaligned Z402. Defective 7B7 tube. Open R405, R406, R409, or R410. Shorted C411 or C414. Shorted, leaky or open C413 or C415.
4	D	Clear signal, louder than step 3.	Defective or misaligned Z401. Defective 7H7 tube. Open R402, R403, R404, or R407. Shorted C407. Shorted, open or leaky C408 or C409.
5	E	Clear signal, approx. same as step 4.	Defective or misaligned Z400. Open R401.

FM CIRCUITS

For the FM circuit tests in this section, short test point F, in Section 3, to the radio chassis, to permit use of an AM signal. Connect the AM signal-generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf condenser to the test points indicated in the chart. With the exception of the i-f switch, tubes, and transformers (all of which may function properly at 455 kc but not at 9.1 mc) and the parts specified in the chart, the parts in this section which are normal on AM will be normal on FM.

Set the r-f signal generator to 9.1 mc, with modulation ON. Depress the FM push button (PB 10). Set the radio volume control at maximum, the bass tone control fully counterclockwise, and the treble control fully clockwise. Adjust the signal-generator output as required for each step.

SECTION 4 — (Continued)

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	A	Clear signal with strong signal input.	Defective or misaligned Z403. Defective 7H7 or 6SQ7GT (diode section) tube. Shorted or open C423.
3	B	Loud, clear signal with moderate signal input.	Defective or misaligned Z402. Defective 7B7 tube, or PB 10. Open C414.
4	D	Loud, clear signal with weak signal input.	Defective or misaligned Z401. Defective 7H7 tube. Open C407.
5	E	Loud, clear signal with weak signal input.	Defective or misaligned Z400.

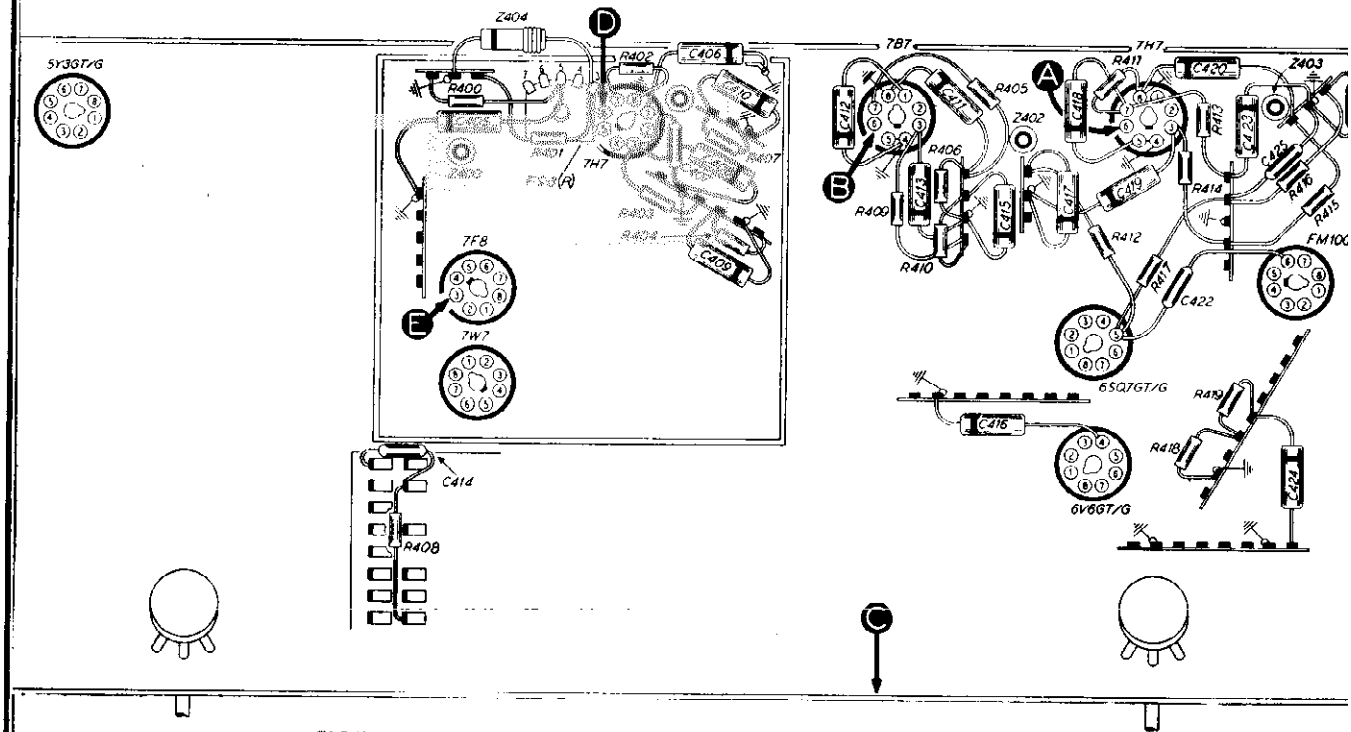

FIGURE 6. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS.

SECTION 5 – TROUBLE SHOOTING AM CIRCUITS

For the signal tests, use an r-f signal generator with amplitude-modulated output. Connect the signal-generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf condenser to the test points indicated. Turn the radio volume control to maximum, treble tone control fully clockwise, and bass tone control fully counterclockwise. Set the signal generator for weak generator output.

OSCILLATOR TESTS

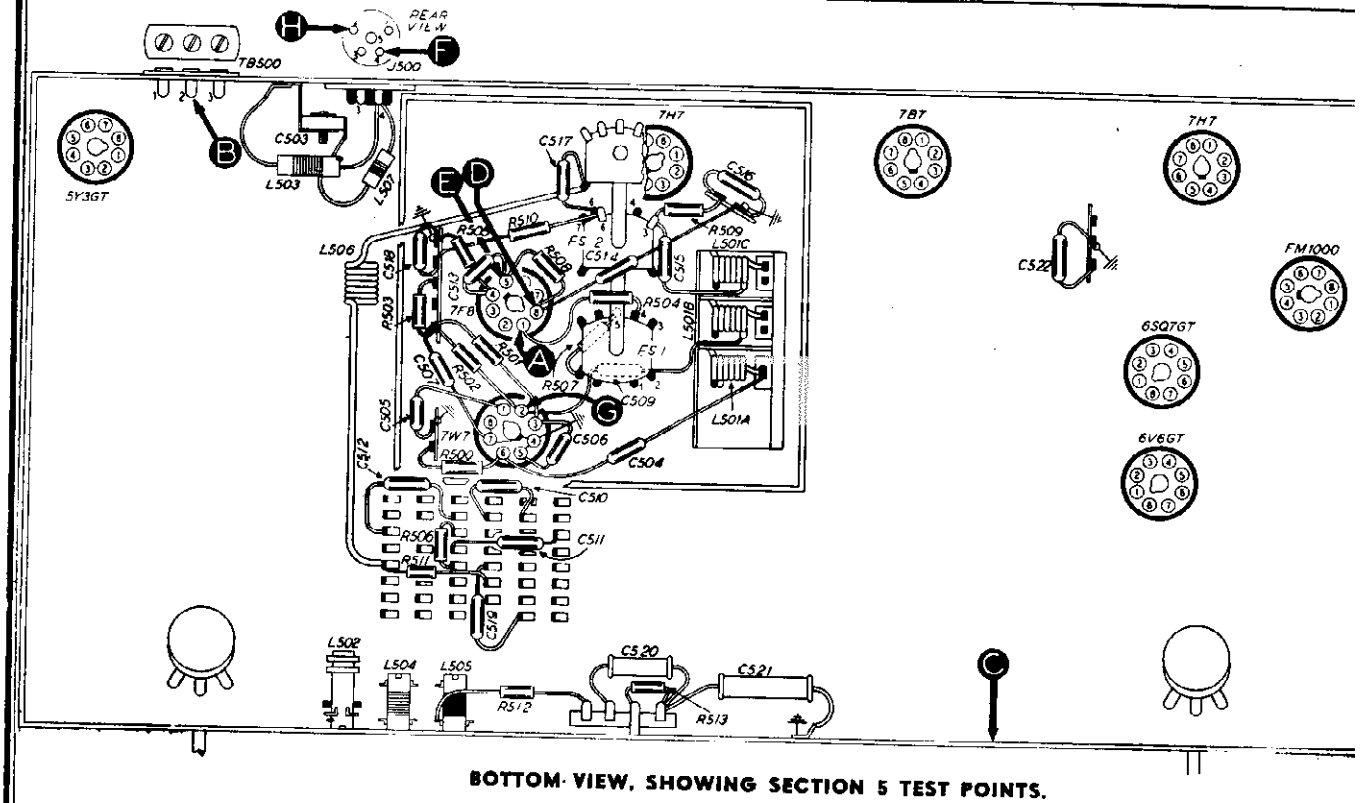
For steps 5, 8, and 10, connect the positive lead of a 20,000-ohms-per-volt meter to test point E, and the prod end of the negative lead through a 100,000-ohm isolating resistor to test point D. Read the voltage on the 10-volt range. Absence of negative voltage at any dial or band position indicates that the oscillator is not functioning properly; check the parts listed in the chart for the oscillator tests.

STEP	TEST POINT	SIGNAL-GEN. SETTING	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	B	Vary through range of each button	Depress, in order, PB 2 to PB 7	Loud, clear signal when each button is depressed	Trouble within push-button band. Isolate by steps 4, 5, and 6.
2	B	1000 kc	Depress BC push button (PB 8). Tune radio to signal	Loud, clear signal	Trouble within BC band. Isolate by steps 7 and 8.
3	F	12 mc	Depress SW push button (PB 9). Tune radio to signal	Loud, clear signal	Trouble in short-wave section. Isolate by steps 9 and 10.
4	A	Adjust to frequency of push button	Depress PB 7	Loud, clear signal	Defective 7F8 tube or FS 1 (F). Open R505, R400, or C513. Shorted C405.
5	D to E (see OSC. TESTS)		Depress, in order, PB 2 to PB 7	Negative voltage	No voltage for any one push button: Defective coil (L500A to L500F) or push button. No voltage for all push buttons: Defective 7F8 tube, FS 2, PB 9, or PB 8. Open C517, C520, C521, or C514. Open R508, R510, R513, L506, or R511. Shorted C515, C516, C518, or C522.
6	B	Vary through range of each button	Depress, in order, PB 2 to PB 7	Loud, clear signal	Defective L502. Shorted C502A, C500A to C500F. Open C511, R504, or R507.
7	B	1000 kc	Depress BC push button PB 8. Tune to signal from generator	Loud, clear signal	Defective C501, or PB 8.
8	D to E (see OSC. TESTS)		Depress BC push button PB 8. Rotate radio tuning control through entire range	Negative voltage over entire tuning range	Defective L505. Open R512.
9	F	12 mc	Depress SW push button PB 9. Tune to signal from generator	Loud, clear signal	Defective L503 or L507. Shorted C503. Open C510.
10	D to E (see OSC. TESTS)		Depress SW push button PB 9. Rotate tuning control through entire range	Negative voltage over entire tuning range	Defective 7F8 tube, or L504. Shorted C502C. Open C519.

FM CIRCUITS

Before proceeding with the FM circuit tests, connect test point F, in Section 3, to the radio chassis. Follow the same general procedure gi for AM tests.

STEP	TEST POINT	SIGNAL-GEN. SETTING	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	H	100 mc	Depress FM push button PB 10. Tune to signal	Loud, clear signal	Trouble in FM band. Isolate b following tests.
2	D to E (See OSC. TESTS under AM CIRCUITS)		Depress FM push button PB 10. Rotate tuning control through entire range	Negative voltage over entire range	Defective 7F8 tube, FS 2 (F), L501C C501, or PB 10. Open R509. Shor ed C515 or C501C.
3	G	100 mc	Depress FM push button PB 10. Tune to signal	Loud, clear signal	Defective L501B, C501, or FS 1 (F Open or shorted C509. Shorte C501B.
4	H	Same	Same	Loud, clear signal	Defective 7W7 tube, L501A, C501 Open R500, R502, or R503. Shorte C506, C501A, or C507.



BOTTOM VIEW, SHOWING SECTION 5 TEST POINTS.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer. The proper locations for the points may be determined as follows:

1. Hold a rule against the dial backplate as shown in figure 1.

2. Mark pencil dots at the proper points fo the index mark and the desired frequency set tings.

With the tuning gang fully meshed, the dia pointer on the drive cord should be adjusted t coincide with the index mark.

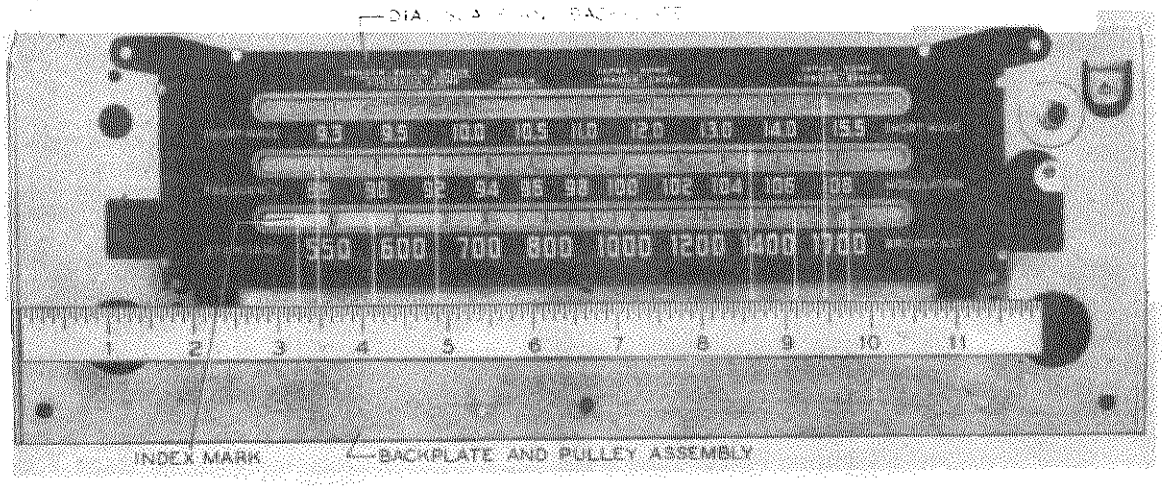


FIGURE 1. DIAL BACKPLATE CALIBRATION MEASUREMENTS. TP-2826

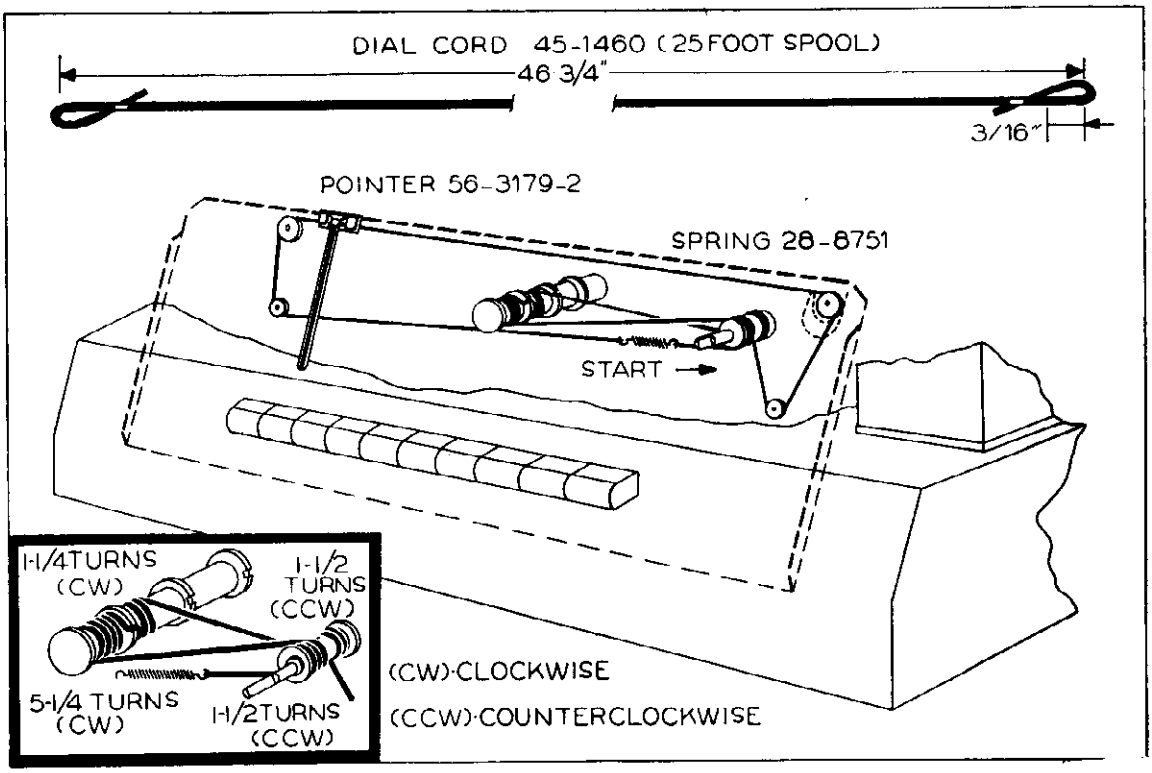

FIGURE 2. DRIVE-CORD INSTALLATION DETAILS.

ALIGNMENT PROCEDURE

ALIGNMENT OF AM CIRCUITS

When the complete AM and FM alignment is to be made, the AM alignment should be made FIRST; however, if FM alignment is not required, the AM alignment alone may be made.

OUTPUT METER: Connect between terminal No. 3 (voice-coil connection) of aerial terminal panel and chassis.

AM SIGNAL GENERATOR: Connect ground lead to radio chassis, and output lead as indicated in chart.

DIAL POINTER: With tuning condenser fully closed, the dial pointer must coincide with the index mark at the low-frequency end of the scale. See CALIBRATING DIAL BACKPLATE, page 3.

CONTROLS: Set volume control at maximum, bass tone control fully counterclockwise, and treble tone control fully clockwise; set the radio band push button, radio dial, and signal-generator dial as indicated in the chart.

OUTPUT LEVEL: During alignment, the signal-generator output must be attenuated to maintain the radio output below 1.5 volts, as indicated by the output meter.

AM ALIGNMENT CHART

SIGNAL GENERATOR			RADIO			
STEP	CONNECTIONS TO RADIO	DIAL SETTING	BAND PUSH BUTTON	DIAL SETTING	SPECIAL INSTRUCTIONS	AD TRI
1	Through .1-mf condenser to stator of ant. section of tuning gang	455 kc	BC	1700 kc	Adjust each trimmer, in order, for maximum output. Do not repeat adjustments.	
2	Loosely coupled with loop (see Note below)	15 mc	SW	15 mc	Adjust for maximum output. Check for image at 14.1 mc.	
3	Same	15 mc	SW	15 mc	Adjust for maximum output (rock tuning control).	
4	Same	1700 kc	BC	1700 kc	Adjust for maximum output.	
5	Same	1500 kc	BC	1500 kc	Adjust for maximum output.	
6	Same	580 kc	BC	580 kc	Adjust for maximum output (rock tuning control).	
7	Repeat steps 4, 5 and 6 in order until no further increase is noted. Then repeat step 4.					

NOTE: Make up a six-to-eight-turn, 6-inch diameter loop, using insulated wire: connect to the signal-generator leads and place near the radio loop.

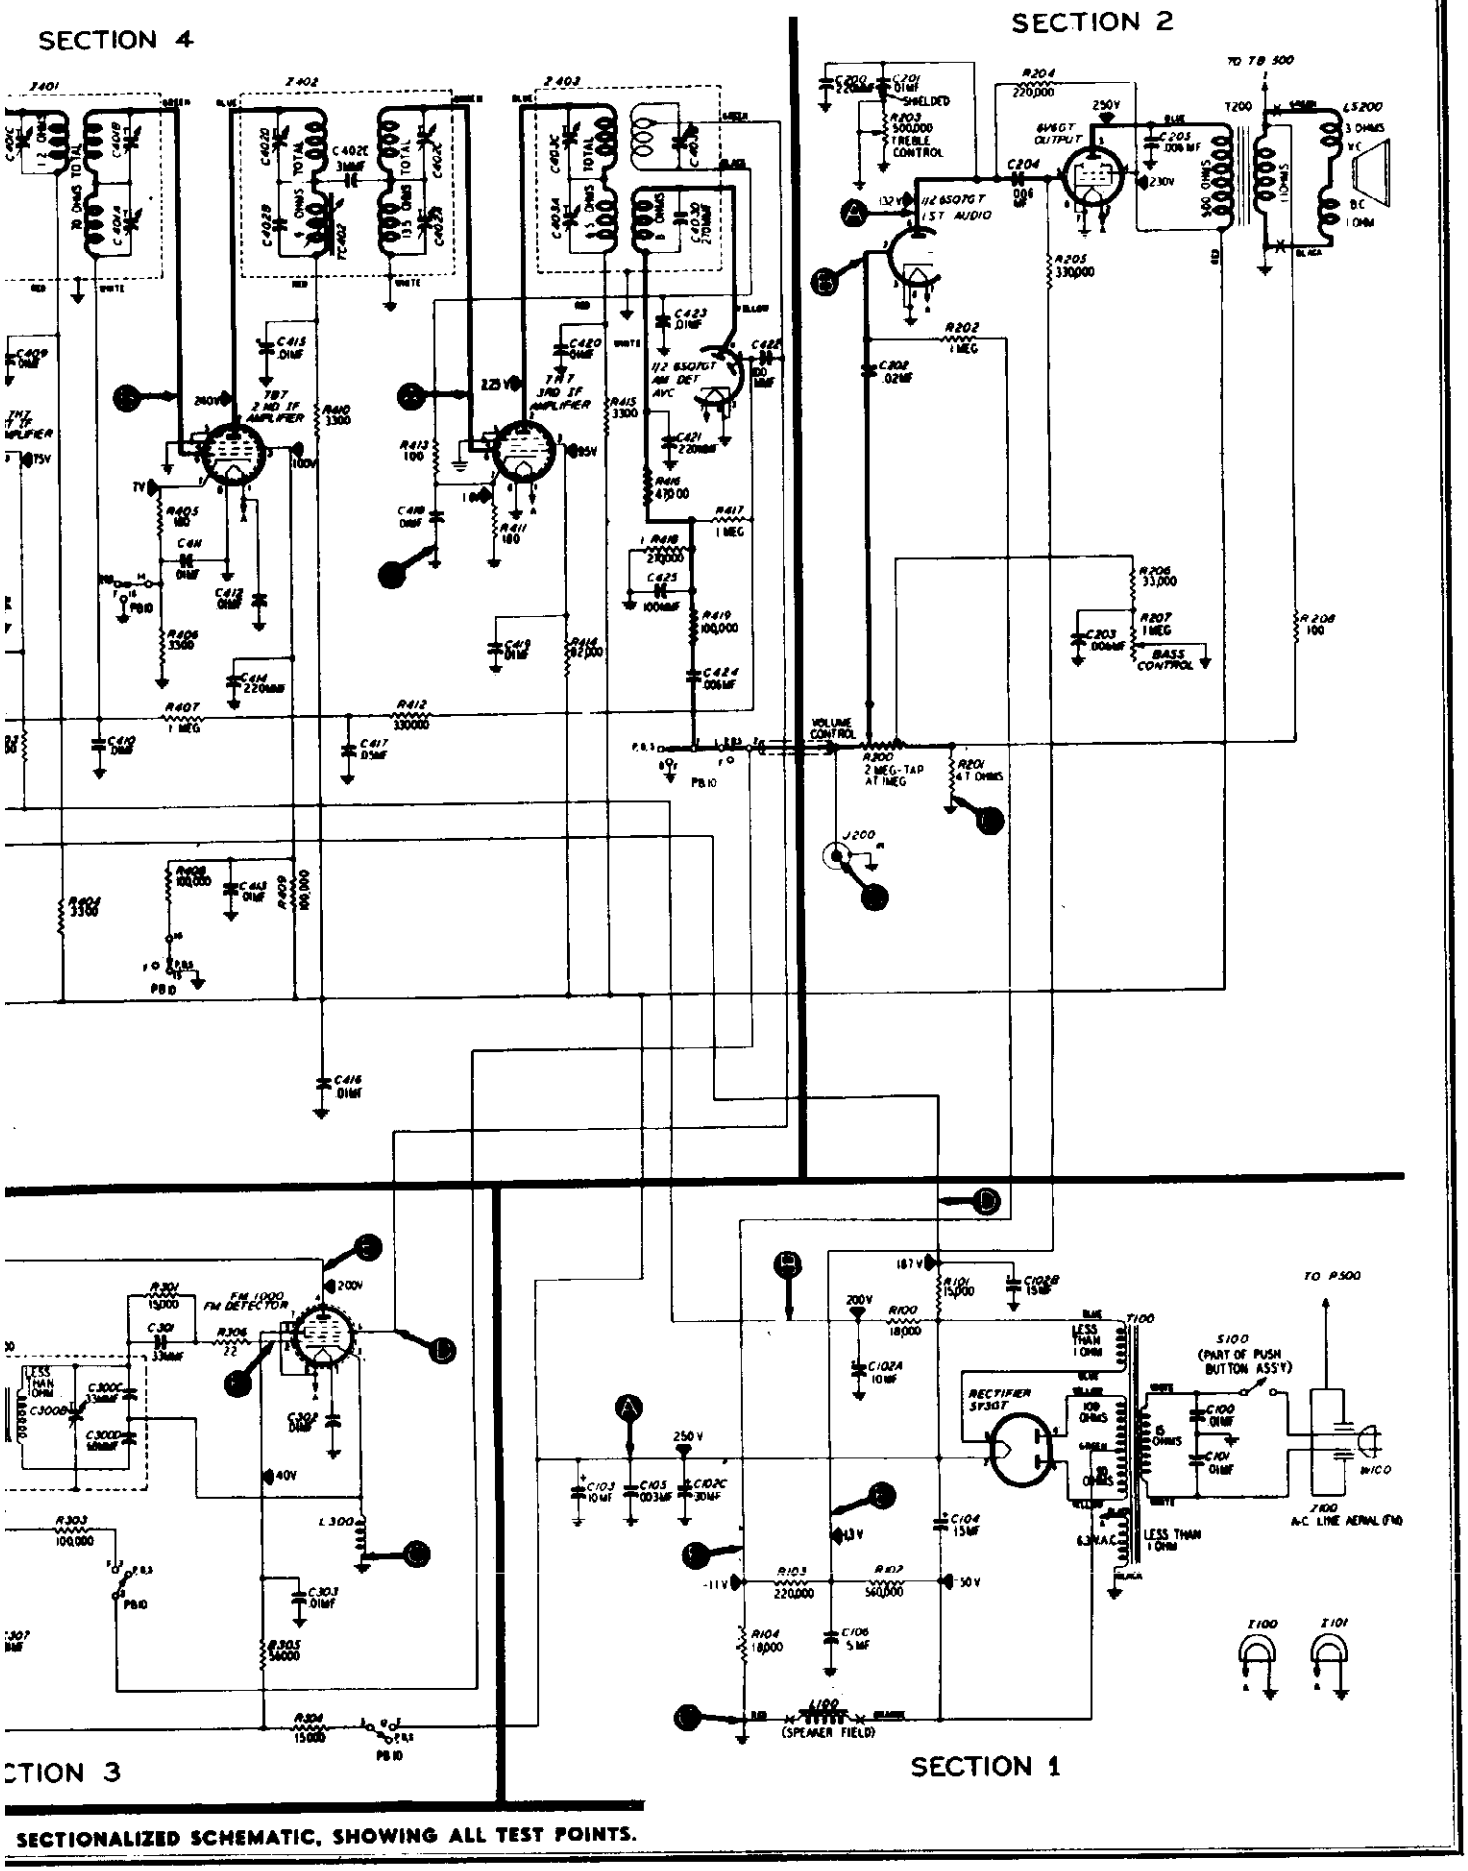
CO CORP. MODEL 48-482



SECTIONALIZED SCHEMATIC, SHOWING ALL TEST POINTS.

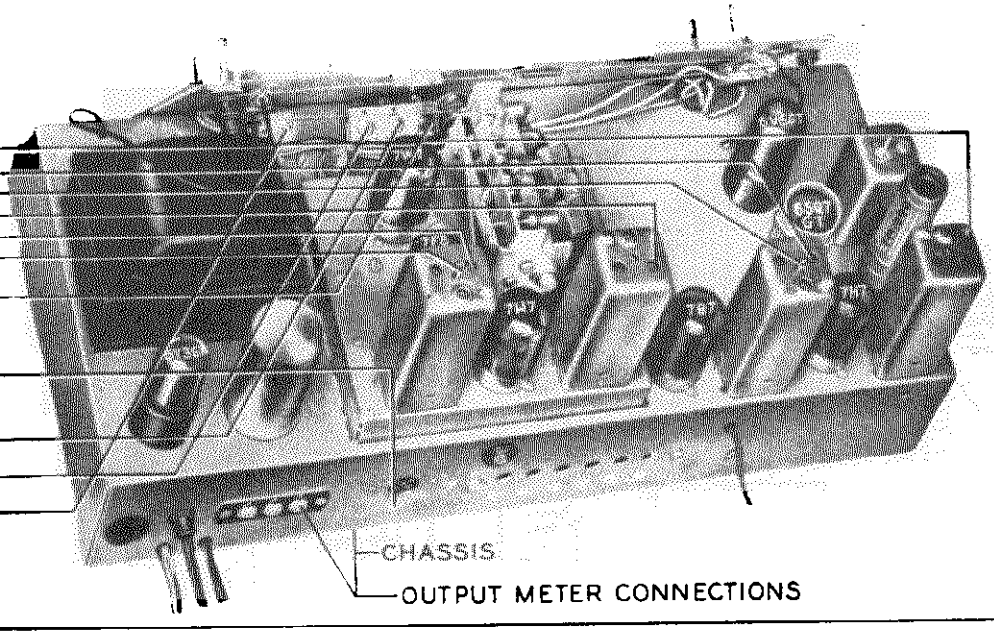


FIGURE 9. CHASSIS VIEW, SHOWING AM TRIMMER LOCATIONS.

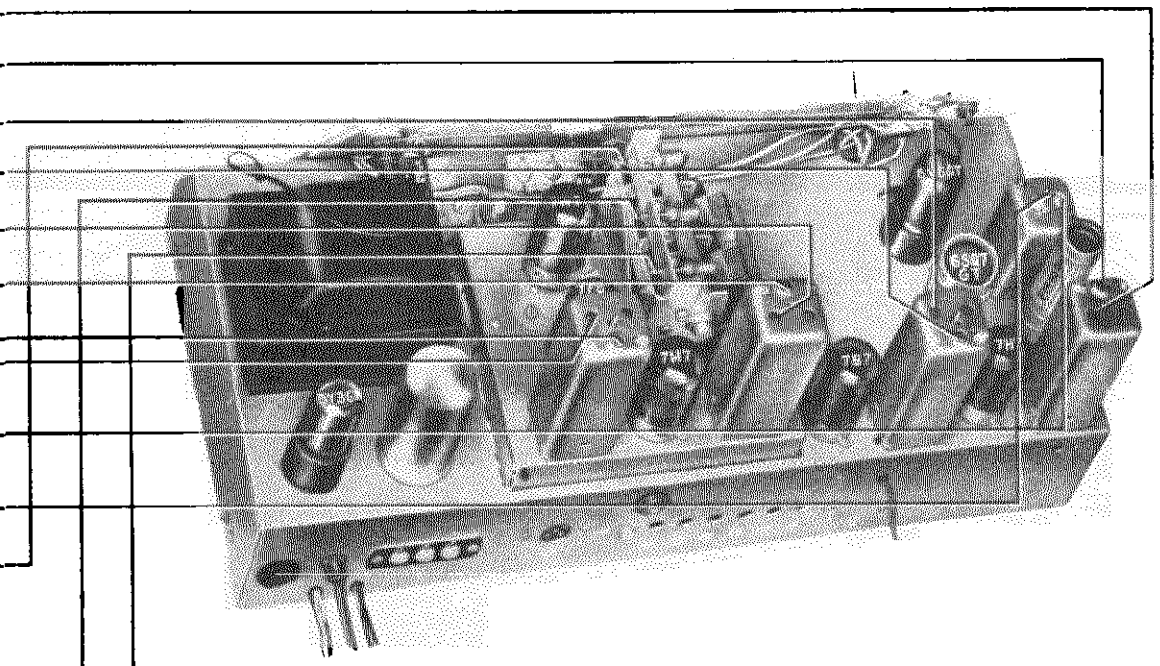

FIGURE 10. CHASSIS VIEW, SHOWING FM TRIMMER LOCATIONS.

ALIGNMENT OF FM CIRCUITS

Align the AM circuits first.

AM SIGNAL GENERATOR: Connect the generator ground lead to the radio chassis; connect the output lead through a .1-mf condenser to the points specified in the chart.

OUTPUT METER: Connect the output meter between terminal No. 3 of the aerial terminal panel and the radio chassis.

CONTROLS: Set volume control at maximum, t tone control fully counterclockwise, and treble tone c trol fully clockwise. Depress FM push button.

LOCATION OF FM COILS: For the location of c L501A, L501B, and L501C (steps 11 and 15), refe the base layout of Section 5, figure 7.

FM ALIGNMENT NOTES

1. When pin No. 2 of the FM1000 tube is connected to the chassis, the oscillator section of the tube is made inoperative, thereby converting the circuit from an FM to an AM detector.

2. Make the loading network by connecting a 4700-ohm resistor and a .1-mf condenser in series. Attach an alligator clip to each free end of the network. When this network is connected across the primary or secondary circuit of an i-f transformer, the network loads the circuit so that the transformer is effectively below critical coupling; the unloaded winding may then be correctly peaked at the intermediate frequency.

3. The top of padder C403B can be reached only from the top of the shield can. Slide a length of flattened solder or wire down between the ceramic form and the edge of the trimmer plate. Attach the loading network between this connection and the chassis.

4. It is essential that the output from the generator be kept below the point where the detector-oscillator locks in, otherwise an erroneous zero-beat will be obtained. When a single very sharp zero-beat point is obtained, the adjustment is correct.

5. The use of a signal generator for steps 10 to 16 is recommended only if the available generator is sufficiently accurate to insure correct frequency settings. Otherwise, an alternate procedure employing FM br cast station signals in place of a signal generato recommended. For adjustment at the high-frequ end of the band, use the station nearest 105 mc; the low-frequency adjustments, use the stations nea 88 and 92 mc. If the radio is greatly misaligne may be necessary to adjust the padders and coils maximum noise at each end of the band before sta signals can be heard. The oscillator section of the detector must be made inoperative, as given in ste of FM circuit alignment.

6. Check all coil adjustments with a tuning w If inserting the brass end in or near the coil incre the output-meter reading, spread the turns; if the p dered-iron end increases the output reading, comp the turns. If both ends cause a decrease in output, coil is correctly tuned. Do not change the coils e sively, since only a small adjustment is require these frequencies.

7. Make two simple dipole aerials to feed sig from the signal generator to the radio. Each dipole a may consist of two 30-inch lengths of rubber-cov wire. Connect one dipole aerial to terminal No and 2 on the radio FM aerial socket J500. Connect other dipole to the output of the signal gener Space the two dipoles several feet apart.

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items, and the part numbers may not be identical with those on the original parts; also, the electrical values of some replacement items furnished may differ from the values indicated in the schematic and parts list. The values substituted in any case are so chosen that the operation of the instrument will be either unchanged or improved. When ordering replacements, use only the "Service Part No." in this parts list.

Reference No.	Description	Service Part No.
C100	Condenser, .01 mf, line filter	61-0120*
C101	Condenser, .01 mf, line filter	61-0120*

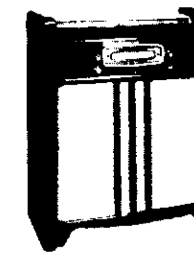
MODEL 48-485 PHILCO CORP.

Circuit Description

Philco Radio Model 48-485 is a six-tube superheterodyne, which provides reception in the standard-broadcast band. The circuit includes a 14AF7 converter, a 7B7 1st i-f amplifier, a 7B7 2nd i-f amplifier, a 7C6 detector, a.v.c., and 1st audio amplifier, and a 35L6GT output amplifier. The power supply employs a 50X6 rectifier in a voltage-doubling circuit.

A low-impedance loop aerial, located within the cabinet, normally provides adequate signal pickup. If greater signal pickup is required, the jumper should be disconnected from the terminal at the rear of the chassis and an external aerial connected to the terminal.

Two series-resonant circuits, consisting of condensers C302 and C303 together with the coils wound on these condensers, function as traps to prevent feedback of the intermediate frequency and the second harmonic of the intermediate frequency through the B– lead. One circuit is resonant at 455 kc., and the other at 910 kc. Each circuit offers a very low impedance to the resonant frequency, and, therefore, shunts it to the chassis.



MODEL 48-485

SPECIFICATIONS

CABINET	Wood, mahogany
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
INTERMEDIATE FREQUENCY	455 kc.
AUDIO OUTPUT	2.5 watts
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	40 watts
AERIAL	Built-in low-impedance loop; provisions for external aerial.
PHILCO TUBES (6)	14AF7, 7B7(2), 7C6, 35L6GT, 50X6

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power.

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.
2. Measure the resistance between B+ (pin 7 of 50X6 rectifier) and B–. When the ohmmeter leads are connected in the proper polarity, the highest reading will be obtained. If the reading is lower than 3000 ohms, check condensers C101, C102, C103A, and C207 for leakage or shorts.

NOTE: The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

TROUBLE SHOOTING

Section 1—Power Supply

Make the tests for this section with a d-c voltmeter; connect the leads between B–, test point B, and the test points indicated in the chart.

The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts.

Set the volume control to minimum, and the tone control fully clockwise.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

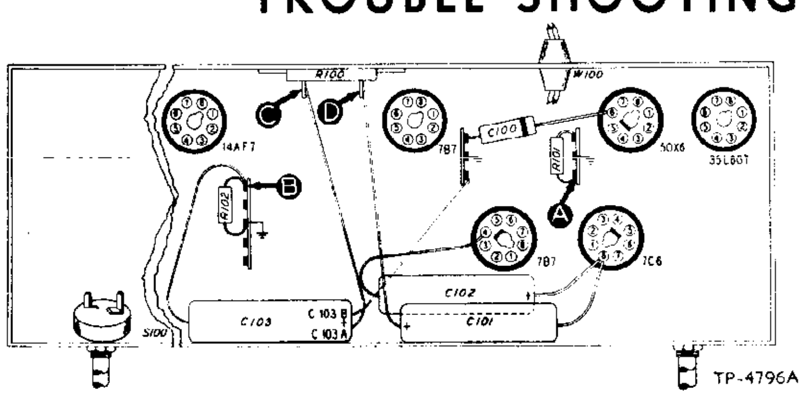


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	107v		Trouble in this section. Isolate by the following tests.
2	D	225v	No voltage	Defective: 50X6, S100, W100, PL100. Shorted: C101 and C102.
			Low voltage	Defective: 50X6. Open: C101, C102. Leaky: C101, C102, C1 C103B.
			High voltage	Open: R100, R101.
3	C	190v	No voltage	Shorted: C103A. Open: R100.
			Low voltage	Changed resistance: R100. Shorted: C207*, C103B. Leaky: C1
			High voltage	Open: R101, T200*, R207*.
4	A	107v	No voltage	Shorted: C103B. Open: R101.
			Low voltage	Leaky: C103B.
			High voltage	Open: R207*, T200*.

Listening Test: Abnormal hum may be caused by open C100, C103A, C103B, or R102.

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

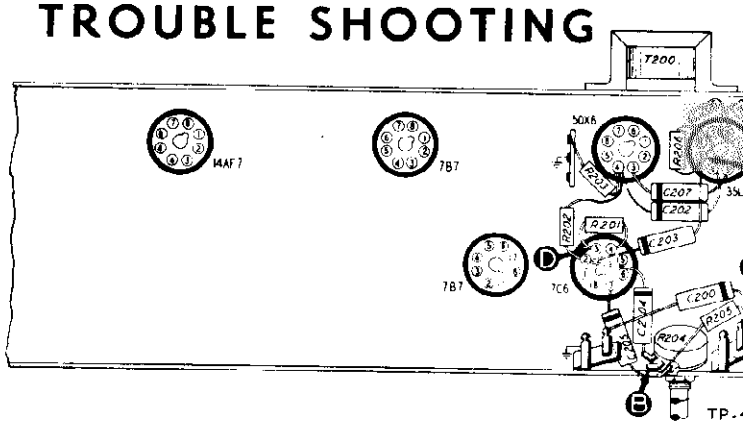

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Open: T200, R207. Shorted: C203, C206, C207, C205. Leaky: C2 Defective: 35L6GT, LS200.
3	D	Same as step 1.	Open: R202, R203, C203. Shorted: C202, C204. Defective: 7C6 (ode section).
4	A	Same as step 1.	Open: C200, C201, R200 (rotate through range). Shorted: C30 C301D*.

Listening Test: Distortion may be caused by open R201 or R206, or by shorted or leaky C200 or C201.

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTIN

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise. Rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

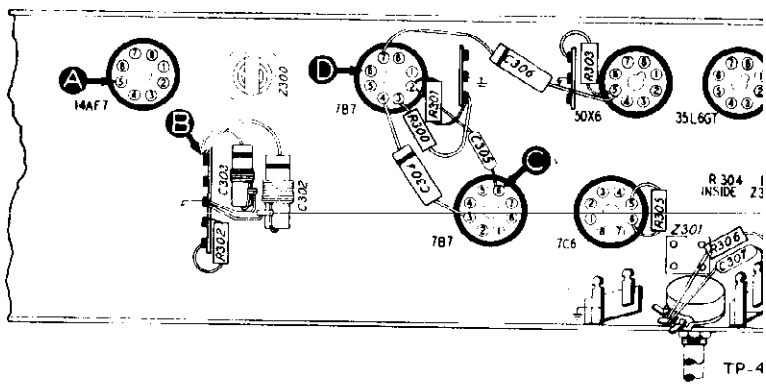

Figure 3. Bottom View, Showing Section 3 Test Points

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1 as a ma check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "P SIBLE CAUSE OF ABNORMAL INDICATION."

MODEL 48-485 PHILCO CORP.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear signal with moderate signal input.	Defective: 7B7 (2nd i-f amplifier), 7C6 (diode section). Open: L301A, L301B, R306, R304, R303, R300. Shorted: C305, C301A, C301B, C306, C304, C301C, L301A, L301B. Leaky: C305.
3	D	Same as step 1.	Defective: 7B7 (1st i-f amplifier). Open: C305, R301, R302. Shorted: C300B, L300B.
4	A	Same as step 1.	Defective: 14AF7. Open: R402*, L401*, L300A, C300A, L300B. Shorted: C300A, L300A.

NOTE: Voltage on the chassis may be caused by shorted C302 or C303. Oscillation may be caused by open C302 or C303.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise. Set the radio tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section.

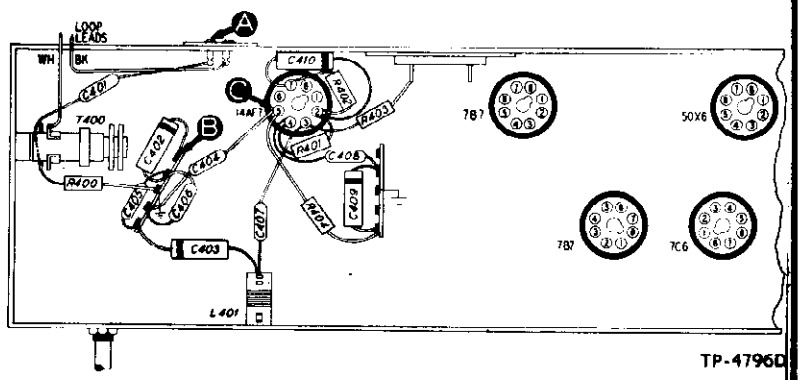

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C (Osc. test; see note below.)		Rotate through range.	Negative 3.5 to 5 volts.	Defective: 14AF7. Open C403, C407, C408, L401, R401. Shorted: C405, C400A, C400C, C408, C407. Leaky: C407, C408.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C401, C404, T400. Shorted: C400B, C400D, C406.

Listening Test: Distortion and hum may be caused by open C409 or R404.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of the 14AF7), test point C. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

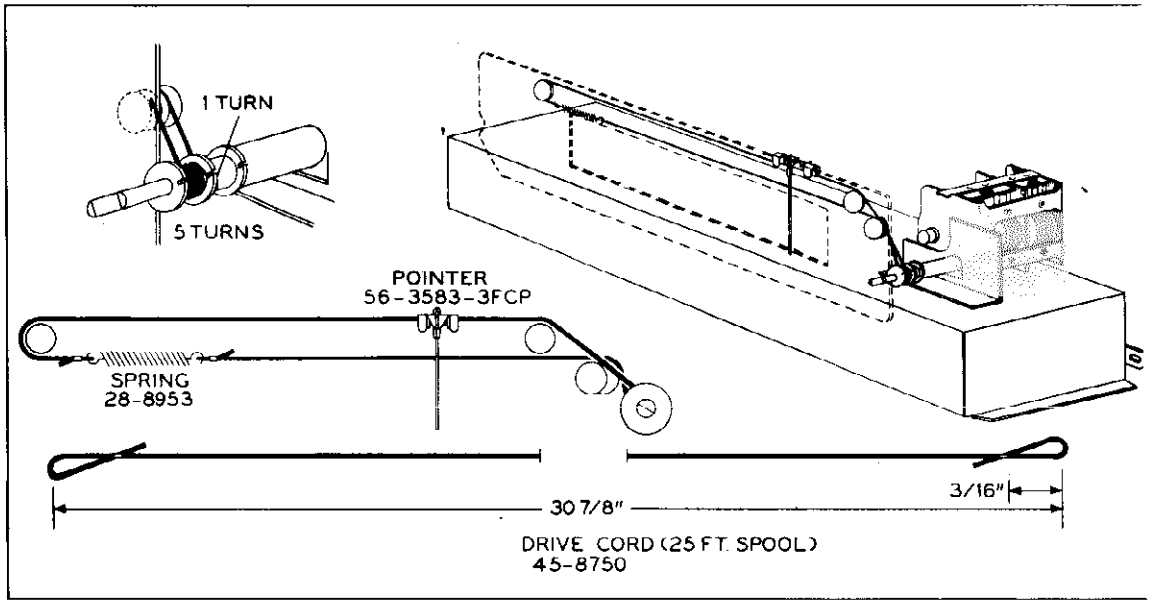

Figure 8. Drive-Cord Installation Details

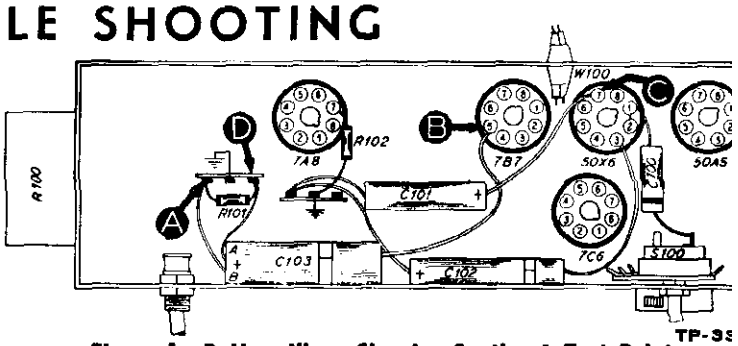
TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to the B— bus, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

With the radio-phono switch set to the radio position, turn the volume control to minimum.

Follow the steps in sequence; if the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.



TP-3

Figure 1. Bottom View, Showing Section 1 Test Points

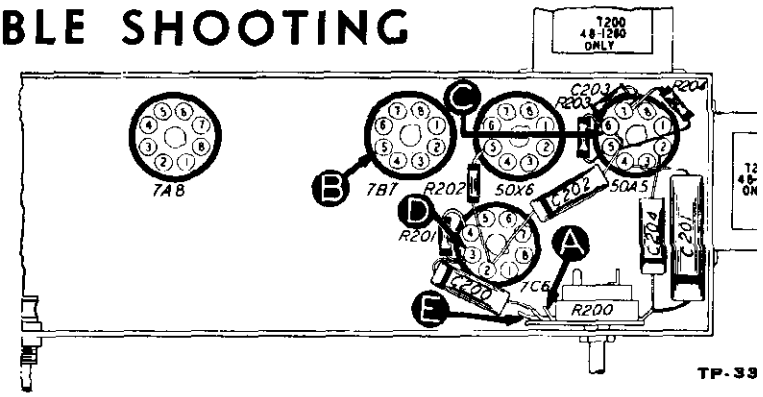
STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	90v		Trouble within this section. Isolate by the following tes
2	C	215v	No voltage Low voltage High voltage	Defective: 50X6, S100, W100. Shorted: C101, C102, C1 Defective: 50X6. Open: C101, C102. Leaky: C101, C1 C103A. Open: R100, R204,* T200.*
3	D	185v	No voltage Low voltage High voltage	Open: R100. Shorted: C103A. Shorted: C103B. Leaky: C103A. Open: R101, R204,* T200.*
4	A	90v	No voltage Low voltage	Open: R101. Shorted: C103B. Leaky: C103B.
Listening Test: Abnormal hum or garbled speech may be caused by open C100, C101, C102, C103A, C103B, or R102				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the B— bus, test point B; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

In steps 1 and 4, set the volume control to maximum in the radio position when testing at test point A, and to maximum in the phono position when testing at test point E. Adjust the signal-generator output as required for each step.



TP-3

Figure 2. Bottom View, Showing Section 2 Test Points

If the "NORMAL INDICATION" is obtained for both test points A and E in step 1, proceed with the tests for Section 3. If the "NORMAL INDICATION" is obtained at one test point not at the other, the volume control is defective. If the "NORMAL INDICATION" is not obtained at ei test point, isolate and correct the trouble within this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective: 50A5, LS200. Shorted: C203, C204, T200. Open: R2 T200.
3	D	Loud, clear signal with weak signal input.	Defective: 7C6. Open: C202, R202, R203. Shorted: C202. Leaky: C202.
4	A E	Loud, clear signal with weak signal input.	Defective: R200. Open: C200. Shorted: C305.* Leaky: C305.*
Listenting Test: Distortion on strong signals may be caused by open-circuited R201 or by short-circuited or leaky C200. Hum modulation on phonograph operation may be caused by open-circuited C201.			

Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the B— bus, test point B; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum in the radio position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

NOTE: Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

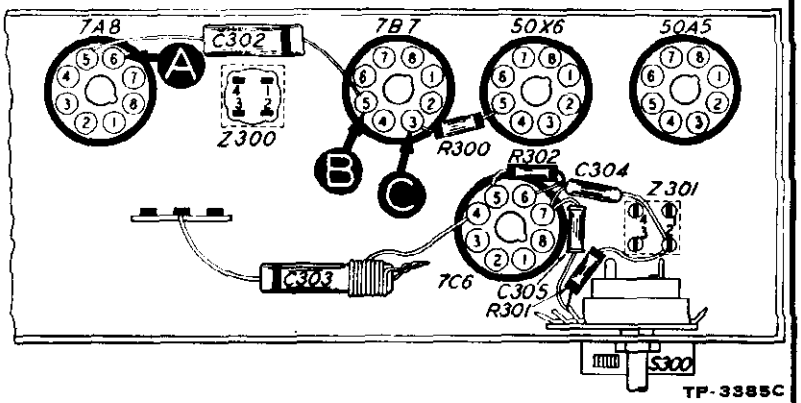


Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective: 7B7, 7C6, Z301. Open: C302, R300, R301, R302. Shorted: C302, C304, C305.
3	A	Loud, clear signal with weak signal input.	Defective: 7A8,* Z300. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section (with the exception of the oscillator test), use an r-f signal generator with modulated output. Connect the generator ground lead to the B— bus, test point B; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum in the radio position.

Except as noted for the oscillator test, set the radio and signal-generator dials to 1000 kc.

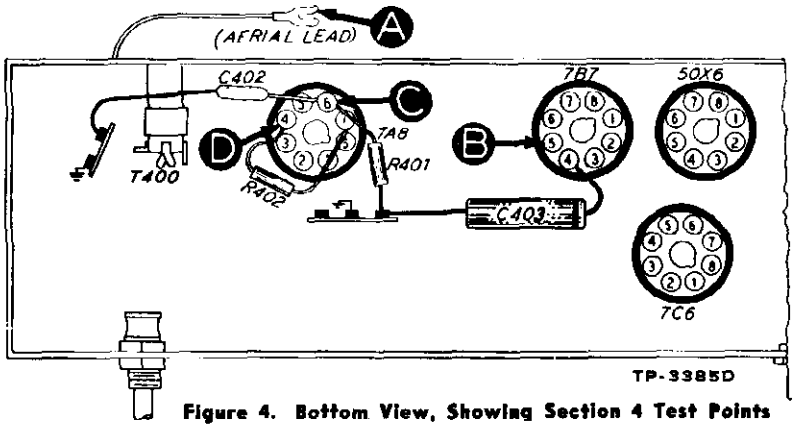

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with moderate signal input.	Defective: 7A8, osc. circuit. Misaligned: osc. circuit. Open: C403, R401.
3	D (Osc. test; see note below.)	Negative 4—8 volts.	Defective: 7A8, T400. Shorted: C400, C400B. Open: R402.
4	A	Loud, clear signal with weak signal input.	Defective: LA400. Shorted: C400, C400A. Open: C401, C402.

OSCILLATOR-TEST NOTE: Connect positive lead of high-resistance d-c voltmeter to B— bus, test point B; connect prod end of negative lead through 100,000-ohm isolating resistor to oscillator grid, test point D. Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage of 4 to 8 volts (measured with 20,000-ohms-per-volt meter) throughout range of tuning control.

ALIGNM

TURN VOLUME CONTROL

NOTE: Make alignment with loop connected to radio.

OUTPUT METER—Connect to terminals indicated in figure 7.

DIAL—Calibration and pointer-index measurement shown in figure 8. With tuning gang fully me set pointer to index mark.

STEP	SIGNAL GENERATOR		RADIO		AD
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS

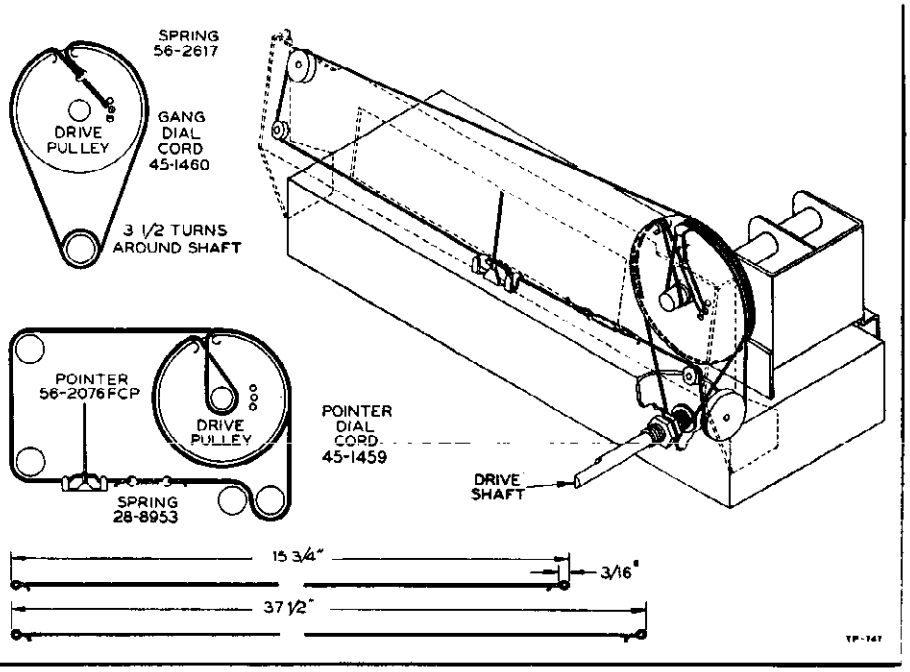

Figure 6. Drive-Cord Installation Details

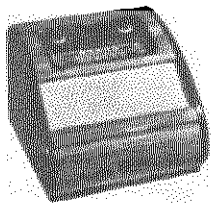
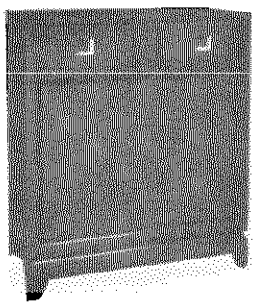
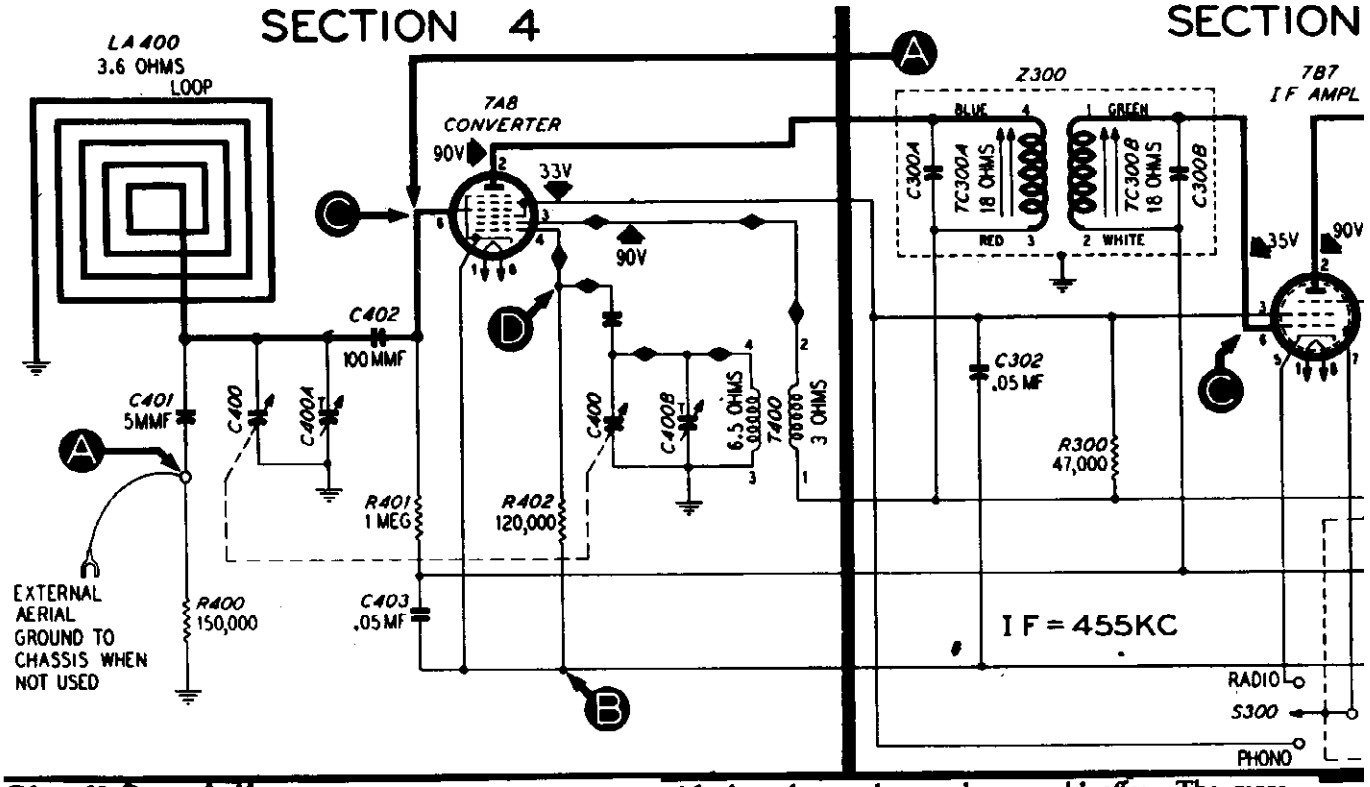


MODEL 48-1201



MODEL 48-1260



Circuit Description

Philco Radio-Phonographs, Models 48-1201 and 48-1260 are identical electrically. The radio is a five-tube superheterodyne with a built-in loop aerial and provisions for connecting an external aerial.

The loop aerial feeds into the mixer section of a 7A8 pentagrid converter. The aerial and oscillator circuits are tuned by ganged, variable tuning condensers, and the oscillator-section rotor plates are shaped to provide proper tracking without the use of a series padding condenser.

The output of the 7A8 converter is transformer-coupled to the 7B7 i-f amplifier which, in turn, is transformer-coupled to the diode section of the 7C6 diode-triode. Each of the i-f coupling transformers has permeability-tuned primary and secondary windings.

One diode functions as the 2nd detector; the other diode develops the a-v-c voltage, which is applied to the mixer section of the converter and to the i-f amplifier. The output of the 2nd detector is resistance-coupled to the triode section of the 7C6 which, in turn, is resistance-coupled to the 50A5 beam-power output tube. The output tube is transformer-coupled to the permanent-magnet dynamic loud-speaker, to which it supplies approximately 1.8 watts of audio power.

D-c operating voltages are supplied from a voltage-doubler power supply employing a 50X6 full-wave rectifier and a resistor-condenser filter network.

A 120,000-ohm resistor, R102, is connected between B— and the chassis to prevent hum under conditions of high humidity. A series-tuned circuit consisting of a condenser, C303, and a choke is also connected between B— and the chassis. This combination is resonant at 455 kc. and, therefore, offers a lower impedance at the i.f. than the condenser alone would offer. The more effective grounding of the i-f circuits improves the stability of the high-gain i-f stages.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of the 50X6 rectifier) and the B— bus, test point B. When the ohmmeter leads are connected in proper polarity, the highest resistance reading will be obtained. This reading should be not lower than 4000 ohms. If it is lower, check condensers C101, C102, C103A, C103B, and C204 for leakage or shorts.

SPECIFICATIONS

CABINET
Model 48-1201; wood, mahogany finish, harvest (L)
Model 48-1260; wood, Philcote finish
CIRCUIT ..... Five-tube superheterodyne
FREQUENCY RANGE ..... 540 to 1600 kc.
AUDIO OUTPUT ..... 1.8 watts
OPERATING VOLTAGE
105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION
Radio, 45 watts; Phonograph, 60 watts
AERIAL ..... Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY ..... 455 kc.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

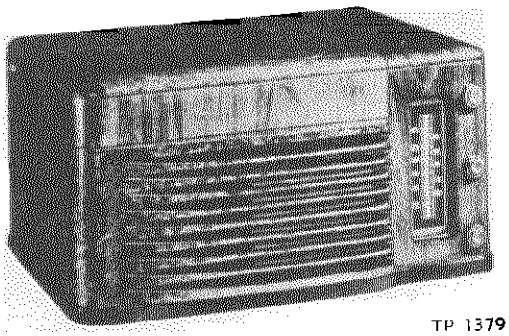
MODEL 48-1256 PHILCO CORP.



TP 1379

MODEL 48-1256

SPECIFICATIONS

CABINET	Wood, walnut or mahogany finish
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	60 watts
AERIAL	Built-in loop; terminal provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (6)	7C7, 7A8, 14A7, 7C6, 35L6GT, 50X6
RECORD CHANGER	Philco Automatic Record Changer, Model D-10 *(For service information, see manual PR-1156.)*

Circuit Description

Philco Model 48-1256 is a table-model radio-phonograph combination consisting of a six-tube, a-c, superheterodyne radio and a Philco Model D-10 Automatic Record Changer. The tuning range is 540—1620 kc. The built-in, high-impedance loop is usually adequate, although an external aerial may be used where additional signal pickup is required. The tube complement is as follows: 7C7, r-f amplifier; 7A8, converter; 14A7, i-f amplifier; 7C6, detector-a.v.c.-1st audio; 35L6GT, output amplifier; 50X6, rectifier.

A series-resonant, i-f by-pass, C304 (with choke), is connected between the chassis and B–; this combination functions as an r-f by-pass at broadcast frequencies. If short-wave interference originating near 14—28 mc. is encountered, install a .01-mf. by-pass condenser between the chassis and B– (the choke wound on C304 has appreciable impedance at these frequencies).

The d-c operating voltages are obtained from a voltage-doubler circuit using a 50X6 rectifier; a resistance-capacitance network is used for filtering. The radio operates on a.c. only.

The radio-phono switch, which is mechanically connected to the volume-control shaft, is operated by turning the control to either side of center—clockwise for radio and counterclockwise for phonograph.

Preliminary Checks

The following preliminary checks should be made before turning on the radio:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of the 50X6 rectifier) and B–, test point B; use the ohmmeter polarity that gives the highest resistance reading. If the reading is lower than 3000 ohms, check condensers C101, C102, C103A, and C103B for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests for Section 1 are performed.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure. Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

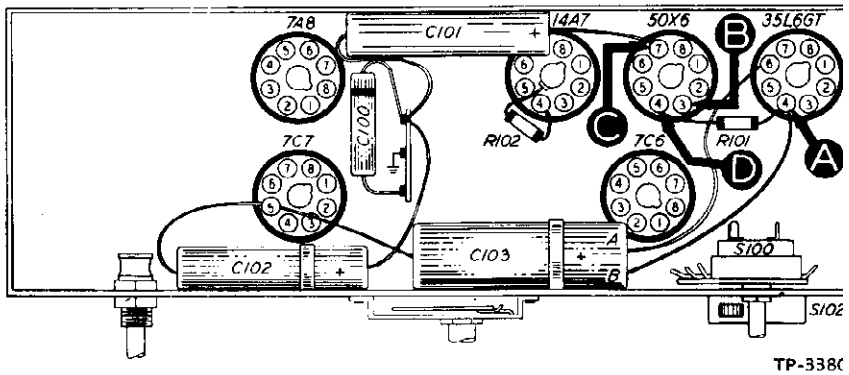
After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Section 1 TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn the power on; set the volume control to minimum for radio, and the tone control counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.



TP-338C

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	140v	Trouble within this section. Isolate by the following tests.
2	C	215v	Defective: 50X6. Open: W100, S100, C101, C102. Shorted leaky: C101, C102, C103A, C103B, C204*, C205*.
3	D	200v	Change in value: R100. Leaky: C103A.
4	A	140v	Change in value: R101. Leaky: C103B.
Listening Test: Abnormal hum may be due to loss of capacitance in C101, C102, C103A, or C103B; test by substituting good condensers.			

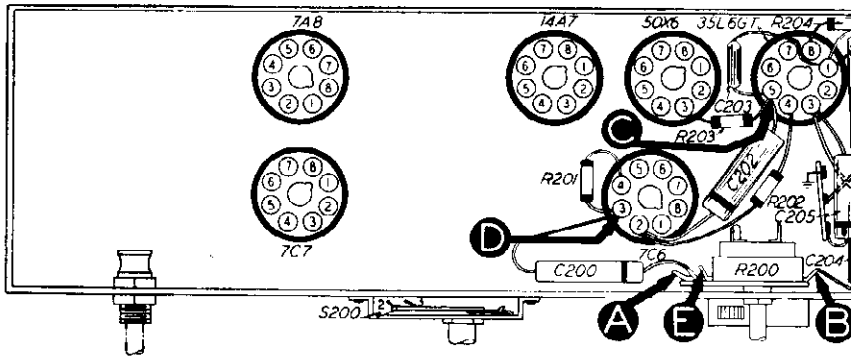
* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum for radio, and the tone control counterclockwise. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.



TP-338C

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble within this section. Isolate by the following tests.
2	C	Moderate, clear signal with strong signal input.	Defective: 35L6GT. Open: LS200 voice coil, T200 pri. or sec R204. Shorted: C202, C203, C204, C205, LS200 voice co T200 pri. or sec.
3	D	Loud, clear signal with moderate signal input.	Defective: 7C6. Open: C202, C203, R202.
4	A	Loud, clear signal with moderate signal input.	Open: C200, R200. Shorted: C303*.
5	E	Volume control at maximum for phono. Loud, clear signal with moderate signal input.	Open: R200. Shorted: crystal pickup, shielded pickup cable.
Listening Test: Distortion or hum may be due to defective 7C6 or 35L6GT (test by substituting good tubes). Distortion may also result from open R201, or shorted or leaky C200.			

* This part, located in another section, may cause abnormal indication in this section.

Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum for radio, and the tone control counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

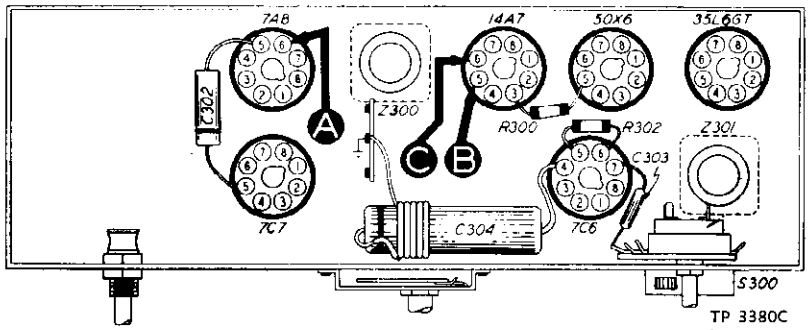


Figure 3. Bottom View, Showing Section 3 Test Points

Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective: 14A7, 7C6 (diode section). Misaligned: Z301. Open: Z301 pri. or sec., C301A, C301B, C303, R300, R301. Shorted: Z301 pri. or sec., C301A, C301B, C301C, C301D, C300B, C302.
3	A	Loud, clear signal with moderate signal input.	Defective: 7A8*. Misaligned: Z300. Open: Z300 pri. or sec., C300A, C300B, C302, R300, S300, R403*. Shorted: Z300 pri. or sec., C300A, C300B, C302, T400* sec.
Listening Test: Instability or whistles may be due to shorted coil on C304, or by open C302.			

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section (with the exception of the oscillator test), use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum for radio, and the tone control counterclockwise.

Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.

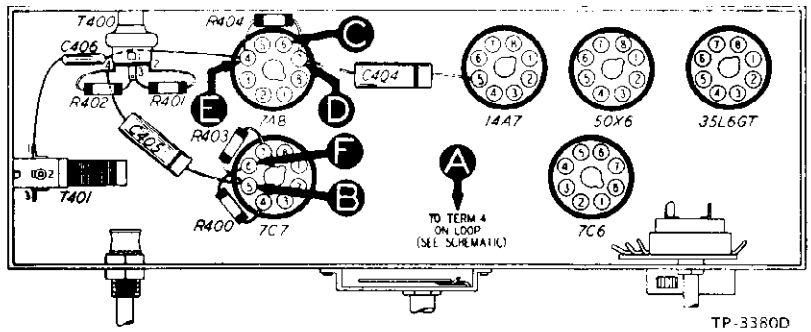

Figure 4. Bottom View, Showing Section 4 Test Points (Locations of C400, C401, C403, and C407 are shown in figure 7.)

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	1000 kc.	1000 kc.	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	1000 kc.	1000 kc.	Clear signal with moderate signal input.	Oscillator trouble (see oscillator test below) Defective: 7A8. Misaligned: T401. Open: T401 pri. or sec., C406, R404. Shorted: C402B, C402D, C407.
3	F	1000 kc.	1000 kc.	Loud, clear signal with weak signal input.	Defective: 7C7. Open: T400 pri. or sec., C405, C404.
4	A	1000 kc.	1000 kc.	Somewhat louder signal than in step 3.	Misaligned: C402C. Open: LA400, C400, C403. Shorted: LA400, C401.

Listening Test: Distortion may be due to open R400.

OSCILLATOR TEST: Connect positive lead of high-resistance, d-c voltmeter to test point D; connect the prod end of the negative lead through 100,000-ohm isolating resistor to oscillator grid (pin 4 of 7A8), test point E. Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage throughout range of tuning condenser.

SYMBOLIZATION AND TERMINOLOGY

The components in the radio circuit are symbolized according to the types of parts and th of the radio in which the parts are located. The prefix letter of the symbol designates the typ as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loud-speaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.
400-series components are in Section 4—the aerial, r-f, and oscillator circuits.

A suffix letter identifies the part as a non-replaceable component of the assembly which identical number without a suffix letter, and with perhaps a different prefix letter.

REPLACEMENT PARTS LIST

NOTE

Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 48-1262

SPECIFICATIONS

CABINET	Wood, walnut finish
CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	540 to 1620 kc.
AUDIO OUTPUT	2.5 watts
OPERATING VOLTAGE	105 to 120 volts, 60-cycle, a.c. only
POWER CONSUMPTION	Radio, 40 watts; Phonograph, 20 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (6)	7B7(2), 7C6, 14AF7, 35L6GT, 50X6
PHONOGRAPH	Philco Automatic Record Changer, Model D-10

Circuit Description

Philco Model 48-1262 is a console combination of a Philco Model D-10 Automatic Record Changer and a six-tube superheterodyne radio which provides reception within the Standard Broadcast Band.

The loop aerial normally provides adequate signal pickup. If greater pickup is required, an external aerial may be connected.

The loop works into a 14AF7 converter, and variable-condenser tuning is used. The two i-f stages employ 7B7 high-transconductance tubes. To obtain good stability, resistance coupling is employed between the first and second i-f tubes. The diodes of the 7C6 provide detection and a-v-c voltage. The triode section of this tube functions as the first audio amplifier, and is resistance-coupled to the 35L6GT output tube. The loud-speaker is a permanent-magnet dynamic type. The power supply employs a 50X6 full-wave voltage-doubling rectifier and a resistor-condenser filter network.

The 120,000-ohm resistor, R102, is connected between B— and the chassis to prevent hum under conditions of high humidity.

The two series-resonant circuits, C304 and C305, function as by-passes of exceptionally low impedance; one is resonant at the i.f., 455 kc., while the other is resonant at the second harmonic of the i.f., 910 kc.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of the 50X6 rectifier) and the B— bus, test point B. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. This reading should be not lower than 3000 ohms. If it is lower, check condensers C101, C102, C103A, and C204 for leakage or shorts.

The above resistance value is not intended as a quality check for these condensers. It is the lowest value at which the rectifier will operate safely while the voltage tests of Section 1 are being performed.

For service information concerning Model 48-1283

Model 48-1283 is similar to Model 48-1262, Code 121, with the exceptions given in this supplement. The radio-phonograph is contained in a cabinet which has two record shelves. The aerial loop is mounted on rails at the back of the cabinet. Automatic Record Changer Model M-8 is used, and the isolating condenser and the load resistor for the crystal pickup are mounted on a terminal strip located on the speaker baffle.

SCHEMATIC DIAGRAM

Section 1

The .05-mf. condenser between the phono chassis and the phono-cable shield is removed, and is connected between the phono chassis and the radio chassis. This condenser is located on a terminal strip attached to the cabinet.

A 1-megohm resistor is connected across the crystal pickup.

A .01-mf. condenser is connected between the low side of the crystal pickup and the phono-cable shield.

R102 is 150,000 ohms.

Section 2

C200 is removed and the cable shield is connected directly to B —.

C205 is .03 mf.

Section 3

R302 is 150,000 ohms.

Section 4

R400 is 150,000 ohms.

LA400 is 3.5 ohms.

REPLACEMENT PARTS LIST

Section 1

R102 is 150,000 ohms, Service Part No. 66-4153340*.

Section 2

C200 is removed.

C205 is .03 mf., Service Part No. 45-3500-1*.

LS200 is Service Part No. 36-1626-1.

Section 3

C304 is .15 mf., Service Part No. 38-9851-5.

C305 is .05 mf., Service Part No. 38-9851-4.

R302 is 150,000 ohms, Service Part No. 66-4153340*.

Section 4

C400 is Service Part No. 31-2715-1.

LA400 is Service Part No. 32-4273.

R400 is 150,000 ohms, Service Part No. 66-4153340*.

Section 1 TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to the B— bus, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

With the radio-phono switch set to the radio position, turn the volume control to minimum and turn the tone control fully clockwise.

Follow the steps in sequence; if the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct th trouble in this section.

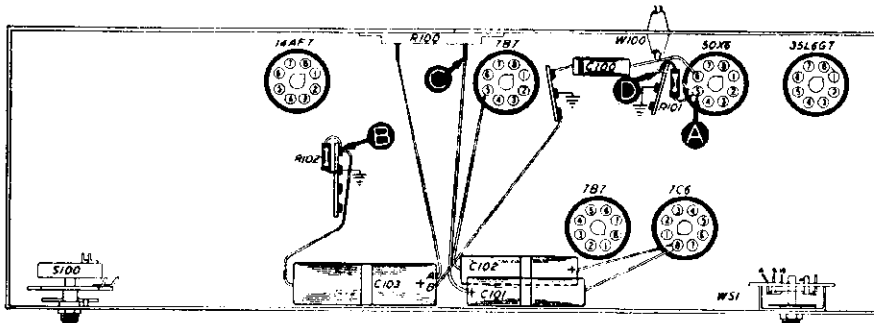

Figure 1. Bottom View, Showing Section 1 Test Points TP-3395

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	167 v.		Trouble within this section. Isolate by the following tests.
2	C	214 v.	No voltage.	Defective: 50X6, S100, W100. Shorted: C101, C102.
			Low voltage.	Defective: 50X6. Open: C101, C102. Leaky: C101, C102, C103A, C103B.
			High voltage.	Open: R100, T200,* R204.*
3	D	181 v.	No voltage.	Shorted: C103A.
			Low voltage.	Open: C103A. Leaky: C103A, C204.*
			High voltage.	Open: R101, R204,* T200.*
4	A	167 v.	No voltage.	Shorted: C103B.
			Low voltage.	Leaky: C103B.
			High voltage.	Open: R204,* T200.*

Listening Test: Abnormal hum may be caused by open C103A, C103B, or R102.

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the B— bus, test point B; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed to the tests in Section 3; if not, isolate and correct the trouble in this section.

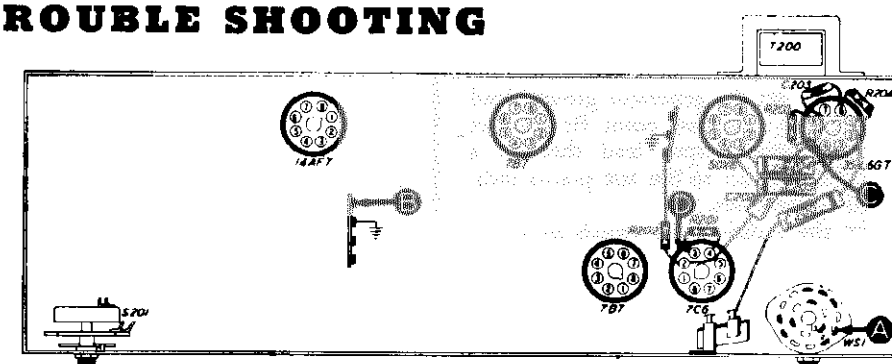

Figure 2. Bottom View, Showing Section 2 Test Points TP-3395

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective: 35L6GT, LS200, T200. Shorted: C202, C203, C204, C205. Leaky: C202, C203, C204, C205. Open: R203, R204.
3	D	Loud, clear signal with weak signal input.	Defective: 7C6. Open: C202, R202, R201. Leaky: C202.
4	A	Loud, clear signal with weak signal input. (Rotate R200 through its range.)	Defective: WS1, R200. Open: C201. Shorted: C301D.*

Listening Test: Distortion on strong signals may be caused by short-circuited or leaky C201, or open-circuited R201.

* This part, located in another section, may cause abnormal indication in this section.

MODEL 48-1262, Code 121 PHILCO CORP.

Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the B— bus, test point B; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio-phono switch to radio, turn the volume control to maximum, and set the tone control fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

NOTE: Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

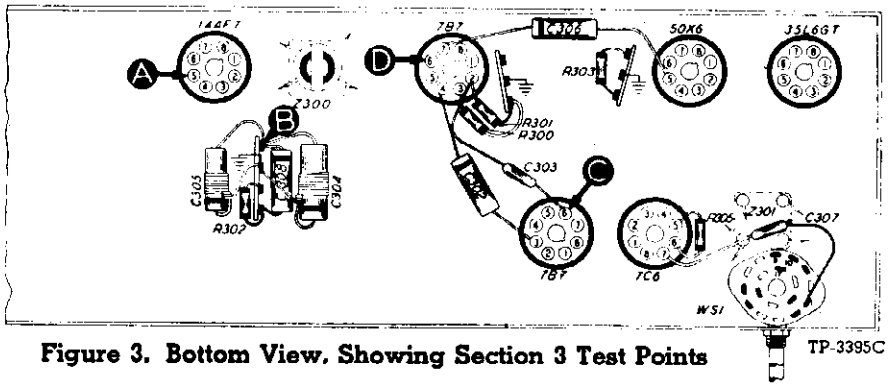

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective: WS1, 7B7 (2nd i.f.), 7C6, Z301. Open: C302, C306, R300, R302. Shorted: C302, C306. Leaky: C302, C306.
3	D	Loud, clear signal with moderate signal input.	Defective: 7B7 (1st i.f.). Open: C303, C304, C305, C308, R301, R302. Shorted: C303. Leaky: C303.
4	A	Loud, clear signal with weak signal input.	Defective: 14AF7,* Z300. Misaligned: Z300. Open: R402,* R401.*

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section (with the exception of the oscillator test), use an r-f signal generator with modulated output. Connect the generator ground lead to the B— bus, test point B; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio-phono switch to radio, turn the volume control to maximum, and set the tone control fully clockwise.

Except as noted for the oscillator test, set the radio and signal-generator dials to 540 kc.

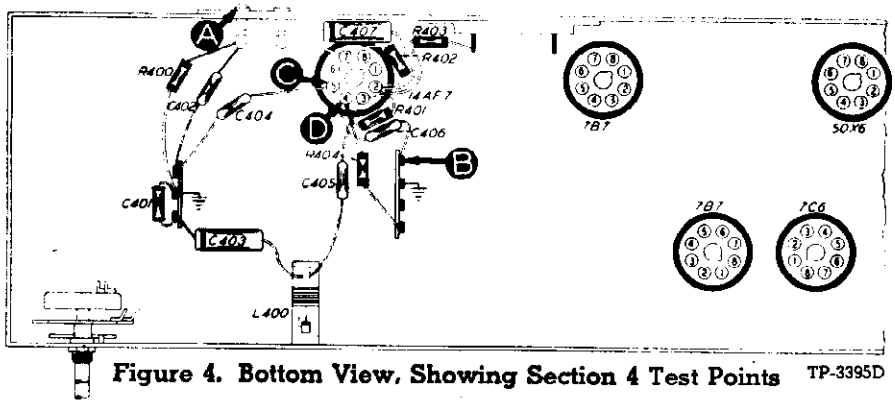

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with weak signal input.	Defective: 14AF7, osc. circuit. Open: C407, R402. Shorted: C407. Leaky: C407.
3	D (Osc. test; see Note below.)	Negative 3.3 to 4.2 volts.	Defective: L400. Open: C403, C405, C406, R401, R403. Shorted: C400, C400A, C401, C403, C405, C406.
4	A	Loud, clear signal with weak signal input.	Defective: LA400. Shorted: C400, C400A, C402, C404. Open: C402, C404. Leaky: C402, C404.

OSCILLATOR-TEST NOTE: Connect positive lead of high-resistance d-c voltmeter to B— bus, test point B; connect prod end of negative lead through 100,000-ohm isolating resistor to oscillator grid, test point D. Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage of 3.3 to 4.2 volts (measured with 20,000-ohms-per-volt meter) throughout range of tuning control.

ALIGNM

SET RADIO-PHONO SWITCH TO RADIO

NOTE: Make alignme

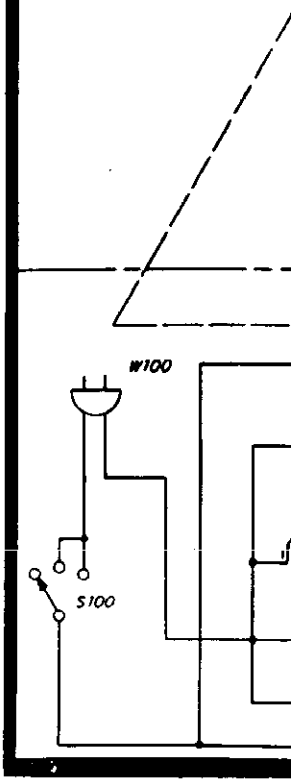
NOTE: ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE MARKED.



SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser	**LA—loop aerial**	**S—switch**	**WS—wafer switch**
I—pilot lamp	**LS—loud-speaker**	**T—transformer**	
L—choke or coil	**R—resistor**	**W—power cord and plug**	**Z—electrical assembly**

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1, the power supply.
200-series components are in Section 2, the audio circuits.
300-series components are in Section 3, the i-f amplifier, detector, and a-v-c circuits
400-series components are in Section 4, the aerial, r-f, and oscillator circuits.

A suffix letter identifies the part as a non-replaceable component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

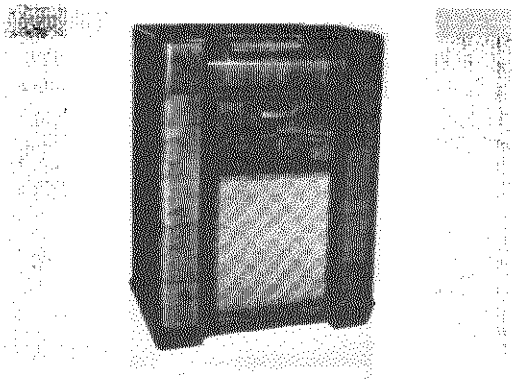
To reduce phonograph rumble, a 1 megohm resistor, part number 66-5103340, has been added across the crystal pickup.

MODEL 48-1263 PHILCO CORP.



MODEL 48-1263

Circuit Description

Philco Model 48-1263 is a console model radio-phonograph combination consisting of an eight-tube superheterodyne radio and a Philco Model D-10 Automatic Record Changer. The radio provides reception within the standard broadcast band, 540 to 1720 kc., and within the short-wave band, 9.3 to 15.5 mc.

The built-in loop aerial is usually adequate for normal reception, but provision is made for connecting an external aerial if additional pickup is required.

A 7AF7 dual-triode converter is used to provide high signal-to-noise ratio. Oscillator-to-mixer coupling is made by a condenser connected between the cathodes of the mixer and oscillator. On the short-wave band, reverse feedback from the oscillator to the mixer is applied through a 10-mmf. condenser to minimize the reaction on the oscillator frequency caused by adjustment of the aerial trimmer.

Two i-f amplifier stages, operating at 455 kc. and using type 7A7 pentodes, provide high gain and good selectivity. The diode section of the 7C6 dual-diode triode operates as the detector and a-v-c rectifier, while the triode section operates as the first audio amplifier. The type 6J5GT triode functions as a phase inverter and drives the two 6K6GT beam-power output tubes in push-pull operation.

The audio section employs inverse feedback to provide bass compensation and to reduce distortion. The feedback takes place from the secondary of the output transformer to the input of the first audio stage. The tone control is continuously variable, and, when rotated clockwise, provides: first, an increase in bass response, and then, as ro ation is continued, attenuation of the higher audio frequencies. The 12-inch electrodynamic loud-speaker is capable of excellent bass reproduction.

SPECIFICATIONS

CABINET	Wood, walnut finish
CIRCUIT	Eight-tube superheterodyne
FREQUENCY RANGES	Broadcast: 540 to 1720 kc. Short Wave: 9.3 to 15.5 mc.
AUDIO OUTPUT	6 watts
OPERATING VOLTAGE	117 volts, 60-cycle, a.c.
POWER CONSUMPTION	Radio, 110 watts Phonograph, 20 watts
AERIAL	Built-in low-impedance loop
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (8)	7AF7, 7A7 (2), 7C6, 6J5GT, 6K6GT (2), 5Y3GT
PHONOGRAPH	Philco Automatic Record Changer Model D-10. (For service information, refer to PR-1156.)

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube-electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 8 of the 5Y3GT rectifier) and the radio chassis, test point C. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. This reading should be not lower than 3400 ohms. If it is lower, check condensers C101 and C102A for leakage or shorts.

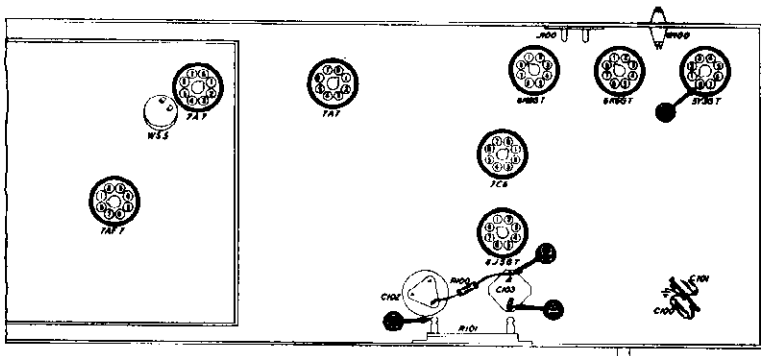
The above resistance value is not intended as a quality check of these condensers. It is the lowest value at which the rectifier will operate safely while the voltage tests of Section 1 are being performed.

Section 1 TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to the radio chassis, test point C; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the wafer switch to BC, turn the volume control to minimum, and turn the tone control fully counterclockwise.

Follow the steps in sequence; if the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.



TP-4045-A

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	235v		Trouble within this section. Isolate by the following tests.
2	D	340v	No voltage	Defective: 5Y3GT, S100, T100. Shorted: C102.
			Low voltage	Defective: 5Y3GT, T100. Open: C102. Leaky: C102. Shorted: C103A, C103B.
			High voltage	Open: L100, R100, T200*.
3	B	235v	No voltage	Open: R100. Shorted: C102A.
			Low voltage	Leaky: C103A. Shorted: C304*, C308*, C407*.
4	A	235v	No voltage	Open: L100, R101. Shorted: C305*.
			Low voltage	Shorted: C309*, C410*. Defective: T200*.
			High voltage	Defective: T200*.
Listening Test: Abnormal hum may be caused by open-circuited C102, C103A, or C103B.				

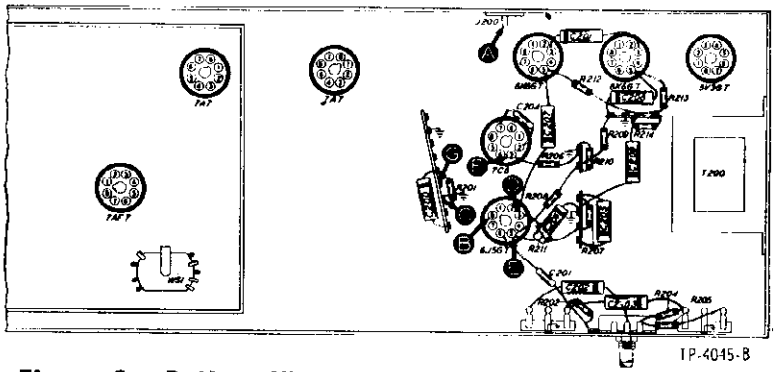
*This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the radio chassis, test point C; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, turn the tone control fully counterclockwise, and set the wafer switch to BC. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed to the tests in Section 3; if not, isolate and correct the trouble in this section.



TP-4045-B

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	B	(Remove 6J5GT.) Loud, clear signal with strong signal input.	Defective: 6K6GT, T200, LS200. Open: C208, R213. Shorted: C208. Leaky: C208.
3	D	Same as step 2.	Defective: 6K6GT, T200, LS200. Open: C207, R212. Shorted: C207. Leaky: C207.
4	E	(Replace 6J5GT.) Loud, clear signal with moderate signal input.	Defective: 6J5GT. Open: R209, R210, R211. Shorted: C206. Leaky: C206.
5	F	Loud, clear signal with weak signal input.	Open: C206, R207. (Rotate volume control through its range.) Shorted: C205, C204. Leaky: C204. Defective: 7C6.
6	A	Same as step 5.	Defective: WS1(F), R200. Open: C200, C202, R204, R206.
7	G	Same as step 5. (Set wafer switch to phono.)	Defective: WS1(F), PL200. Open: R201.
Listening Test: Distortion may be caused by leaky C202, C206, C207, C208, C209, or C200, or by shorted C209 or open-circuited R214. Hum will result if C209 is open-circuited.			

Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the radio chassis, test point C; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the wafer switch to BC, turn the volume control to maximum and turn the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

NOTE: Since the circuit location for test point A of this section is the same as that for test point B of Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

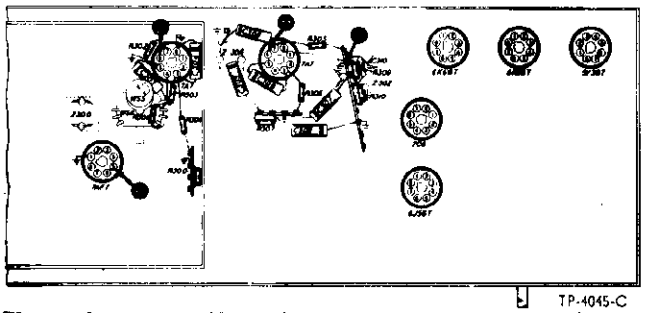


Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	B	Loud, clear signal with moderate signal input.	Defective: 7C6, Z302, 7A7, WS1 (R). Misaligned: Z302. Open: C306, C308, C309, R305, R306, R307, R309. Shorted: C306, C308, C309, C310. Leaky: C306, C308, C309.
3	D	Loud, clear signal with weak signal input.	Defective: 7A7, Z301. Misaligned: Z301. Open: C303, C304, C305, C307, R301, R302, R303, R304. Shorted: C303, C304, C305, C307.
4	A	Loud, clear signal with weak signal input.	Defective: 7AF7*, WS3 (F)*, Z300. Misaligned: Z300. Open: C410*, L402*, R402*.

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section (with the exception of the oscillator tests), use an r-f signal generator with modulated output. Connect the generator ground lead to the radio chassis, test point C; connect the generator output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum and the tone control fully counterclockwise. Set the wafer switch, signal generator dial, and radio dial as indicated in the chart.

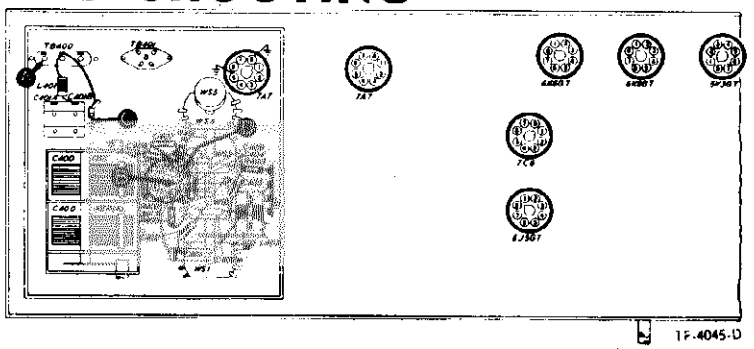

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	WAFER SWITCH	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
			SIG. GEN.	RADIO		
1A	A	BC	1000 kc.	1000 kc. (tune to signal)	Loud, clear signal with weak signal input.	Trouble within BC circuits. Isolate by performing steps 2, 3, and 4.
1B	A	SW	15 mc.	15 mc. (tune to signal)	Loud, clear signal with weak signal input.	Trouble within SW circuits. Isolate by performing steps 5 and 6.
2	B	BC	1000 kc.	1000 kc. (tune to signal)	Loud, clear signal with moderate signal input.	Defective: 7AF7, Osc. circuit. Open: C409, R400.
3	D (Osc. test; see Note below.)	BC	Not used	Rotate through range	Negative voltage 5 to 7 volts.	Defective: 7AF7, WS3, WS4. Open: R403, R401, L402, C407, C408. Shorted: C400, C402B, C407, C408. Leaky: C407, C408
4	A	BC	1000 kc.	1000 kc. (tune to signal)	Loud, clear signal with weak signal input.	Defective: WS2, WS4, L400. Open: C404. Shorted: C400, C401A, C404. Leaky: C404.
5	D (Osc. test; see Note below.)	SW	Not used	Rotate through range	Negative voltage 2 to 3 volts.	Defective: 7AF7, WS3, WS4, L403. Shorted: C402C, C405. Open: C405.
6	A	SW	15 mc.	15 mc. (tune to signal)	Loud, clear signal with weak signal input.	Defective: 7AF7, WS2, WS4, L401. Shorted: C401B, C403. Open: C404. Leaky: C404.

OSCILLATOR-TEST NOTE: Connect positive lead of high-resistance d-c voltmeter to radio chassis, test point C; connect prod end of negative meter lead through 100,000-ohm isolating resistor to oscillator grid, test point D. Use suitable meter range, such as 0 to 10 volts. Proper operation of oscillator is indicated by negative voltage within limits shown in "NORMAL INDICATION" column throughout range of tuning control. Indicated values were measured with 20,000-ohms-per-volt meter.

MODEL 48-1263

ALIGNME

CAUTION: Do not turn on t

NOTE: Make alignment

DIAL: Calibration and pointer-index measurements are shown in figure 6. With tuning gang fully meshed, set pointer to index mark.

OUTPUT METER: Connect to terminals indicated figure 7.

STEP	SIGNAL GENERATOR		RADIO			
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	WS POSITION	SPECIAL INSTRUCTIONS	AD
1	Through .1-mf. condenser to Terminal 1 of TB400.	455 kc.	540 kc.	BC	Adjust for maximum, ONCE only, in order.

L400 BC AERIAL

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C —condenser	LA—loop aerial	S —switch	WS—wafer switch
I —pilot lamp	LS—loud-speaker	T —transformer	Z —electrical assembly
L —choke or coil	R —resistor	W —power cord and plug	

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1, the power supply.
200-series components are in Section 2, the audio circuits.
300-series components are in Section 3, the i-f amplifier, detector, and a-v-c circuits.
400-series components are in Section 4, the aerial, r-f, and oscillator circuits.

A suffix letter identifies the part as a non-replaceable component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

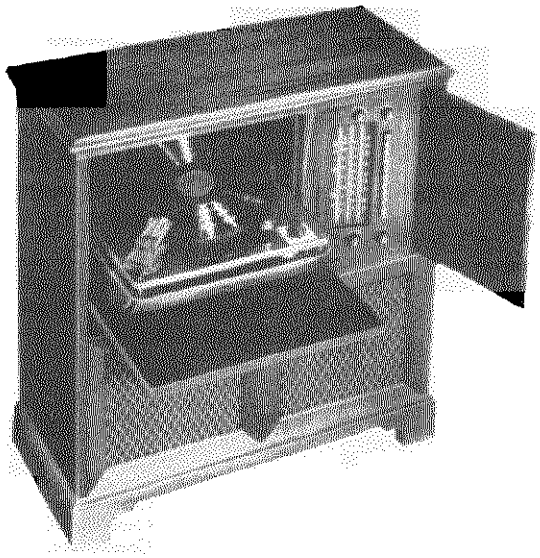
MODEL 48-1270 PHILCO CORP.



PHILCO RADIO-PHONOGRAPH
MODEL 48-1270

Circuit Description

Philco Radio-Phonograph, Model 48-1270, contains a 13-tube superheterodyne, providing reception on the standard-broadcast band, 540 to 1720 kc., the short wave range between 9.3 and 15.5 mc., and the FM band 88 to 108 mc.

A low-impedance loop within the cabinet provides adequate signal pickup for the standard-broadcast and short-wave bands. In most locations, the built-in FM dipole aerial provides satisfactory FM reception. In areas where FM signals are weak, an outdoor dipole aerial (Philco Part No. 45-1462) will provide additional pickup.

The r-f stage (FM only), converter stage, and first i-f stage are mounted on a separate chassis to insure reliable performance at high frequencies. A 7W7 high-frequency pentode is used in the r-f stage, and a 7F8 high-frequency double triode is employed as a converter. These stages provide high signal-to-noise ratio, high conversion efficiency, and good image rejection. The FM tuning gang is constructed with copper plates to obtain the high Q required for proper selectivity.

Three transformer-coupled i-f stages are used. The first, third, and fourth i-f transformers have two sets of windings; one set is tuned to 455 kc. for AM operation, and the other to 9.1 mc. for FM operation. The second i-f transformer, having a single primary winding tuned to 9.1 mc., one secondary winding tuned to 9.1 mc., and another secondary winding tuned to 455 kc., provides untuned-primary, tuned-secondary coupling on AM, to prevent instability. All transformers provide tuned-primary, tuned-secondary coupling on FM, to supply the additional gain needed at 9.1 mc. Switching of the windings, to attenuate undesired beat frequencies, is necessary only in the first i-f transformer; the large difference between the two intermediate frequencies makes further switching unnecessary. One 7B7 and two 7H7 high-transconductance pentodes are used in the i-f stages.

The new Philco advanced FM detector circuit, employing the FM1000 tube of special design, is used for FM reception. This circuit has excellent tuning characteristics, and inherently rejects AM and noise. Very briefly, the circuit functions as follows: The first and second grids (pins 2 and 5) of the FM1000 are used as grid and anode, respectively, of a modified Colpitts

SPECIFICATIONS

CABINET	Wood, mahogany or walnut finish
CIRCUIT	13-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1720 kc.
Short wave	9.3—15.5 mc.
FM	88—108 mc.
AUDIO OUTPUT	10 watts
PUSH BUTTONS	Ten: One for OFF, five for broadcast-station selection, three for band selection and one for phonograph operation
OPERATING VOLTAGE	105—120 volts, 60 cyles, a.c.
POWER CONSUMPTION	Radio: 110 watts Phonograph: 140 watts
AERIALS	Built-in loop and dipole; external aerial also may be used
INTERMEDIATE FREQUENCY	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (13)	7W7, 7F8, 7H7(2), 7B7, FM1000, 7AF7, 6SQ7GT, 6V6GT(2), 7F7, 7E7, 5U4G
RECORD PLAYER	Philco Automatic Record Changer, Model M-4

oscillator, which nominally operates at the intermediate frequency of 9.1 mc. The output of the i-f amplifier stages is fed into the injection grid (pin 6). The reactive coupling between the plate and oscillator circuits causes the oscillator to lock in and follow the frequency variations of the i-f signal. As the oscillator frequency increases, the plate current through R324 decreases, and as the oscillator frequency decreases, the plate current increases. This variation is linear with respect to frequency deviation; the plate current, therefore, produces the same wave shape as the modulation of the FM carrier. This audio signal is fed to the audio amplifier through the decoupling network, C331 and R322.

The high-mu-triode section of a 6SQ7GT is used in the first audio stage, and is biased from the bleeder in the negative return of the power supply. The first audio stage is resistance-coupled to one triode section of a 7AF7 twin-triode. This section functions as a cathode-and-plate-loaded phase inverter, and is resistance-coupled to the audio output stage, which employs two 6V6GT beam pentodes in push-pull combination. The output tubes are transformer-coupled to a twelve-inch electrodynamic speaker, and are biased from the bleeder circuit connected across the speaker field in the negative return of the power supply. Inverse feedback is obtained by connecting the secondary of the output transformer, through the resistor network, R203 and R204, to the volume control. The second triode section of the 7AF7 tube is used as the phonograph preamplifier stage, and is self-biased by cathode resistor R213.

The new Philco scratch-eliminator circuit reduces the high-frequency surface noise during the low-volume passages on a phonograph record, and permits maximum treble response during the high-volume passages. The circuit consists of a reactance tube (pentode section of the 7E7), a two-stage amplifier (7F7), and a half-wave rectifier (diode section of the 7E7). The reactance tube (connected to the plate circuit of the phono amplifier) functions as a variable capacitance which shunts a controlled amount of the surface-noise frequencies to ground. A portion of the audio signal is amplified, rectified, and applied as a bias voltage to the grid of the reactance tube. During the low-volume passages, when the surface noise tends to mask the high frequencies, the low bias voltage increases the capacitance of the reactance tube, and the surface noise is reduced. During the high-volume passages, when the surface noise itself is masked by the volume, the high bias voltage decreases the capacitance of the tube, thus permitting all audio frequencies to pass relatively unaffected.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and components of that section.

In each chart, the first step is a master check fo determining whether trouble exists in that section, with out going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" i any given step indicates trouble within the circuit und test.

After isolating the trouble to a single stage, th defect is located by: first, testing the tube; secon measuring the tube electrode voltages; third, measurin circuit resistances; fourth, substituting condensers. Th trouble revealed should be corrected before testin further.

Preliminary Checks

To avoid possible damage to the radio, the followin preliminary checks should be made before turning o the power:

1. Inspect the top and bottom of the chassis. Mak sure that all tubes are secure in the proper sockets, an look for any broken or shorted connections, burne resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 2 of th 5U4G) and the radio chassis (test point C). When th ohmmeter test leads are connected in the proper polar ty, the highest resistance reading will be obtained. I the reading is lower than 1000 ohms, check condense C101A, C101B, C101C, C102, and C103 for leakag or shorts.

This resistance value, which is much lower tha normal, is not intended as a quality check of these co densers; the value given is the lowest at which the re tifier will operate safely while the voltage tests of Se tion 1 are performed.

Symbolization

The components in the radio circuit are symbolize according to the types of parts and the sections of th radio in which the parts are located. The prefix lette of the symbol designates the type of part, as follows:

C—condenser	LS—loud-speaker	W—line cord
I—pilot lamp	PB—push button	TB—terminal board
J—socket	R—resistor	WS—wafer switch
L—choke or coil	S—switch	Z—electrical assembl
LA—loop aerial	T—transformer	

The number of the symbol, except when the numbe is less than 100, designates the section in which th part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio and scratch eliminator circuits.
300-series components are in Section 3—the i-f amplifier, d tector, & a-v-c circuit
400-series components are in Section 4—the aerial, r-f, and o cillator circuits.

A suffix letter identifies the part as a non-replaceabl component of the assembly which bears an identica number without a suffix letter, and with perhaps a di ferent prefix letter.

Section 1

TROUBLE SHOOTING

CAUTION: Do not turn on the power with the speaker disconnected, or the radio may be damaged.

For the tests in this section, use a d-c voltmeter. Connect the negative lead to the chassis (test point C); connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Depress the BC push button, set the volume control to minimum, and turn both tone controls counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

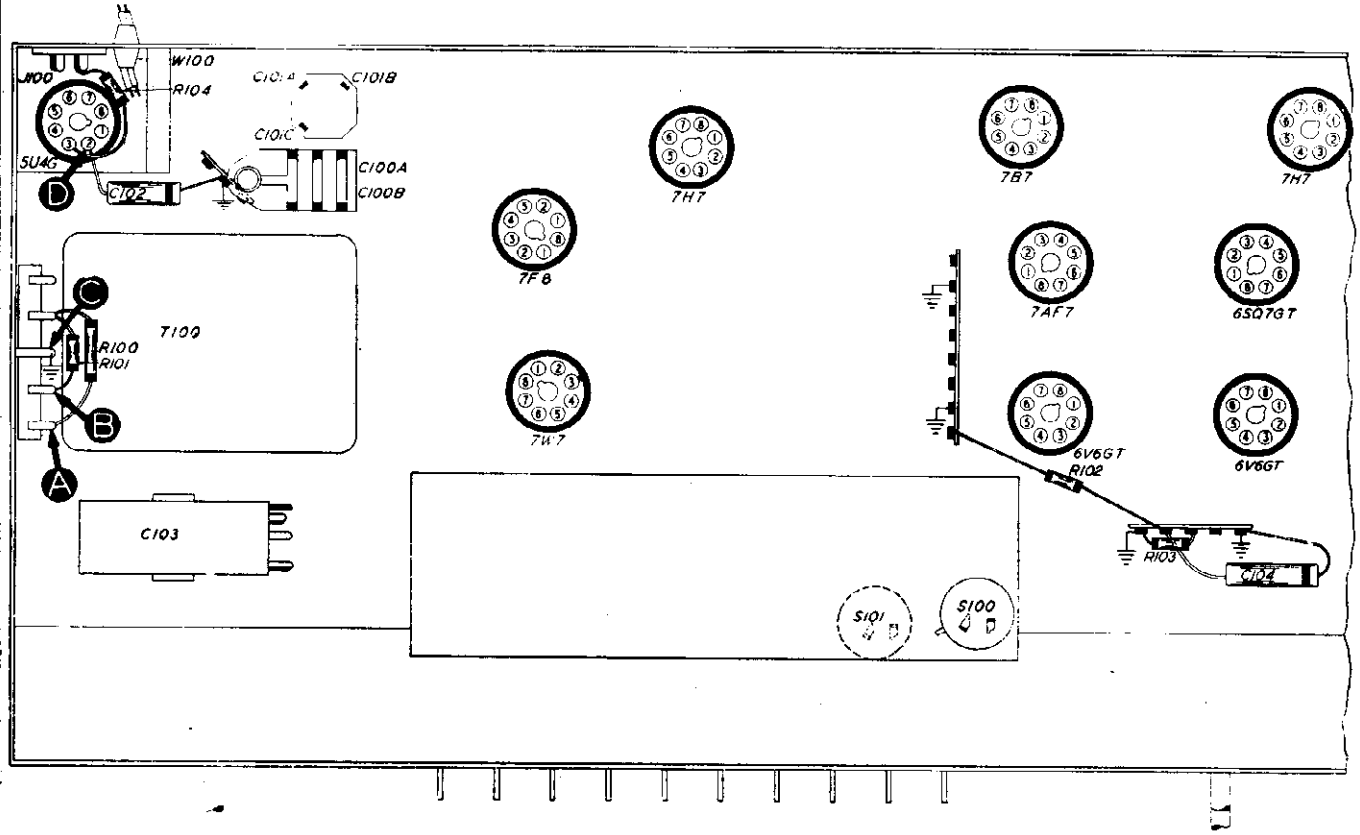


Figure 2. Bottom View, Showing Section 1 Test Points TP-4023A

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B	220v 200v		†Trouble within this section. Isolate by the following tests.
2	D	250v	No voltage	Defective: 5U4G, T100, W100, S100. Shorted: C101C, C102, C316*, C317*. Open: L100, C316*.
			Low voltage	Defective: 5U4G, T100. Leaky: C101C, C102, C103, C316*, C317*. Open: R102.
			High voltage	Defective: 6V6GT*. Open: R103, T200*.
3	B	200v	No voltage	Open: R101. Shorted: C101B, C417*, C419*, C421*.
			Low voltage	Defective: R101. Leaky: C101B, C417*, C419*, C421*.
			High voltage	Defective: 6V6GT*, T200*.
4	A	220v	No voltage	Open: R100. Shorted: C101A.
			Low voltage	Defective: R100. Leaky: C101A.

Listening Test: Abnormal hum may be caused by open C101A, C101B, C101C, or C103.

*This part, located in another section, may cause abnormal indication in this section.

Section 2

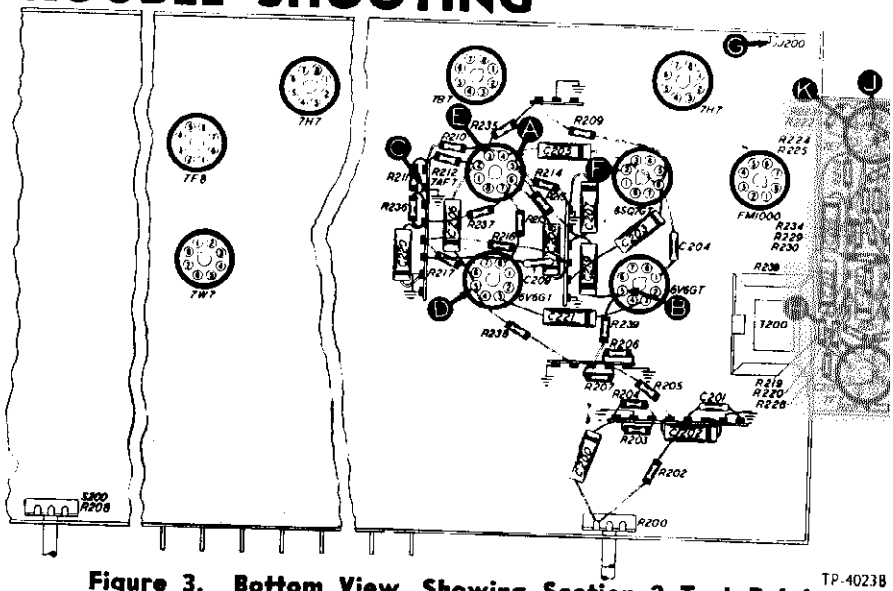
TROUBLE SHOOTING

AUDIO-CIRCUIT TESTS

For the tests in the audio circuit, use an audio signal generator. Connect the ground lead of the generator to the chassis (test point C); connect the output lead through a .1-mf. condenser to the test points indicated.

Set the radio volume control to maximum, turn both tone controls counterclockwise, and depress the phono push button.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the scratch-eliminator-circuit tests. If not, isolate and correct the trouble in the audio circuit.



TP-4023B

Figure 3. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in audio circuit. Isolate by the following tests.
2	B D	Loud, clear signal with strong signal input.	Defective: 6V6GT, T200, LS200, R238, R239. Shorted or leaky: C221. Open: C104.
3	E	Loud, clear signal with moderate signal input.	Defective: 7AF7, R211, R212, R235. Open: C206, C219. Shorted or leaky: C206, C219.
4	F	Loud, clear signal with weak signal input.	Defective: 6SQ7GT. Open: R208 (rotate through entire range), R209, R210. Shorted or leaky: C203, C204, C205.
5	G	Same as step 4.	Defective: R200, R203, R205, R206, R207. Shorted or leaky: C202.
6	A	Same as step 4.	Defective: 7AF7, R236, R237, PB9. Shorted or leaky: C220. Open: C208, R216, R217.

SCRATCH-ELIMINATOR-CIRCUIT TESTS

For the tests in the scratch-eliminator circuit, set the volume control to maximum, turn the bass tone control counterclockwise, and depress the phono push button. Set the scratch-eliminator switch, which is operated by the treble-tone-control knob, as directed in the chart.

Connect the output lead of an audio signal generator through a .1-mf. condenser to the test points indicated in the chart. Set the generator for an output frequen of 5000 cycles.

If the "NORMAL INDICATION" is obtained step 1, proceed with the tests for Section 3; if no isolate and correct the trouble in the scratch-eliminat circuit.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A (With scratch eliminator turned off, adjust generator for 2 volts across voice coil)	.8 volt across voice coil, with scratch eliminator turned on.	Trouble in scratch-eliminator circuit. Isolate by the following tests.
2	H (Adjust generator output to approximately .3 volt)	Approximately –6 volts* from J to C, with scratch eliminator turned on.	Defective: 7F7, 7E7 (diode section). Open: R231, R233, R234, C217. Shorted or leaky: C213, C217, C218.
3	A (Reduce generator output to maintain –6 volts* from J to C)	Considerable reduction in generator output required to maintain voltage from J to C at –6 volts.*	Defective: 7F7. Open: R228, C215, R221, R220, R219, C209. Shorted or leaky: C209, C214, C215.
4	A (Generator output reduced as in step 3)	–1.4 volts* from K to C.	Open: R222, R225, R226. Shorted or leaky: C210, C212, C213.
5	A (Generator adjusted as in step 1)	.8 volt across voice coil, with scratch eliminator turned on.	Defective: 7E7 (pentode section). Open: R218, R223, R224, C210, C211. Shorted or leaky: C211.

* Readings taken with 20,000-ohms-per-volt meter on 10-volt range, with 100,000-ohm resistor connected in series with negative lead.

Section 3 TROUBLE SHOOTING

AM CIRCUITS

For the following tests use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress the BC push button, set the volume control to maximum, and turn both tone controls counterclockwise.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for the FM circuits. If not, isolate and correct the trouble in this section.

Since the circuit location of test point A for this section is the same as that of test point D for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION".

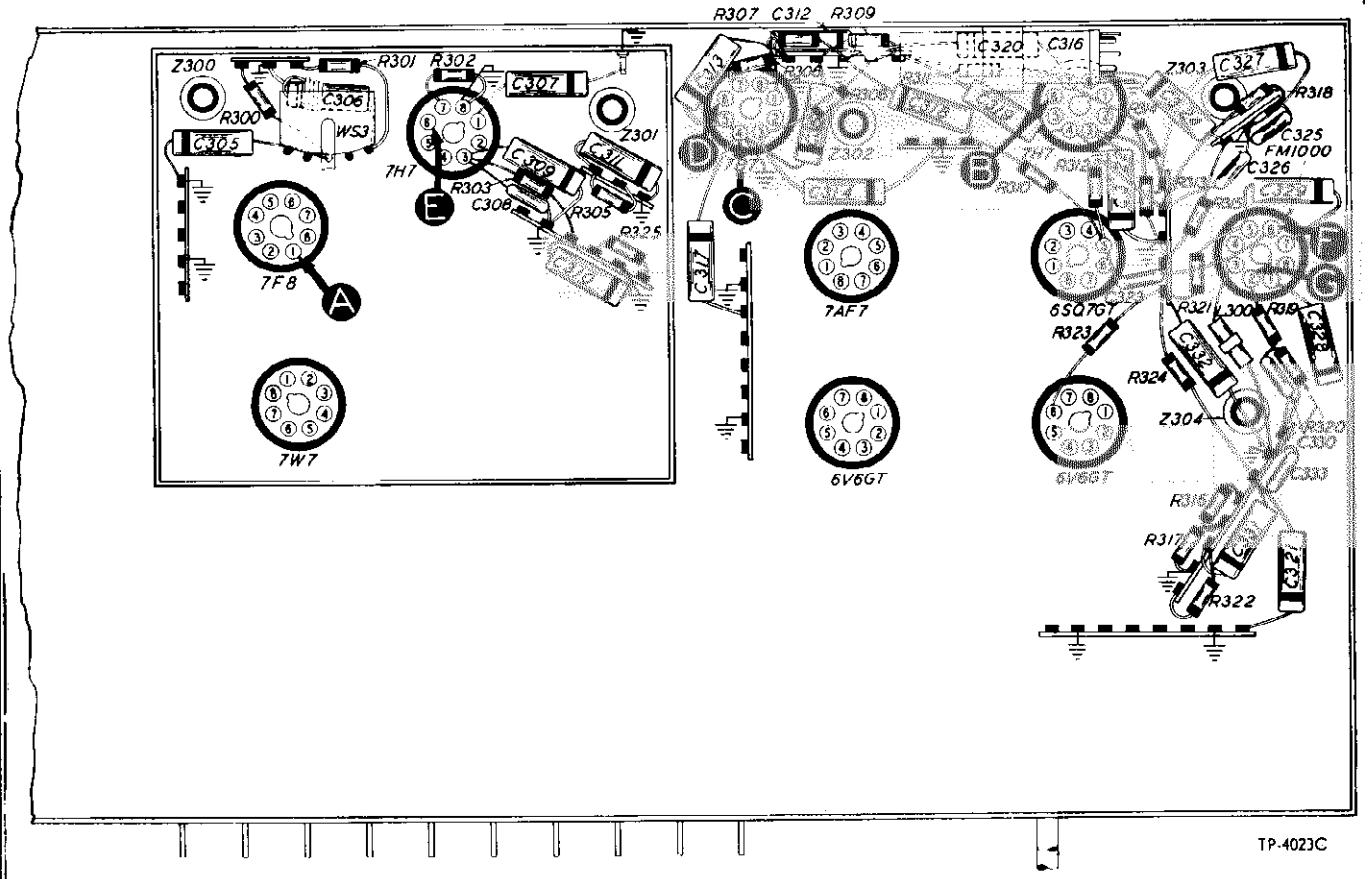


Figure 4. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7H7, 6SQ7GT (diode section), PB1, PB9. Open: R311, R313, R315, R316, R318, C321. Shorted: C320, C322, C324, C325, C326. Defective or misaligned: Z303.
3	D	Loud, clear signal with moderate signal input.	Defective: 7B7, PB1. Open: R305, R306, R307, R308, R309. Shorted: C312, C313, C314, C315, C403*. Defective or misaligned: Z302.
4	E	Loud, clear signal with weak signal input.	Defective: 7H7. Open: R301, R302, R303, R325. Shorted: C306, C307, C308, C309, C310. Defective or misaligned: Z301.
5	A	Loud, clear signal with much weaker signal input.	Defective: 7F8*, WS3(R). Open: R300, R410*. Shorted: C305. Defective or misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 3 (Cont.) TROUBLE SHOOTING

FM CIRCUITS (FM DETECTOR)

The tests in this circuit are made with an audio signal generator, an AM r-f signal generator, and a 20,000-ohms-per-volt meter. Connect a .1-mf. condenser in series with the output lead of each generator.

In step 1, unmodulated r-f signals together with d-c voltage readings are used to check the response of the detector circuit to FM, by observing the voltage drops across the audio-load resistor R324 for different input frequencies within the i-f range of the detector. In step 3, the oscillator section of the detector is made inoperative, thereby converting the circuit to an AM detector and making it possible to check certain components with an AM signal. The tests in this section will not indicate the condition of alignment of the detector unless the circuit is extremely misaligned.

NOTE: In steps 1 and 3, the output of the AM signal generator must be at least .5 volt. If the output is insufficient, the generator lead may be connected t test point B or D in this section, depending upon th maximum output of the generator used. When usin these test points, it is assumed that the last two i- stages are trouble-free. These two i-f stages may be a fault, however, if abnormal indications are obtained i BOTH steps. If doubtful, refer to steps 2 and 3 in th chart for "FM CIRCUITS (I-F Amplifier)" and chec the components listed under "POSSIBLE CAUSE O ABNORMAL INDICATION".

Set the radio volume control to maximum. Turn bot tone controls counterclockwise, and depress the FM push button.

If the "NORMAL INDICATION" is obtained in th first step, proceed with the tests for "FM CIRCUIT (I-F Amplifier)." If not, isolate and remedy the trouble in the FM detector.

STEP	PROCEDURE	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	Connect d-c voltmeter across resistor R324 (positive lead to junction of R324 and R323; negative lead to junction of R324 and C331), with meter on 50-volt range. Connect r-f-generator output to test point F. Turn off modulation and adjust generator output to approximately .5 volt. Swing generator frequency from approximately 80 kc. above to 80 kc. below 9.1 mc.	Approximately 15 to 30 volts across R324 for 9.1-mc. signal or no signal; a swing of approximately ± 12 to 20 volts for a deviation of ± 80 kc.	Trouble in FM detector. Isolate by the following tests.
2	Connect audio signal generator to test point F; adjust for high generator output.	Loud, clear signal.	Defective: Z304, FM1000, PB1. Shorted: C332, C333. Open: C316B, C331, R322, R323, R324, L300.
3	Short test point G (pin 2 of FM1000) to chassis. Connect r-f-generator output to test point F. Use modulated signal. Set generator for maximum output at 9.1 mc.	Loud, clear signal	Defective: FM1000. Shorted: C316B, C332. Open: R323, R324, L300.
4	Remove short from test point G. Connect negative lead (prod end) of d-c voltmeter through 50,000-ohm resistor to test point G; connect positive lead to test point C. Set meter to 10-volt range.	Approximately 2.5 volts negative.	Defective: FM1000, Z304, L300. C330. Shorted: C329. Open: R320, R321.

FM CIRCUITS (I-F AMPLIFIER)

Follow the preliminary instructions for the AM circuits with these exceptions: Depress the FM push button, set the signal-generator frequency to 9.1 mc., and short test point G (pin 2 of FM1000) to the chassis (test point C), to permit the use of an AM signal.

The parts which were found to be satisfactory for AM, with the exception of those indicated in the chart, will usually operate satisfactorily for FM.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4. If not, isolate and correct the trouble in the FM i-f amplifier.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in FM i-f amplifier. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7H7. Shorted or open: C327. Defective or misaligned: Z303.
3	D	Loud, clear signal with moderate signal input.	Defective: 7B7. Defective or misaligned: Z302.
4	E	Loud, clear signal with weak signal input.	Defective: 7H7. Defective or misaligned: Z301.
5	A	Loud, clear signal with weak signal input.	Defective: 7F8, WS3(R). Defective or misaligned: Z300.

Section 4 TROUBLE SHOOTING

For the following tests, with the exception of the oscillator tests, use an r-f signal generator with modulated output. Connect the ground lead to the chassis (test point C); connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Adjust the generator to give a weak input signal.

Set the radio volume control to maximum, and turn both tone controls counterclockwise.

OSCILLATOR TESTS ("AM CIRCUITS" chart, steps 5, 8, and 10; "FM CIRCUITS" chart, step 2): Connect the positive lead of a high-resistance voltmeter to the oscillator cathode (pin 5) of the 7F8, test point E. Connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 8), test point F. Use a suitable meter range, such as 0—10 volts. Absence of negative voltage with any push button (PB8 through PB4 depressed, or for any dial position (push button PB1, PB2, or PB3 depressed), indicates the oscillator is not functioning.

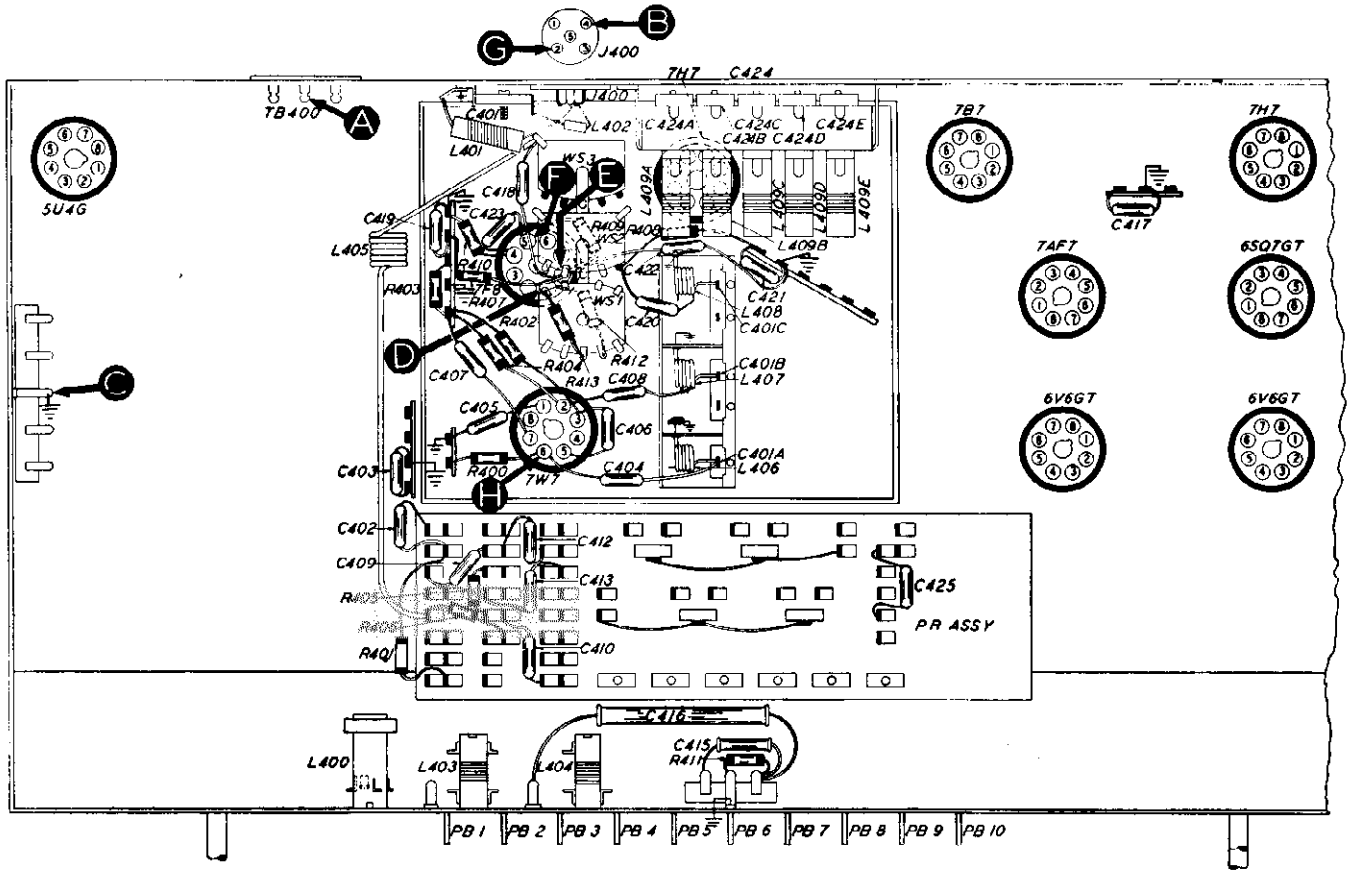

Figure 5. Bottom View, Showing Section 4 Test Points

AM CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQUENCY	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Adjust to frequency of each push-button in sequence.	Depress, in sequence, PB8 through PB4.	Loud, clear signal when each push button is depressed.	Trouble in circuits associated with push-button station selectors. Isolate by tests in steps 4, 5, and 6.
2	A	1000 kc.	Depress BC push button (PB3). Tune in signal with tuning control.	Loud, clear signal.	Trouble in circuits associated with dial tuning (BC band). Isolate by tests in steps 7 and 8.
3	B	12 mc.	Depress SW push button (PB2). Tune in signal with tuning control.	Loud, clear signal.	Trouble in circuits associated with dial tuning (SW band). Isolate by tests in steps 9 and 10.

Section 4 (Cont.) TROUBLE SHOOTING

STEP	TEST POINT	SIG. GEN. FREQUENCY	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
4	D	Adjust to frequency of push button	Depress PB6.	Loud, clear signal.	Defective: 7F8, WS1(F). Open: R41(C423.
5	E to F (Oscil-lator test)		Depress, in sequence, PB8 through PB4.	Negative voltage.	No voltage for any particular pus button—Defective: Coil (L409A throug L409E) or push button. No voltage fo all push buttons—Defective: 7F WS2(F), PB2, PB3, C416. Open: R406 R407, R409, R411, C400, C411B, C41 C418, L404, L405, WS2(F), WS2(R).
6	A	Adjust to frequency of each push button in sequence.	Depress, in sequence, PB8 through PB4.	Loud, clear signal when each push button is depress-ed.	Defective: TB400, L400, C411C, C424 through C424E. Open: R412, R413 C413, PB2, PB3, WS1(F), WS2(F).
7	A	1000 kc.	Depress BC push but-ton (PB3). Tune in signal with tuning control.	Loud, clear signal.	Defective: C400, PB3.
8	E to F (Oscil-lator test)		Depress BC push but-ton (PB3). Rotate tun-ing control through range.	Negative voltage.	Defective: L404.
9	B	12 mc.	Depress SW push button (PB2). Tune in signal with tuning control.	Loud, clear signal.	Defective: J400, L401, L402, C401, C412.
10	E to F (Oscil-lator test)		Depress SW push button (PB2). Rotate tuning control through range.	Negative voltage.	Defective: 7F8, L403, C409, C411A, C410.

FM CIRCUITS

Before proceeding with the tests for the FM circuits, connect test point G in Section 3 to the chassis.

STEP	TEST POINT	SIG. GEN. FREQUENCY	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	G	100 mc.	Depress FM push but-ton (PB1). Tune in signal with tuning control.	Loud, clear signal.	Trouble in FM circuits. Isolate by the following tests.
2	E to F (Oscil-lator test)		Depress FM push but-ton. Rotate tuning control through range.	Negative voltage.	Defective: 7F8, L408, C400, C400C, PB1, WS2(F). Open R408. Shorted: C421.
3	H	100 mc.	Depress FM push but-ton (PB1). Tune in signal with tuning control.	Loud, clear signal.	Defective: 7W7. Open: R400, R402, R403, R404, C408. Shorted: C400, C400B, C405, C406, C407, WS2(F).
4	G	100 mc.	Same as step 3.	Loud, clear signal.	Defective: J400, L406, C400A, C404.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer with a pencil.

The method of measuring for these points is illustrated in figure 1. Hold a rule against the dial backplate, with the start of the rule against the inside of the upturned edge of the backplate.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

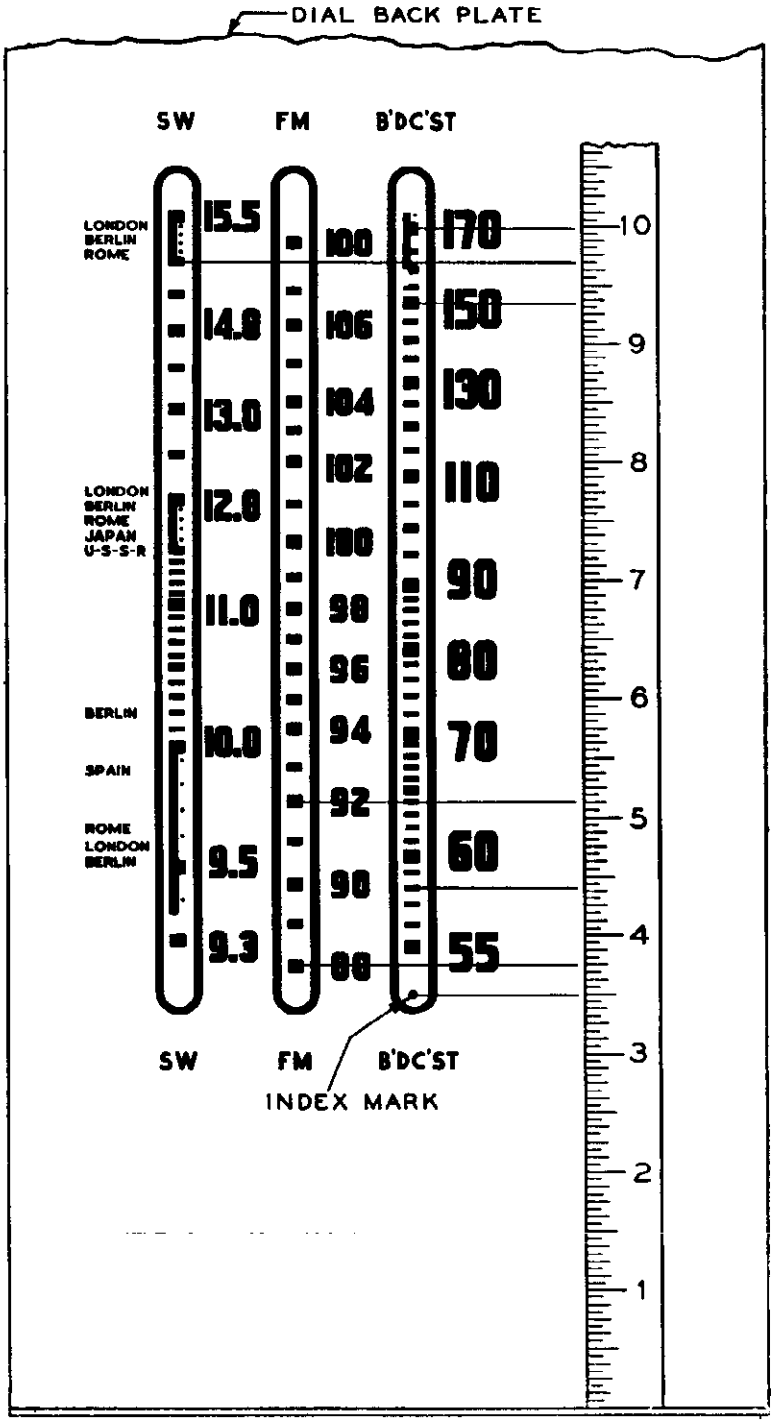

Figure 1. Calibration Measurements for Dial Backplate

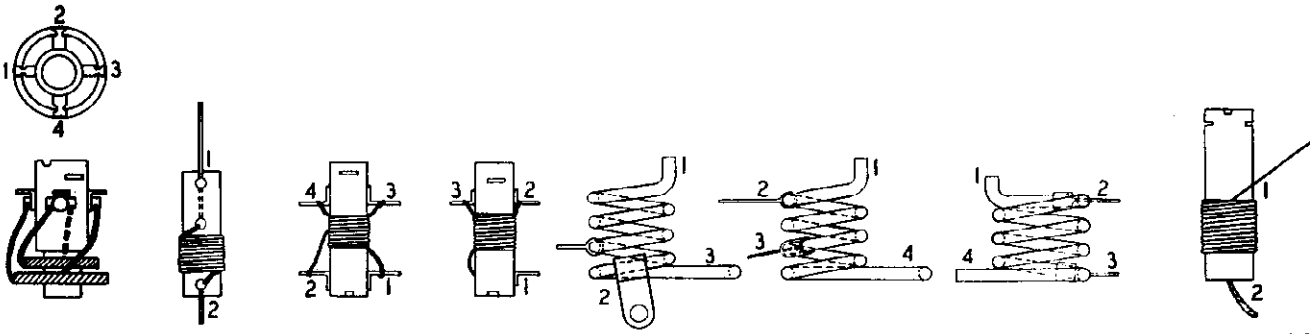
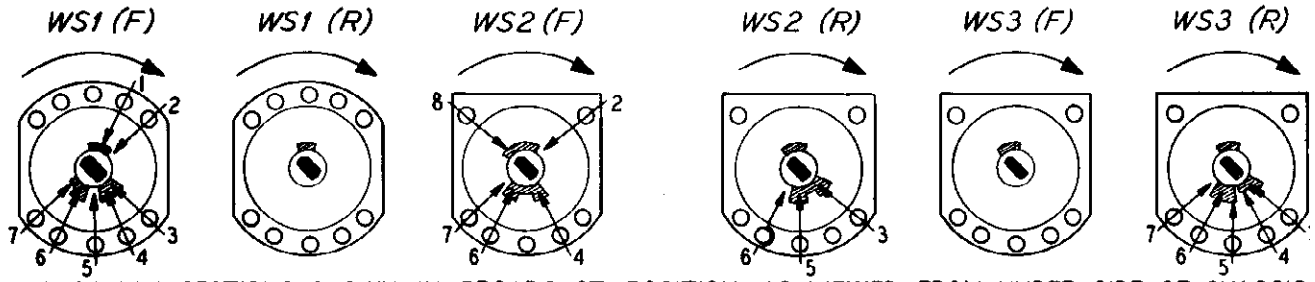
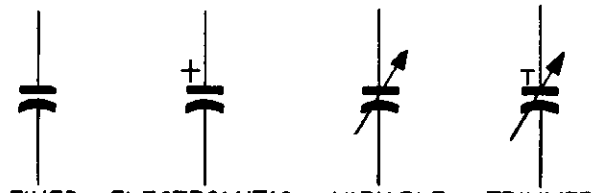
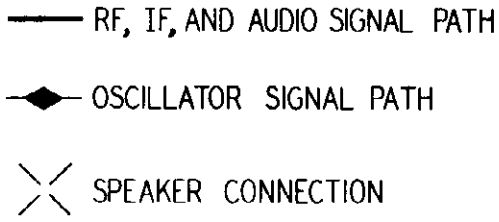




BAND-SWITCH SECTIONS SHOWN IN BROADCAST POSITION AS VIEWED FROM UNDER SIDE OF CHASSIS (F) INDICATES FRONT CONTACTS, LOOKING FROM FRONT. (R) INDICATES REAR CONTACTS, LOOKING THROUGH WAFER.

CONDENSER SYMBOLS





NOTE:

ALL PUSH BUTTONS EXCEPT PB8 ARE SHOWN IN OUT POSITION. ALL ROTARY SWITCHES ARE LINKED TO FM PUSH BUTTON.

ALL RESISTOR VALUES ARE IN OHMS UNLESS MARKED OTHERWISE.

VOLTAGES IN SECTION 1 AND IN AUDIO CIRCUITS OF SECTION 2 WERE TAKEN WITH BC PUSH BUTTON IN. VOLTAGES IN SCRATCH ELIMINATOR CIRCUITS OF SECTION 2 WERE TAKEN WITH PHONO PUSH BUTTON IN AND TREBLE CONTROL SET TO SCRATCH ELIMINATOR POSITION. VOLTAGES IN SECTIONS 3 AND 4 WERE TAKEN WITH FM PUSH BUTTON IN.

ALIGNMENT PROCEDURE

CAUTION: Do not turn on power with speaker disconnected, or the radio may be damaged.

ALIGNMENT OF AM CIRCUITS

When the complete AM and FM alignment is to be made, the AM alignment should be made FIRST; however, if FM alignment is not required, the AM alignment alone may be made.

OUTPUT METER—Connect between No. 3 terminal (voice-coil connection) of the aerial terminal panel and the chassis.

AM SIGNAL GENERATOR—Connect the ground lead to the chassis, and the output lead as indicated in the chart. Use modulated output.

OUTPUT LEVEL—During the alignment, the signal-generator output must be attenuated to maintain the radio output below 1.5 volts, as read on the output meter.

CONTROLS—Set the volume control to maximum, the bass tone control fully counterclockwise, the treble tone control fully clockwise, and the signal-generator dial, radio dial, and radio push buttons as indicated in the chart.

DIAL POINTER—With the tuning condenser fully meshed, the dial pointer must coincide with the index mark at the low-frequency end of the dial. See "CALIBRATING DIAL BACKPLATE" for method of measuring backplate for index and calibration marks.

ALIGNMENT OF FM CIRCUITS

Align the AM circuits first.

OUTPUT METER—Connect the output meter between terminal No. 3 of the aerial terminal panel and the chassis.

AM SIGNAL GENERATOR—Connect the generator ground lead to the radio chassis; connect the output lead through a .1-mf. condenser to the points specified in the chart. Use modulated output.

CONTROLS—Set the treble tone control and the volume control fully clockwise, and the bass tone control fully counterclockwise. Depress the FM push button.

LOCATION OF COILS—For the location of coils L406, L407, and L408 (steps 11 and 15), refer to the base layout of Secton 4, figure 5.

Note 1. When pin 2 of FM1000 is connected to the chassis, the oscillator portion of the FM detector is made inoperative, thereby converting the circuit from an FM to an AM detector.

Note 2. Make the loading network by connecting a 4700-ohm resistor and a .1-mf. condenser in series. Attach an alligator clip to each free end of the network. When this network is connected across the primary or secondary winding of an over-coupled i-f transformer, the network loads the circuit so that the transformer is effectively below critical coupling; the unloaded winding may then be correctly peaked at the intermediate frequency.

Note 3. The top of padder C303D can be reached only from the top of the shield can. Slide a length of flattened solder or wire down between the ceramic form and the edge of the trimmer plate. Attach the loading network between this connection and the chassis.

Note 4. It is essential that the output from the generator be kept below the point where the oscillator of the FM detector locks in, otherwise an erroneous zero beat will be obtained. When a single very sharp zero-beat point is obtained, the adjustment is correct.

Note 5. The use of a signal generator for steps 10 through 16 is recommended only if the available generator is sufficiently accurate to insure correct frequency settings. Otherwise, an alternate procedure employing FM broadcast-station signals in place of a signal generator is recommended. For the adjustments at the high-frequency end of the band, use the station nearest 105 mc.; for the adjustments at the low-frequency end of the band, use the station nearest 88 mc. or 92 mc., as indicated. If the radio is greatly misaligned, it may be necessary to adjust the padders and coils for maximum noise at each end of the band before station signals can be heard. The FM detector must be made inoperative as directed in step 10 of the "FM ALIGNMENT CHART."

Note 6. Check all coil adjustments with a tuning wand. If inserting the brass end in or near the coil increases the output-meter reading, spread the turns; if the powdered-iron end increases the output reading, compress the turns. If both ends cause a decrease in output, the coil is correctly tuned. Do not change the coils excessively, since only a small adjustment is required at these frequencies.

Note 7. Make two simple dipole aerials to feed signals from the signal generator to the radio. Each dipole aerial may consist of two 30-inch lengths of rubber-covered wire. Connect one dipole aerial to terminals 1 and 2 on the FM aerial socket of the radio. Connect the other dipole aerial to the output of the signal generator. Place the two dipoles several feet apart.

16	Repeat steps 13, 14, and 15 until no further improvement in sensitivity can be obtained.			

SETTING PUSH BUTTONS

1. Connect the output meter between terminal No. 3 on the aerial terminal panel and the chassis.

2. Turn the volume control to maximum, and both tone controls fully counterclockwise.

3. Couple the signal generator loosely t a coil of wire to the loop aerial (se under "AM ALIGNMENT CHART")

4. Turn on the power, and allow the r warm up for 15 minutes before start adjustments.

5. Starting with the lowest frequency desired, set the signal generator to the desired frequency (modulation on), push the station-selector push button, and adjust the associated oscillator tuning core and aerial trimmer condenser (marked on rear of chassis) for maximum indication on the output meter. During alignment, the input signal must be attenuated to hold the output-meter reading below 1.5 volts.

6. Reset the signal-generator frequency, and repeat the procedure for each remaining station-selector push button.

7. Turn off the signal generator, and make a final adjustment of all tuning cores and trimmer condensers while listening to the stations for which the adjustments are being made.

REPLACEMENT PARTS LIST

NOTE

Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

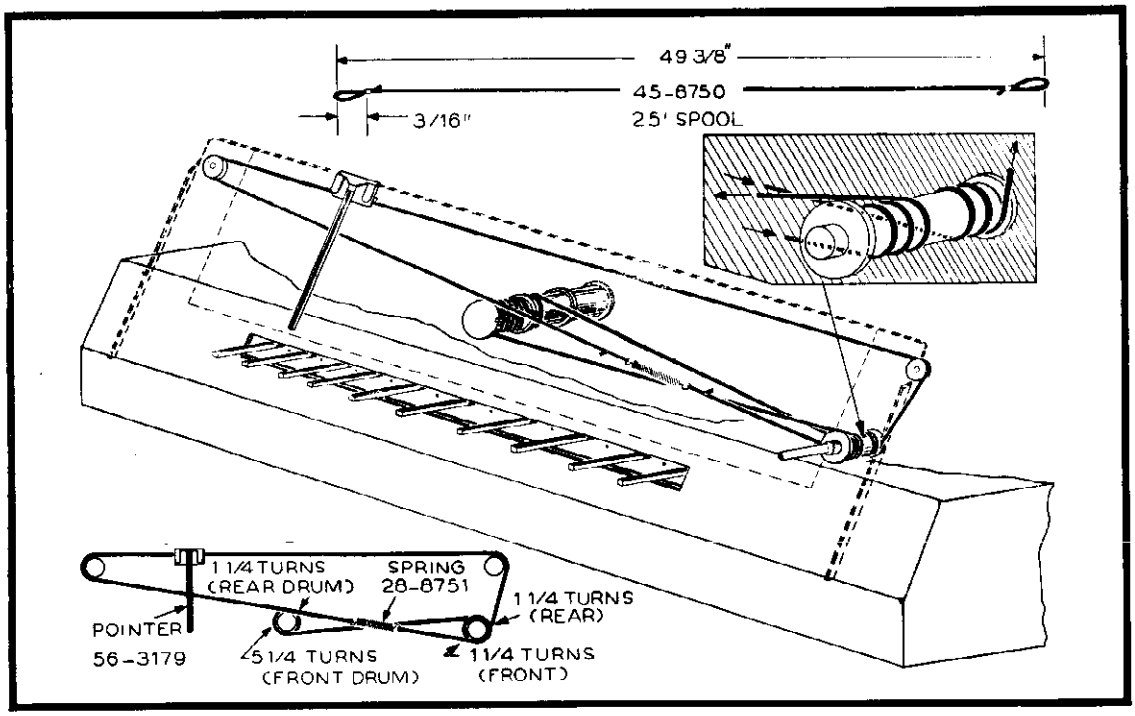

Figure 6. Drive-Cord Installation Details

Circuit Description

Philco Radio-Phonograph Model 48-1286 contains an 11-tube superheterodyne and a Model D-10 Philco Automatic Record Changer.

A low-impedance loop aerial within the cabinet normally provides adequate signal pickup on the standard broadcast band. In most locations, the built-in FM dipole aerial provides satisfactory FM reception. In areas where FM signals are weak, an outdoor dipole aerial (Philco Part No. 45-1462) will provide additional pickup. To increase the pickup on both bands, use the Philco Aerial Coupler, Part No. 76-2353, with the outdoor dipole aerial. For increased pickup on the standard broadcast band only, the coupler may be used with an external aerial of the single-wire type, such as Philco Part No. 45-1494. Information on aerial and coupler connections is given in the external aerial bulletin PR-1200.

The r-f stage (FM only) and converter stage are mounted on a separate chassis, for improved performance at high frequencies. A 6AU6 high-frequency pentode is used in the r-f stage, and a 7F8 high-frequency double triode is employed as a converter.

Two transformer-coupled i-f stages are used. The transformers have two sets of windings; one set is tuned to 455 kc., for AM operation, and the other set is tuned to 9.1 mc., for FM operation. A 6BA6 high-frequency pentode is used in the first i-f stage. The pentode section of a 7R7 duo-diode, pentode functions as the second i-f amplifier; one diode of this tube is used for AM detection, while the other diode provides a.v.c.

The dual-diode section of a 7X7 is employed in the FM ratio-detector circuit; this circuit has good noise-reducing properties and an excellent tuning characteristic.

The triode section of the 7X7 functions as the first audio stage. A 6J5GT triode operates as a plate-and-cathode-loaded phase inverter, driving two 6K6GT output amplifiers, in push-pull operation. Tone fidelity is obtained by the use of inverse feedback in the audio system; feed-back voltage is taken from the secondary of the output transformer.

The Philco Electronic Scratch Eliminator, for phono operation, may be switched on or off, as required. The pentode section of a 7E7 functions as a variable shunt capacitance at the phono-input circuit; at low signal levels, a controlled portion of the higher audio frequencies is by-passed to ground. The grid bias of the reactance tube controls the effective capacitance, which becomes maximum with low bias, and minimum with high bias. This control bias is developed by the audio signal itself; a proportionate amount of the signal is taken from the pickup output, amplified by each triode section of the 7F7, and rectified by the diode section of the 7E7.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

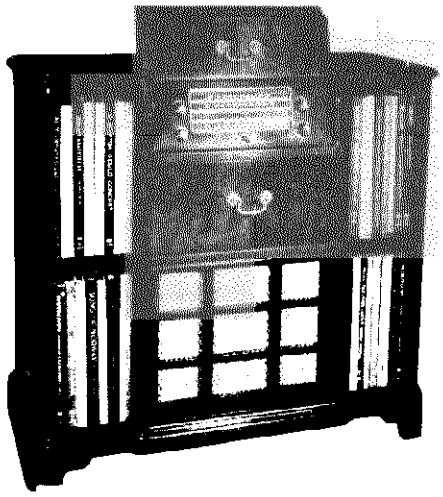
Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and indicated in the sectionalized schematic diagram. trouble-shooting procedure given for each section cludes a simplified test chart and a bottom view of chassis showing the locations of the test points and components of that section.

In each chart, the first step is a master check determining whether trouble exists in that sect without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" any given step indicates trouble within the circuit ur test.

After isolating the trouble to a single stage, the de is located by: first, testing the tube; second, measu tube electrode voltages; third, measuring circuit re ances; fourth, substituting condensers. The trouble vealed should be corrected before testing further.



SPECIFICATIONS

CABINET	Wood, mahogany finish
CIRCUIT	11-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1720 kc.
FM	88—108 mc.
AUDIO OUTPUT	6 watts
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c
POWER CONSUMPTION	
Radio	110 watts
Phonograph	125 watts
AERIALS	Built-in loop and FM cabine dipole; external aerial als may be used
INTERMEDIATE FREQUENCIES	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (11)	6AU6, 7F8, 6BA6, 7R7, 7X7 6J5GT, 6K6GT (2), 7E7 7F7, 5AZ4
PHONOGRAPH	Philco Automatic Record Changer, Model D-10

Section 1

TROUBLE SHOOTING

POWER SUPPLY

CAUTION: Do not turn on the power with the speaker disconnected, or the set may be damaged.

Make the tests for this section with a d-c voltmeter, connecting the leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, and the tone control fully counterclockwise. Set the band selector-phono switch to the broadcast position.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	195v		Trouble in this section. Isolate by the following tests.
2	B	300v	No voltage. Low voltage. High voltage.	Defective: 5AZ4. Open: S100, T100. Shorted: C102. Defective: 5AZ4. Shorted: C103B, C310*, C411*. Leaky: C102. Open: C102, L100. Shorted: L100. Open: T200*.
3	A	195v	No voltage. Low voltage. High voltage.	Open: R100. Shorted: C103A, C311*. Leaky: C103A, C311*. Changed resistance: R100. Open: T200*.
4	D	Negative 27v	No voltage. High voltage.	Open: R101. Open: R102.
Listening Test: Abnormal hum and instability may be caused by open C103A or C103B.				

* This part, located in another section, may cause abnormal indication in this section.

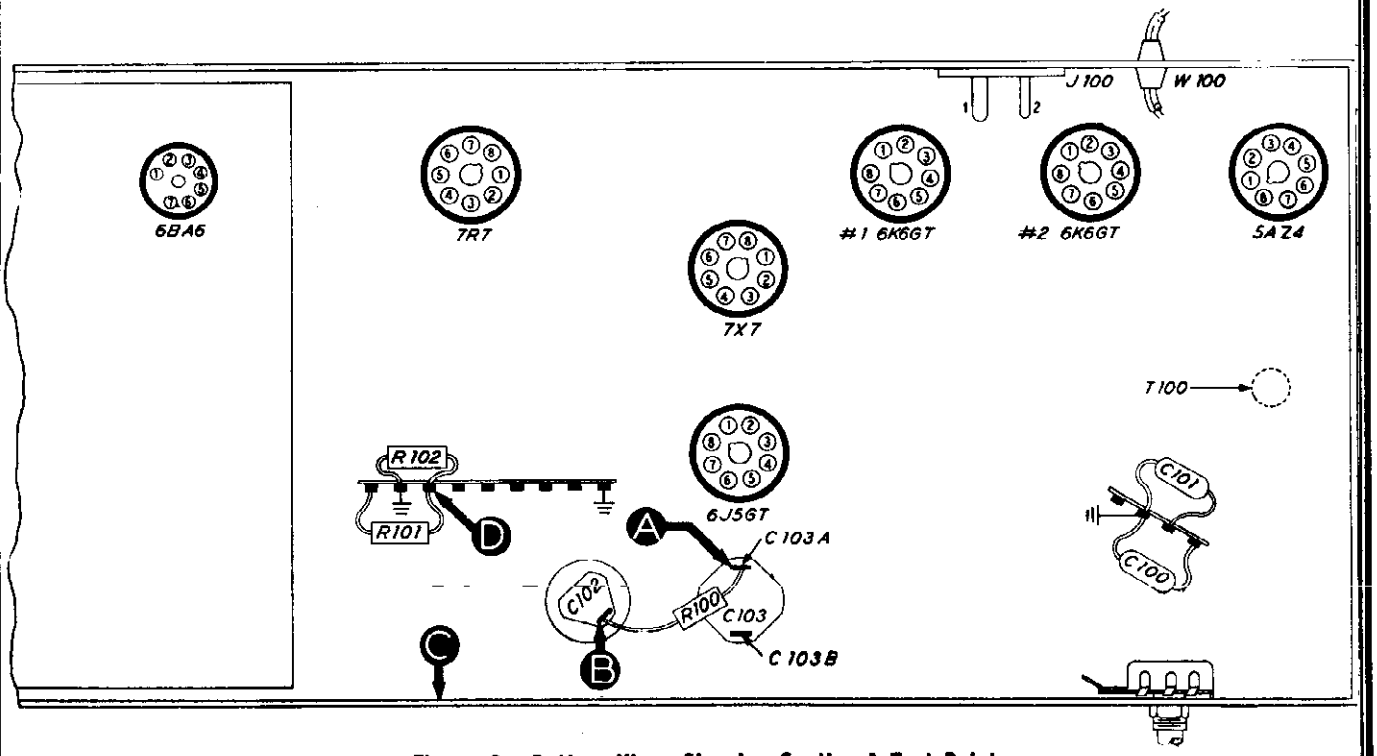


Figure 2. Bottom View, Showing Section 1 Test Points

Section 2

TROUBLE SHOOTING

AUDIO-AMPLIFIER TESTS

AUDIO CIRCUITS

Use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Set the band (wafer) switch to the broadcast position. Make certain th the scratch-eliminator switch is turned off (two-positic switch turned counterclockwise). If the "NORMA INDICATION" is obtained in steps 1 and 6, proce with the scratch-eliminator tests; if not, isolate ar correct the trouble in the audio-amplifier circuits.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in audio-amplifier circuits. Isolate by the following tests.
2	B (Remove 6J5GT)	Clear signal with strong signal input.	Defective: 6K6GT(#1), LS200. Open: C206, R211, T200. Shorted or leaky: C206, C209.
3	D (6J5GT removed)	Same as step 2.	Defective: 6K6GT(#2). Open: C207, R212. Shorted or leaky: C207.
4	E (Replace 6J5GT)	Loud, clear signal with moderate signal input.	Defective: 6J5GT. Open: R208, R209, R207, R210. Shorted or leaky: C205, C204.
5	A	Same as step 1.	Defective: 7X7. Open: R200 (rotate through range), C202, R205, R206. Shorted: C203.
6*	F	Loud, clear signal with weak signal input.	Open: R230, WS-2(R).
Listening Test: Distortion may be caused by leaky C202, C205, C206, or C207; or by open R205, C207, C211, or C212.			

*For this step, set band (wafer) switch to phono.

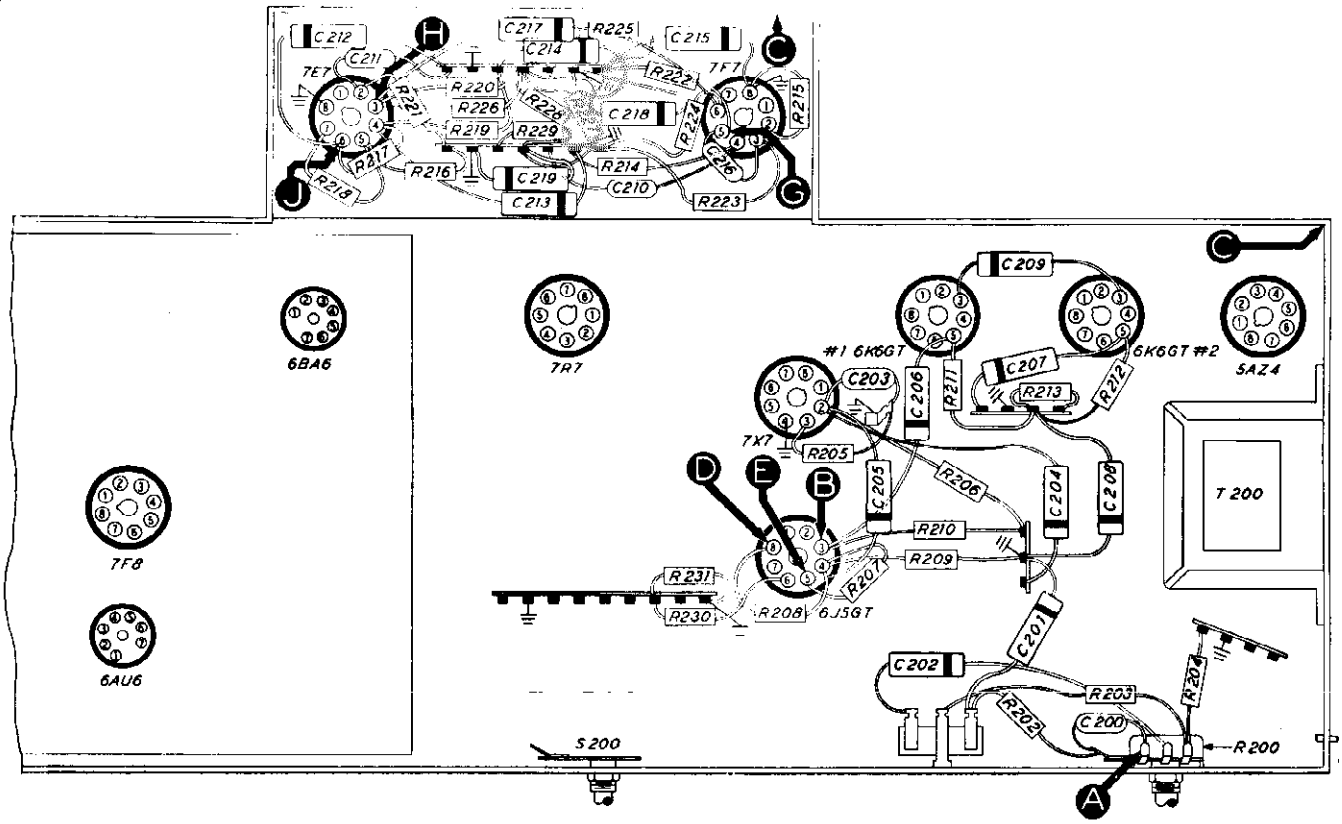

Figure 3. Bottom View, Showing Section 2 Test Points

TP-5328B

Section 2 (Cont.)

TROUBLE SHOOTING

SCRATCH-ELIMINATOR TESTS

Set the tone control fully counterclockwise. Turn the band (wafer) switch to the phono position. For all steps except 1(b), set the volume control to maximum; for this step, adjust the volume control as directed in the chart.

Turn the scratch eliminator on or off as indicated in the chart. (The scratch eliminator is on when the two-position switch is turned clockwise.)

Connect an output meter across the *primary* of the output transformer, T200.

IMPORTANT! For all steps except step 4, use the 0—10-volt output-meter range; for step 4 only, use the 0—50-volt range. If the proper ranges are not used, erroneous readings will result.

Connect the ground lead of an audio signal generator to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator for 5000 cycles. Adjust the generator output as directed in the chart.

If normal operation is indicated by the tests in step 1, (a) and (b), proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in the scratch-eliminator circuits.

NOTE: For steps 2, 3, and 4, connect the positive lead of a 20,000-ohms-per-volt, d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the "VOLTMETER" test points indicated in the chart.

STEP	TEST POINT	SIG. GEN. OUTPUT	VOLT-METER	SPECIAL INSTRUCTIONS	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	F	Adjust for 10v output-meter reading, with scratch-eliminator off.		Turn scratch eliminator on; output voltage should drop to 6.5v (approx.).	
1(b)	F	Same as for 1(a).		Reduce volume control to obtain output-meter reading of 1v. Increase generator output for output-meter reading of 10v. Turn scratch eliminator on; output voltage should not drop below 8.8v (approx.).	Trouble in scratch-eliminator circuits. Isolate by the following tests.
2	G	See SPECIAL INSTRUCTIONS.	H	With scratch eliminator on, increase generator output for voltmeter reading of 8.8v, negative; failure to obtain this value indicates trouble.	Defective: 7F7, 7E7 (diode section), WS-3(R). Open R224, R222, R226, R228, C217, S200.
3	G	Same setting which produced 8.8v reading in step 2, with scratch eliminator on.	J	With scratch eliminator on, voltage at point J should be 2v, negative.	Open: R220, R219, R217. Shorted: C213, C214, C212.
4	F	Same as step 2.	H	With scratch eliminator on, voltage at point H should be approx. 28v, negative.	Defective: 7F7. Open: C210, C216, R214, R215, R223. Shorted or leaky: C216.
5	F	Adjust for 10v output-meter reading, with scratch-eliminator off.		Turn scratch eliminator on; output voltage should drop to 6.5v (approx.).	Defective: 7E7 (pentode section). Open: R221, R216, R218, C211, C212. Shorted: C211, C212.

Section 3

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM CIRCUITS

Use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully counterclockwise. Set the band (wafer) switch to the broadcast position. Turn the tuning condensers to full-mesh position.

If the "NORMAL INDICATION" is obtained i step 1, proceed with the tests for the FM circuits, the tests for Section 4 (r-f and converter circuits); not, isolate and correct the trouble in the AM circuit

Since the circuit location of test point A for th section is in Section 4, the effectiveness of step 1 as master check is dependent upon the condition of certai parts in Section 4; these parts are listed below und "POSSIBLE CAUSE OF ABNORMAL INDICATION.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7R7. Open: R309, R310, R312, L302A, L302C, L302D, R313, R314, R316, C325, C317, WS-3(R). Shorted: C317, C318, C321, C322, C323, C324, C320, C302B. Misaligned: Z302.
3	D	Loud, clear signal with moderate signal input.	Defective: 6BA6. Open: R302, R305, C308, R306, L301A, L301B, L301C, L301D, C301A, C301C, C301D. Shorted: C308, C301C, C301D, C309, C313, L301C, L301D, C300D. Misaligned: Z301.
4	A	Loud, clear signal with weak signal input.	Defective: 7F8*. Open: R406*, R405*, L406*, C300C, L300C, L300D, C300D, R300, WS-4(R), WS-4(F). Shorted: C300C, L300C, C303, C304, L300D. Misaligned: Z300.

*This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

These tests are also made with an AM r-f signal generator, using modulated output.

Set the band (wafer) switch to the FM position, and follow the instructions preliminary to the tests for the AM circuits, with these exceptions: set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector ope ation is the ability of this circuit to take the alignmer properly (see page 14).

If the "NORMAL INDICATION" is obtained i step 1, proceed with the tests for Section 4 (r-f an converter circuits); if not, isolate and correct the troubl in the FM circuits.

Section 3 (Cont.) TROUBLE SHOOTING

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in FM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Open: L302B, C302A, C328, C329, R315, R318, C325, R317, WS-3(R). Shorted: L302A, C319, C302A, C328, L302E, C329, C330, C331, C332, C337.
3	D	Loud, clear signal with moderate signal input.	Defective: 6BA6. Open: R302, R305, C308, R306, L301A, L301B, L301C, L301D, C301A, C301C, C301D. Shorted: C308, C301C, C301D, C309, C313, L301C, L301D, C300D. Misaligned: Z301.
4	A	Loud, clear signal with weak signal input.	Open: WS-4(R), WS-4(F).

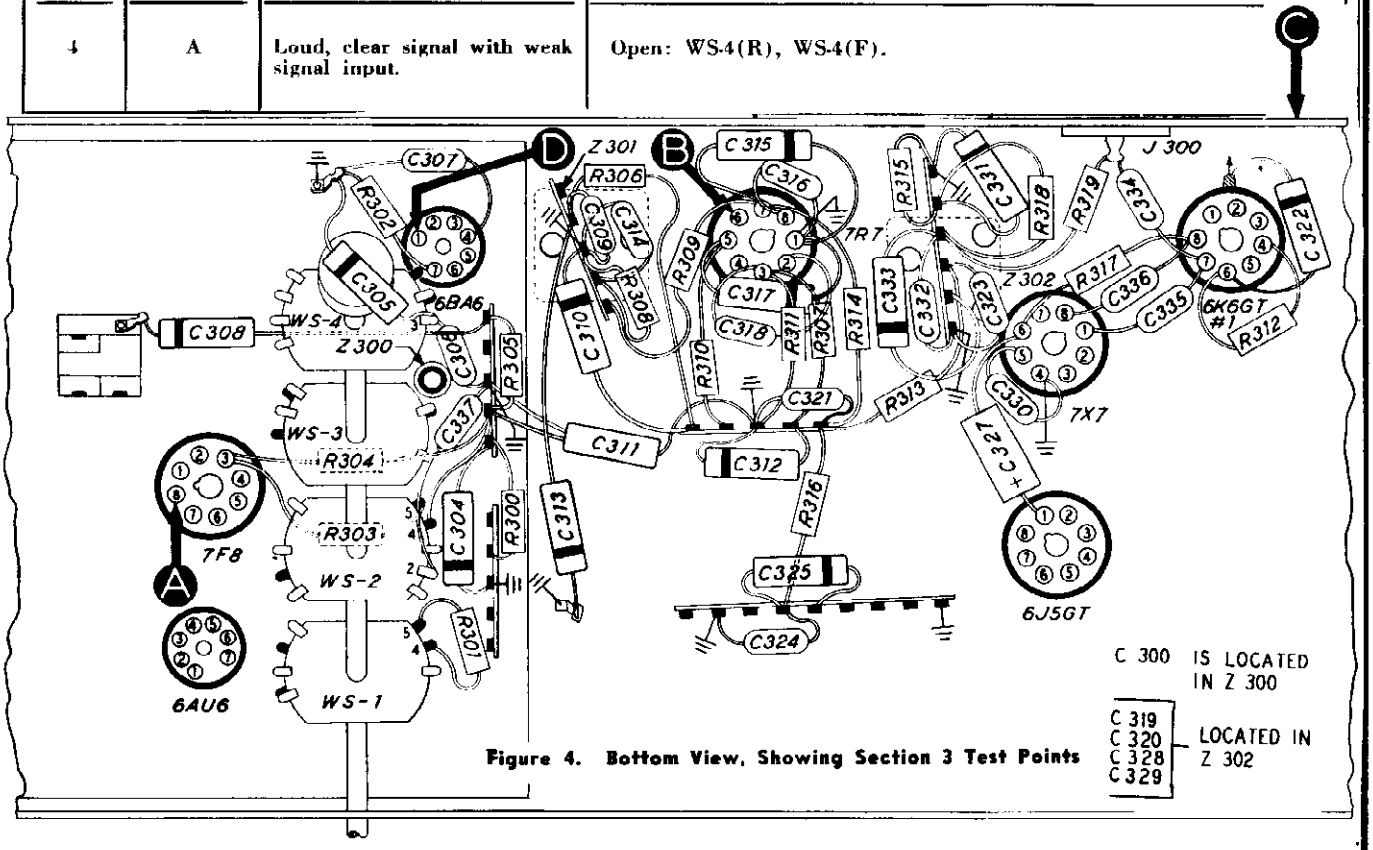

Figure 4. Bottom View, Showing Section 3 Test Points

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power:

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance across condenser C102 (see figure 2). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 3500 ohms, check condensers C102 and C103B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical locations as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

Section 4

TROUBLE SHOOTING

For the following tests, with the exception of the oscillator tests, use an AM r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C, and connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the tone control fully counterclockwise.

Set the band (wafer) switch, tuning control, and signal-generator frequency as indicated in the chart.

OSCILLATOR TESTS (AM AND FM CIRCUITS): Connect the positive lead of a high-resistance d-c vo meter to the chassis, and connect the negative le through a 100,000-ohm isolating resistor to the 7 oscillator grid (pin 1), test point B. Use a suitab range, such as 0—10 volts. Proper operation of t oscillator is indicated by negative voltages of appro mately the values given in the chart (measured wi 20,000-ohms-per-volt meter), throughout the tunir range.

If the "NORMAL INDICATION" is not obtain in step 1 of both the AM and the FM test charts, isola the trouble by following the remaining steps.

AM CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Broadcast	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2 (Osc. test; see note above.)	B		Broadcast	Tune through range.	Negative 1.5v to 3.5v.	Defective: 7F8. Open: R304*, C405, C404B, C408, L404, R402, WS-2(F), WS-2(R), WS-1(F), WS-3(F), WS-3(R). Shorted: C405, C404A, C400E, C404B, C408.
3	A	1000 kc.	Broadcast	Tune to signal.	Loud, clear signal with weak signal input.	Open: LA400, R401, L402, C402, C413, WS-1(R) Shorted: L402, C400D, C403.

Listening Test: Distortion may be caused by open R401 or R307*.
Hum and instability may be caused by open C312* or R301*.

*This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

Observe the instructions preliminary to the tests for the AM circuits, with the following exception: After tuning the signal generator and the radio to 95 mc., detune one or the other until a satisfactory test signa is obtained.

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	D	95 mc.	FM	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in FM circuits. Isolate by the following tests.
2 (Osc. test; see note above.)	B		FM	Tune through range.	Negative 1v.	Defective: 7F8. Open: L403, WS-2(F), WS-2(R), WS-1(F), WS-3(F), WS-3(R). Shorted: L403, C400C, C400H.
3	D	95 mc.	FM	Tune to signal.	Loud, clear signal with weak signal input.	Defective: 6AU6. Open: L400, L405, R400, R403, R404, C409, L401, WS-1(R). Shorted: L400, C400A, C400F, C407, C409, C410, C411, L101, C400B, C400G.

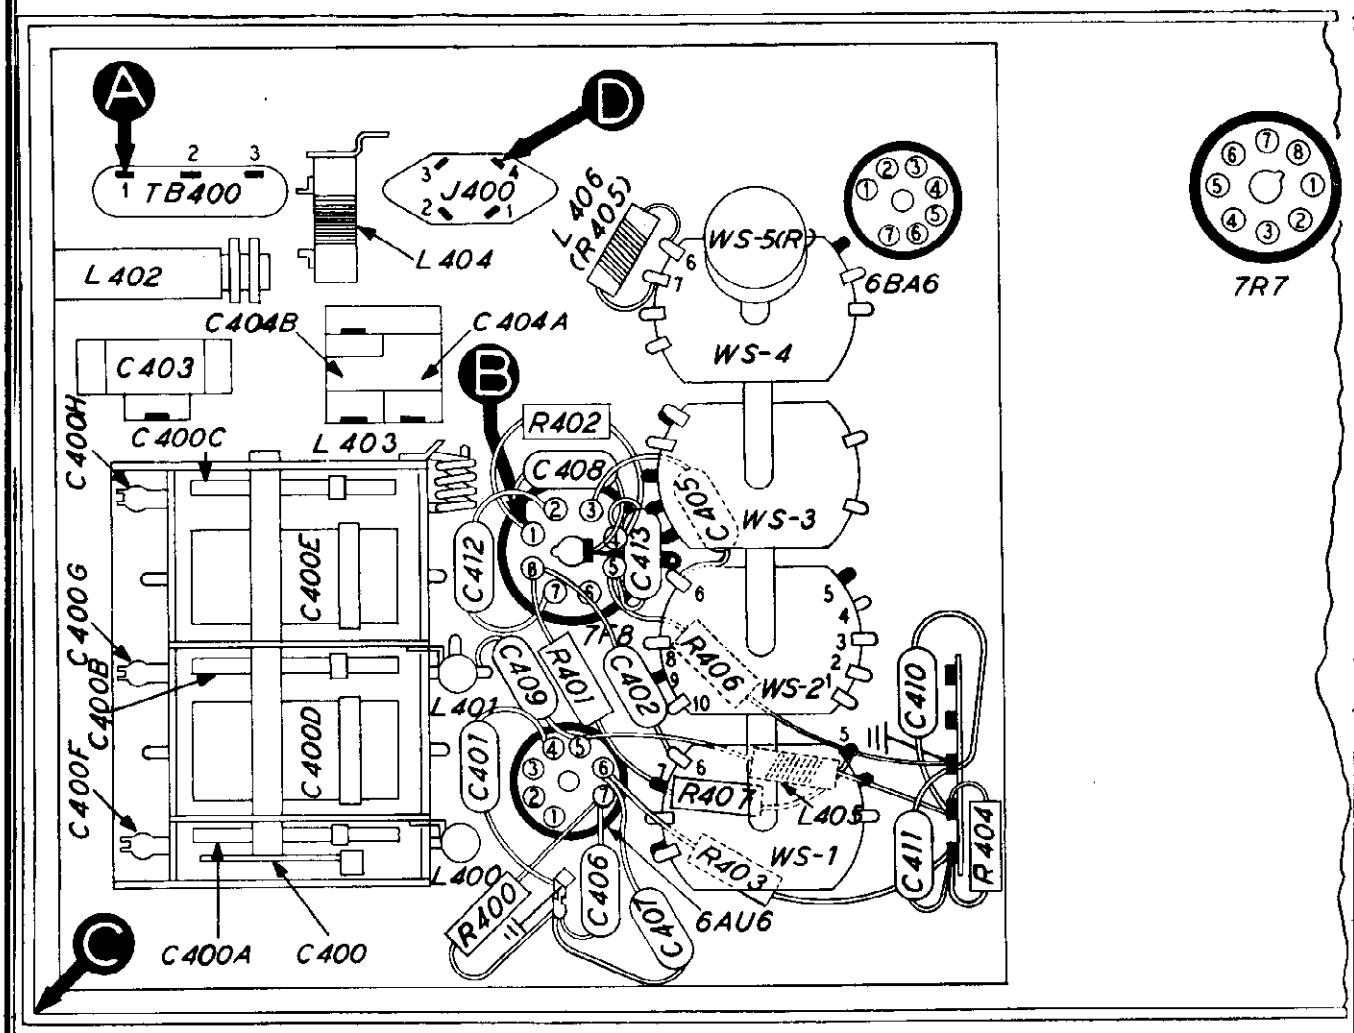

Figure 5. Bottom View, Showing Section 4 Test Points

TP-5328D

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial (chassis) backplate at the end of the pointer with a pencil. The method of measuring for these points is illustrated in figure 1.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

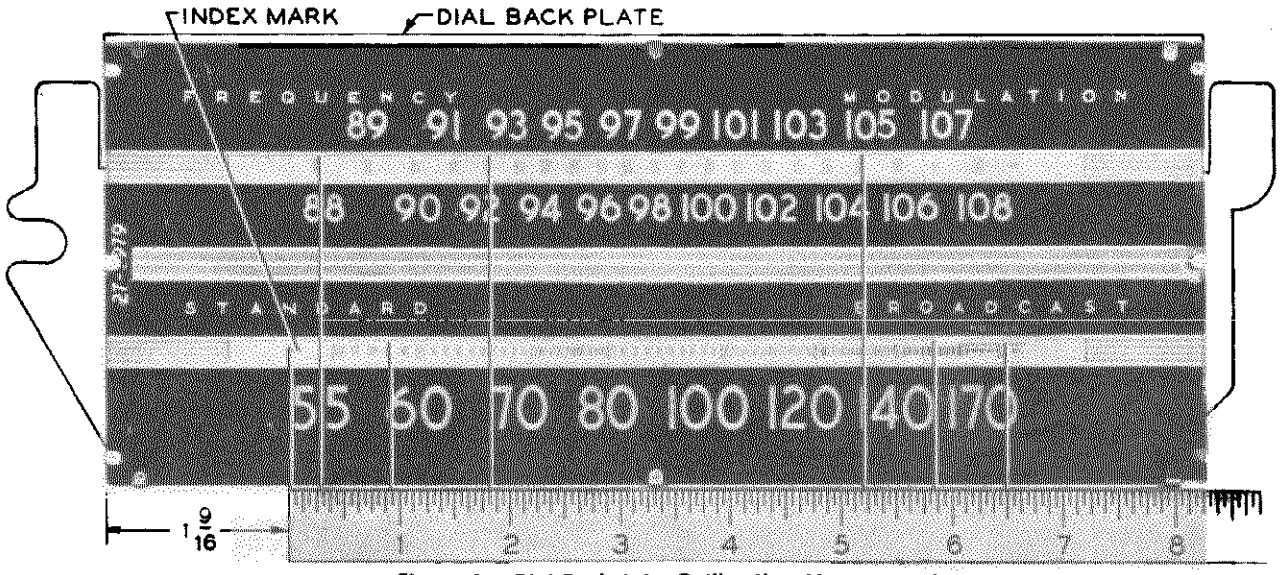

Figure 1. Dial-Backplate Calibration Measurements

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items. These numb may not be identical with those on factory assemblies; also, the electrical values of so replacement items may differ from the values indicated in the schematic diagram and pc list. The values substituted in any case are so chosen that the operation of the radio v be either unchanged or improved. When ordering replacements, use only the "Serv Part No."

ALIGNMENT PROCEDURE

When the complete AM and FM alignment is to be made, the AM alignment should be made FIRST; if A alignment is not required, the FM alignment alone may be made.

ALIGNMENT OF AM CIRCUITS

DIAL POINTER: With tuning condensers fully meshed, dial pointer must coincide with index mark at low-fr quency end of dial. (See "CALIBRATING DIAL BACKPLATE," page 2.)

OUTPUT METER: Connect between No. 3 terminal (voice-coil connection) of aerial terminal panel and chassi

AM R-F SIGNAL GENERATOR: Connect ground lead to chassis, and output lead as indicated in chart. U modulated output.

OUTPUT LEVEL: During alignment, signal-generator output must be attenuated to maintain radio output belo 1.5 volts, as read on output meter.

CONTROLS: Set band switch to broadcast position. Set volume control to maximum, and tone control ful counterclockwise. Set signal-generator frequency and radio tuning dial as indicated in chart.

ALIGNMENT OF FM CIRCUITS

Make AM alignment first.

OUTPUT METER: Connect as for AM alignment (this meter is used only in step 3).

D-C METER: Connect 20,000-ohms-per-volt meter across 2-mf. condenser, C327, in FM-detector circuit—negati lead to pin 6 of 7X7 tube, and positive lead to chassis. Use 10-volt range.

AM R-F SIGNAL GENERATOR: Use modulated output for entire alignment. Generator must have sufficier output to give reading of approximately 9 volts on d-c meter, and signal should be attenuated during alignmer to keep meter at this value. Connect generator ground lead to chassis, and output lead as indicated in chart.

VOLUME AND TONE CONTROLS: Same as for AM alignment.

RADIO BAND SWITCH, RADIO DIAL, AND SIGNAL-GENERATOR DIAL: Set as indicated in chart. Allo radio and generator to warm up for 15 minutes before starting alignment.

R-F COIL NOTE: When making the tracking adjustments, the resonance of the circuits using coils L400, L40 and L403 may be checked with a powdered-iron tuning core, such as Part No. 56-6100. If the signal strengt (meter reading) increases when the iron end is placed in, or near, the coil, compress the turns slightly. If th threaded brass end causes an increase in signal strength, spread the turns. Do not compress or spread the turn excessively; only a small change is required at these frequencies.

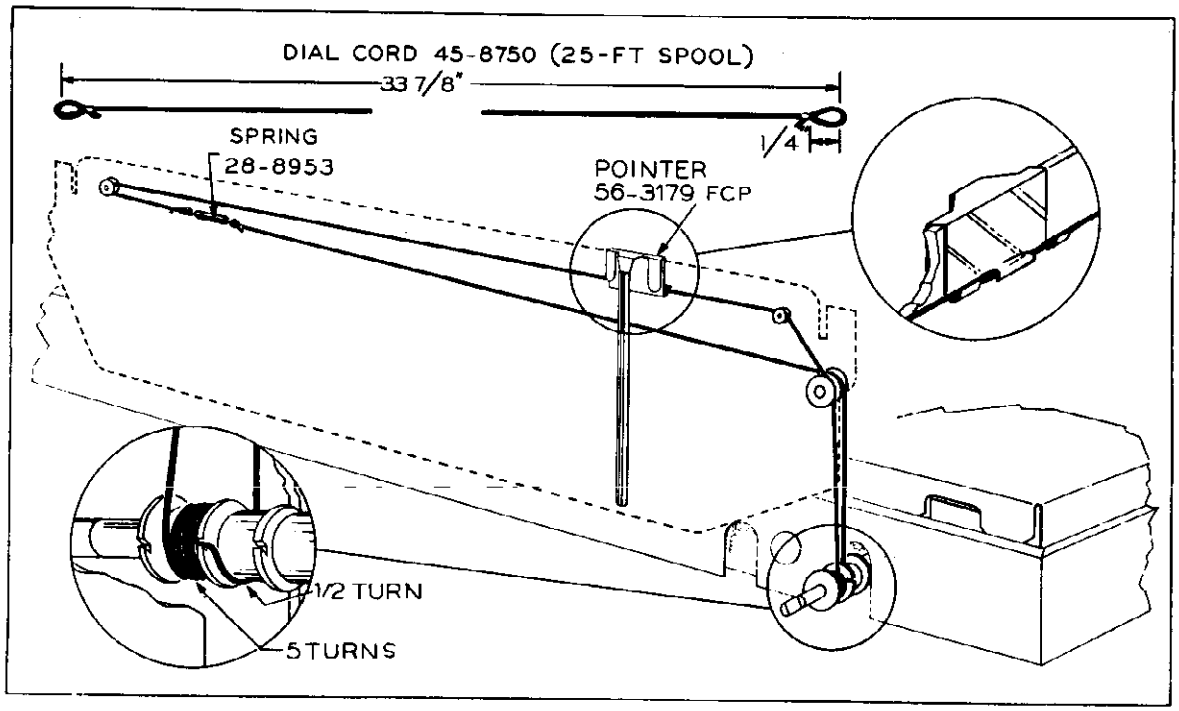

Figure 7. Drive-Cord Installation Details

TP-4058E

Circuit Description

Philco Radio-Phonograph Model 48-1290 contains a 13-tube superheterodyne and a Model D-10A Philco Automatic Record Changer.

A low-impedance loop within the cabinet normally provides adequate signal pickup for the standard-broadcast and short-wave bands. In most locations, the FM a-c line aerial provides satisfactory FM reception. In areas where FM signals are weak, an outdoor dipole aerial (Philco Part No. 45-1462) will provide additional pickup.

To increase the pickup on all three bands, use the Philco Aerial Coupler, Part No. 76-2353, with the outdoor dipole aerial. Information on aerial and coupler connections is given in the external aerial bulletin PR-1200.

The r-f stage (FM only), converter stage, and first i-f stage are mounted on a separate chassis to insure reliable performance at high frequencies. A 6AU6 high-frequency pentode is used in the r-f stage, and a 7F8 high-frequency double triode is employed as a converter

Three transformer-coupled i-f stages are used. The first, third, and fourth i-f transformers have two sets of windings; one set is tuned to 455 kc. for AM operation, and the other to 9.1 mc. for FM operation. The second i-f transformer, having a single primary winding tuned to 9.1 mc., one secondary winding tuned to 9.1 mc., and another secondary winding tuned to 455 kc., provides untuned primary for AM operation, to prevent instability. All transformers provide tuned-primary, tuned-secondary coupling on FM, to supply the additional gain needed at 9.1 mc. Switching of the windings, to attenuate undesired beat frequencies, is necessary only in the first i-f transformer; the large difference between the two intermediate frequencies makes further switching unnecessary. One 7A7 and two 6BA6 high-transconductance pentodes are used in the i-f stages. The wide-band response required for FM reception is obtained by "over-coupled" FM windings in the i-f transformers.

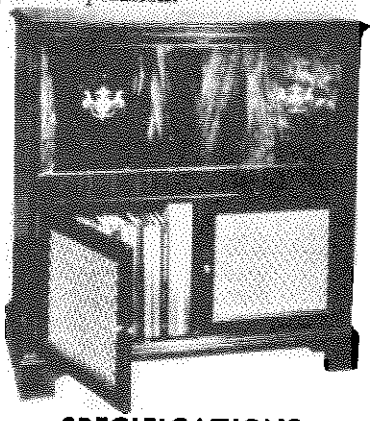
The new Philco advanced FM detector circuit, employing the FM1000 tube of special design, is used for FM reception. This circuit has excellent tuning characteristics, and inherently rejects AM and noise. Very briefly, the circuit functions as follows: The first and second grids (pins 2 and 5) of the FM1000 are used as grid and anode, respectively, of a modified Colpitts oscillator, which normally operates at the intermediate frequency of 9.1 mc. The output of the i-f amplifier stages is fed into the injection grid (pin 6). The reactive coupling between the plate and oscillator circuits causes the oscillator to lock in and follow the frequency variations of the i-f signal. As the oscillator frequency increases, the plate current through R324 decreases, and as the oscillator frequency decreases, the plate current increases. This variation is linear with respect to frequency deviation; the plate current, therefore, produces the same wave shape as the voltage that frequency-modulated the carrier. This audio signal is fed to the audio amplifier through the decoupling network, C331 and R322.

The high-mu-triode section of a 6SQ7GT is used in the first audio stage, and is biased from the bleeder in the negative return of the power supply. The first audio stage is resistance-coupled to one triode section of a 7AF7 twin triode. This section functions as a cathode-and-plate-loaded phase inverter, and is resistance-coupled to the audio output stage, which employs two 6V6GT beam pentodes in push-pull combination. The output tubes are transformer-coupled to a twelve-inch electrodynamic speaker, and are biased from the bleeder circuit connected across the speaker field in the negative return of the power supply. Inverse feedback is obtained by connecting the secondary of the output transformer, through the resistor network, R204 and R203, to the volume control. The second triode section of the 7AF7 tube is used as the phonograph preamplifier stage, and is self-biased by cathode resistor R213.

The Philco Electronic Scratch Eliminator, which is used in phono operation, reduces the high-frequency surface noise during the low-volume passages of a record, and permits maximum treble response during the high-volume passages. The circuit employs a 7F7 double triode as a two-stage audio amplifier and a 7E7 diode, pentode as a half-wave rectifier and reactance tube. The latter functions as a variable capacitance (across the output circuit of the phono preamplifier), which shunts a controlled portion of the higher audio frequencies to ground. The bias on the grid of the reactance tube controls the effective shunt capacitance, which becomes maximum with low bias, and minimum with high bias. The control bias is obtained from the audio signal, of which a definite amount is taken off (at the output circuit of the phono preamplifier), amplified by the 7F7, and rectified by the diode section of the 7E7.

Any push button except the OFF button operates the a-c switch to turn on the power; the OFF button turns off the power.

The treble control, when turned to its maximum clockwise position, actuates switch S200 to place the scratch eliminator in operation; in any other position, the control regulates the treble response in either radio or phono operation.



SPECIFICATIONS

CABINET	Wood, mahogany finish
CIRCUIT	13-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1720 kc.
Short wave	9.3—15.5 mc.
FM	88—108 mc.
AUDIO OUTPUT	10 watts
PUSH BUTTONS	Ten: One for OFF, five for broadcast-station selection, three for band selection, and one for phonograph operation
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	Radio: 110 watts Phonograph: 140 watts
AERIALS	Built-in loop and a-c line (FM) aerial; external aerial also may be used
INTERMEDIATE FREQUENCIES	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (13)	6AU6, 7F8, 6BA6(2), 7A7, FM1000, 7AF7, 6SQ7GT, 6V6GT(2), 7F7, 7E7, 5U4G
PHONOGRAPH	Philco Automatic Record Changer, Model D-10A

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Section 1 TROUBLE SHOOTING
POWER SUPPLY

CAUTION: Do not turn on the power with the speaker disconnected, as this may cause damage to the set.

Make the tests for this section with a d-c voltmeter; connect the leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, and the bass and treble controls fully counterclockwise. Depress the BC push button.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	200v		Trouble in this section. Isolate by the following tests.
2	B	250v	No voltage	Defective: 5U4G. Open: L100, T100, W100, S100. Shorted: C101B, C102, C103, C317*, C405*.
			Low voltage	Defective: 5U4G, T100. Open: C103. Leaky: C101B, C102, C103, C317*, C405*.
			High voltage	Defective: 6V6GT*. Open: T200*.
3	D	Negative 9.8v	No voltage	Shorted: C104. Open: R101.
			Low voltage	Changed resistance: R101.
			High voltage	Open: R102.
4	A	200v	No voltage	Open: R100. Shorted: C101A, C415*, C417*, C419*.
			Low voltage	Changed resistance: R100. Leaky: C101A, C415*, C417*, C419*.

Listening test: Abnormal hum may be caused by open C101A, C101B, or C104.

* This part, located in another section, may cause abnormal indication in this section.

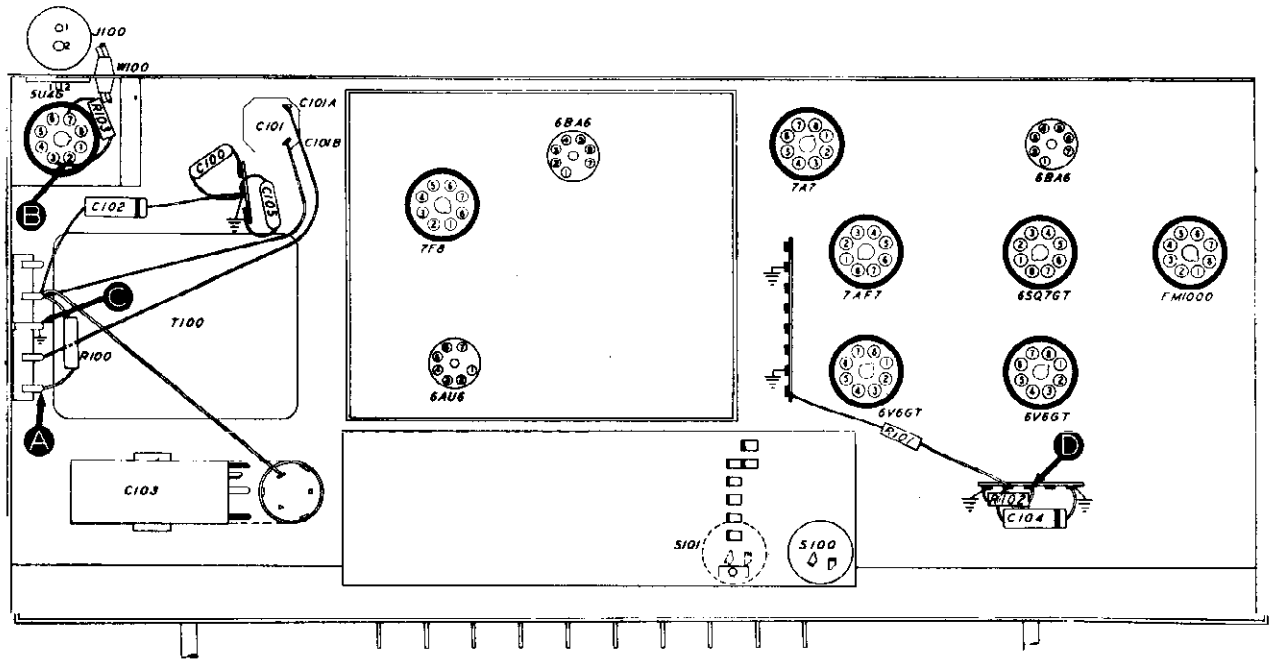


Figure 1. Bottom View, Showing Section 1 Test Points

Section 2

TROUBLE SHOOTING

AUDIO-AMPLIFIER AND PHONO-PREAMPLIFIER TESTS

Use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the bass and treble controls fully counterclockwise. Depress the push button indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, (a) and (b), proceed with the scratch eliminator tests; if not, isolate the trouble by following the steps as directed in the chart.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	A	Loud, clear signal with weak signal input (with BC button, PB-3, depressed).	Trouble in audio-amplifier circuits. Isolate by steps 2, 3, 4, 5, and 6.
1(b)	B	Loud, clear signal with weak signal input (with PHONO button, PB-9, depressed).	Trouble in phono-preamplifier circuit. Isolate by step 7.
2	D (Remove 7AF7)	Clear signal with strong signal input (BC button depressed).	Defective: 6V6GT. Open: LS200, T200, R238, C206. Shorted or leaky: C221, C206.
3	E (7AF7 removed)	Clear signal with strong signal input (BC button depressed).	Defective: 6V6GT. Open: C219, R239. Shorted or leaky: C219.
4	F (Replace 7AF7)	Loud, clear signal with moderate signal input (BC button depressed).	Defective: 7AF7. Open: R211, R212, R235, R210. Leaky: C205.
5	G	Loud, clear signal with weak signal input (BC button depressed).	Defective: 6SQ7GT. Open: C205, R209. Shorted or leaky: C222, C204.
6	A	Loud, clear signal with weak signal input (BC button depressed).	Open: R200 (rotate through range), C202, R205, R206.
7	B	Loud, clear signal with weak signal input (PHONO button depressed).	Defective: 7AF7. Open: R236, R237, PB-9, C208, R216, R213. Shorted or leaky: C220.

Listening Test: Distortion may be caused by leaky C202, C205, C206, or C219, open R207.

* This part, located in another section, may cause abnormal indication in this section.

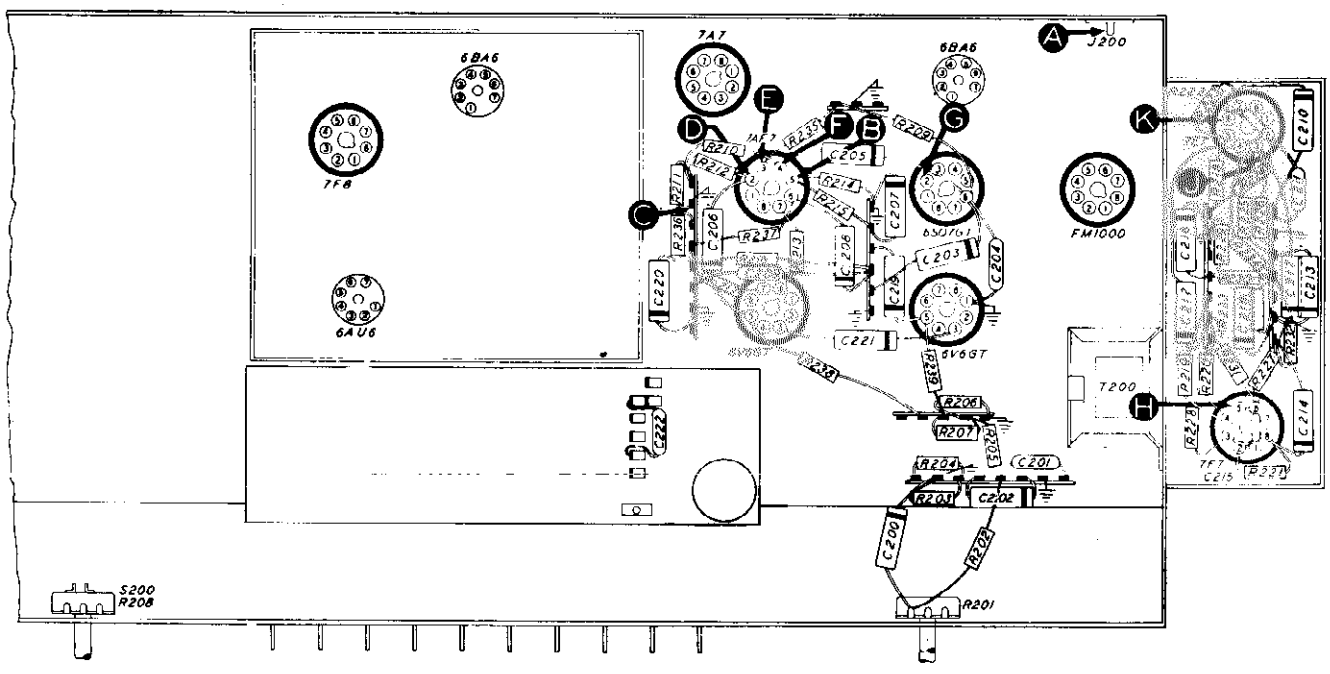

Figure 2. Bottom View Showing Section 2 Test Points (location of R200 shown in figure 8)

Section 2 (Cont.)

TROUBLE SHOOTING

SCRATCH-ELIMINATOR TESTS

Set the bass control fully clockwise. Turn the treble control clockwise as far as possible without turning on the scratch eliminator, except as noted in chart (the scratch eliminator is on when this control is turned fully clockwise until switch S200 is actuated). Depress the PHONO push button, PB-9. For all steps except 1(b), set the volume control to maximum; for this step, adjust the volume control as indicated in the chart.

Connect an output meter between terminal 3 (voice-coil connection) of the aerial terminal panel and the chassis.

Connect the ground lead of an audio signal generator to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator for 5000 cycles. Adjust the generator output as indicated in the chart.

If normal operation is indicated by the tests in step 1, (a) and (b), proceed with the tests for Section (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in the scratch-eliminator circuits.

NOTE: For steps 2, 3, and 4, connect the positive lead of a 20,000-ohms-per-volt, d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the points indicated in the "METER POINT" column of the chart.

STEP	TEST POINT	SIG. GEN. OUTPUT	METER POINT	SPECIAL INSTRUCTIONS	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	A	Adjust for 3v output-meter reading, with scratch eliminator off.		Turn scratch eliminator on; output voltage should drop to 1.2v (approx.).	
1(b)	A	Adjust for 3v output-meter reading, with scratch eliminator off.		Reduce volume control to obtain output meter reading of .5v. Increase generator output to obtain output-meter reading of 3v. Turn scratch eliminator on; output voltage should not drop more than .6v (approx.).	Trouble in scratch-eliminator circuits. Isolate by the following tests.
2	H	See "SPECIAL INSTRUCTIONS" column.	J	With scratch eliminator on, increase generator output to obtain 11v, negative; failure to obtain this value indicates trouble.	Defective: 7F7, 7E7 (diode section). Open: R231, C217, R234, R233. Shorted: C218, C217.
3	H	Same setting which produced 11v reading in step 2, with scratch eliminator on.	K	With scratch eliminator on, voltage at point K should be 5v, negative.	Open: R222, R225, R226. Shorted or leaky: C212, C213, C210.
4	A	Same as step 3.	J	With scratch eliminator on, voltage at point J should be approx. 28v, negative.	Defective: 7F7. Open: R229, C215, R227, R221, R220, R219, C209. Shorted or leaky: C209, C215, C214.
5	A	Adjust for 3v output-meter reading, with scratch eliminator off.		Turn scratch eliminator on; output voltage should drop to 1.2v (approx.).	Defective: 7E7 (pentode section). Open: R224, R218, R223, C210, C211. Shorted or leaky: C211.

Section 3

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

AM CIRCUITS

Use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress the BC push button, PB-3. Set the volume control to maximum, and turn the bass and treble controls fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits, or the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the AM circuits.

Since the circuit location of test point A for this section is the same as that of test point D for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 6BA6, 6SQ7GT (diode section). Open: PB-1, PB-9, R311, R313, R315, R316, R317, R318, C321, L303A,. B, D. Shorted: C322, C324, C325, C326, C302C, L303B, D. Misaligned: Z303.
3	D	Loud, clear signal with moderate signal input.	Defective: 7A7. Open: PB-1, R305, R306, R307, R308, R309, L302A, B, C, D. Shorted: C340, C314, C315, C301B, L302B, C. Misaligned: Z302.
4	E	Loud, clear signal with weak signal input.	Defective: 6BA6. Open: R301, R302, R303, R325, L301A, B, C. Shorted: C308, C309, C310, C300B, L301A, B. Misaligned: Z301.
5	A	Loud, clear signal with signal input much weaker than in step 4.	Defective: 7F8*, WS-3(R). Open: R300, R408*, L300B, C, D. Shorted: C338, C305, L300B, D. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

The tests for the FM circuits are made with an AM r-f signal generator and a 20,000-ohms-per-volt, d-c voltmeter.

In steps 1(a), 4, 5, 6, 7, and 8, the oscillator section of the FM detector is made inoperative, thereby converting the circuit to an AM detector; this makes it possible to use an AM signal for testing the i-f amplifiers and the pentode section of the detector.

In step 1(b), an unmodulated r-f signal is used to check FM detection (with the oscillator section operating); the test is made by observing the d-c voltage drops across the audio load resistor (R324) for different input frequencies within the i-f range of the detector.

In steps 2 and 3, d-c voltage and r-f signal tests are used to check the oscillator section of the FM detector.

Set the volume control to maximum, and turn the bass and treble controls fully clockwise. Depress the FM push button, PB-1. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

NOTE: The "TEST POINT" column refers to signal-generator connections in all cases except for step 2, in which the test is made with the voltmeter only.

If the "NORMAL INDICATION" is obtained in step 1, (a) and (b), proceed with the test for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

Since the circuit location of test point A for this section is the same as that of test point D for Section 4, the effectiveness of step 1, (a) and (b), as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

Section 3 (Cont.) TROUBLE SHOOTING

STEP	TEST POINT	SPECIAL INSTRUCTIONS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	A (I-f-ampl. check).	Set generator to 9.1 mc. (mod. on). Short test point G (pin 2 of FM1000) to chassis.	Loud, clear signal with very weak signal input.	Trouble in detector or i-f circuits. Isolate by steps 4, 5, 6, 7, and 8.
1(b)	B (FM-det. check).	Set generator to 9.1 mc. (mod. off), with high output. Remove short from test point G. Connect positive lead of voltmeter to test point J, and negative lead to test point H. Use 50-volt range.	15 to 30 volts for 9.1-mc. signal or no signal. 12 to 20 volts when generator is set at 80 kc. above or 80 kc. below 9.1 mc.	Trouble in FM-detector circuit. Isolate by steps 2 and 3.
2	G (FM-det. osc. check).	Connect positive lead of voltmeter to chassis; connect prod end of negative lead through 100,000-ohm isolating resistor to test point G. Use 10-volt range.	Negative 1.8 volts (approx.)	Defective: FM1000. Open: L305, C330, R321, L304A, B, C342, C341, C343, R319, R320, R304. Shorted: C330, C342, C341, C343, C331, C333, C334, C332, C304A, L304A.
3	B	Using low to moderate output (mod. off), tune generator across 9.1 mc.	Beat signal, with zero beat at 9.1 mc.	Misaligned: Z304. Shorted: L304A, B. Changed capacitance: C342, C343. Open: C331, R322.
4	F	Set generator to 9.1 mc. (mod, on). Short test point G to chassis. Short test point B (for this step only) to chassis.	Clear signal with strong signal input.	Defective: FM1000. Open: R324, R323, PB-1. Shorted or leaky: C329, C333, C334.
5	B	Set generator to 9.1 mc. (mod on). Leave test point G shorted. Remove short from test point B.	Loud, clear signal with strong signal input.	Defective: 6BA6 (3rd i.f.). Shorted or leaky: C303B, C, L303A, C. Open: R314. Misaligned: Z303.
6	D	Set generator to 9.1 mc. (mod. on). Leave test point G shorted.	Loud, clear signal with moderate signal input.	Defective: 7A7 (2nd i.f.). Misaligned: Z302. Shorted: C302A, C302B, L302A, B.
7	E	Set generator to 9.1 mc. (mod. on). Leave test point G shorted.	Loud, clear signal with weak signal input.	Defective: 6BA6 (1st i.f.). Misaligned: Z301. Shorted: C301A, C301C, L301C.
8	A	Set generator to 9.1 mc. (mod. on). Leave test point G shorted.	Loud, clear signal with very weak signal input.	Defective: 7F8*. Misaligned: Z300. Open: L300A, WS-3(R), WS-1(F). Shorted: C300A, C300C, L300A, C.

* This part, located in another section, may cause abnormal indication in this section.

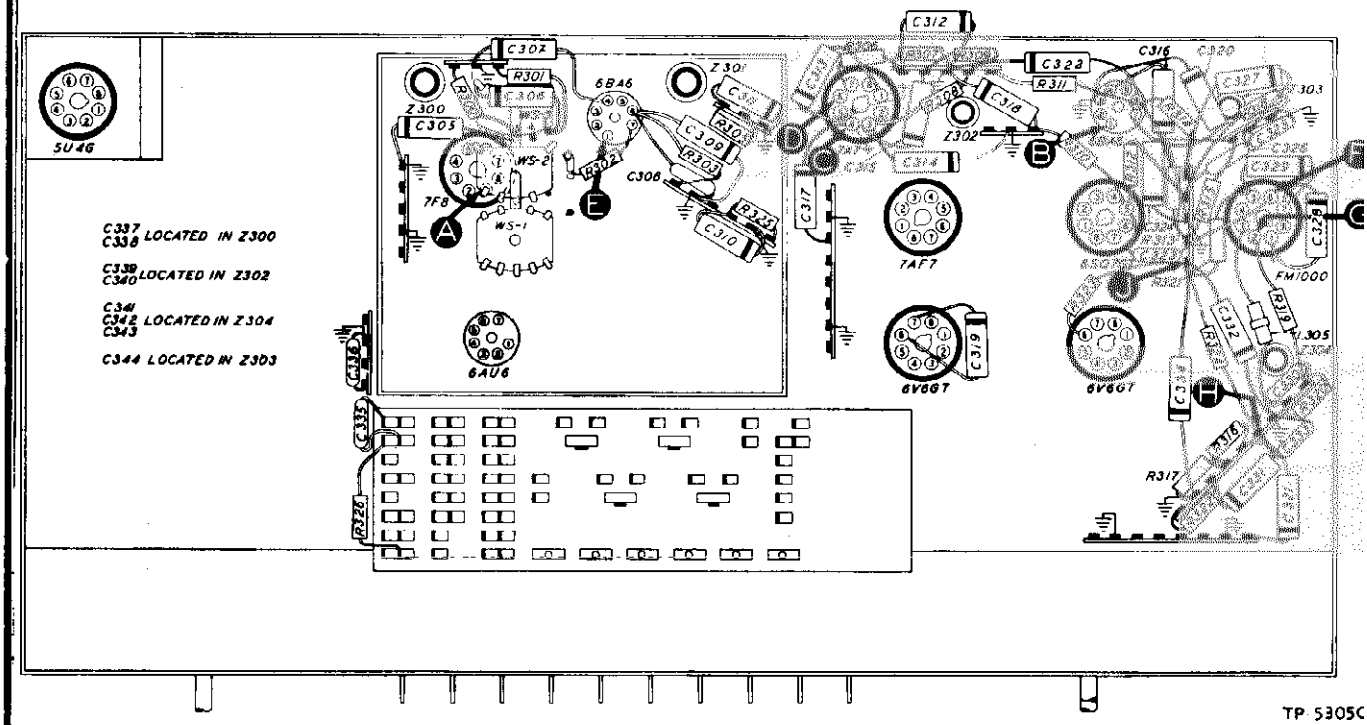

Figure 3. Bottom View, Showing Section 3 Test Points

Section 4

TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

For the following tests, with the exception of the oscillator tests, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Adjust the generator to give a weak input signal.

Set the radio volume control to maximum, and turn the bass and treble controls counterclockwise.

OSCILLATOR TESTS (AM and FM CIRCUITS): Connect the positive lead of a high-resistance voltmeter to the oscillator cathode (pin 5) of the 7F8, test point F. Connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 8), test point E. Use a suitable range, such as 0—10 volts. Absence of negative voltage with any station-selector push button (PB-8 through PB-4) depressed, or for any dial position with push button PB-1, PB-2, or PB-3 depressed, indicates that the oscillator is not functioning.

AM CIRCUITS

PUSH BUTTON

STEP	TEST POINT	SIG. GEN. FREQUENCY	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Adjust to frequency of each push button, in turn.	Depress, in turn, PB-8 through PB-4.	Loud, clear signal when each push button is depressed.	Trouble in circuits associated with push-button station selectors. Isolate by tests in steps 2 and 3.
2	E to F (Oscillator test)		Depress, in turn, PB-8 through PB-4.	Negative voltage.	No voltage for any particular push button — Defective: Coil (L409A through L409E) or push button. No voltage for all push buttons—Defective: 7F8, WS-2(F), PB-2, PB-3. Open: R404, R405, R407, R409, C413, C414, C416, L405, WS-2(F), WS-2(R). Shorted: C415, C417, C419.
3	A	Adjust to frequency of each push button, in turn.	Depress, in turn, PB-8 through PB-4.	Loud, clear signal when each push button is depressed.	Defective: L400, C411, C424A through C424E. Open: R412, R413, C413, PB-2, PB-3, WS-1(F), WS-2(F).

BROADCAST MANUAL

4	A	1000 kc.	Depress BC push button, PB-3. Tune to signal.	Loud, clear signal.	Trouble in broadcast manual-tuning circuits. Isolate by tests in steps 5 and 6.
5	A	1000 kc.	Depress BC push button, PB-3. Tune to signal.	Loud, clear signal.	Open: PB-3, PB-2, C421, C411, WS-1(F). Shorted: C400D, L400.
6	E to F (Oscillator test)		Depress BC push button, PB-3. Rotate tuning control through range.	Negative voltage.	Open: PB-3, L404. Shorted: C409E, L404, C400E

SHORT-WAVE MANUAL

7	B	12 mc.	Depress SW push button, PB-2. Tune to signal.	Loud, clear signal.	Trouble in short-wave circuits. Isolate by tests in steps 8 and 9.
8	B	12 mc.	Depress SW push button, PB-2. Tune to signal.	Loud, clear signal.	Defective: J400, L401, L402, C401 C410. Open: L401, PB-2.
9	E to F (Oscillator test)		Depress SW push button, PB-2. Rotate tuning control through range.	Negative voltage.	Open: L403, C408, C407. Shorted: C409A.

Section 4 (Cont.)

TROUBLE SHOOTING

FM CIRCUITS

Before proceeding with the tests for the FM circuits, connect test point G in Section 3 to the chassis.

STEP	TEST POINT	SIG. GEN. FREQUENCY	PUSH BUTTON OR TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	G	100 mc.	Depress FM push button, PB-1. Tune to signal.	Loud, clear signal.	Trouble in FM circuits. Isolate the following tests.
2	E to F (Oscillator test)		Depress FM push button, PB-1. Rotate tuning control through range.	Negative voltage.	Defective: 7F8. Open: L408, R PB-1, WS-2(F). Shorted: C400H, C4 C419, C418.
3	H	100 mc.	Depress FM push button, PB-1. Tune to signal.	Loud, clear signal.	Defective: 6AU6. Open: L410, R R400, R402, C406. Shorted: C4 WS-2(F), C404, C405.
4	G	100 mc.	Same as step 3.	Loud, clear signal.	Open: L406, C402. Shorted: C40 C400F.

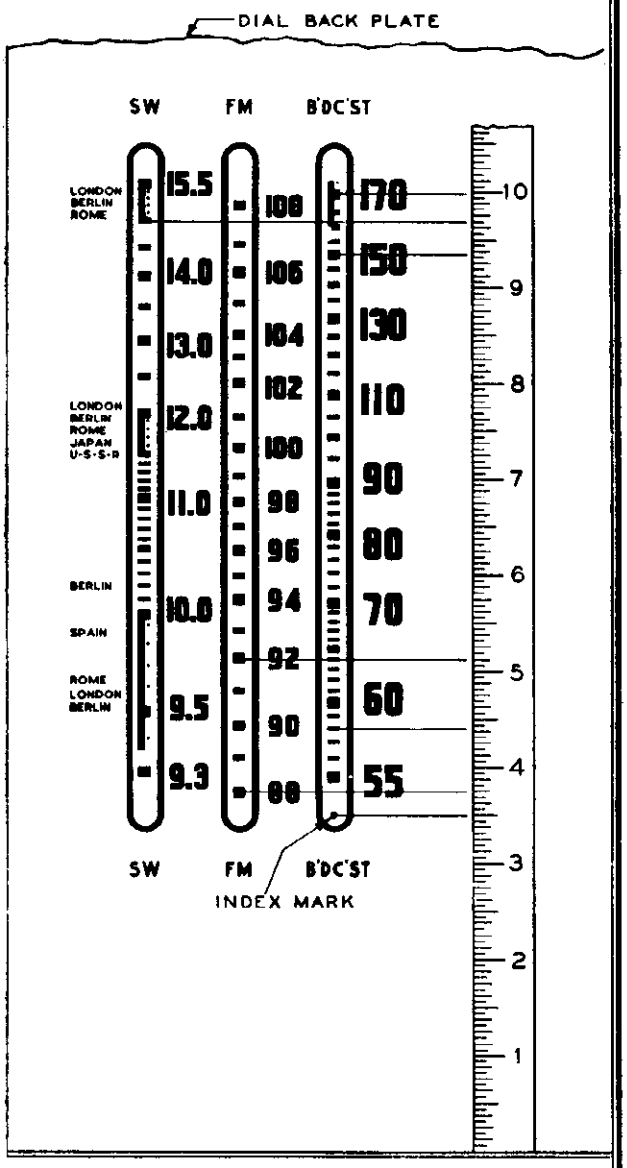
CABLIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked, with a pencil, on the dial backplate at the end of the pointer.

The method of measuring for these points is illustrated in figure 5. Hold a rule against the dial backplate, with the start of the rule against the inside of the upturned edge of the backplate.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.



TP-1C

Figure 5. Calibration Measurements for Dial Backplate

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 2 of the 5U4G) and the radio chassis. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1000 ohms, check condensers C101B, C102, and C103 for leakage or shorts.

This resistance value, which is much lower than normal, does not represent a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

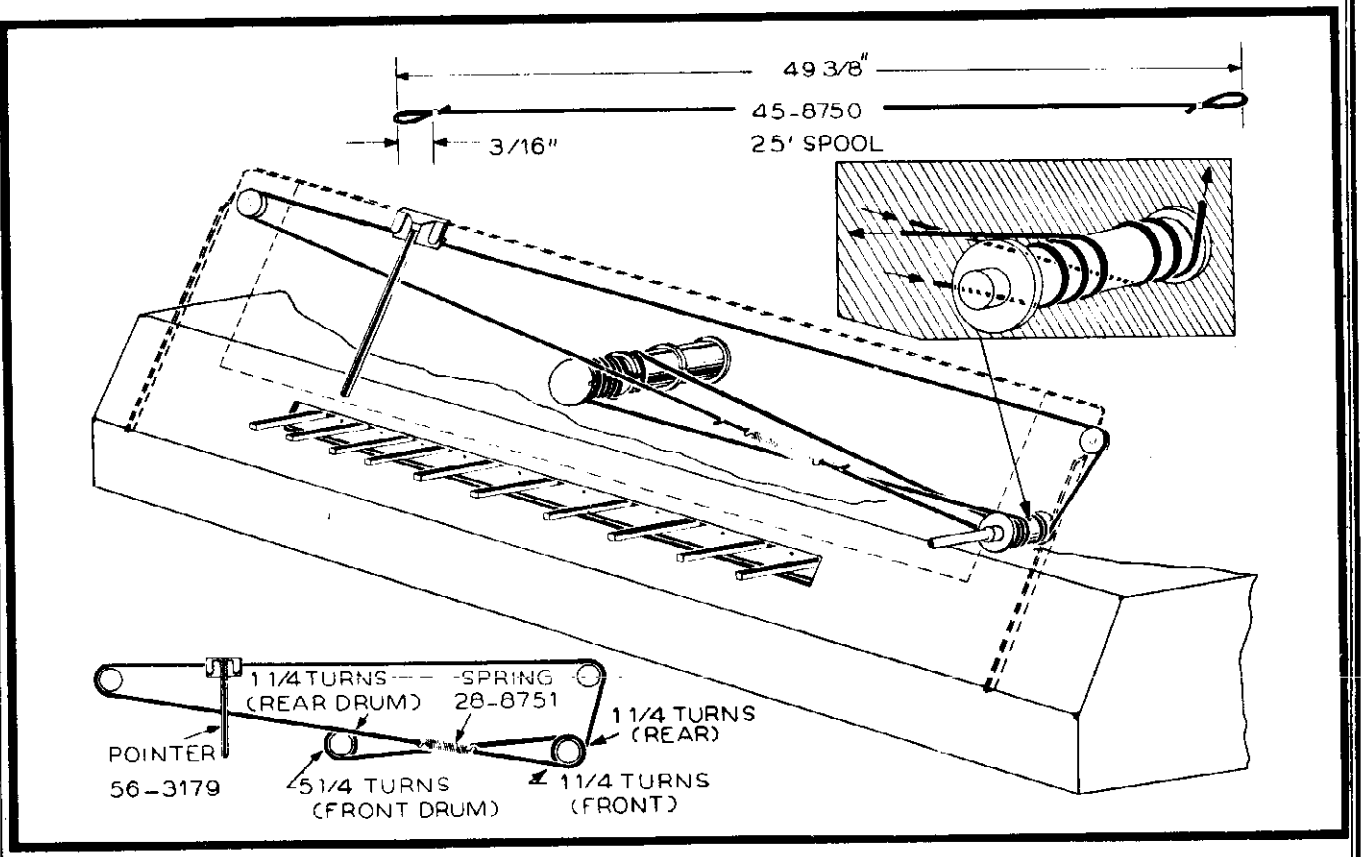
Socket, Loktal, scratch eliminator (2 req.)	27-6138*
Wafer-Switch Hardware	
Fulcrum assembly	76-2206
Link, connecting	54-7169

SETTING PUSH BUTTONS

1. Connect the output meter between the No. 3 terminal of the aerial terminal panel and the chassis.
2. Turn the volume control to maximum, and bass and treble controls fully counterclockwise.
3. Couple the signal generator loosely to the loop aerial (see Note under "AM ALIGNMENT CHART").
4. Turn on the power, and allow the radio to warm up for 15 minutes before starting the adjustments.
5. Starting with the lowest frequency desired, set the signal generator to the desired frequency (modulation on), push the station-selector push button, and adjust the associated oscillator tuning core and aerial trimmer condenser (marked on rear of chassis) for maximum indication on the output meter.
6. Reset the signal-generator frequency, and repeat the procedure for each remaining station-selector push button.
7. Turn off the signal generator, and make a final adjustment of all tuning cores and trimmer condensers while listening to the stations for which the adjustments are being made.

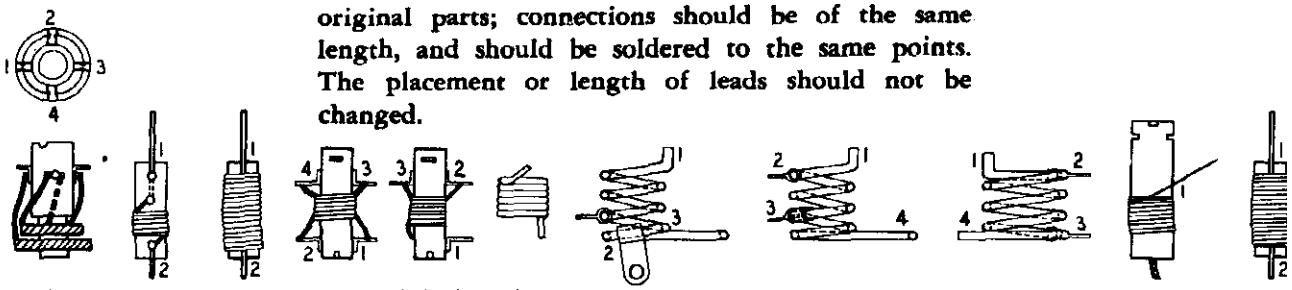


TP-164

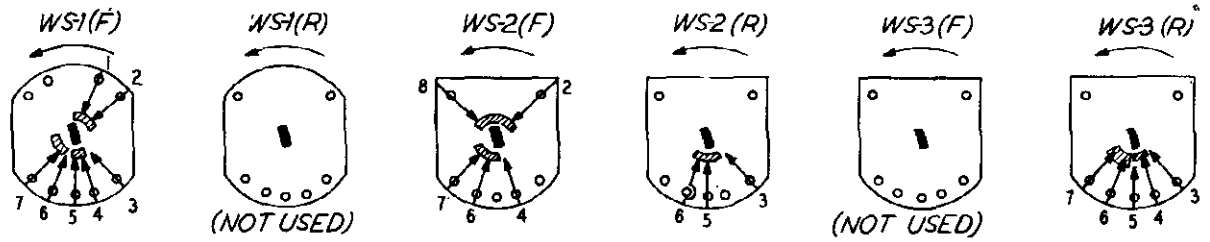
Figure 6. Drive-Cord Installation Details

IMPORTANT!

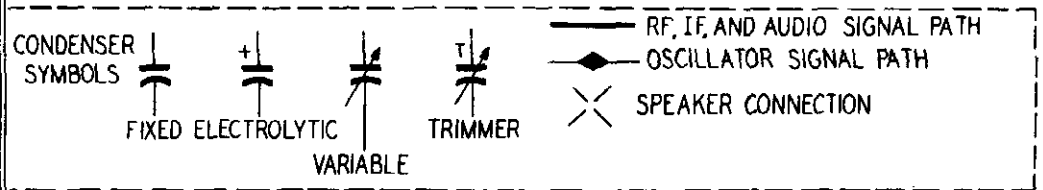
To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

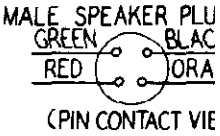


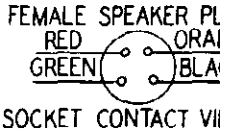
L400 BC AERIAL | L401 SW AERIAL | L402 FM CHOKE | L403 SW OSC | L404 BC OSC | L405 OSC CHOKE | L406 FM AERIAL | L407 FM RF | L408 FM OSC | L409A-L409E PB OSC | L41C FM CHOK



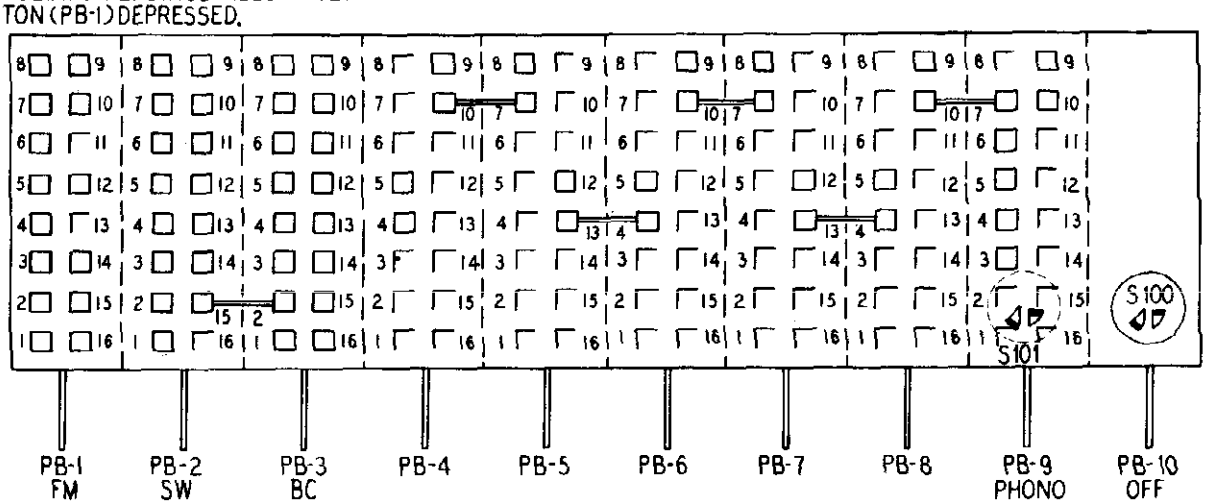
ROTARY WAFER SWITCH SECTIONS ARE SHOWN (AS VIEWED WITH CHASSIS INVERTED) IN THE POSITION FOR BROADCAS SHORT-WAVE, PUSH-BUTTON, OR PHONO OPERATION. THESE SECTIONS ARE THROWN TO THE FM POSITION WHEN ACTUAT BY THE FM PUSH BUTTON. WAFER SECTIONS ARE SYMBOLIZED WS-1, WS-2, WS-3, FROM FRONT OF CHASSIS TOWARD REAR. (F) INDICATES FRONT CONTACTS, LOOKING FROM FRONT. (R) INDICATES REAR CONTACTS, LOOKING THROUGH FROM FRONT.







NOTE:-
VOLTAGE READINGS GIVEN WERE TAKEN WITH A 20,000-OHMS-PER-VOLT METER, AT A LINE VOLTAGE OF 117 V A C.
VOLTAGE READINGS IN SCRATCH ELIMINATOR CIRCUITS OF SECTION 2 WERE TAKEN WITH PHONO PUSH BUTTON (PB-9) DEPRESSED, AND TREBLE CONTROL SET TO SCRATCH ELIMINATOR POSITION.
VOLTAGE READINGS ASSOCIATED WITH FM DETECTOR WERE TAKEN WITH FM PUSH BUTTON (PB-1) DEPRESSED.



PUSH-BUTTON SWITCHES AS VIEWED WITH CHASSIS INVERTED.

ALIGNMENT PROCEDURE

CAUTION: Do no turn on power with speaker disconnected, or the radio may be damaged.

ALIGNMENT OF AM CIRCUITS

When the complete AM and FM alignment is to be made, the AM alignment should be made first; however, if AM alignment is not required, the FM alignment alone may be made.

OUTPUT METER—Connect between No. 3 terminal (voice-coil connection) of aerial terminal panel and chassis.

AM SIGNAL GENERATOR—Connect ground lead to chassis, and output lead as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, signal-generator output must be attenuated to maintain radio output below 1.5 volts, as read on output meter.

CONTROLS—Set volume control to maximum, bass tone control fully counterclockwise, treble tone control fully clockwise (do not turn on scratch eliminator), and signal-generator dial, radio dial, and radio push buttons as indicated in chart.

DIAL POINTER—With tuning condensers fully meshed, dial pointer must coincide with index mark at low-frequency end of dial. See "CALIBRATING DIAL BACKPLATE" for method of measuring backplate for index and calibration marks.

ALIGNMENT OF FM CIRCUITS

OUTPUT METER—Connect between No. 3 terminal (voice-coil connection) of aerial terminal panel and chassis.

AM SIGNAL GENERATOR—Connect ground lead to chassis; connect output lead through .1-mf. condenser to points specified in chart. Use modulated output unless otherwise specified.

OUTPUT LEVEL—During alignment, signal-generator output must be attenuated to maintain radio output below 1.5 volts, as read on output meter. All adjustments are made for maximum output, unless otherwise specified in chart.

CONTROLS—Set volume control to maximum, bass tone control fully counterclockwise, and treble tone control fully clockwise. Depress FM push button, PB-1.

LOCATIONS OF COILS—For the locations of coils L406, L407, and L408 (steps 11 and 15), refer to figure 4.

Note 1. When the oscillator grid (pin 2) of the FM1000 is connected to the chassis, the oscillator section of the FM detector is made inoperative; the circuit is thereby converted from an FM to an AM detector.

Note 2. Make the loading network by connecting a 4700-ohm resistor and a .1-mf. condenser in series. Attach an alligator clip to each free end of the network. When this network is connected across the primary or secondary winding of an overcoupled i-f transformer, the network loads the circuit so that the transformer is effectively below critical coupling; the unloaded winding may then be correctly peaked at the intermediate frequency.

Note 3. The top of padder C303C can be reached only from the top of the shield can. Slide a length of flattened solder or wire down between the ceramic form and the edge of the trimmer plate. Attach the loading network between this connection and the chassis.

Note 4. It is essential that the output of the generator be kept below the level at which the oscillator of the FM detector locks in; otherwise, an erroneous zero beat will be obtained. When a single very sharp zero-beat point is obtained, the adjustment is correct.

Note 5. The use of a signal generator for steps 10 through 16 is recommended only if the available generator is sufficiently accurate to insure correct frequency settings. Otherwise, an alternative procedure employing FM broadcast-station signals is recommended. For the adjustments at the high-frequency end of the band, use the station nearest 105 mc.; for the adjustments at the low-frequency end of the band, use the station nearest 88 mc. or 92 mc., as indicated. If the radio is greatly misaligned, it may be necessary to adjust the trimmers and coils for maximum noise at each end of the band before station signals can be heard. The FM detector must be made inoperative, as directed in step 10 of the "FM ALIGNMENT CHART."

Note 6. Check the tracking of oscillator and r-f circuits with a tuning wand. If placing the brass end in or near the coil increases the output-meter reading, spread the turns; if the powdered-iron end increases the output reading, compress the turns. If both ends cause a decrease in output, the coil is correctly tuned. Do not change the coils excessively, since only a small adjustment is required at these frequencies.

Note 7. Make two simple dipole aerials to feed signals from the signal-generator to the radio. Each dipole aerial may consist of two 30-inch lengths of rubber-covered wire. Connect one dipole aerial to terminals 1 and 2 on the FM aerial socket of the radio. Connect the other dipole aerial to the output leads of the signal generator. Place the two dipoles several feet apart.

Section 1—Power Supply

TROUBLE SHOOTINC

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

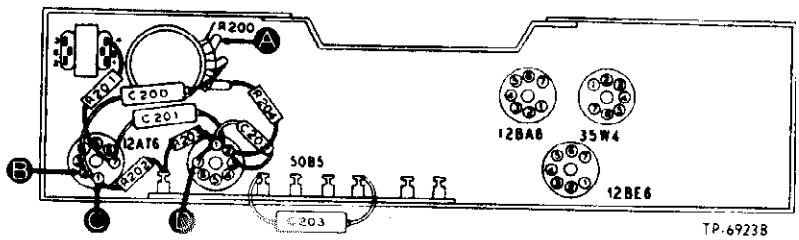
			Low voltage	Leaky: C101A, C101B.
			High voltage	Open: R101.
4	A	104v	No voltage	Open or shorted: C101C. Open: R101.
			Low voltage	Leaky: C101B.
Listening Test: Abnormal hum may be caused by open or leaky C100, C101A, C101B, C101C.				

Section 2—Audio Circuits

TROUBLE SHOOTINC

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.



TP-6923B

Figure 2. Bottom View, Showing Section 2 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	D	Same as step 1.	Defective: 50B5, LS200. Shorted: C203, T200. Open: C203, T200, R205.
3	C	Same as step 1.	Defective: 12AT6. Open: C201, R201, R204. Shorted: C202.
4	A	Same as step 1.	Open: C200. Shorted: Z301*.
Listening Test: Distortion may be caused by shorted or leaky C200, C201.			

* This part, located in another section, may cause abnormal indication in this section.

Section 3—I-F, Detector, And A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

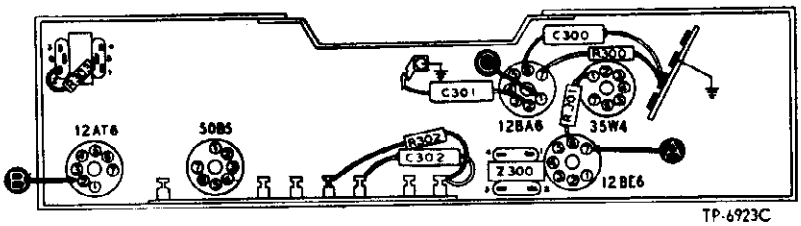


Figure 3. Bottom View, Showing Section 3 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not isolate and correct the trouble in this section.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Same as step 1.	Defective: 12BA6, 12AT6. Open or shorted: C300, C302, Z301. Open: R301, R304. Misaligned: Z301.
3	A	Same as step 1.	Defective: 12BE6*. Open or shorted: Z300. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F And Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum. Set the tuning control and the signal-generator frequency as indicated in the chart.

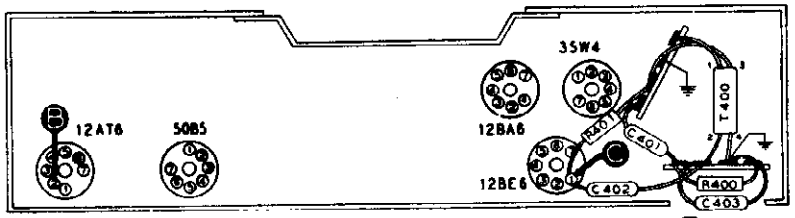

Figure 4. Bottom View, Showing Section 4 Test Points

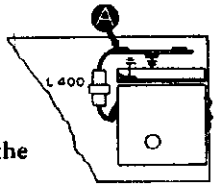


If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C (Osc. test; see note		Rotate through range.	Negative 3 to 6 volts.	Defective: 12BE6. Open or shorted: C400, C400B, C402, C403, T400.
3	A	1000 kc.	1000 kc.	Same as step 1.	Open: LA400, L400, C401, R400. Shorted: C400, C400A.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1 of 12BE6), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

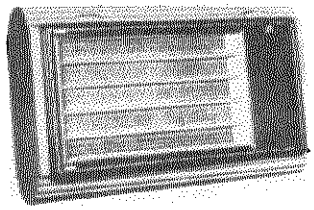
ALIGN

RADIO CONTROLS — Set volume control to maximum. Set tuning control as indicated in chart.

OUTPUT METER — Connect to left-hand terminal on wiring panel and to chassis.

STEP	SIGNAL GENERATOR		RADIO	
	CONNECTION TO RADIO	DIAL	DIAL	SPECIAL INSTRUCTIONS
1	Through .1-mf. condenser to aerial loop.	455 kc.	Tuning condenser fully meshed.	Adjust tuning cores, in order given, for maximum output.
2	Radiating loop. See note below.	1600 kc.	1600 kc.	Adjust trimmer for maximum output.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust trimmer for maximum output.

RADIATING LOOP: Make up a 6—8 turn, 6-inch-diameter loop, using insulated wire; connect to sig leads and place near radio loop aerial. Radio loop aerial must be connected to radio.



MODEL 49-603

SPECIFICATIONS

CABINET	Easel style
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
AUDIO OUTPUT	8 watt
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Built-in high-impedance loop
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	12BE6, 12BA6, 12AT6, 50B5, 35W4

Preliminary Checks

To avoid possible damage to the radio, the followin preliminary checks should be made before it is turne on:

1. Inspect both the top and the bottom of th chassis. Make sure that all tubes are secure in th proper sockets, and look for any broken or shorte connections, burned resistors, or other obvious source of trouble.

2. Measure the resistance between B+ (pin 7 o 35W4) and B– (test point B). When the ohmmete test leads are connected in the proper polarity, the high est resistance reading will be obtained. If the readin is lower than 1000 ohms, check condensers C101A C101B, and C203 for leakage or shorts. The resistanc value given is much lower than normal, and is no intended as a quality check of these condensers; th value given is the lowest at which the rectifier wi operate safely while the voltage checks of Section (power supply) are performed.

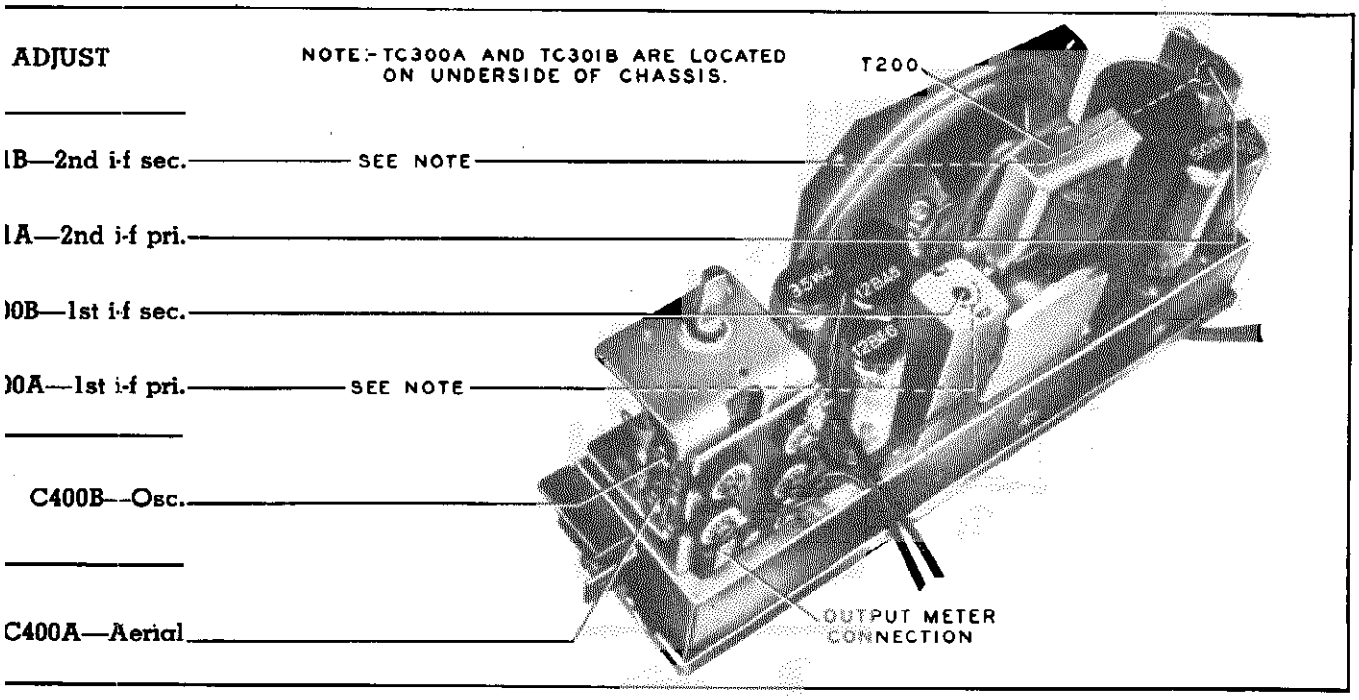
tionalized Schematic Diagram, Showing Test Points

NT PROCEDURE

SIGNAL GENERATOR — Use r-f signal generator, with modulated output. Connect generator and set frequency as indicated in chart.

OUTPUT LEVEL — During alignment, signal-generator output must be attenuated to hold output-meter reading below 1.25 volts.



:nerator

Figure 6. Top View, Showing Trimmer Locations

TP-6620

'cuit Description

'hilco Radio Model 49-603 is a five-tube, manually ed superheterodyne, providing reception on the ıdard broadcast band, 540—1620 kc. A high-im-ance loop within the cabinet normally provides quate signal pickup.

'he converter employs a 12BE6, which provides h-signal-to-noise ratio and high conversion efficiency. : signal from the converter is transformer-coupled ı 12BA6 i-f amplifier. This in turn is transformer-pled to a 12AT6 tube, one-half of which functions the detector and supplies a-v-c voltage. Both i-f ısformers have permeability-tuned primary and sec-ary windings.

'he other half of the type 12AT6 is used as a first io amplifier, which is resistance-coupled to the 50B5 ɔut tube. The 50B5 is transformer-coupled to the l-speaker.

he d-c operating voltages are supplied by a type 74 rectifier through a resistance-condenser network.

150,000-ohm resistor is connected between B– and chassis to prevent hum which might otherwise occur er conditions of high humidity.

C301 is a special condenser, inductively wound to act as a series-resonant circuit at the 455-kc. intermediate frequency. This condenser provides an exceptionally low-impedance i-f by-pass between B– and the chassis.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

Section 1 TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to the B– bus, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Turn the power switch "on," and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

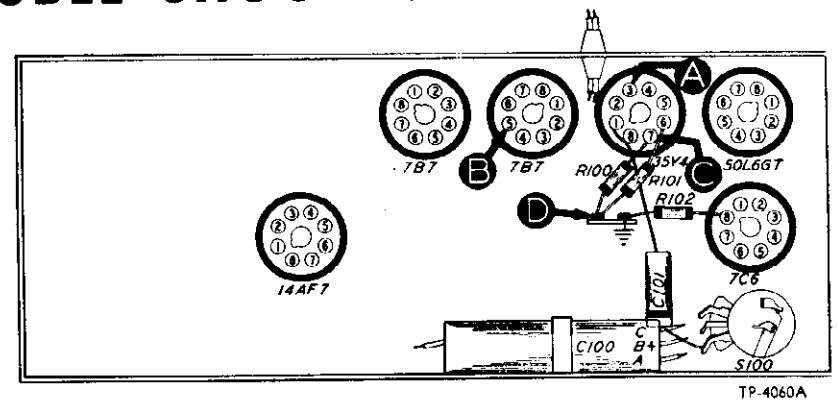

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	98 volts		Trouble within this section. Isolate by the following tests.
2	C	131 volts	No voltage. Low voltage. High voltage.	Defective: 35Y4, W100, S100. Shorted: C100A. Defective: 35Y4. Open: C100A, I100. Leaky: C100A. Open: R100.
3	D	118 volts	No voltage. Low voltage. High voltage.	Shorted: C100B. Leaky: C100B, C100C, C203*. Open: R101, T200*, R204*.
4	A	98 volts	No voltage. Low voltage. High voltage.	Shorted: C100C. Open: R101. Leaky: C100C. Open: R204*.
Listening Test: Abnormal hum may be caused by open C100A, C100B, C100C, or R102.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3. If not, isolate and correct the trouble in this section.

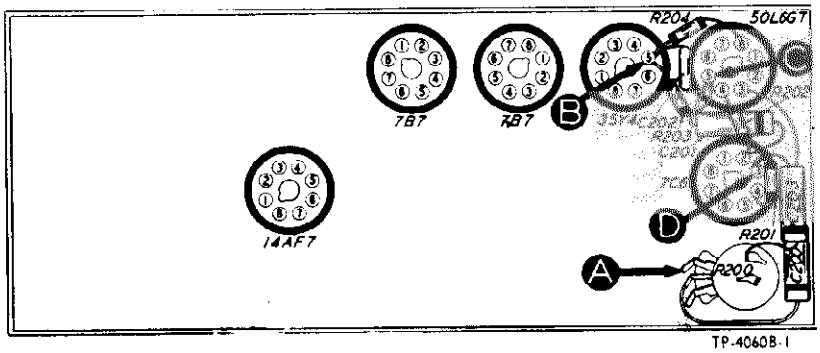

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 50L6GT, T200, LS200. Shorted or leaky: C203, C202. Open: R204, R203.
3	D	Same as step 1.	Defective: 7C6. Shorted or leaky: C201. Open: R201, R202, C201.
4	A	Same as step 1. Note: Rotate R200 through range.	Defective: R200. Shorted or leaky: C200. Open: R201, C200.
Listening Test: Distortion on strong signals may be caused by leaky C200 or open R201.			

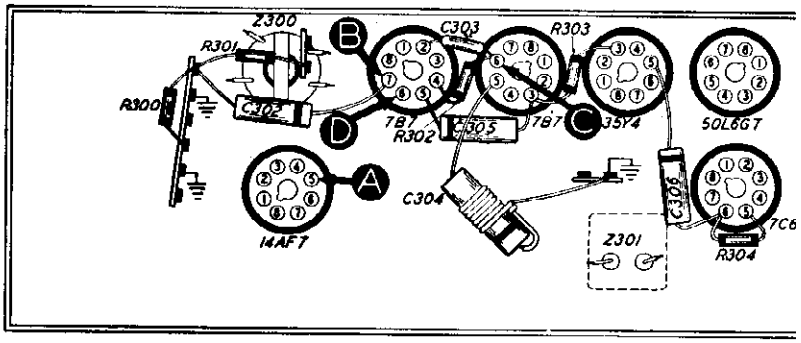
Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION."



TP-4060C-1

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear signal with strong signal input.	Defective: 7B7 (2nd i.f.), 7C6 (diode section), Z301. Shorted or leaky: C305. Open: R303. Misaligned: Z301.
3	D	Loud, clear signal with moderate signal input.	Defective: 7B7 (1st i.f.). Shorted or leaky: C303, C302. Open: R301, R302, R300, C303, C302.
4	A	Loud, clear signal with weak signal input.	Defective: 14AF7*, Z300. Open: R401*, R403*, C306. Shorted or leaky: C306. Misaligned: Z300.

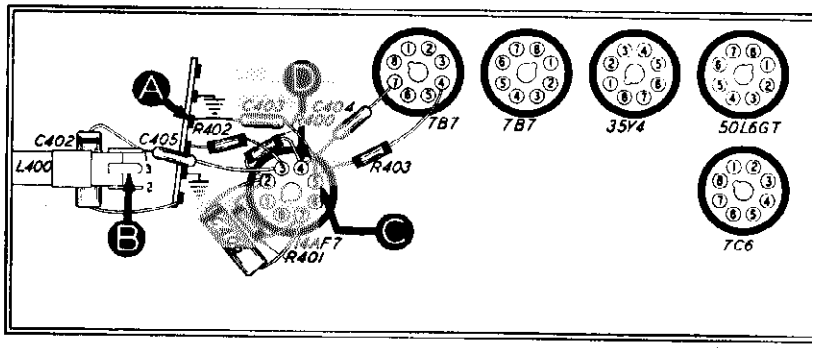
* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.



TP-4060D-1

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS (LOCATION OF C401 SHOWN IN FIGURE 6)

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	540 kc.	540 kc.	Same as step 1.	Defective: 14AF7. Open: C406, R402. Trouble in oscillator circuit. See step 3.
3	D Osc. Test (See note below.)		540 kc. to 1620 kc.	Negative voltage 1.6 volts to 1.8 volts.	Defective: L400. Open: R400, R402, C405, C404, C400A. Shorted: C402, C400, C405, C404, C400A.
4	A	540 kc.	540 kc.	Same as step 1.	Defective: LA400, C400, C400B. Open or shorted: C403.

OSCILLATOR TEST: Connect positive lead of a high-resistance voltmeter to B–, test point B; connect prod end of negative lea through a 100,000-ohm isolating resistor to 14AF7 oscillator grid, test point D. Use a suitable range, such as 0–10 volts. Prope operation of oscillator is indicated by negative voltage of 1.6v to 1.8v (measured with 20,000-ohms-per-volt meter) throughout rang of tuning condensers.

REPLACEMENT PARTS LIST

NOTE

Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

ALIGNME

SET RADIO

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain an output-meter indication below 1.25 volts.

SIGNAL GENERATOR—Connect as indicated in Use modulated output.

STEP	SIGNAL GENERATOR		RADIO		A
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1				Turn C300B down tight.	
2	(Chassis out of cabinet). Ground lead to B–; output lead through .1-mf. condenser to test point C, Section 4.	455 kc.	540 kc.	Adjust trimmers, in the order given for maximum output.	
3	(Chassis in cabinet). Radiating loop. (See note below.)	1600 kc.	1600 kc.	Adjust for maximum output.	
4	Same as step 3.	1500 kc.	1500 kc.	Adjust for maximum output.	

RADIATING LOOP: Make up a six-to-eight-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator le place near radio loop.

Circuit Description

Philco Models 49-900-E and 49-900-I are six-tube table-model superheterodyne radios, providing reception in the standard broadcast band. The two models are identical except for the cabinets.

The high-impedance loop aerial normally provides adequate signal pickup. If greater pickup is required, an external aerial may be connected.

The loop works into a 14AF7 converter. Variable condenser tuning is used. The two i-f stages employ 7B7 pentode tubes. To obtain good stability, resistance coupling is employed between the first and second i-f tubes. One diode (pin 5) of the 7C6 provides detection and a-v-c voltage. The triode section of this tube functions as the first audio amplifier, and is resistance-coupled to the 50L6GT output tube. The speaker is a permanent-magnet dynamic. The power supply employs a 35Y4, working into a resistance-capacitance filter system.

The 150,000-ohm resistor R102, connected between B– bus and chassis, prevents the hum which might otherwise occur under conditions of high humidity.

The series-resonant circuit, C304, functions as a by-pass of exceptionally low impedance; C304 is resonant at the i.f., 455 kc.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the lo tions of the test points and components of that secti

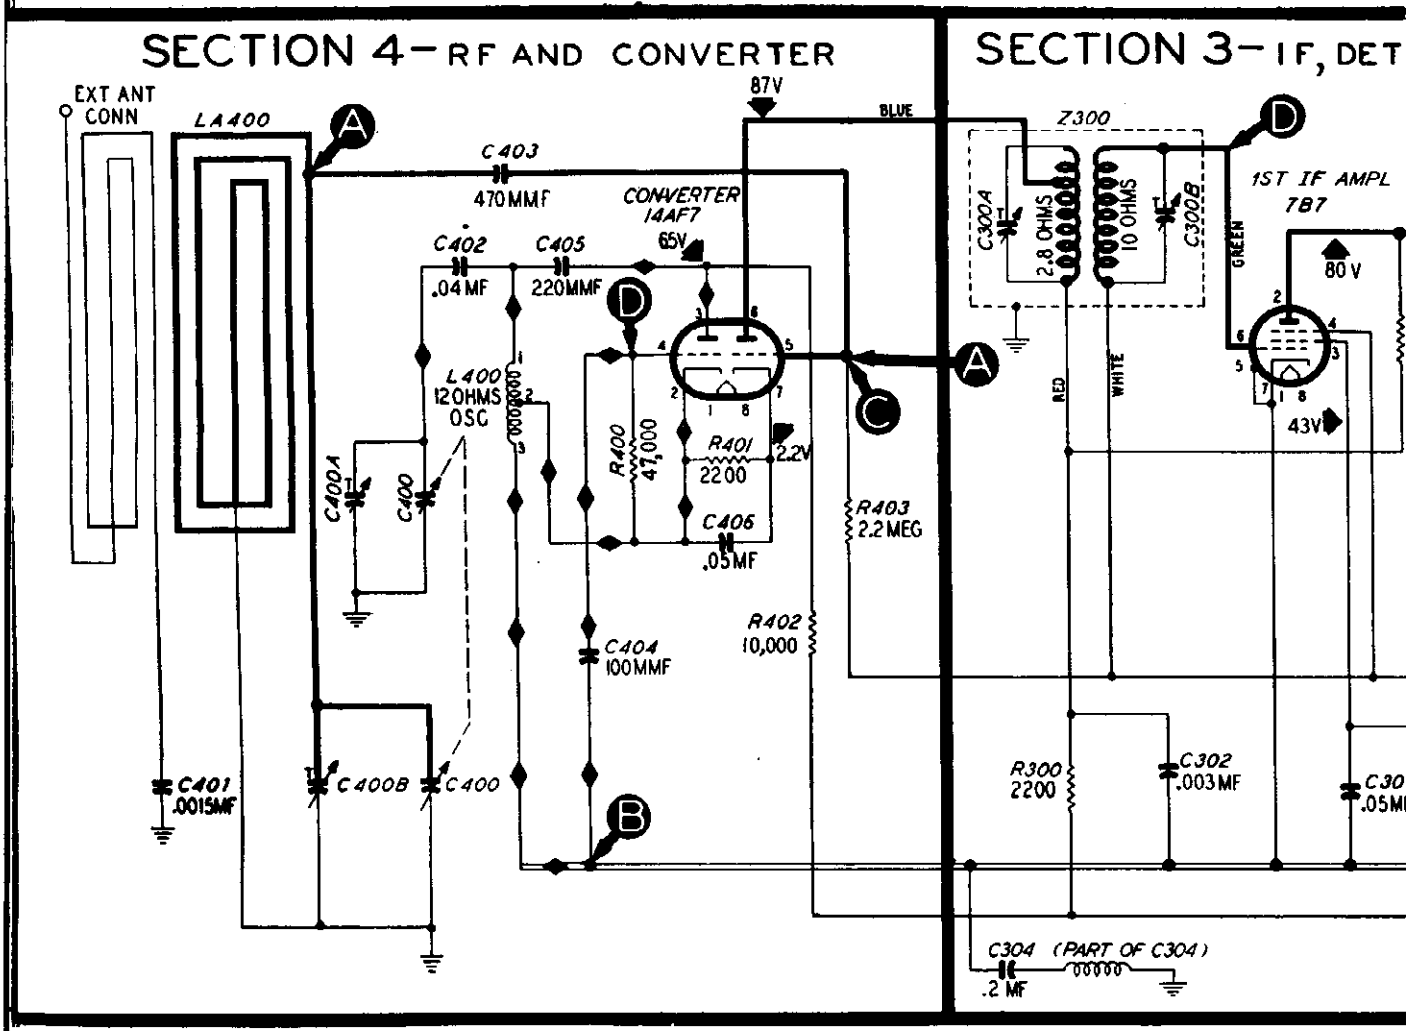
In each chart, the first step is a master check determining whether trouble exists in that section, wi out going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" any given step indicates trouble within the circuit un test.

After isolating the trouble to a single stage, defect is located by: first, testing the tube; seco measuring the tube-electrode voltages; third, measuri circuit resistances; fourth, substituting condensers. T trouble revealed should be corrected before testing f ther.

SPECIFICATIONS

CABINET	
Model 49-900-E	Plastic, ebony
Model 49-900-I	Plastic, ivory
CIRCUIT	6-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
AUDIO OUTPUT	1 watt
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (6)	14AF7, 7B7 (2), 7C6, 50L6GT, 35Y4



Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of 35Y4 rectifier tube) and B– (test point B). When the ohmmeter test leads are connected in proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C100A, C100B, and C100C for leakage or shorts.

This resistance value, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

VOLTAGES WERE MEASURED BETWEEN THE POINTS INDICATED AND B-, USING A 20,000-OHMS-PER-VOLT METER WITH AN INPUT OF 117 V A C

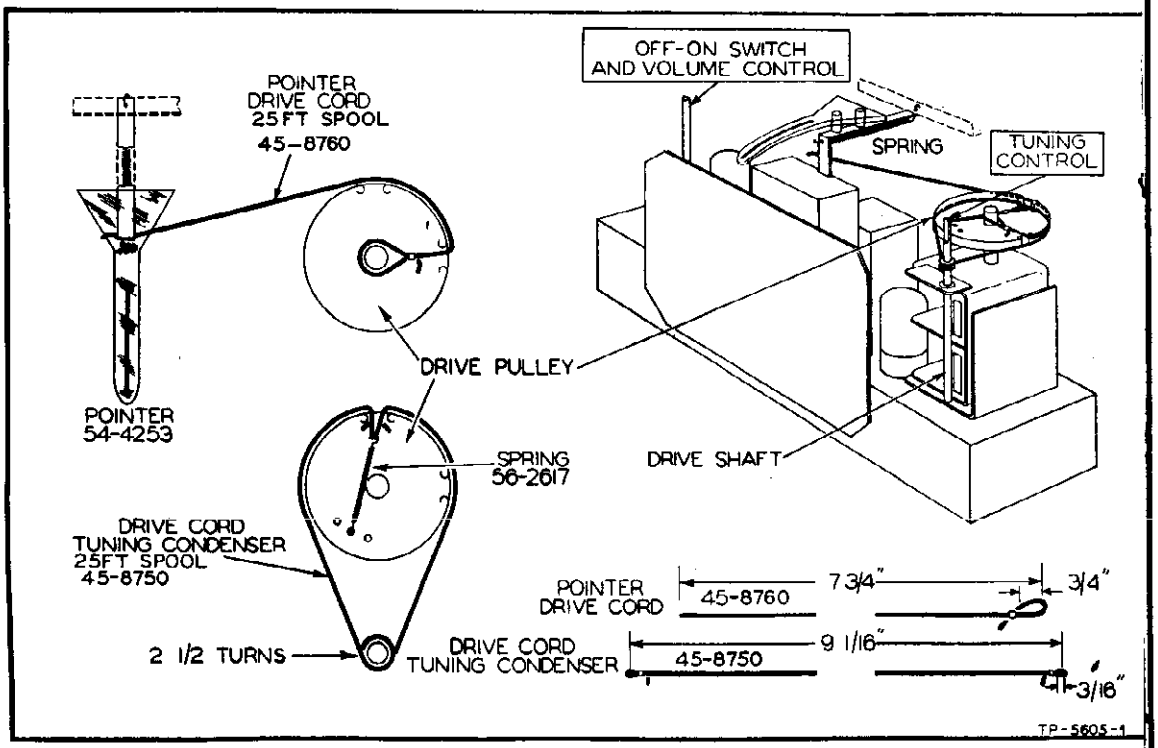

FIGURE 7. DRIVE-CORD INSTALLATION DETAILS

TROUBLE SHOOTING

Section 1

Power Supply

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

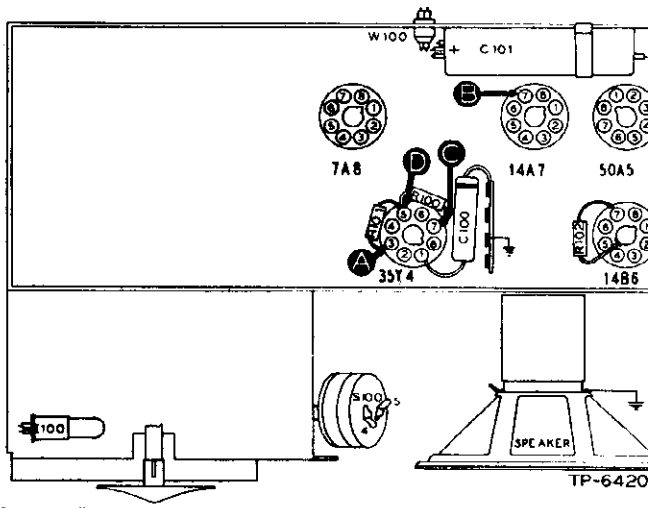

Figure 1. Bottom View, Showing Section 1 Test Poi

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	100 volts		Trouble within this section. Isolate by the following tests.
2	C	124 volts	No voltage	Defective: 35Y4. Open: W100, S100. Shorted: C101A.
			Low voltage	Leaky: C101A. Open: C101A.
			High voltage	Open: R100.
3	D	111 volts	No voltage	Shorted: C101B. Open: R100.
			Low voltage	Leaky: C101A, C101B. Shorted: C203*.
			High voltage	Open: R101, T200*, R204*.
4	A	100 volts	No voltage	Shorted: C101C. Open: R101.
			Low voltage	Leaky: C101C.

Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 2

Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

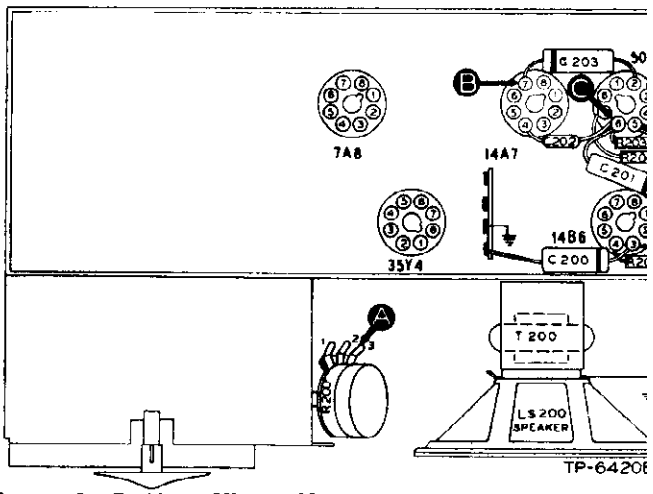

Figure 2. Bottom View, Showing Section 2 Test Poi

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 50A5, LS200. Shorted: C202, C201, C203. Open: T200, R204.
3	D	Loud, clear output with moderate input.	Defective: 14B6. Open: R202, R201, C201.
4	A	Same as step 3.	Shorted: C200, C301D*. Open: C200, R200 (rotate through range).

Listening Test: Distortion may be caused by shorted or leaky C201.

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 3

I-F, Detector, and A-v-c Circuits

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

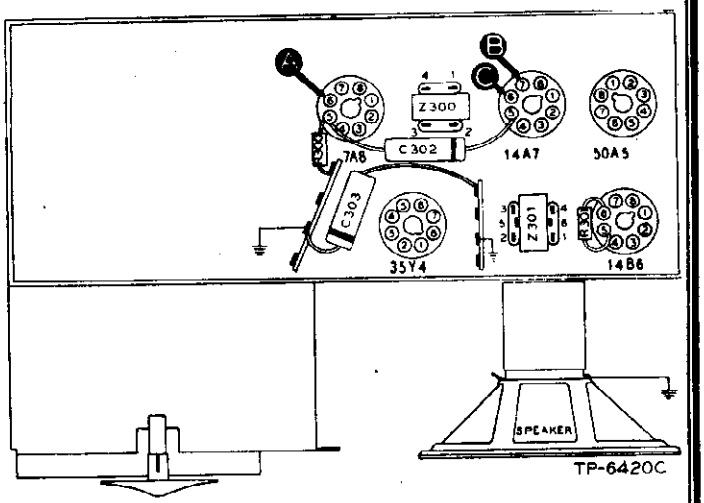

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 14A7, 14B6 (diode section). Shorted: C302, Z301. Open: Z301, R300, R301, R302. Misaligned: Z301.
3	A	Same as step 2.	Defective: 7A8*. Shorted: Z300. Open: Z300. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 4

R-F and Converter Circuits

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume to maximum, and set the drum tuner and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

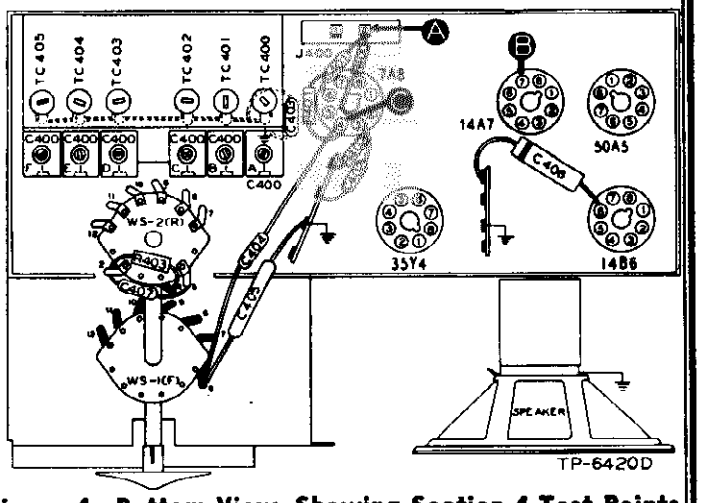

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	DRUM TUNER	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Adjust to frequency of each station setting.	Depress drum tuner for each station setting, in turn.	Loud, clear speaker output with weak signal-generator input.	Trouble in circuits associated with each position of the station-selector drum tuner. Isolate by steps 2 and 3.
2	C to B Osc. Test (see Note below)		Same as step 1.	–3.5v to –4.5v.	No voltage for any station setting—Defective: 7A8. Shorted: C402, C403, C404, C405, L400 to L405, WS-1(F). Open: L400 to L403, C404, C403, R401.
3	A	Same as step 1.	Same as step 1.	Same as step 1.	Shorted: C407, WS-2(R), C400A—F. Open: C401, C407, R403, WS-2(R), C400A—F.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 7A8), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNM

RADIO CONTROLS—Set volume to maximum.

OUTPUT METER—Connect between left-hand terminal (viewed from rear) of J400 and chassis.

STEP	SIGNAL GENERATOR		RADIO		AD TRI
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B–; output lead through .1-mf. condenser to pin 6 of 7A8 converter.	455 kc.	540 kc.	Adjust trimmers, in order given, for maximum output.	TC301B TC301A TC300 TC300

STATION-SELECTOR ADJUSTMENTS

1. Turn on the power, and set the volume for normal volume level.

2. Couple the signal generator loosely as outlined in Note 1.

3. Allow the radio to warm up for 15 minutes.

4. Starting with the lowest frequency desired, set the signal generator, and depress the drum tuner as indicated in the chart. Adjust the associated oscillator tuning core and aerial trimmer for maximum output.

5. Detune the signal generator, and make a final ment of the tuning core and aerial trimmer while li to the station for which the adjustment is being ma

6. Repeat steps 4 and 5 for each remaining station

Note 1: Make up a 6-to-8 turn, 6-inch-diamete using insulated wire; connect to generator leads an near radio loop.

Note 2: For a more critical adjustment, a-v-c may be used as a resonance indicator by connec 20,000-ohms-per-volt voltmeter from pin 6 of the 1 test point B. Adjust for maximum.

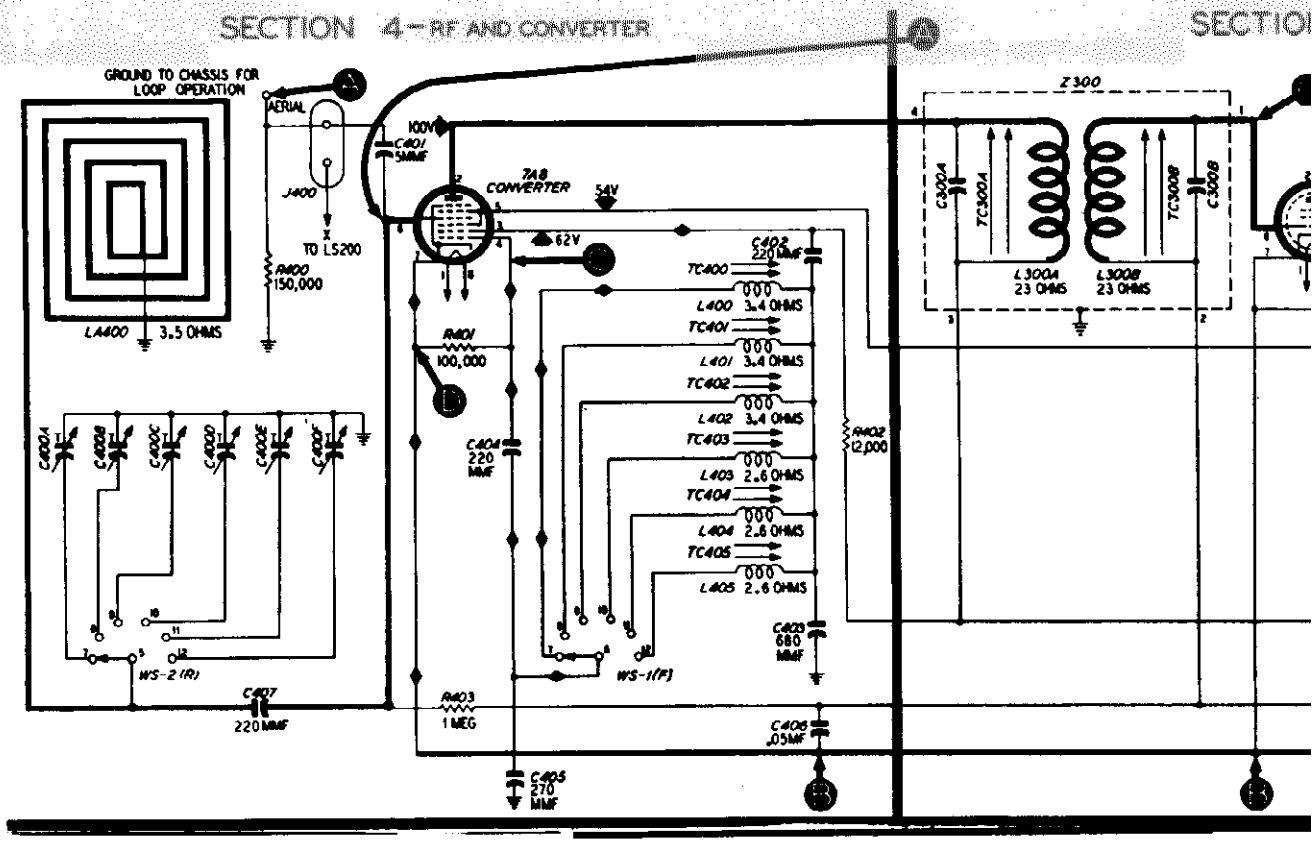
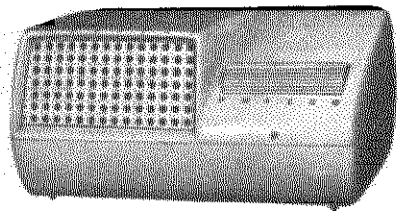
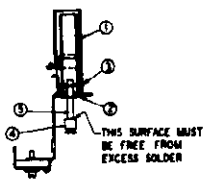
6	900—1600 kc.	TC405	C400F

SECTION 4—RF AND CONVERTER





INSTRUCTIONS FOR REMOVING OSCILLATOR COILS

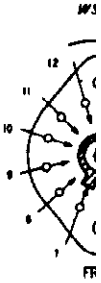


THE FOLLOWING PROCEDURE IS RECOMMENDED FOR REMOVING THE OSCILLATOR COILS:

1. REMOVE ALL WIRE CONNECTIONS AND FIBER SHIELD FROM COILS.
2. HEAT COUPLING (4) WITH SOLDERING IRON AND REMOVE.
3. REMOVE CLIP (2). COIL SHOULD THEN BE REMOVABLE.

REVERSE PROCEDURE FOR REPLACING COILS. WHEN MOUNTING COUPLING, REMOVE ALL EXCESS SOLDER FROM SCREW THREADS.

ALL VOLTAGES WERE MEASURED FROM B- WITH A 20,000 OHMS-PER-VOLT METER AT A LINE VOLTAGE OF 117 V AC.



Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of 35Y4 rectifier) and B—, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, and C203 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

Circuit Description

Philco Model 49-901 is a table-model radio employing a five-tube superheterodyne circuit. The radio is turned on by rotating the drum tuner. Continued rotation adjusts the volume. Any one of six pretuned stations is selected by depressing the drum tuner once for each station. The built-in loop aerial normally provides adequate signal pickup. However, a terminal is provided for connecting an external aerial, if required.

The loop works through a condenser into a 7A8 converter. The 7A8 is transformer-coupled to a 14A7 i-f amplifier, which, in turn, is transformer-coupled to the diode section of a 14B6. Both i-f transformers have permeability-tuned primary and secondary windings, and are tuned to 455 kc. The diode section of the 14B6 provides detection and a-v-c voltage; the a-v-c voltage is applied to the grids of the mixer and i-f amplifier. The 1st audio (triode) section of the 14B6 is resistance-coupled to the 50A5 beam-power output amplifier, which supplies approximately 1 watt of audio power to the PM dynamic speaker.

D-c operating voltages are supplied by a 35Y4 half-wave rectifier and a resistance-capacitance filter. The 150,000-ohm resistor, R102, is connected between B— and the chassis to prevent hum caused by condenser leakage under high-humidity conditions.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistance; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

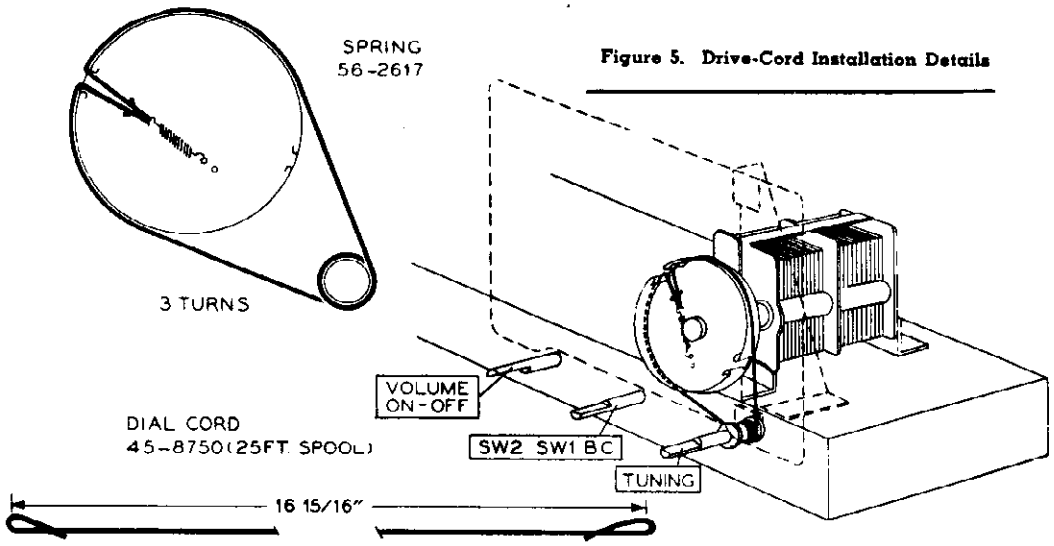

Figure 5. Drive-Cord Installation Details

Circuit Description

Philco Radio Model 49-905 is a six-tube superhetrodyne, which provides reception in the standard-broadcast band and in the FM band. A built-in high-impedance loop is used as the aerial on the broadcast band, and the line cord is used as the aerial on the FM band. These aerials normally provide adequate signal pickup; if additional pickup is required, Philco Dipole Aerial, Part No. 45-1462, may be used. When connecting the dipole aerial, disconnect the blue, external AM aerial lead from the chassis, and attach it to pin 1 of the dipole-aerial plug which fits into J400. No additional coupler is required.

A 12AT7 dual triode is used as the oscillator and mixer for both bands by switching the mixer grid and both the oscillator and mixer cathodes to the proper circuits.

For broadcast reception, the i-f signal is transformer-coupled to a 12AU6 i-f amplifier. The output of this stage is transformer-coupled to a diode section of the 19T8, which provides detection and a-v-c action.

For FM reception, an additional i-f amplifier stage, which employs a 6BH6, is used to provide adequate gain and stability. This stage is coupled into the circuit by applying B+ voltage to the plate and screen grid when the band switch is in the FM position. The 6BH6 is transformer-coupled to both the mixer and the second i-f amplifier. The 12AU6 is also transformer-coupled to two diode sections of the 19T8 in a ratio-detector circuit.

In the i-f circuits, two sets of i-f transformers are used; one set is tuned to 455 kc. for standard broadcast, and the other set is tuned to 9.1 mc. for FM. The use of two sets of transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated.

The triode section of the 19T8 is employed as the first audio amplifier, and is resistance-coupled to the 35C5 output tube, which supplies an audio output of approximately one watt to the permanent-magnet dynamic speaker.

The power supply utilizes a 35W4 as a half-wave rectifier, which operates from a line voltage of 105—120 volts, a.c. or d.c

SPECIFICATIONS

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; those sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 35W4 rectifier) and B–, test point B. When t ohmmeter test leads are connected in the prop polarity, the highest resistance reading will be o tained. If the reading is lower than 1700 ohn check condensers C100A, C100B, C100C, C2C C305, C308, and C310 for leakage or shorts. T resistance value given is much lower than norm and is not intended as a quality check of the condensers; the value given is the lowest at whi the rectifier will operate safely while the volta checks of Section 1 (power supply) are performe

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be altered.

Section 1 TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, set the volume control to minimum, and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

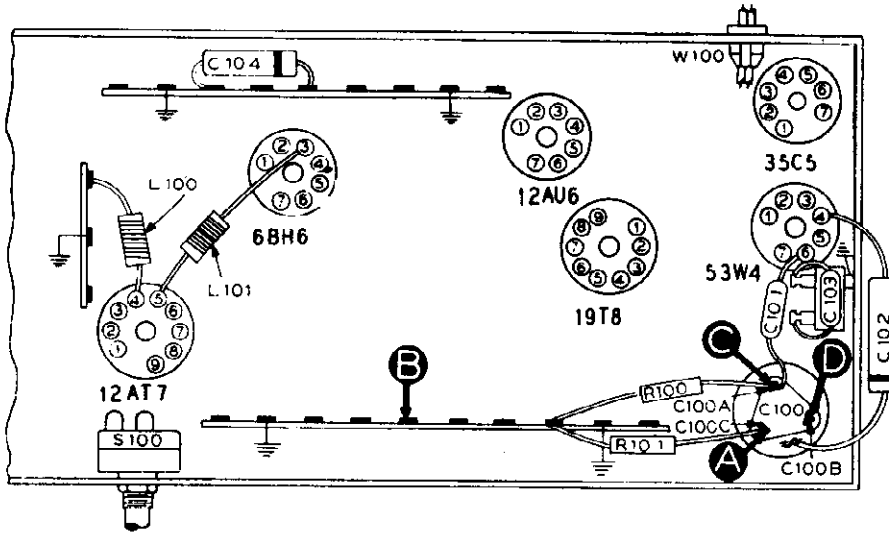

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	104v		Trouble in this section. Isolate by the following tests.
2	C	125v	No voltage	Defective: 35W4. Open: L100, L101, S100, W100. Shorted: C100A, C101.
			Low voltage	Defective: 35W4. Shorted: C100B. Open: C100A.
			High voltage	Open: R100.
3	D	113v	No voltage	Shorted: C100B. Open: R100.
			Low voltage	Open: C100B. Shorted: C201*. Leaky: C100B, C201*.
			High voltage	Open: R101. T200*, R204*. Defective: 35C5*.
4	A	104v	No voltage	Open: R101. Shorted: C100C.
			Low voltage	Leaky: C100C.
Listening Test: Abnormal hum may be caused by leaky or open C100A, C100B, or C100C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING
AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum. Set the band switch to the broadcast position for test points A, C, and D, and to the FM position for test point E.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A E	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 35C5. LS200. Open: R204, C200, T200, R203. Shorted: C201, C200, C202. Leaky: C200, C201, C202.
3	D	Same as step 1.	Defective: 19T8 (triode section). Open: R202, C202, R201. Shorted or leaky: C203.
4	A	Same as step 1.	Open: WS, C205, R200 (rotate through range). Shorted: WS-1(F).
5	E	Same as step 1.	Open: WS-1(F). Shorted: WS-1(F).
Listening Test: Distortion may be caused by shorted or leaky C205 or C202.			

* This part, located in another section, may cause abnormal indication in this section.

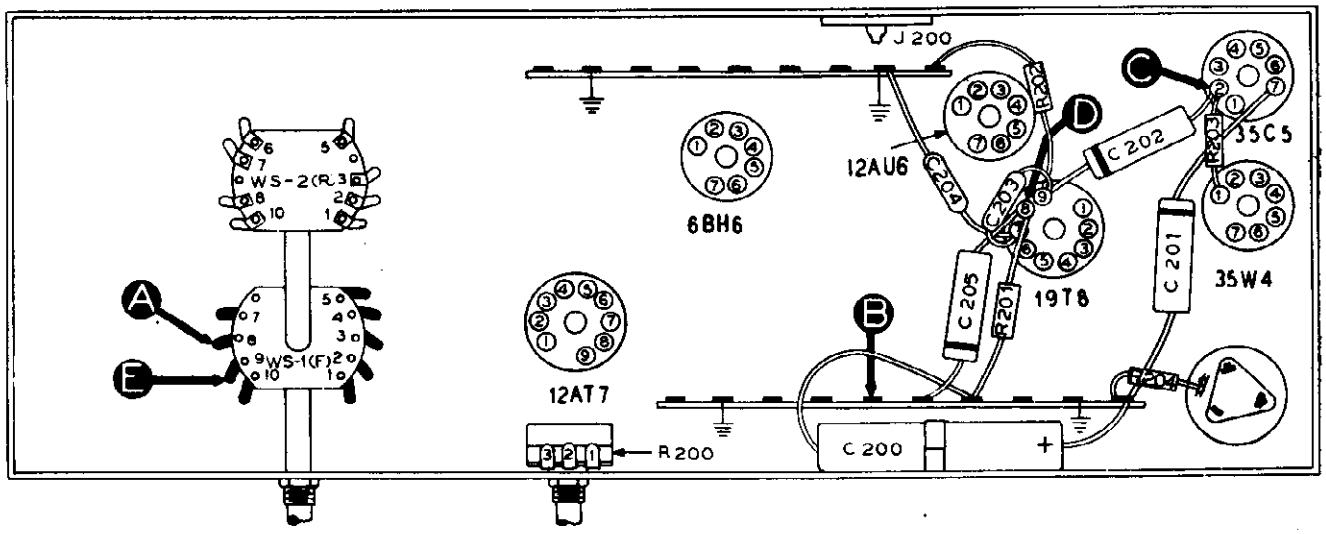

Figure 2. Bottom View, Showing Section 2 Test Points

Section 3 TROUBLE SHOOTING
I-F, DETECTOR, AND A-V-C CIRCUITS
AM Circuits

For the following tests, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, set the band switch to the broadcast position, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits or to the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the AM circuits.

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

Section 3—Cont. TROUBLE SHOOTING

AM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in AM circuits. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 12AU6, 19T8. Open: Z303, Z304, R303, R308. Shorte C310, C312, C304C, Z304, C315, C314.
3	A	Same as step 1.	Open: Z300, Z301, Z302, R302, L300, R402*, R400*, WS-2(R) Shorted: Z301, Z302, C308, C309, C305, C408*. Defectiv 12AT7* (mixer section). Misaligned: Z302.

* This part, located in another section, may cause abnormal indication in this section.

FM Circuits

The following tests are also made with an AM r-f signal generator, using modulated output.

Observe the instructions preliminary to the tests for the AM circuits, with these exceptions: Set the band switch to the FM position. Set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 11).

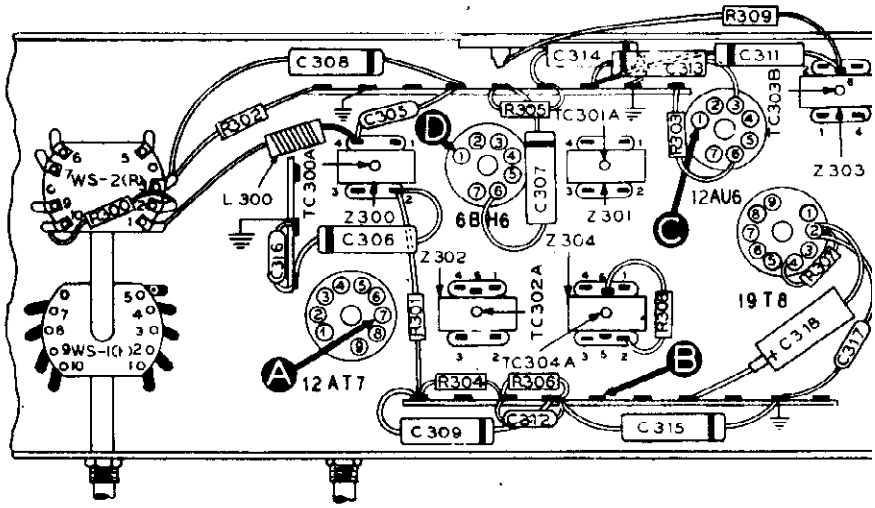

Figure 3. Bottom View, Showing Section 3 Test Points

The parts which were found to be satisfactory for AM operation, with the exception of those ir cated in the chart, will usually be satisfactory for FM operation.

If the "NORMAL INDICATION" is obtained in step 1, proced with the tests for Section 4 (r-f a converter circuits); if not, isolate and correct the trouble in the FM circuits.

FM Chart

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in FM circuits. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 12AU6, 19T8 (diode section). Open: Z301, Z302 Z303, Z304, R304, R307, R309, C318. Shorted: Z301, Z303, C311 C317, C318.
3	D	Loud, clear output with moderate input.	Defective: 6BH6. Open: Z300, Z301, R300, R301, WS-2(R) Shorted: C307, Z301, C306.
4	A	Same as step 1.	Defective: 12AT7*. Open: Z300, C316, C305, WS-2(R)*, C316 R401*. Shorted: C316, Z300.

This part, located in another section, may cause abnormal indication in this section.

MODEL 49-905 PHILCO CORP.

Section 4 TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

AM Circuits

For the tests in this section, with the exception of the oscillator test, use an AM r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, set the band switch to the broadcast position, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the AM circuits. If the trouble is not revealed by the tests for this section, check the alignment.

FM Circuits

The following tests are also made with an AM r-f signal generator, using modulated output. Observe the instructions preliminary to the tests for the AM circuits with the following exceptions:

Set the band switch to the FM position.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the FM circuits.

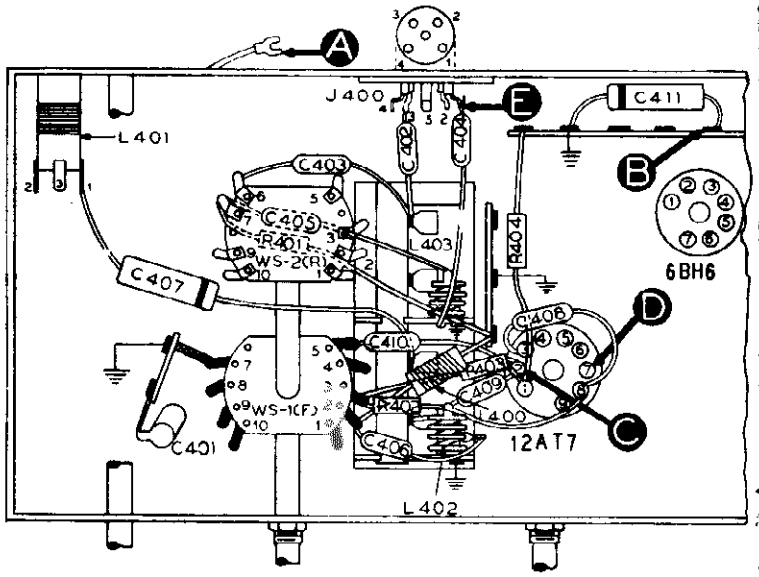

Figure 4. Bottom View, Showing Section 4 Test Points

AM Chart

STEP	TEST POINT	SIG. GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input	Trouble in AM circuits. Isolate by the following tests.
2	C (Osc. test; see note below.)		Tune through range.	Negative 2 to 2.5 volts.	Defective: 12AT7 (osc. section). Open: C410, R404, WS-1(F), R403, L401, C411, C407. Shorted: C409, C410, C407, C411, L401, WS-1(F), C400, C400B.
3	D	1000 kc.	Tune to signal.	Same as step 1.	Defective, 12AT7 (mixer section). Open: R400, R402, WS-2(R). Shorted: WS-2(R), C408.
4	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C402, C403, LA400. Shorted: C400, C400A, LA400.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B-, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2 of 12AT7), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

FM Chart

STEP	TEST POINT	SIG. GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	100 mc.	Tune to signal.	Loud, clear speaker output with weak generator input	Trouble in FM circuits. Isolate by the following tests.
2	C (Osc. test; see note above.)		Tune through range.	Negative 1 to 1.5 volts.	Defective: 12AT7 (osc. section). Open: C409, C406, L400, C410, L402, WS-1(F). Shorted: C400, C401, L402, C406, C409, C410, L400, WS-1(F).
3	D	100 mc.	Tune to signal.	Same as step 1.	Open: R401, WS-2(R). Shorted: C408, WS-2(R).
4	E	100 mc.	Tune to signal.	Same as step 1.	Open: C404, L403, C405. Shorted: C404, L403, C400, C400C, C405.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) indicate general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and replacement parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements use only the "Service Part No."

Window, acetate	54-4595

† 42-1870 is a two-section wafer switch (band switch).

AM ALIGNMENT PROCEDURE

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignment is made.

DIAL POINTER—With tuning-condenser plates fully meshed, adjust dial pointer to coincide with index mark at low-frequency end of dial.

OUTPUT METER—Connect across voice-coil terminals.

AM R-F SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, and set band switch to broadcast position.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

FM ALIGNMENT PROCEDURE

Make AM Alignment First

OUTPUT METER—Connect across voice-coil terminals.

ALIGNMENT INDICATOR—Connect negative lead of 20,000-ohms-per-volt meter to pin 2 of 19T8 tube; connect positive lead to B–, test point B, in Section 2. Use 10-volt range.

AM R-F SIGNAL GENERATOR—Generator must have sufficient output to give a reading of 8.5 volts on alignment indicator. Connect ground lead to B–; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, and set band switch to FM position. Allow radio and signal generator to operate for at least 15 minutes before making alignment.

NOTE: Check resonance of coils L402 and L403 by inserting each end of a powdered-iron tuning core, such as Philco Part No. 56-6100, into the coils. If the signal strength increases when the iron end is inserted, compress the turns slightly. If the signal strength increases when the brass end is inserted, spread the turns slightly. If the signal strength decreases when either the iron or the brass end is inserted, no further adjustment is necessary. Do not spread or compress turns of coil excessively; only a small change is required at these high frequencies.

MODEL 49-905

AM AL

STEP	SIGNAL GENERATOR		RADIO		AD
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B-, test point B; output lead through .1-mf. condenser to mixer grid (pin 7 of 12AT7).	455 kc.	540 kc.	Adjust tuning cores, in order given, for maximum output. Do not repeat adjustments.	TC304B—AI TC304A—A TC302B—AI TC302A—A
2	Radiating loop (See note below.)	1600 kc.	1600 kc.	Adjust trimmer for maximum output.	C4
3	Same as step 2.	1500 kc.	1500 kc.	Adjust trimmer for maximum output.	C4(

NOTE: Make up a six-to-eight-turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and pla radio loop aerial. Make certain that loop aerial is connected to radio.

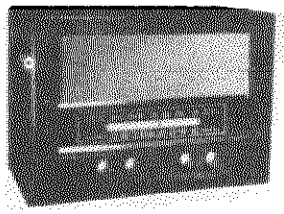
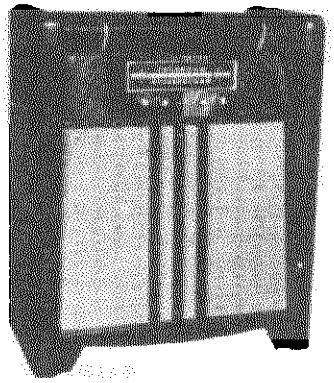
PHILCO CORP.

MODEL 49-90
49-1101



Circuit Description

Both models are 9-tube superheterodynes designed to provide reception on the standard broadcast band and the FM band. The only electrical difference between the two models is in the broadcast loop aerial; Model 49-909 has a semi-high-impedance loop and a series aerial coil; Model 49-1101 has a low-impedance loop and an aerial transformer. Any other minor differences are indicated in the schematic diagram and the replacement parts list. A built-in line-cord aerial is used for FM reception.



These aerials normally provide adequate signal pickup; if additional pickup is required, Philco Dipole Aerial, Part No. 45-1462, may be used. When connecting the dipole aerial, disconnect the black lead from terminal 2 of TB400, and attach it to pin 1 of the dipole-aerial plug which fits into J400. No additional coupler is required.

To eliminate complicated switching and to provide greater stability and gain on both bands, separate converter tubes are used for broadcast and FM reception. A 12AU6 high-gain pentode is used as a tuned-r-f amplifier on the FM band. The output of this stage is fed to a 14F8 dual triode, which functions as the converter for the FM signal. A 12AU7 dual triode is used as the converter for the broadcast signal. Band-switching is accomplished by means of a single-wafer switch, which connects the B+ voltage to the proper mixer plate.

6BJ6 tubes are used in the two i-f-amplifier stages. Two sets of i-f transformers are used; one set is tuned to 455 kc. for standard broadcast, and the other set is tuned to 9.1 mc. for FM. The use of two sets of transformers makes better shielding possible, so that undesirable beat signals and interaction between transformers are eliminated.

Two diode sections of the 19T8 triple-diode-triode are used in a ratio-detector circuit for the detection of FM signals. The other diode section is used in a half-wave rectifier circuit for detection of standard-broadcast signals and to provide a-v-c voltage.

The triode section of the 19T8 is employed as the first audio amplifier, and is resistance-coupled to the 50L6GT output tube, which supplies an audio output of approximately three watts to the PM dynamic speaker.

The d-c operating voltages are provided by two 117Z3 rectifier tubes in a half-wave doubler circuit. The output is filtered by a resistance-capacitance network.

SPECIFICATIONS

CABINET	
Model 49-909	Table model, wood, mahogany
Model 49-1101	Console, wood, mahogany
CIRCUIT	9-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1620 kc.
FM	88—108 mc.
AUDIO OUTPUT	3 watts
OPERATING VOLTAGE	105—120 volts, 50/60 cycles, a.c.
POWER CONSUMPTION	45 watts
AERIALS	Built-in loop (semi-high-impedance for Model 49-909; low-impedance for Model 49-1101); FM line-cord aerial; provision for external aerial
INTERMEDIATE FREQUENCY	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (9)	12AU6, 12AU7, 14F8, 6BJ6(2), 19T8, 50L6GT, 117Z3(2)
PANEL LAMP	110-volt, screw-base, Part No. 34-2477

TP-5856 & TP-6234A

MODEL 49-909, 49-1101

PHILCO CORP.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (lug 1 of R101) and B—, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1875 ohms, check condensers C104A, C104B, and C104C for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

3. If the 50L6GT or the 6BJ6 1st i-f amplifier is burned out, check C314 for a short before installing a new tube.

Important!

To avoid altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

Section 1 TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Set the tone control for minimum treble response (fully clockwise), and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

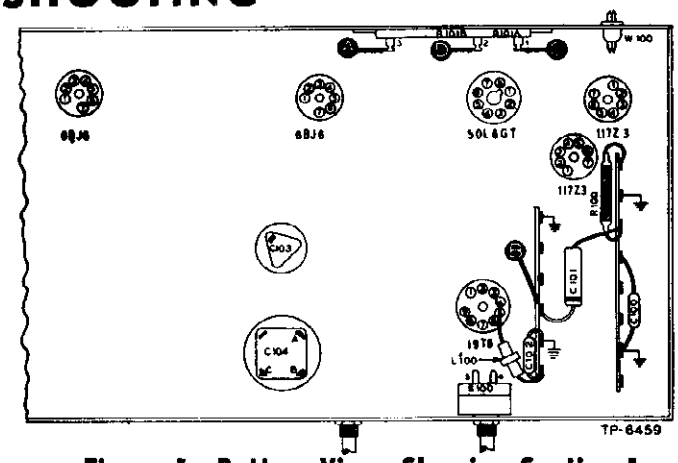


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	120 volts		Trouble in this section. Isolate by the following tests.
2	C	210 volts	No voltage	Defective: 117Z3. Open: W100, S100, R100, C103. Shorted: C101, C104A.
			Low voltage	Defective: 117Z3. Leaky: C104A, C103. Shorted: C103, C104B. Open: C104A.
			High voltage	Open: R101A.
3	D	190 volts	No voltage	Open: R101A. Shorted: C104B.
			Low voltage	Leaky: C104B. Shorted: C104C. Open: C104B.
			High voltage	Open: R101B, T200*, R204*. Defective: 50L6GT.
4	A	120 volts	No voltage	Open: R101B. Shorted: C104C.
			Low voltage	Leaky: C104C. Shorted: C317*, C311*.

Listening Test: Abnormal hum may be caused by open C104A, C104B, or C104C.

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, turn the tone control for maximum treble response (fully counterclockwise) and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in st 1, proceed with the tests for Section 3 (i-f, detector, a a-v-c circuits); if not, isolate and correct the trouble in t section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate signal-generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 50L6GT. Shorted: LS200, T200. Open: R203, R204, C205, LS200, T200. Shorted or leaky: C203, C205, C207.
3	D	Same as step 1.	Defective: 19T8. Open: R205, R202, C203, R207, R201. Shorted or leaky: C202, C204 (rotate R201 through range).
4	A	Same as step 1.	Open: R200 (rotate through range), C200, C201, R206 (rota R201 through range). Shorted or leaky: C200, C201, C206 (rotate R201 through range C305D*.
Listening Test: Distortion may be caused by leaky C200, C201, C202, or C203.			

* This part, located in another section, may cause abnormal indication in this section.

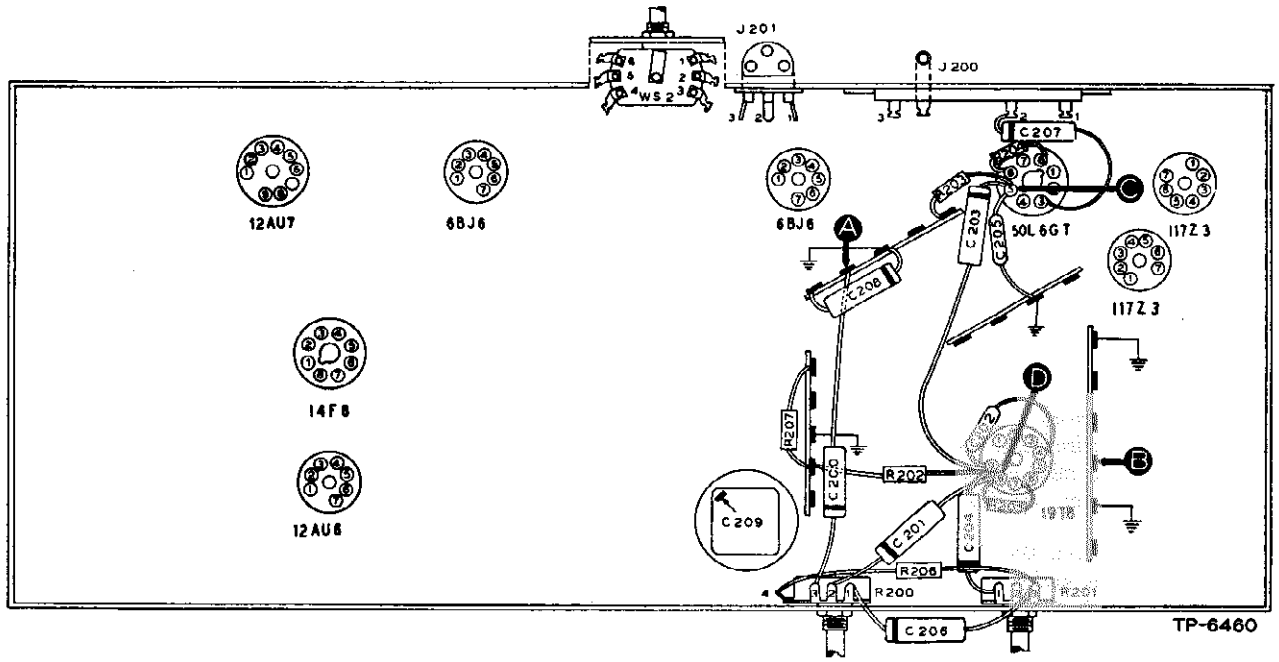

Figure 2. Bottom View, Showing Section 2 Test Points

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS—AM CIRCUITS

For the following tests, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control for maximum treble response (fully counterclockwise). Set the band switch to the broadcast position, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in st 1, proceed with the tests for the FM circuits; if not, isol and correct the trouble in the AM circuits.

To provide a complete i-f-amplifier check, test point for the AM i-f circuits is placed at the grid of the AM mi in Section 4; therefore, the effectiveness of step 1 as master check is dependent upon the condition of cert parts in the mixer circuit. These parts are listed bel under "POSSIBLE CAUSE OF ABNORMAL IND CATION."

Section 3 (Cont.)

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble in AM circuits. Isolate by the following tests.
2	D	Loud, clear output with moderate input.	Defective: 19T8, 6BJ6 (2nd i-f amplifier). Open: Z302, Z303, Z304, Z305, R307, WS2, R308, R309, R311, C305C, C305D, WS1, R310. Shorted or leaky: C303B, C315, C316, C317, C324, C305A, C305B, C305C, C305D. Shorted: Z303, Z305.
3	E	Same as step 2.	Defective: 6BJ6 (1st i-f amplifier). Open: Z300, Z301, R301, R305, R306, R302, R304, Z302, Z303. Shorted or leaky: C308, C313, C311. Shorted: Z303.
4	A	Same as step 1.	Defective: 12AU7*. Open: R409*, L404*, R303, R300, Z301, R411*, WS1. Shorted or leaky: C410*, C307. Shorted: Z301.

Listening Test: Hum and distortion may be caused by shorted or leaky C100*, C310, C314, C320, C312, C102*, C420*, C421*, C422*, C423*, C324, C325 or C323.

* This part, located in another section; may cause abnormal indication in this section.

FM CIRCUITS

For the following tests, use an AM r-f signal generator, with modulated output. Set the generator frequency to 9.1 mc. and detune to one side or the other until a satisfactory test signal is obtained. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control for maximum treble response (fully counterclockwise). Set the band switch to the FM position, and rotate the tuning control until the tuning condenser is fully meshed.

The most satisfactory check on the operation of the discriminator is the ability of the circuit to take proper alignment, as directed under "ALIGNMENT PROCEDURE."

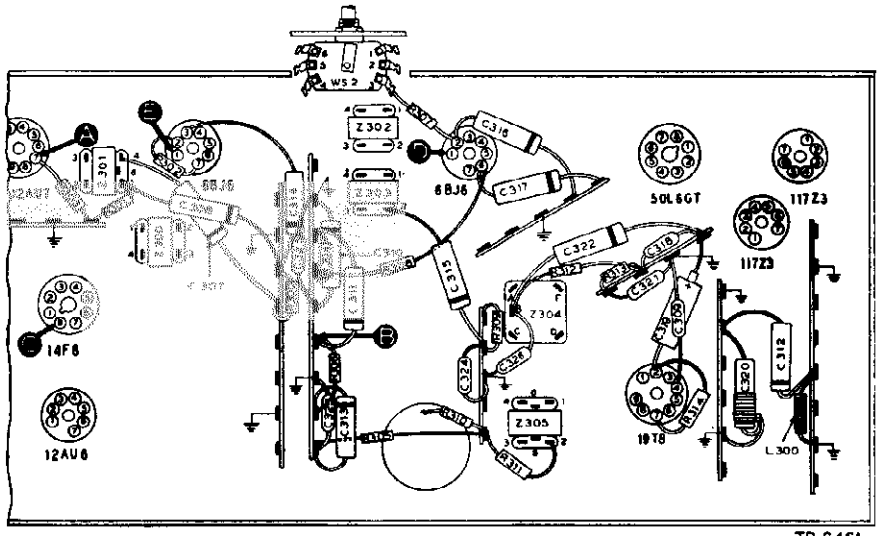

Figure 3. Bottom View, Showing Section 3 Test Points TP-6461

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in the FM circuits.

The parts which were found to be satisfactory for AM operation, with the exception of those indicated in the following chart, will usually be satisfactory for FM operation.

To provide a complete i-f-amplifier check, test point A for the FM i-f circuits is placed at the grid of the FM mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	C	Loud, clear speaker output with weak signal-generator input.	Trouble in FM circuits. Isolate by the following tests.
2	D	Loud, clear output with strong input.	Defective: 6BJ6 (2nd i-f amplifier), 19T8, Z304. Misaligned: Z304. Open: R312, R313, R314, C320, C319, C318, C304, C306. Shorted or leaky: C319, C320, C304, C306, C318, C326.
3	E	Loud, clear output with moderate input.	Defective: 6BJ6 (1st i-f amplifier). Misaligned: Z302. Open: Z302. Shorted: Z302.
4	C	Same as step 1.	Defective: 14F8*. Open: R300, R406*, R405*, R407*, L408*, Z300, WS1. Shorted or leaky: C418*, C419*.

* This part, located in another section, may cause abnormal indication in this section.

Section 4

TROUBLE SHOOTING

R-F AND CONVERTER CIRCUITS

AM CIRCUITS

For the following tests, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and turn the tone control for maximum treble response (fully counterclockwise). Set the band switch to the broadcast position, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits, if not, isolate and correct the trouble in the AM circuits.

FM CIRCUITS

For the following tests, with the exception of the oscillator test, use an AM r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

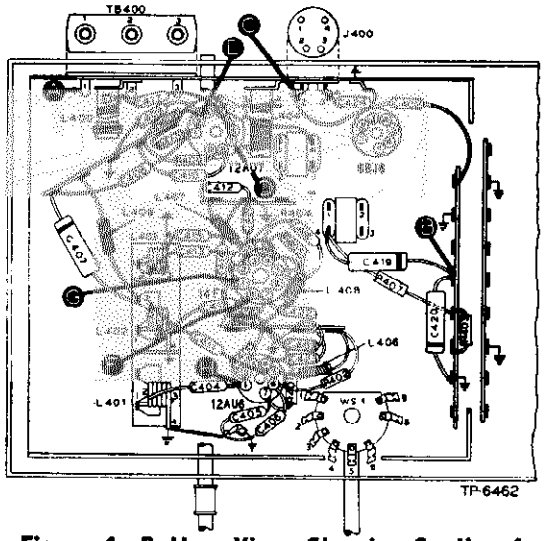

Figure 4. Bottom View, Showing Section 4 Test Points

Set the volume control to maximum, and turn the tone control for maximum treble response (fully counterclockwise). Set the band switch to the FM position, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in the FM circuits. If the trouble is not revealed by the tests for these circuits, check the alignment.

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak signal-generator input.	Trouble in AM circuits. Isolate by the following tests.
2	D	1000 kc.	1000 kc.	Loud, clear output with moderate input.	Defective: 12AU7, oscillator circuit. Shorted: C410, C417, WS1. Open: R409, R411, R303*, WS2.
3	E to B (Osc. test, see note below.)		Rotate through range.	Negative 2 to 3 volts.	Defective: 12AU7. Open: R408, R410, L404, C408, C407, L409. Shorted: C408, C409, C400, C401B.
4	A	1000 kc.	1000 kc.	Same as step 1.	Open: L400, C417, L405. Shorted: C400, C401A, C425.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B—, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 2 of 12AU7), test point E. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	C	95 mc.	Tune to signal.	Loud, clear speaker output with weak signal-generator input.	Trouble in FM circuits. Isolate by the following tests.
2	F	95 mc.	Tune to signal.	Loud, clear output with moderate input.	Defective: 14F8, oscillator circuit. Open: R405, R406, R407, L408, C418, L402. Shorted: C418, C416, C400, C400B, C419, L402.
3	G to B (Osc. test, see note below.)		Tune through range.	Negative 1.2 to 2 volts.	Defective: 14F8. Open: R404, L407, R403, C413, C415, L403. Shorted: C400, C400C, C413, C415, C414, C412, L403, L407.
4	H	95 mc.	Tune to signal.	Same as step 1.	Defective: 12AU6. Open: L402, L406, R400, R401, R402, C411, C418, R412. Shorted: C405, C404, C406, C411, C400, C400B, C404, L402.
5	C	95 mc.	Tune to signal.	Same as step 1.	Open: C402, L401, C404, R412. Shorted: C404, C400, C400A, L401.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B—, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1 of 14F8), test point G. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart. (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 49-909, 49-1101

PHILCO CORP.

ALIGNMENT OF AM CIRCUITS

Make alignment with loop aerial connected to radio. The AM alignment should be completed before the FM alignment is made.

DIAL POINTER—With tuning condenser fully meshed, adjust dial pointer to coincide with index mark at low-frequency end of dial. See figure 7.

OUTPUT METER—Connect between terminal 3 (voice-coil connection) of aerial terminal panel TB400 and chassis.

AM SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, signal-generator output must be attenuated to hold radio output below 1.25 volts, as read on output meter.

CONTROLS—Set volume control to maximum, turn tone control for maximum treble response (fully counterclockwise), and set band switch to broadcast position.

ALIGNMENT OF FM CIRCUITS

Align the AM circuits first.

OUTPUT METER—Connect between terminal 3 (voice-coil connection) of aerial terminal panel TB400 and chassis.

ALIGNMENT INDICATOR—Connect negative lead of a 20,000-ohms-per-volt, d-c voltmeter to pin 2 of 19T8 tube; connect positive lead to B—, test point B in Section 2. Use 10-volt range.

AM SIGNAL GENERATOR—Generator must have sufficient output to give a reading of at least 8.5 volts on alignment indicator. Connect generator ground lead to B—, test point B; connect output lead as indicated in chart. Use modulated output.

CONTROLS—Same as for alignment of AM circuits, except set band switch to FM position.

Allow radio and signal generator to warm up for at least 15 minutes before starting alignment.

NOTE: Check resonance of circuits using coils L401, L402, and L403 by inserting each end of a powdered-iron tuning core, such as Philco Part No. 56-6100, in the coil. If the signal strength increases when the iron end is inserted, compress the turns slightly. If the signal strength increases when the threaded brass end is inserted, spread the turns slightly. If the signal strength decreases when either the iron or the brass end is inserted, no adjustment is necessary. Do not spread or compress the turns of the coil excessively; only a small change is required at these high frequencies.

ANTENNAS.— The built-in antennas are satisfactory in most locations, however, external antennas can be used when needed. For amplitude-modulated reception, connect an external antenna and ground wire to the terminals provided on the built-in loop.

For frequency-modulated signals, the antenna and lead-in should have an impedance of 300 ohms. Connect the lead-in to the two left-hand terminal screws on the rear of the chassis. Connect a ground wire to the third terminal screw.

POWER SOURCE.— Connect the power plug to an alternating-current supply of 115-120 volts, 60 cycles. DO NOT CONNECT TO DIRECT CURRENT.

RADIO OPERATION.— Switch on the power by turning the Volume control clockwise. Wait 35-40 seconds for the tubes to reach operating temperature. Set the three-position switch on AM or FM as desired. Select the station with the Tuning control. Adjust the Volume control and Tone control to suit.

TYPE: Eleven-tube F-M/A-M superheterodyne.

FREQUENCY RANGES: A-M, 540-1600 KC. F-M, 88-108 MC.

INTERMEDIATE FREQUENCIES: A-M, 456 KC; F-M, 10.7 MC.

POWER SOURCE: 105-125 volts, 60 cycles.

POWER CONSUMPTION:
RADIO, 80 watts.
RADIO AND PHONOGRAPH, 95 watts.

POWER OUTPUT: 4.5 watts

STANDARD RMA WARRANTY APPLIES.

A-M Alignment

Turn gang condenser to fully meshed position. Set dial pointer on the small dot to the left of the end calibration. Turn volume control to maximum volume. Use a standard A-M signal generator, with the high side coupled to the input point through a .01 uf capacitor. Ground the other side to the chassis. Connect the output meter across the voice coil of output transformer 108. The output of the signal generator should be no higher than necessary to obtain the output reading. Where loop coupling is specified, connect the signal generator output to two or three turns of wire spaced about two feet from the antenna loop.

Signal Generator and Coupling Capacitor	Signal Generator Frequency	Input to	Tuning Dial Setting	Output Meter	Adjust	Remarks
A-M Signal Generator .01 uf.	455 KC	Pin 8 6SA7	Low-Freq. End.	Across Voice Coil of 108	A13, A12, A9, A8	Adjust for max. output. Repeat

MODEL 3-63A
MODEL 3-81A

PHILLIPS PETROLEUM CO.

MODEL 3-63A

Operation: The set operates on 105-125 volts 60 cycles, AC. The power drain is approximately 35 watts on radio operation and 17 watts additional on phonograph operation.

Range: This set has both a broadcast and shortwave range. The complete broadcast band is covered from 532 to 1700 kilocycles. Since the broadcast dial scale is calibrated from 55 to 160, the actual frequency of the station may be obtained by adding zero to the dial calibration. The shortwave band covers from 5.6 to 12.5-megacycles. The shortwave dial scale is calibrated directly in megacycles.

Alignment: No attempt should be made to re-align this receiver until it has been determined that poor tubes or some local condition is not responsible for faulty reception. The signal generator may be connected through 0.01 mfd capacitor used as a dummy antenna, to the lug on the RF section "B" of the tuning capacitor. Connect ground clip of generator directly to chassis. An output meter may be clipped across the voice coil lug on the speaker. Align IF trimmers to 455 kilocycles, using the least possible input in the signal generator. With tuning plates completely out of mesh (pointer at the extreme right end of travel) the set in broadcast position, adjust the broadcast oscillator trimmer (A) to 1700 kilocycles. Then switch to shortwave and adjust the shortwave oscillator trimmer (D) to 12.5 megacycles. Replace the 01 mfd dummy by a 39 mmfd mica capacitor and connect to antenna terminal "A." Tune set and signal generator to 600 kilocycles and adjust broadcast antenna coil slug for maximum output. Then re-tune set and signal generator to 1550 kilocycles and adjust RF trimmer "B" on tuning capacitor for maximum response. Repeat these adjustments until no further adjustment is required, then switch receiver to shortwave. Tune set and signal generator to 6 megacycles and adjust shortwave antenna coil slug "E" for maximum response. Retune set and signal generator to 10.5 megacycles and tune shortwave antenna, trimmer "C" for maximum response. In these adjustments the tuning control should be rocked for best results. Repeat these adjustments until no further adjustment is needed.

For checking purposes, five marks are engraved on the dial plate. These represent, in order from left to right: the pointer position capacitor plates fully meshed and the pointer settings for 600 kc or 6 mc; 1000-kc, 10.5 mc and 1550 kc.

MODEL 3-81A

Operation: The set operates on 110 to 120 volts, 60 cycles A.C. Power drain is approximately 125 watts for radio and about 20 watts additional for the record changer

Ranges: This receiver has AM broadcast and short-wave and FM ranges

FM—87.4 to 108.7 megacycles
AM Broadcast—535 to 1720 kilocycles
AM Short-Wave—5.6 to 18.5 megacycles

Instructions For Removing Radio From Cabinet

Main Chassis:

To remove main chassis from the cabinet it is first necessary to remove the four control knobs by pulling them gently until they come off. Remove all plugs from the rear of the main chassis and power pack chassis. Pull the 5U4G rectifier tube out of the power pack chassis. The four screws holding the chassis may now be removed. The chassis itself may now be taken out by sliding it straight back toward the rear of the cabinet.

Power Pack Chassis:

The power pack chassis may be removed from the cabinet by unscrewing the four large screws holding it to its support shelf. These are accessible from the under side of the cabinet.

Record Changer:

Most adjustments may be made to the record changer without removing it from its drawer. Before attempting to remove the record changer from the cabinet the motor plug and the phono pickup plug must first be removed from the main and power pack chassis. Loosen the cable clamps on the rear of the cabinet sufficiently to lift out cables.

Pull changer drawer forward until it hits its stop. Lift the turntable completely off. Be careful not to lose the spring and loose gear on the spindle of the record changer. Remove retaining washers from the mounting screws at the front and rear of the record changer. The mounting screws may now be removed from the bottom of record changer drawer and the record changer may be lifted out.

Alignment:

No attempt should be made to realign this receiver until it has been determined that a poor tube or some local condition is not responsible for faulty reception. The following is a list of minimum equipment necessary to realign this receiver:

1—AM signal generator covering 455KC, 600KC, 1550KC, 6 MC, 10.7 MC and 18 MC

2—FM signal generator covering 10.7 MC, 92 MC and 106 MC

3—Output meter, rectifier type, approximately 0 to 2 volts RMS

4—Dummy antennas

0.01 MFD Capacitor
200 MMF Mica Capacitor
400 Ohm Resistor
300 Ohm Resistor

In the following alignment procedure the high side of the signal generator is connected to the terminal indicated in the "Signal Generator Coupling" column below. The ground side of the signal generator is connected directly to the chassis unless otherwise noted. The output meter should be connected across the voice coil of the speaker for all measurements.

In adjusting the radio frequency trimmers and padders it is advisable to "rock" the variable capacitor gang slightly across the signal being delivered by the signal generator until that particular signal has been accurately peaked.

The location of the following trimmers, padders and terminals can be found by referring to the tube and trimmer location diagram.

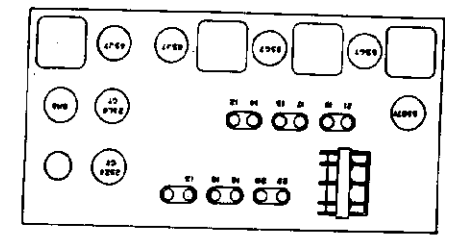
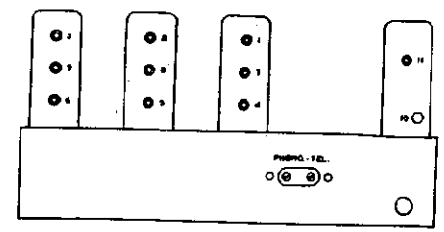
TRIMMER LAYOUT





ALIGNMENT NOTES

Alignment should be attempted only if the proper output meters and signal generators are at your disposal. Insulated alignment tools are necessary. Output meters should include (1) a low range A.C. meter, (2) a 0-200 D.C. microammeter in series with a 100,000 ohm resistor or 0-20 volt D.C. vacuum tube voltmeter, and (3) a 50-0-50 microammeter in series with a 100,000 ohm resistor. The signal generators must cover frequencies from 450 kc to 108 mc.

It is essential that the signal generator be connected to the points indicated in the alignment chart through the proper dummy antenna.

A good ground connection, between the groundpost of the signal generator and the groundpost of the antenna strip, is necessary.

The output of the signal generator must always be kept at its lowest possible value. This is to prevent the automatic volume control of the

During alignment, the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The locations of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

TUNING RANGE

Band (1) — **Phonograph-Television** — (Must be attached to phonograph or television receiver)

Band (2) — **Frequency Modulation** — (87.5 to 108.5 mc or 2.77 to 3.43 meters)

Band (3) — **Standard Broadcast** — (535 to 1720 kc or 174 to 561 meters)

Band (4) — **International Shortwave** — (5.6 to 18.5 mc or 16.2 to 53.6 meters)

Band (5) — **31 Meter Bandspread** — (9.353 to 9.795 mc or 30.65 to 32.10 meters)

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC signal with 400 cycles modulation (use nearby frequency if local station interferes.)

2. For R.F. and I.F. measurements connect negative terminal of a 3-volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.

3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)

4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capacity of a stage.

Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet.

2. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, release pointer clip on dial and reposition pointer.

3. Connect an output meter across the speaker voice coil or from the plate of the 50L6GT tube to chassis through a .1 Mfd. condenser.

4. Connect the ground lead of the signal generator to the receiver chassis through a .25 Mfd. condenser.

5. Set volume control at maximum volume position and use a weak signal from the signal generator.

ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

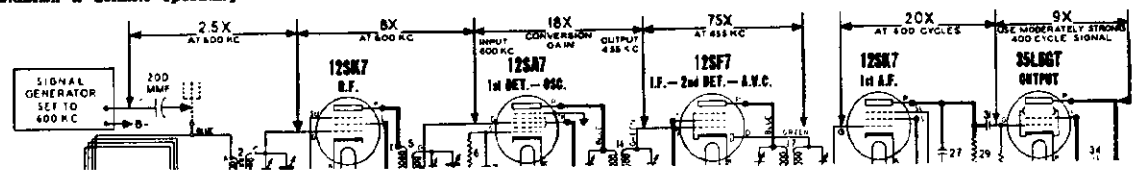
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. **IMPORTANT:** Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

MODELS MI-13174-1, MI-13174-3

RADIO CORP. OF AMERICA

Alignment Procedure

Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible
2. Dress R-F plate filter capacitor (C2, 0.1 mf.) back against rear chassis apron.
3. Dress yellow and brown leads from 2nd I-F away from all other leads.
4. Dress all heater leads next to chassis.
5. Dress capacitor (C13, .01 mf.) parallel to osc. coil and approximately 3/16 inch from coil.
6. Dress tone control lead and speaker field leads next to chassis and front apron.
7. Dress pilot lamp leads away from ant. coil.
8. Dress leads from loop ant. coil around rectifier tube towards end of chassis.
9. Dress output plate lead against chassis.

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf. capacitor to common "-B." Keep the output signal as low as possible to avoid A.V.C. action.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum clockwise position, station selector switch to broadcast maximum high position (pos. 1), for broadcast alignment and to position 3 for high frequency band.

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer to left (max. cap.) mark on dial back plate.

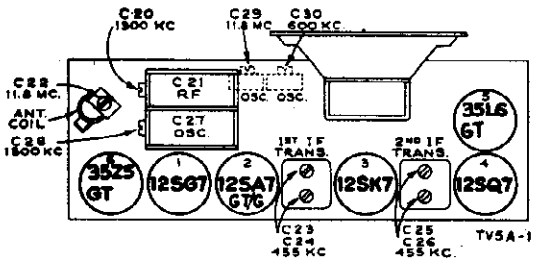
Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate.

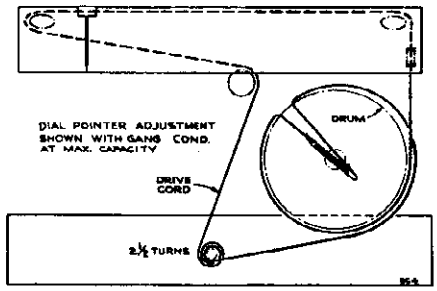
Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Pin #8 of 12SA7 in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C25, C26 2nd I-F trans.
2				C23, C24† 1st I-F trans.
3	Ant. terminal in series with 220 mmf.	600 kc	600 kc "A" Band	C30 (osc.) Rock gang
4		1300 kc	1300 kc "A" Band	C28 (osc.) C20 (R-F)
5		Repeat 3 Rocking gang		
6		Repeat 3, 4 and 5 for exact cal.		
7	Ant. terminal in series with 0.1 mfd.	11.8 mc	11.8 mc	C29 (osc.)* Rock gang
8	Ant. terminal in series with 47 mmf.	11.8 mc	11.8 mc	C22 (R-F) Rock gang
9	Repeat steps 7 and 8			

* Use minimum capacity peak if two can be obtained. Check for selection of correct peak by tuning receiver to approximately 10.9 mc where a weaker signal should be received.

† Do not readjust C25 or C26.





Specifications

Frequency Range

Broadcast	540-1600 kc
Short Wave	8.9-12 mc
Intermediate Frequency	455 kc
Pilot Lamp	Mazda No. 51, 6-8 volts, 0.2 amp.

Power Output

Undistorted	1.0 watts
Maximum	1.5 watts

Loudspeaker (92510-1) "PM"

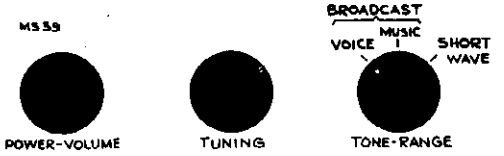
Size	5-inch
V.C. Impedance	3.4 ohms at 400 cycles

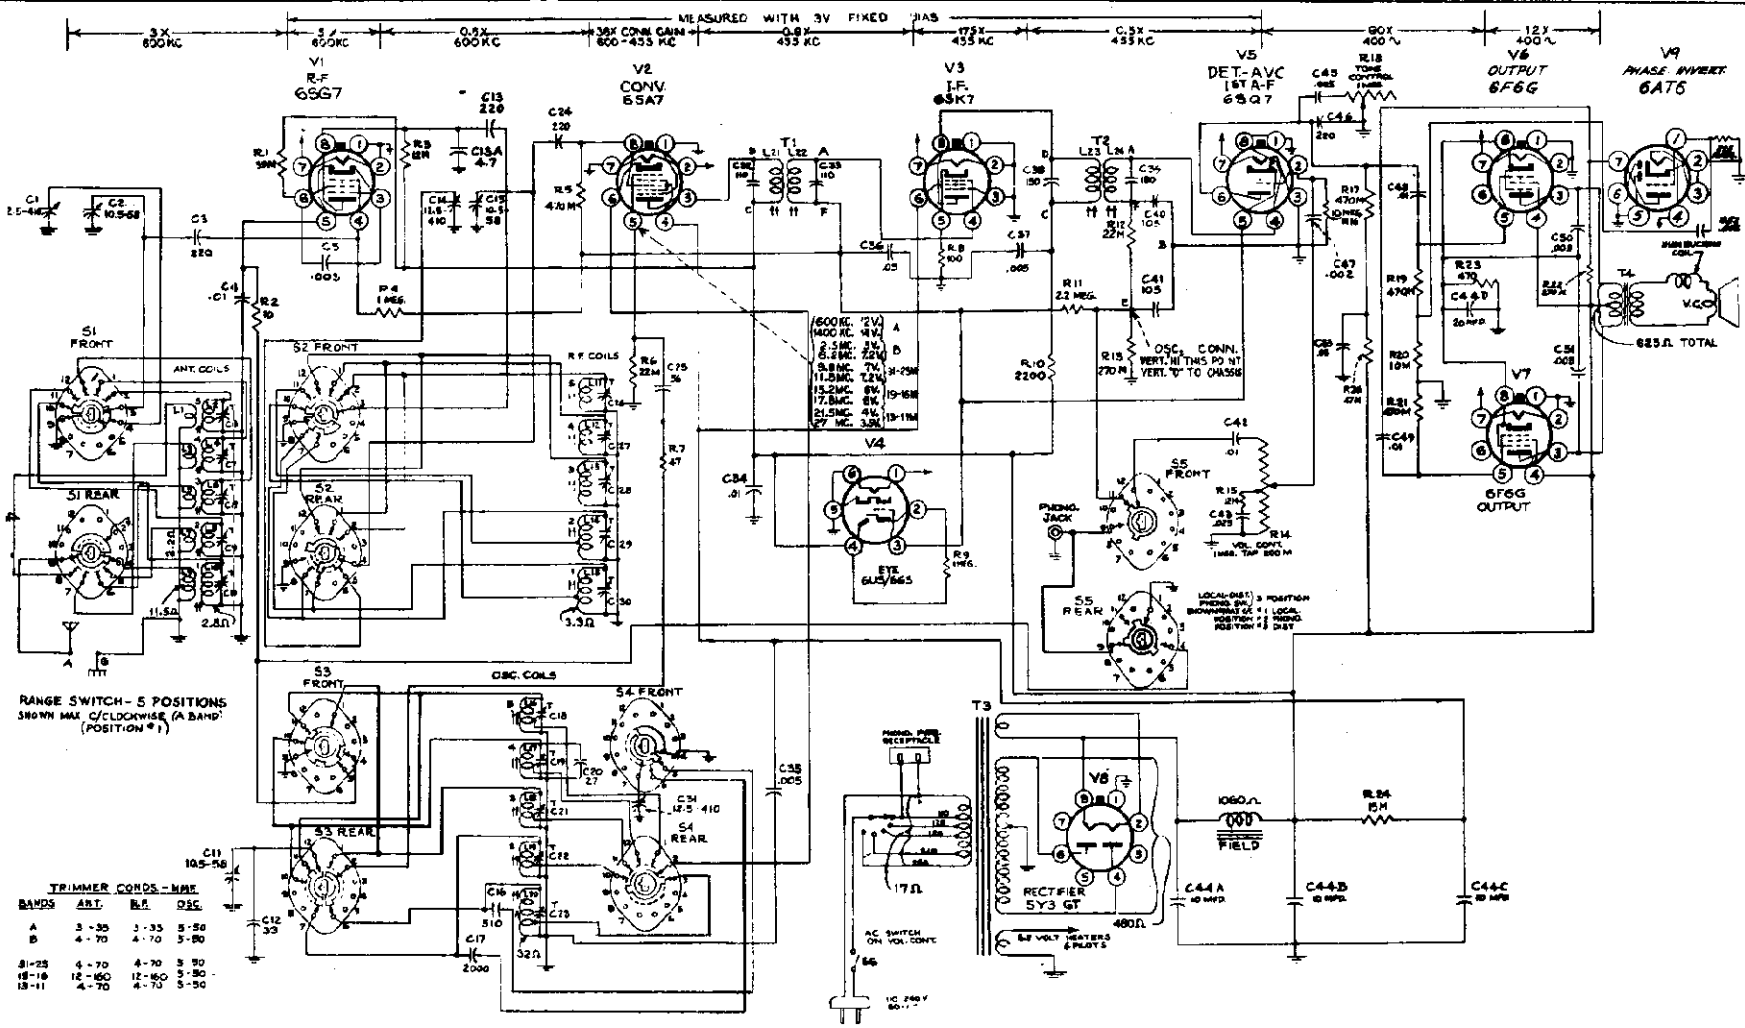
Power Supply Rating

105-125 volts, AC, 50 or 60 cycles, or DC	30 watts
Tuning Drive Ratio	20:1

Dimensions

Width	16-9/16 inches
Height	9¾ inches
Depth	10-7/16 inches





Local-Distance-Phono. Switch:

The Local-Distance-Phono. Switch (S5) used in these receivers is unusual in that the rotor segments do not contact consecutive terminals but instead contact every second terminal as explained below.

S5 Front
Local Position (#1) and Distance Position (#3)
Contacts terminals #11 and #12
Phono. Position (#2)
Contacts terminals #9 and #12

S5 Rear
Local Position (#1) and Phono. Position (#2)
No connection
Distance Position (#3)

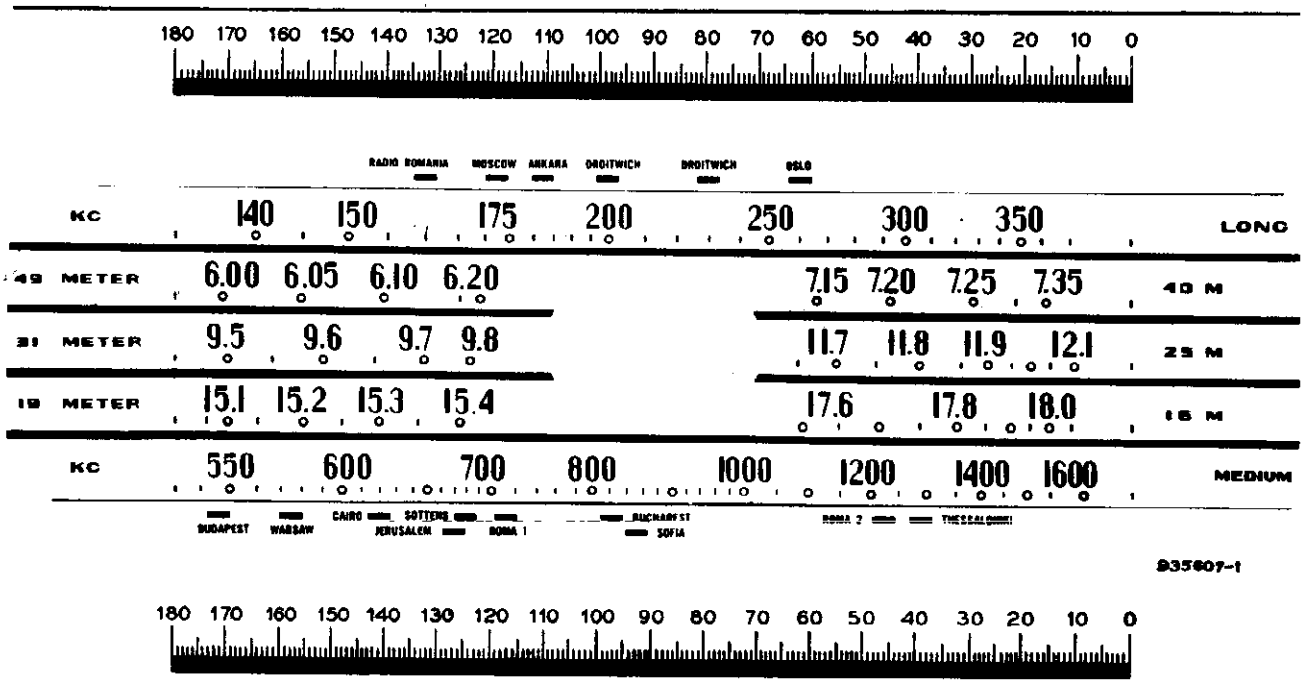
Reduced Reproduction of Receiver Dial, Q109, and Corresponding 0-180° Calibration Scales

The corresponding position of the dial indicator for any setting of the calibration scale can be determined by drawing a line from this point on the bottom calibration scale to the same point on top calibration scale. For example 150° on the calibration scale corresponds to 600 kc on "A" band, etc. Read instructions under "Alignment Procedure."



Reduced Reproduction of Receiver Dial Q109X, and Corresponding 0-180° Calibration Scales

The corresponding position of the dial indicator for any setting of the calibration scale can be determined by drawing a line from this point on the bottom calibration scale to the same point on top calibration scale. For example 150° on the calibration scale corresponds to 600 kc on "A" band, etc. Read instructions under "Alignment Procedure."

Alignment Procedure

Q109

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown on the Schematic Circuit Diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord-Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord-drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "180°" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the calibration scale drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark (the first mark on "A" band to the left of "550"), and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each spread-band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal-controlled oscillator, or by zero-beating against standard broadcast stations.

When a test-oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be retouched so that the stations come in at the correct points on the dial.

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn Range Switch to—	Turn radio dial to—	Adjust the following for max. peak output
1	6SG7 I-F grid in series with .01 mfd.	455 kc	"A" Band	Quiet point near 600 kc (148°)	L23, L24 2nd. I-F trans.

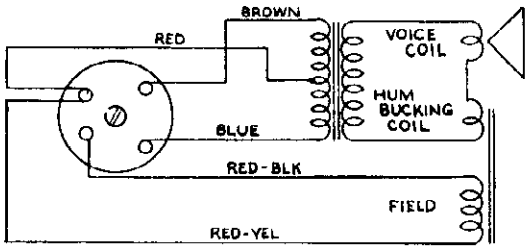
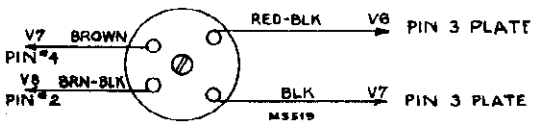
10		6.1 mc		6.1 mc (141°)	L18 osc.† L13 rf.† L6 ant.†
11		11.8 mc	"31-25 Meter" Band	11.8 mc (40°)	C19 osc.* C27 rf.** C7 ant.**
12		9.5 mc		9.5 mc (170°)	L17 osc.† L12 rf.† L4 ant.†
13		17.75 mc	"19-16 Meter" Band	17.75 mc (40°)	C18 osc.* C26 rf.** C6 ant.**
14		15.2 mc		15.2 mc (155°)	L16 osc.† L11 rf.† L2 ant.†

Oscillator tracks above signal on all bands.
*Use minimum capacity peak if two peaks can be obtained.
†These adjustments are pre-set and should not require re-adjustment except when components of the tuning section are changed.
**Rock in—use maximum capacity peak if two peaks can be obtained.

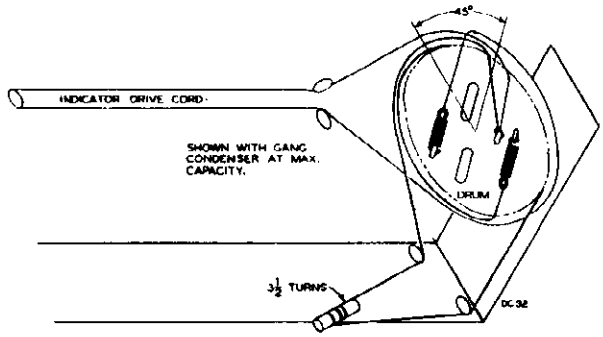
Critical Lead Dress

1. Dress C47 and R16 against chassis.
2. Dress R23 against chassis.
3. Dress C48 on power transformer side of terminal board.
4. All resistor and capacitor leads should be as short as practical.
5. Twist electrolytic capacitor leads and dress between chassis and electrolytic capacitor.
6. Twist all A.C. leads and keep close to chassis and away from other component parts and wires.
7. Dress blue treble tone control (R18) lead along intersection of chassis and rear apron and under electrolytic capacitor.
8. Keep tuning indicator and pilot lamp leads away from 6SQ7 tube.
9. Dress C35 against RF plate assembly.
10. Dress C25 and R7 and C24 midway between range switch and RF coil.
11. Keep coil leads to switch and trimmers with minimum slack but not stretched tight.
12. Flexibility of RF plate assembly must be maintained.
13. Dress black lead from phono-radio switch to range switch close to chassis.
14. Dress C13A away from RF shield.
15. Dress C34 against RF plate assembly.
16. Keep all gang leads as short as practical.
17. A loop must be maintained in ground braid connecting RF plate assembly to chassis.
18. Dress blue lead to antenna terminal against RF shield.

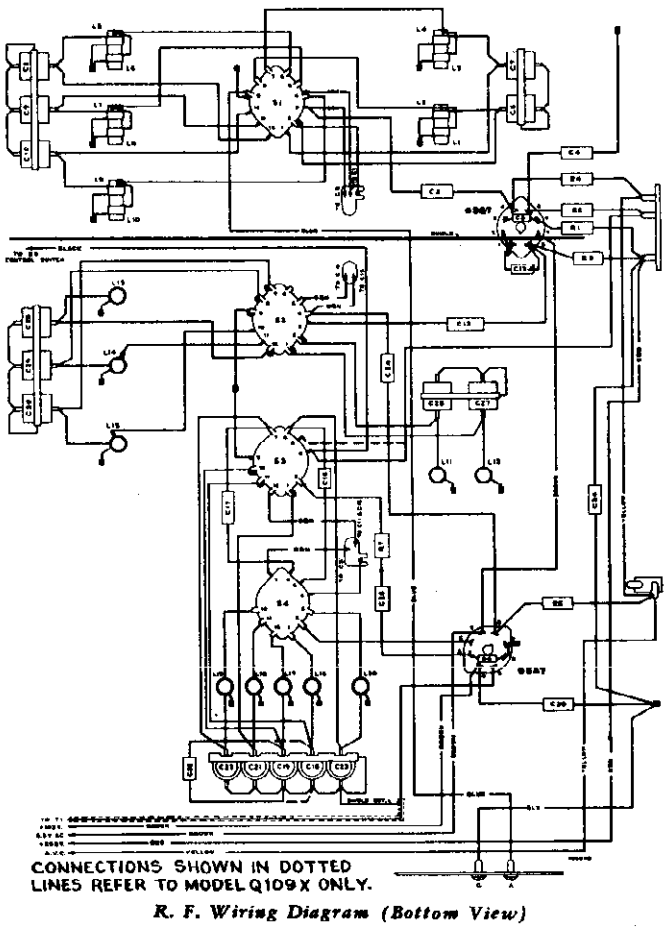




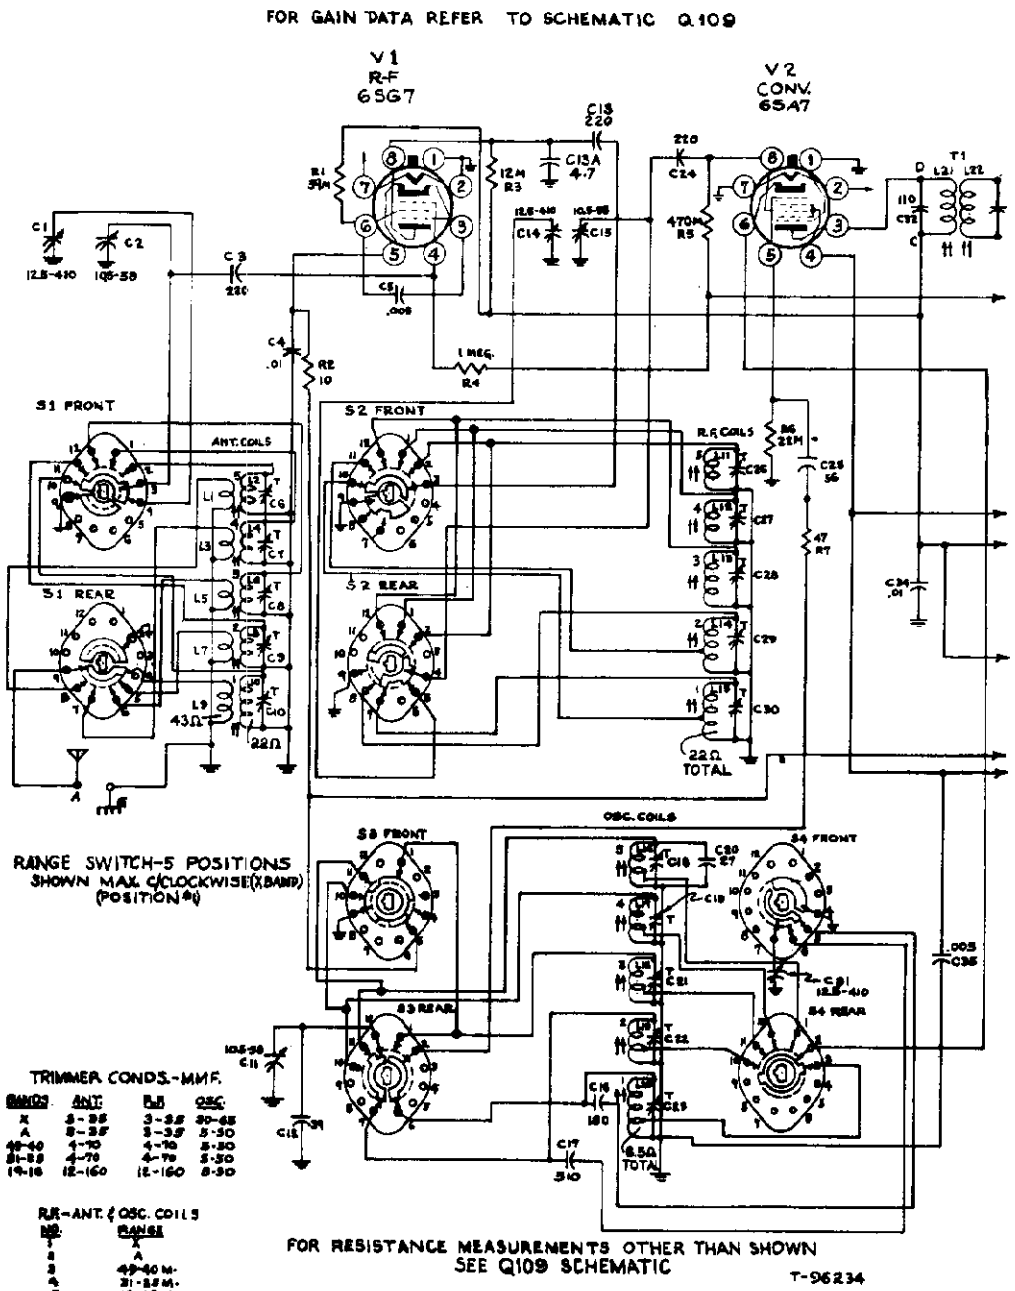
Loudspeaker Connections



Dial-Indicator and Drive Mechanism



R. F. Wiring Diagram (Bottom View)



Frequency Ranges, Q109

Standard Broadcast ("A" Band)	540—1600 kc.	(556—187 m)
Medium Wave ("B" Band)	2.45—6.3 mc.	(122—47.7 m)
"31-25 Meter" Spread Band	9.5 — 12 mc.	(31.6—25 m)
"19-16 Meter" Spread Band	15.1 — 18 mc.	(19.8—16.6 m)
"13-11 Meter" Spread Band	21.4 — 27 mc.	(14 —11.1 m)

Model Q109X will have in place of the "B" Band, and the "13-11 Meter" Band:

Long Wave ("X" Band)	140—375 kc.	(2,140—800 m)
"49-40 Meter" Spread Band	6.— 7.3 mc.	(50—41 m)

Intermediate Frequency ..... 455 kc.

Tube Complement

(1) RCA 6SG7 ..... R-F Amplifier
(2) RCA 6SA7 ..... 1st Detector
(3) RCA 6SK7 ..... I-F Amplifier
(4) RCA 6SQ7 ..... 2nd Detector, A.V.C., A-F Amplifier
(5) RCA 6AT6 ..... Phase Inverter
(6) RCA 6F6G ..... Power Output
(7) RCA 6F6G ..... Power Output
(8) RCA 5Y3 GT ..... Rectifier
(9) RCA 6U5/6G5 ..... Tuning Indicator

Power Output Rating

	Undistorted	Maximum
Q109, Q109X	5.0 watts	6.2 watts

Tuning Drive Ratio 22:1

Power Supply Ratings

Symbol	Voltages	Frequency (cycles)	Watts
Rating A	105-125	50-60	80
Rating B	105-125	25-60	80
Rating D	110 position—100 to 115 volts. 125 position—115 to 135 volts. 150 position—135 to 165 volts. 210 position—190 to 230 volts. 240 position—230 to 260 volts.	50/60	80

The desired range may be selected by the proper positioning of a link beneath a cover on the top of the power transformer:

CAUTION: Remove power cord from line receptacle before changing link position.

Phonograph Attachment.—A jack is provided on the rear of chassis for connection to a phonograph. The cable from the attachment should be terminated in a Stock No. 31048 plug.

When phonograph is in use, if necessary, tune set off frequency from any very strong station.

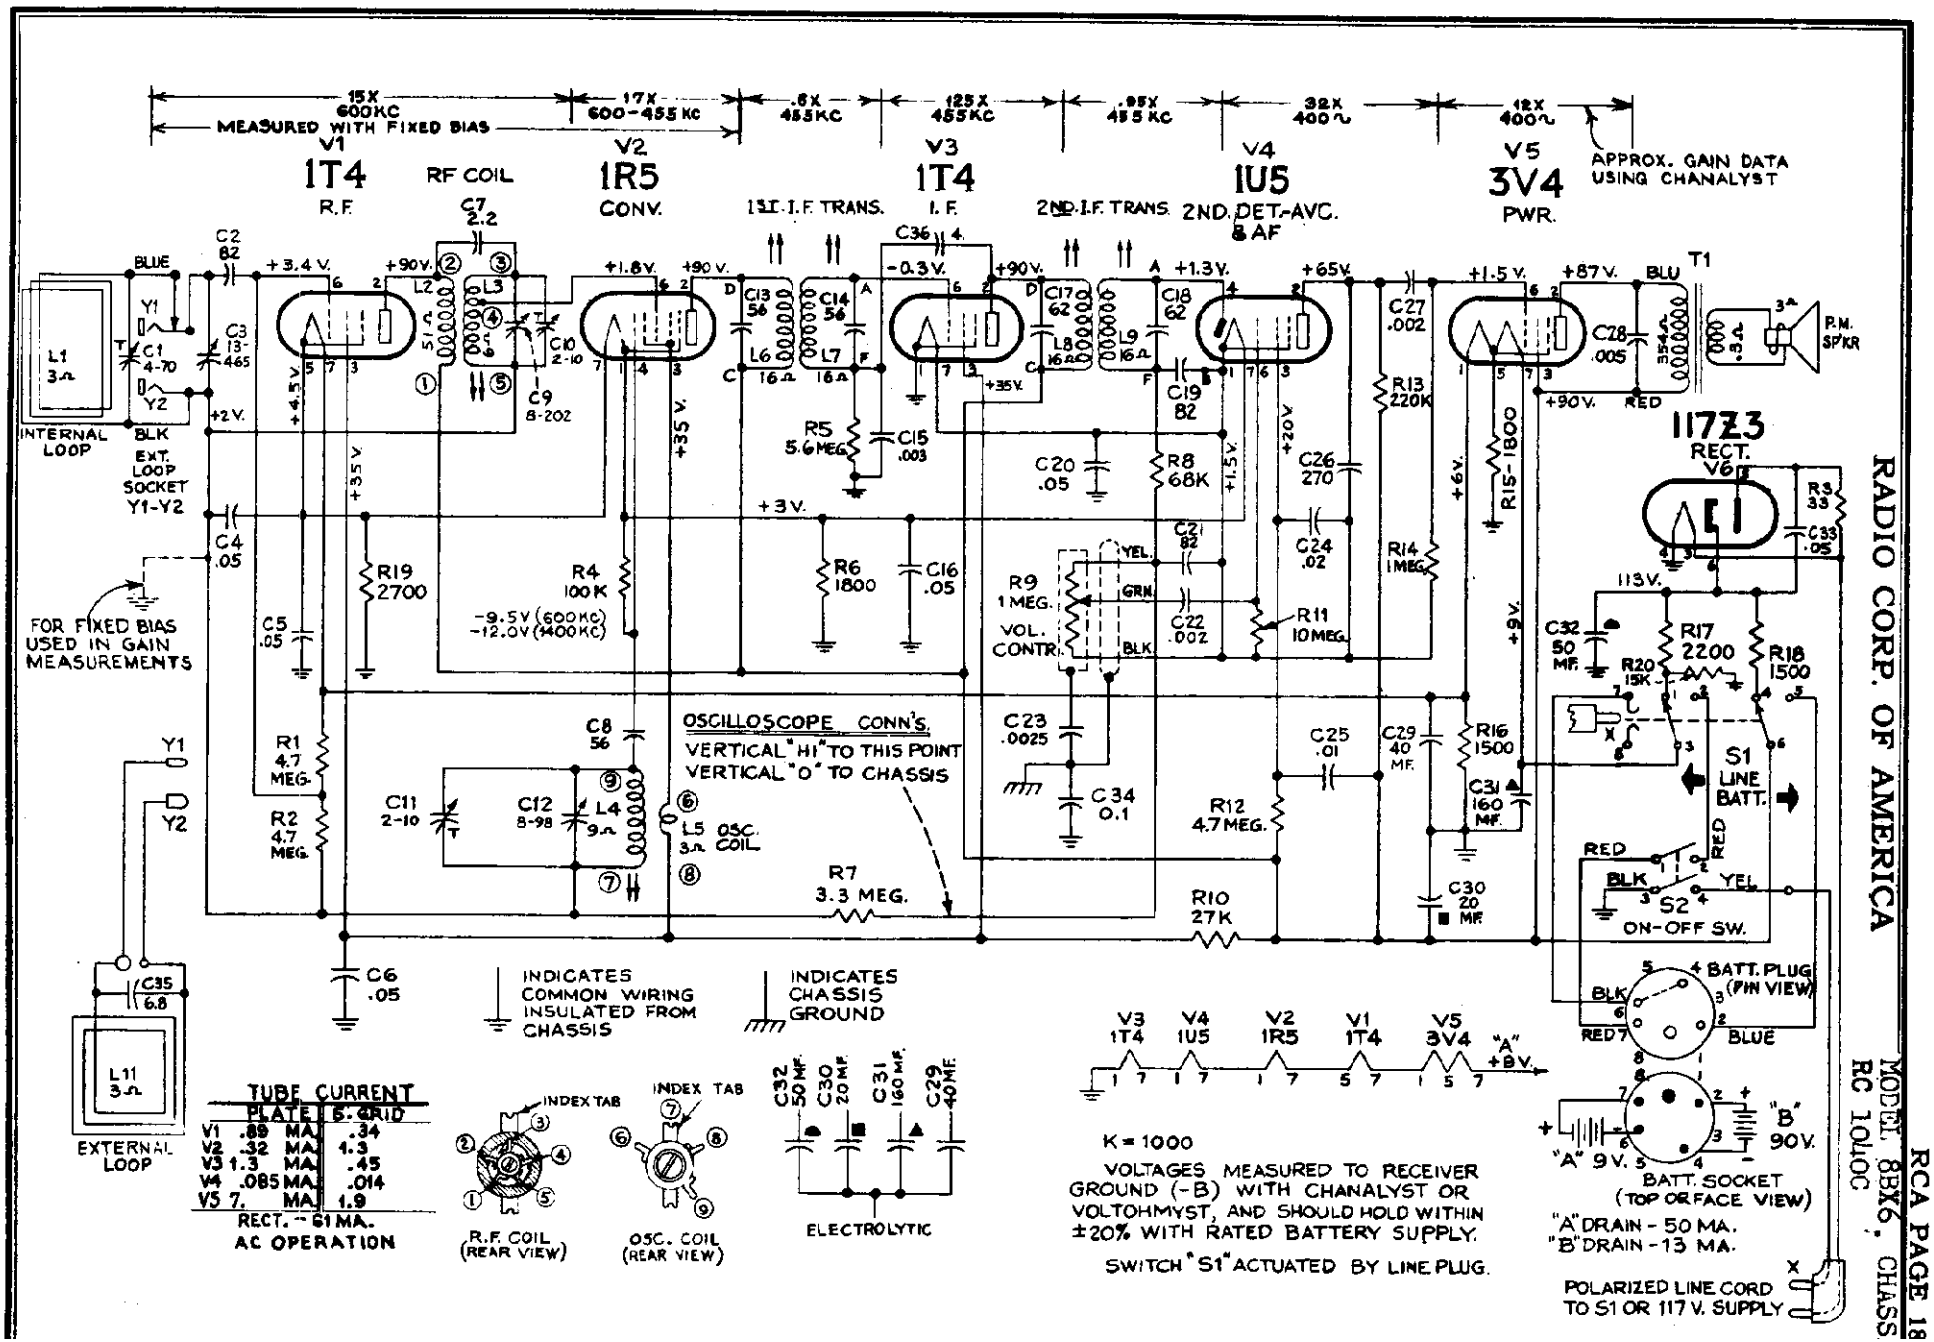
Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES
	RC 602-Q109
	RC 602A-Q109X
12930	Board—"Antenna-Ground" board
*70952	Bracket—L.H. bracket complete with drive cord pulley
*70951	Bracket—R. H. bracket complete with four (4) pulleys
*70840	Cable—Bronze cable (20" long) for band indicator mechanism
35795	Calibrator—Drive Drum Calibrator
*71086	Capacitor—Ceramic, 4.7 mmf. ((C13A)
70935	Capacitor—Ceramic, 27 mmf. (C20)
*73247	Capacitor—Ceramic, 33 mmf. (C12)
71924	Capacitor—Ceramic, 56 mmf. (C25)
71933	Capacitor—Mica, 180 mmf. (C16 for Q109X)
39636	Capacitor—Mica, 220 mmf. (C3, C13, C24, C46)
71932	Capacitor—Mica, 510 mmf. (C16 for Q109, C17 for Q109X)
72526	Capacitor—Mica, 2000 mmf. (C17 for Q109)
70931	Capacitor—Mica trimmer, comprising 1 section of 3-35 mmf. and 2 sections of 4-70 mmf. for Q109 (C8, C9, C10, C28, C29, C30)
*70966	Capacitor—Mica trimmer, comprising 2 sections of 3-35 mmf. and 1 section of 4-70 mmf. for Q109X (C8, C9, C10, C28, C29, C30)
70754	Capacitor—Mica trimmer, comprising 1 section of 4-70 mmf. and 1 section of 12-160 mmf. (C6, C7 for Q109X, C26, C27 for Q109)
70745	Capacitor—Mica trimmer, comprising 1 section of 12-160 mmf. and 1 section of 4-70 mmf. (C6, C7 for Q109, C26, C27 for Q109X)
*70965	Capacitor—Ceramic trimmer, comprising 5 sections of 5-50 mmf. for Q109 (C18, C19, C21, C22, C23)
*70967	Capacitor—Ceramic trimmer, comprising 4 sections of 5-50 mmf. and 1 section of 30-65 mmf. for Q109X (C18, C19, C21, C22, C23)
71592	Capacitor—Moulded paper, .002 mfd., 200 volts (C52)
*71590	Capacitor—Moulded paper, .002 mfd., 600 volts (C47)
71087	Capacitor—Moulded paper, .003 mfd., 1000 volts (C50, C51)
71587	Capacitor—Moulded paper, .005 mfd., 600 volts (C5, C35, C37)
71593	Capacitor—Moulded paper, .005 mfd., 600 volts (C45)
*71589	Capacitor—Moulded paper, .025 mfd., 200 volts (C43)
71585	Capacitor—Moulded paper, .01 mfd., 200 volts (C42)
72219	Capacitor—Moulded paper, .01 mfd., 600 volts (C4, C34, C48, C49)
72527	Capacitor—Moulded paper, .05 mfd., 100 volts (C36)
33014	Capacitor—Electrolytic, comprising three (3) sections of 10 mfd., 450 volts and one (1) section of 20 mfd., 25 volts (C44A, C44B, C44C, C44D)
*70953	Clamp—Mounting clamp for electrolytic capacitor
38201	Clamp—Clamp for drive and pointer cords
70726	Clip—Retaining clip for coils core and stud
70923	Coil—Antenna coil, 13-11 meter band for Model Q109 (L1, L2)
70924	Coil—Antenna coil, 19-16 meter band (L1, L2 for Q109X, L3, L4 for Q109)
70925	Coil—Antenna coil, 31-25 meter band (L3, L4 for Q109X, L5, L6 for Q109)
70928	Coil—Antenna coil, 49-40 meter band for Model Q109X (L5, L6)
70926	Coil—Antenna coil, "B" band for Model Q109 (L7, L8)
70927	Coil—Antenna coil, "A" band (L7, L8 for Q109X, L9, L10 for Q109)
70929	Coil—Antenna coil, "X" band for Model Q109X (L9, L10)
*70964	Coil—R. F. coil, 13-11 meter band for Model Q109 (L11)
*70963	Coil—R. F. coil, 19-16 meter, band (L11 for Q109X, L12 for Q109)
*70962	Coil—R. F. coil, 31-25 meter band (L12 for Q109X, L13 for Q109)
*70961	Coil—R. F. coil, 49-40 meter band for Model Q109X (L13)
*70960	Coil—R. F. coil, "B" band for Model Q109 (L14)
*70959	Coil—R. F. coil, "A" band (L14 for Q109X, L15 for Q109)
*70958	Coil—R. F. coil, "X" band for Model Q109X (L15)
70920	Coil—Oscillator coil, 13-11 meter band for Model Q109 (L16)
70823	Coil—Oscillator coil, 19-16 meter band (L16 for Q109X, L17 for Q109
70825	Coil—Oscillator coil, 31-25 meter band (L17 for Q109X L18 for Q109)
70921	Coil—Oscillator coil, 49-40 meter band for Model Q109X (L18)
70829	Coil—Oscillator coil, "B" band for Model Q109 (L19)
70789	Coil—Oscillator coil, "A" band (L19 for Q109X, L20 for Q109)
70922	Coil—Oscillator coil, "X" band for Model Q109X (L20)
70957	Condenser—Variable tuning condenser (C1, C2, C11, C14, C15, C31)
*70949	Control—Tone control (R18)
*70948	Control—Volume control and power switch (R14, S6)
*72953	Cord—Drive cord (approx. 45" overall length required)
72913	Cord—Indicator cord (approx. 57" overall length required)
70945	Core—Adjustable core and stud for "X" band antenna coil—for Model Q109X
70938	Core—Adjustable core and stud for "A" band antenna coils, for 31-25 meter band R. F. and oscillator coils for Model Q109's "B" band oscillator coil
70944	Core—Adjustable core and stud for 31-25 meter band antenna coils and for Model Q109's "B" band antenna coil and for Model Q109X's 49-40 meter band antenna coil
70943	Core—Adjustable core and stud for 19-16 meter band antenna coil
70941	Core—Adjustable core and stud for Model Q109's 13-11 meter band antenna coil and for Model Q109X's 49-40 meter band oscillator coil
*70968	Core—Adjustable core and stud for Model Q109X's "X" band R. F. coil
*70969	Core—Adjustable core and stud for "A" band R. F. coil
70937	Core—Adjustable core and stud for 19-16 meter band R. F. and oscillator coils and for Q109's 13-11 meter band oscillator coil
*70970	Core—Adjustable core and stud for Model Q109's 13-11 meter band R. F. coil
70942	Core—Adjustable core and stud for Model Q109X's "X" band oscillator coil
70939	Core—Adjustable core and stud for "A" band oscillator coil
72011	Drum—Band indicator actuating drum—located on range switch shaft
31273	Drum—Condenser drive drum
37396	Grommet—Rubber grommet for mounting R. F. assembly (4 required)
35787	Jack—Phono input socket
5117	Lamp—Band indicator lamp—Mazda 55
11765	Lamp—Dial lamp—Mazda 51
35630	Pulley—Drive cord pulley
5040	Plug—4 contact female plug for speaker cable
36637	Receptacle—AC power receptacle
34761	Resistor 10 ohms, ½ watt (R2)
30732	Resistor—47 ohms, ½ watt (R7)
34765	Resistor—100 ohms, ½ watt (R8)
37278	Resistor—470 ohms, 1 watt (R23)
34767	Resistor—2200 ohms, ½ watt (R10)
30436	Resistor—12,000 ohms, ½ watt (R15)
71085	Resistor—12,000 ohms, 2 watts (R3)
35523	Resistor—15,000 ohms, 2 watts (R24)
30492	Resistor—22,000 ohms, ½ watt (R6, R12)
71084	Resistor—39,000 ohms, 1 watt (R1)
30651	Resistor—270,000 ohms, ½ watt (R13, R22)
30648	Resistor—470,000 ohms, ½ watt (R5, R17, R19, R21)
30652	Resistor—1 megohm, ½ watt (R4, R9)
30649	Resistor—2.2 megohms, ½ watt (R11)
30992	Resistor—10 megohms, ½ watt (R16, R20, R25)
14350	Screw—No. 8-32 square head set screw for drive or band indicator drums
*70950	Shaft—Tuning knob shaft and flywheel
34909	Socket—Band indicator lamp socket
31364	Socket—Dial lamp socket
70827	Socket—Tube socket
9914	Socket—Tube socket for 6AT6 tube
*71554	Socket—Tuning tube socket
31418	Spring—Drive or indicator cord spring
*70955	Switch—"Local-Distance" switch (S5)
*70956	Switch—Range switch (S1, S2, S3, S4)
70917	Transformer—First I. F. Transformer (T1, L21, L22, C32, C33)
70918	Transformer—Second I. F. transformer (T2, L23, L24, C38, C39, C40, C41)
*71154	Transformer—Power transformer, 117 volts, 25 cycle (T3)
*71153	Transformer—Power transformer, 117 volts, 60 cycle (T3)
*70947	Transformer—Power transformer, 110/125/150/210/240 volts, 50/60 cycle (T3)
34373	Washer—"C" washer for tuning shaft
	SPEAKER ASSEMBLIES
	Stamped 92562-1J
70927	Cone—Cone and voice coil assembly
5039	Plug—4 prong male plug for speaker
70971	Speaker—6"x9" E. M. speaker complete with cone and voice coil less output transformer and plug
37899	Transformer—Output transformer (T4)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
*70919	Back—Cabinet back
30716	Clip—Tuning tube mounting clip
X1655	Cloth—Grille cloth
*71906	Decal—Control panel decal
*71828	Dial—Glass dial for Q109
*71829	Dial—Glass dial for Q109X
*70977	Disc—Band indicator actuating disc—located on dial frame
11771	Foot—Rubber foot for cabinet (4 required)
*70974	Frame—Dial frame and back plate less dial, tube clip, indicator disc, spring indicator and "C" washer
*70979	Indicator—Station selector indicator
*72954	Knob—"Local-Distance-Phono" switch knob
*72950	Knob—Tone control or range switch knob
*72949	Knob—Volume control or tuning knob
35630	Pulley—Drive cord pulley
*70976	Screen—Band indicator screen—green
6647	Shade—Lamp shade
*70978	Spring—Band indicator disc spring
14270	Spring—Retaining spring for knob
*71143	Washer—"C" washer to hold disc

*This is the first time that this stock number has appeared in service data.



RADIO CORP. OF AMERICA

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Battery operation of the receiver is preferable during alignment; on AC operation an isolation transformer (117v./117v.) may be necessary for the receiver if the test oscillator is also AC operated.

Calibration Scale.—The calibrated dial scale is attached to the chassis. It can be used directly as a reference for alignment.

With the gang at full mesh set the dial pointer so that the pointer is in line with the left hand vertical of the first figure 5 of the figures 55 on the dial scale as illustrated below.

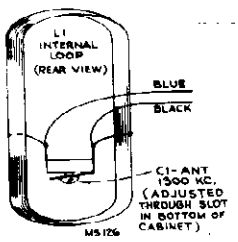
Alignment Tabulation

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Pin No. 6 of 1T4 I.F. Amplifier thru .01 mfd.	455 kc	Quiet point near 1600 kc	2nd I.F. Trans. L8, L9 top† & bottom
2	Pin No. 6 of 1R5 Converter thru .01 mfd.			1st I.F. Trans. L6, L7 top† & bottom
3				2nd I.F. Trans. L8 bottom core
4	High side of loop (Blue lead) in series with .01 mfd. Bottom shield cover in place	1600 kc	1600 kc	C11 (osc.)
5		1400 kc	1400 kc	C10 (r.f.)
6		600 kc	600 kc	L4 (osc.) L3 (r.f.)
7	Repeat steps 4, 5 and 6			
8	Short wire placed near loop. (Chassis in cabinet and internal loop connected)	1400 kc	1400 kc	C1†† (loop) (Cabinet closed)

† Two peaks may be found, the correct peak is that with the core in the outer position (counter-clockwise).

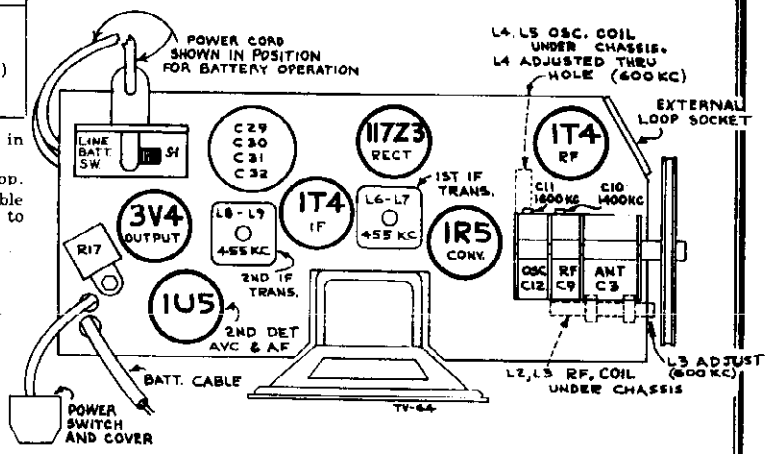
†† Accessible thru slot in case provided for cable of external loop.

NOTE: Adjustments L8, L9, L6, L7, L4 and L3 do not have visible adjusting screws. The magnetite cores have a screw driver slot to permit adjustment (use non-metallic screw driver).



Critical Lead Dress

1. Dress all filament leads next to chassis.
2. Keep the leads short on the end of the three components which connect to the grid terminal (#6) of the r.f. socket. (R-1, R-2, C-2).
3. Keep lead to center section of gang as short as possible.
4. Dress loop leads away from tuning drum and battery.
5. Dress lead to pin #4 of 1U5 tube away from other wiring.
6. Dress r.f. plate lead away from r.f. grid circuit.
7. Dress components and wiring near external loop socket to clear external loop pins.
8. Dress avc lead away from 2nd IF transformer and associated components.
9. Dress converter plate lead away from chassis and away from output leads.
10. Dress output leads up and away from other wiring.
11. Dress neutralizing capacitor C36, flat against chassis.
12. Dress 1st audio plate lead up and away from other wiring.
13. Dress 33 ohm resistor (R3) over bottom of rectifier socket and clear of other wiring.
14. Dress R.F. tube plate lead slightly away from chassis base.



Tube and Trimmer Locations

Specifications

Frequency Range .....540-1,600 kc

Intermediate Frequency .....455 kc

Power Supply Rating

110 to 125 volts, AC 50 or 60 cycles, or DC.....18 watts

Battery Operation.....“A” 50 ma., “B” 13 m
(Average life of RCA VS019 Battery
125 hrs. intermittent service.)
Total Rect. Current (117 volt, 60 cycle).....61 m

Power Output

Undistorted .....150 wa
Maximum .....275 wa

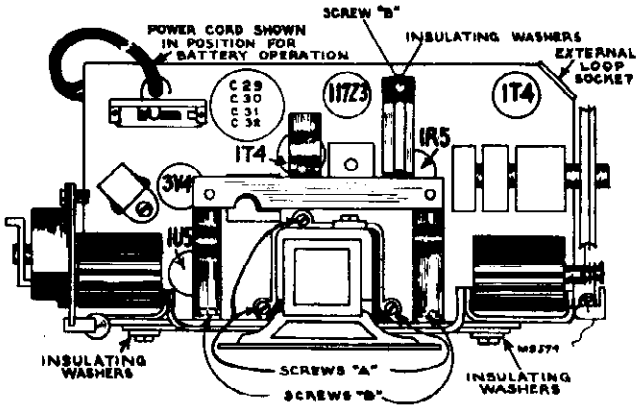
Loudspeaker.....4 in. P.M. 3.4 ohms at 400 cycl

Cabinet Dimensions

Height...13¼ in. Width...9½ in. Depth...5½ i

CAUTION.—

1. **Do not remove any tubes from the chassis with the set oper ing and the plug connected to the power line. Damage to tub may result.**
2. **When cleaning the aluminum portion of the case use soap a water or cleaning fluid. Do not use abrasive cleansers.**



Insulating Washers:

The mounting bracket and dial frame are insulated from t chassis with insulating washers. This serves to insulate the ca from the chassis. In servicing make certain that these washers a in place and properly positioned.

To Remove Chassis from Cabinet:

1. Disconnect battery plug and remove battery.
2. Disconnect antenna in cabinet.
3. Remove the two screws in the top of the cabinet (beneath handle
4. Remove the two battery clips.
5. Remove the chassis from the cabinet

To Remove Speaker:

1. Remove tubes 3V4 and 1U5.
2. Remove the three screws “B” holding power cord bracket assemb and remove bracket.
3. Remove the three screws “A” holding speaker bracket assembl
4. Disconnect voice coil leads.
5. The speaker and speaker bracket may now be removed.

Using External Loop.—

A loop antenna is mounted inside the cabinet. Under normal conditions this will give satisfactory reception. If however, the receiver is used in a shielded compartment such as an automobile, airplane or railroad train, an RCA VICTOR EXTERNAL LOOP ANTENNA can be used.

This external loop antenna has a strap connector cord with identical two prong plugs on either end, this makes it convenient in connecting it to the circuit through the receptacle located in the left hand side of the chassis.

Open the case, plug the external loop antenna cord into the socket (it will only go in one way), bring the strap out through the slot in the case and attach the external loop antenna by means of the suction cup to any convenient vertical surface.

This external loop antenna can be stored in the cabinet, in the compartment below the battery pack, and the cord in the small compartment in the lower right hand corner of the cabinet.

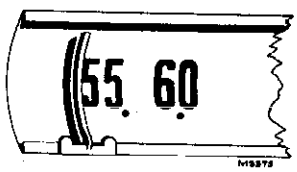
AC-DC Operation.—

This receiver will operate on 105 to 125 volts, AC 50 or 60 cycles, DC.

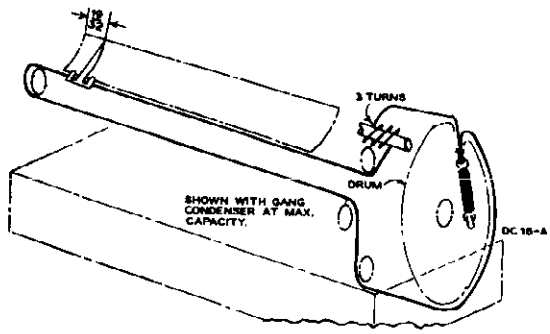
A power cord is stored in the fiber tube which is clamped above chassis inside the cabinet. To open the cabinet, push the w latch on the bottom of the case to the right, and raise the ba cover upward on its hinges. Then pull the power cord plug out the socket on the top of the chassis as shown, and take out and un the power cord. A slot in the bottom of the cabinet allows the closi of the cabinet with the power cord passing through. Close the cabi with the cord extending through the slot and insert the plug int convenient electrical outlet.

When returning to battery operation, be sure to replace the pov plug in its socket inside the case with the cord stored in the fiber tu

NOTE. If reception is not obtained on DC, reverse plug in ou receptacle. This may also reduce hum on AC operation.



Dial Pointer Setting



Dial-Indicator and Drive Mechanism

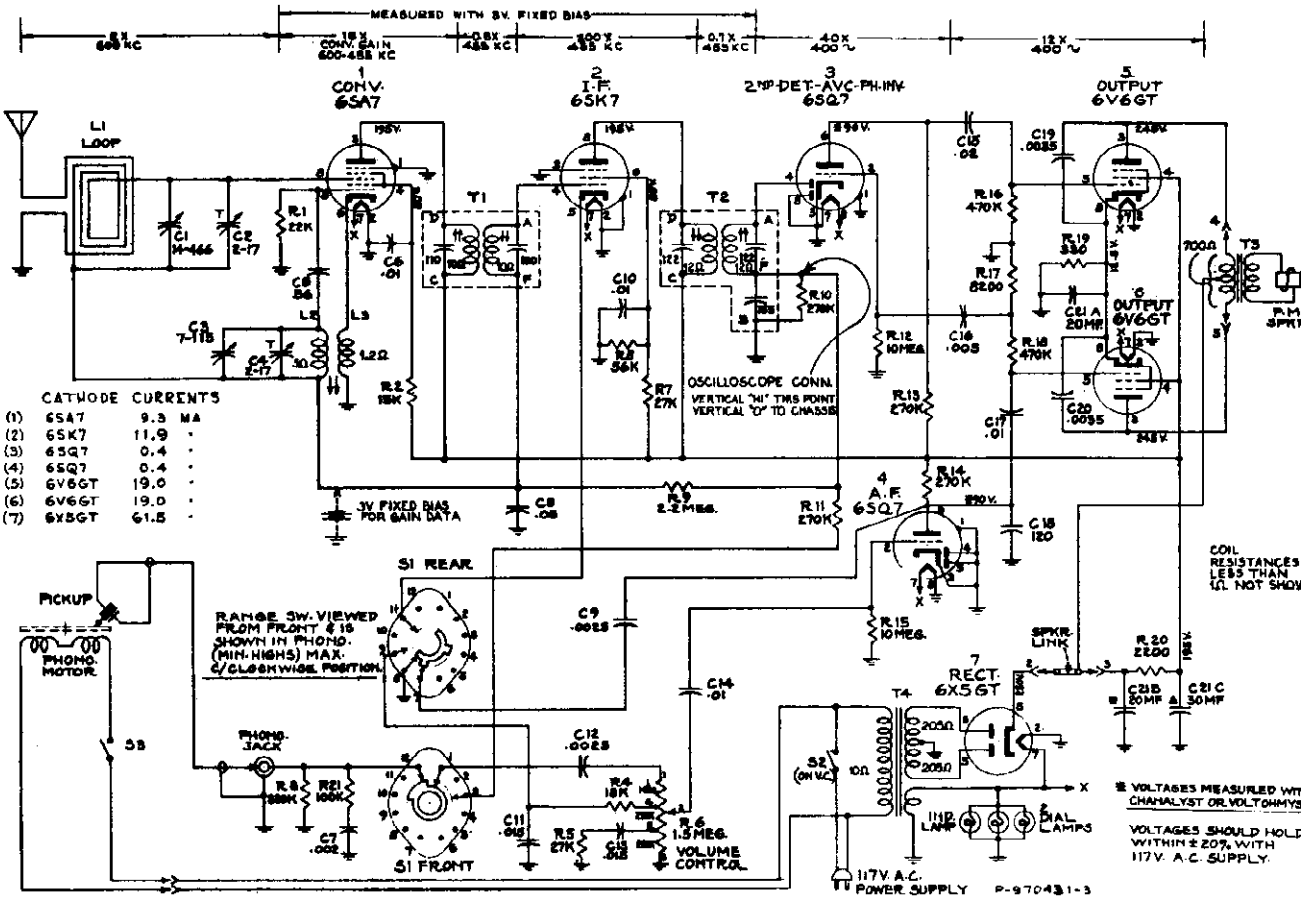
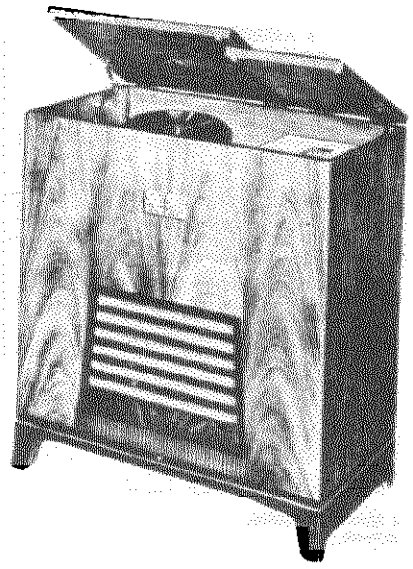
STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1040C
71056	Bracket—Drive cord pulley bracket complete with pulley (volume control side)
71054	Bracket—Drive cord pulley bracket complete with two (2) pulleys
71044	Bracket—Power switch bracket complete with actuating lever less switch
71042	Button—Plug button
71502	Capacitor—Ceramic, 2.2 mmf. (C7)
*73153	Capacitor—Ceramic, 4 mmf. (C36)
71924	Capacitor—Ceramic, 56 mmf. (C8)
71514	Capacitor—Ceramic, 82 mmf. (C2, C21)
71540	Capacitor—Ceramic, 270 mmf. (C26)
70602	Capacitor—Tubular, .0025 mfd., 400 volts (C23)
71552	Capacitor—Tubular, .002 mfd., 400 volts (C22, C27)
71921	Capacitor—Tubular, .003 mfd., 200 volts (C15)
71553	Capacitor—Tubular, .005 mfd., 400 volts (C28)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C25)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C24)
71551	Capacitor—Tubular, .05 mfd., 200 volts (C5, C16, C20)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C4, C6, C33)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C34)
*73113	Capacitor—Electrolytic, comprising 1 section of 50 mfd., 150 volts; 1 section of 20 mfd., 150 volts; 1 section of 160 mfd., 25 volts and 1 section of 40 mfd., 25 volts (C29, C30, C31, C32)
*73176	Coil—R-F coil complete with core and stud (L2, L3)
*73114	Coil—Oscillator coil complete with core and stud (L4, L5)
*73112	Condenser—Variable tuning condenser (C3, C9, C10, C11, C12)
71057	Control—Volume control (R9)
†72953	Cord—Drive cord (approx. 38" overall required)
70022	Cord—Power cord
*73118	Dial—Dial scale and window assembly
72283	Grommet—Rubber grommet for mounting tuning condenser (3 required)
71031	Holder—Power cord holder (fibertube)
*73111	Indicator—Station selector indicator
*73121	Knob—Tuning knob (roller-type) or volume control knob (roller-type)
18469	Plate—Mounting plate for electrolytic capacitor
71041	Plug—5 prong male plug for battery cable
36230	Pulley—Drive cord pulley
*73237	Resistor—Wire wound, 33 ohms, 150 MA (R3)
	Resistor—Fixed composition, 1500 ohms, ±10%, ½ watt (R16)
	Resistor—Fixed composition, 1500 ohms, ±10%, 1 watt (R18)
	Resistor—Fixed composition, 1800 ohms, ±10%, ½ watt (R6, R15)
*73238	Resistor—Ballast resistor, 2200 ohms, 6 watts (R17)
	Resistor—Fixed composition, 2700 ohms, ±10%, ½ watt (R19)
	Resistor—Fixed composition, 15,000 ohms, ±20%, ½ watt (R20)
	Resistor—Fixed composition, 27,000 ohms, ±10%, ½ watt (R10)
	Resistor—Fixed composition, 68,000 ohms, ±20%, ½ watt (R8)
	Resistor—Fixed composition—100,000 ohms, ±20%, ½ watt (R4)
	Resistor—Fixed composition, 220,000 ohms, ±20%, ½ watt (R13)
	Resistor—Fixed composition, 1 megohm, ±20%, ½ watt (R14)
	Resistor—Fixed composition, 3.3 meg., ±10%, ½ watt (R7)
	Resistor—Fixed composition, 4.7 meg., ±10%, ½ watt (R1, R2, R12)
	Resistor—Fixed composition, 5.6 meg., ±10%, ½ watt (R5)
	Resistor—Fixed composition, 10 meg., ±20%, ½ watt (R11)
*73122	Shaft—Tuning knob shaft
*73119	Shield—L.H. end shield for dial
*73120	Shield—R.H. end shield for dial
*73115	Socket—Tube socket—miniature—⅞" mounting center—moulded (no center shield)
*73116	Socket—Tube socket—miniature—⅞" mounting center—moulded (center shield)
*73117	Socket—Tube socket—minature—1" mounting center—wafer
70390	Spring—Drive cord tension spring
30900	Spring—Retaining spring for knob
71039	Switch—"Line-Battery" change switch (S1)
71045	Switch—Power switch (S2)
*73174	Transformer—First I-F transformer (L6, L7, C13, C14)
*73175	Transformer—Second I-F transformer (L8, L9, C17, C18, C19)
71047	Transformer—Output transformer (T1)
71081	Washer—"C" washer for tuning knob shaft
*73332	Washer—Insulating washer (flat) for mounting base holder bracket (1 required) and dial support to chassis base (4 required)
*73333	Washer—Insulating washer (extruded) for mounting base holder bracket (1 required) and dial support to chassis base (4 required)
71049	Window—Dial window only
	SPEAKER ASSEMBLY 92577-3
71059	Gasket—Speaker gasket (black tubing)
*73123	Speaker—4" PM speaker complete with cone and voice coil
	SPEAKER ASSEMBLY 922258-2
71059	Gasket—Speaker gasket (black tubing)
71058	Speaker—4"x6" PM speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
71074	Arm—Shutter arm lever.
*73243	Back—Case back complete with center strip, feet and case spring latch
71073	Bracket—Bearing bracket for shutter arm lever
71070	Bracket—Mounting bracket for capacitor
71069	Capacitor—Adjustable trimmer, 3-35 mmf. (C1)
71080	Clip—Case side spring clip & screw (2 required)
71061	Foot—Case foot for rear section of case (2 required)
71068	Foot—Case foot for front section of case—(2 required)
*73124	Front—Case front complete less shutter
71063	Handle—Carrying handle
*73244	Latch—Latch to mount rear feet (2 required)
71065	Link—Carrying handle link consisting of two (2) links, two (2) shafts and four (4) drive screws (2 required)
71079	Loop—Antenna loop (L1)
71064	Retainer—Battery retainers spring bracket (2 required)
71066	Screw—No. 8—32x5/16" long screw to hold case together (located under carrying handle) (2 required)
71077	Screw—Screw complete with washer and nut to secure case side to case front or to mount rear feet
71071	Shutter—Case shutter
72980	Side—Case side—L.H.
72979	Side—Case side—R.H. (loop side)—less capacitor and bracket
71072	Spring—Case shutter compression spring
31608	Washer—"C" washer for shutter shafts
71078	Washer—Dampening washer for shutter shafts (2 required)

*This is the first time this Stock No. has appeared in Service Data.

RADIO CORP. OF AMERICA

MODEL 8V7, CHASSIS RC-615





Tuning Drive Ratio ..... 16:1 (8 turns of knob)

Lamps (3)

Dial, indicator or compartment lamp .. Mazda 51, 6-8 volts, 0.2 amp.

Loudspeaker (92569-1)

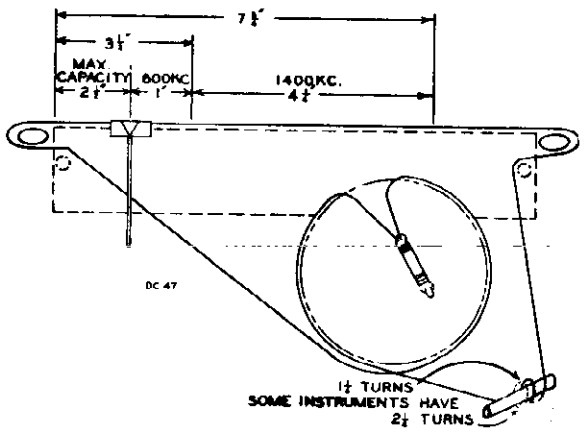
Type ..... 12-inch P.M.
V. C. impedance at 400 cycles ..... 2.2 ohms

Power Output Rating

Undistorted ..... 5 watts
Maximum ..... 5.5 watts

Record Changer (RP-178)

Record Capacity ..... Twelve 10-in., or Ten 12-in.
Turntable Speed ..... 78 r.p.m.
Type Pickup ..... Crystal



Dial Indicator and Drive Mechanism

Frequency Range

Standard Broadcast "A" ..... 540-1,600 kc

Intermediate Frequency ..... 455 kc

Tube Complement

(1) RCA-6SA7 ..... Converter
(2) RCA-6SK7 ..... I-F Amplifier
(3) RCA-6SQ7 ..... 2nd Det., A. V. C. and Phase Inverter
(4) RCA-6SQ7 ..... A-F Amplifier
(5) RCA-6V6GT ..... Output
(6) RCA-6V6GT ..... Output
(7) RCA-6X5GT ..... Rectifier

Power Supply Rating (including record changer)

105-125 volts, 60 cycles ..... 70 watts

MODEL 8V7 RADIO CORP. OF AMERICA

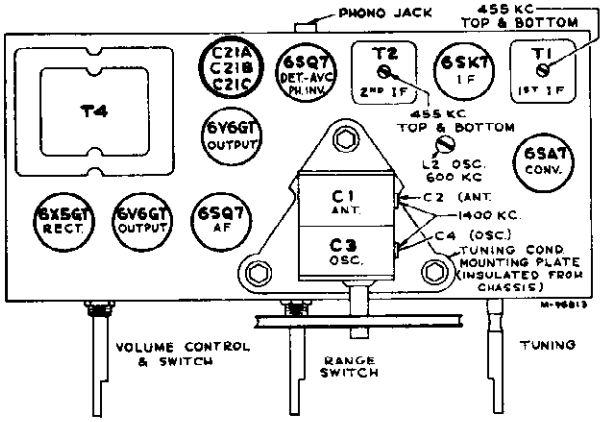
Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the Schematic Diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Steps	Connect high side of test oscillator to—	Tune test oscillator to—	Turn radio dial to—	Adjust the following for maximum peak output
1	6SK7 grid in series with .01 mfd.	455 kc.	Quiet Point at 550 kc. end of dial	Top and bottom (2nd I-F Trans.) T-2
2	6SA7 grid in series with .01 mfd.			Top and bottom (1st I-F Trans.) T-1
3	Primary lead on loop in series with 200 mmfd.	1,400 kc.	1,400 kc.	C4 (osc.) C2 (ant.)
4		600 kc.	600 kc.	L2 (osc.) Rock gang
5		Repeat steps 3 and 4		



Tube and Trimmer Locations (Top View)

Critical Lead Dress:

1. Dress speaker cable leads down next to chassis.
2. Dress output plate capacitors next to chassis.
3. Dress plate lead of output tube away from grid of audio amplifier.
4. Dress all a-c leads away from volume control down next to chassis.
5. Dress lead from top tap of volume control to range-tone switch along front apron of chassis.
6. Dress R12 and R15 down near chassis base.

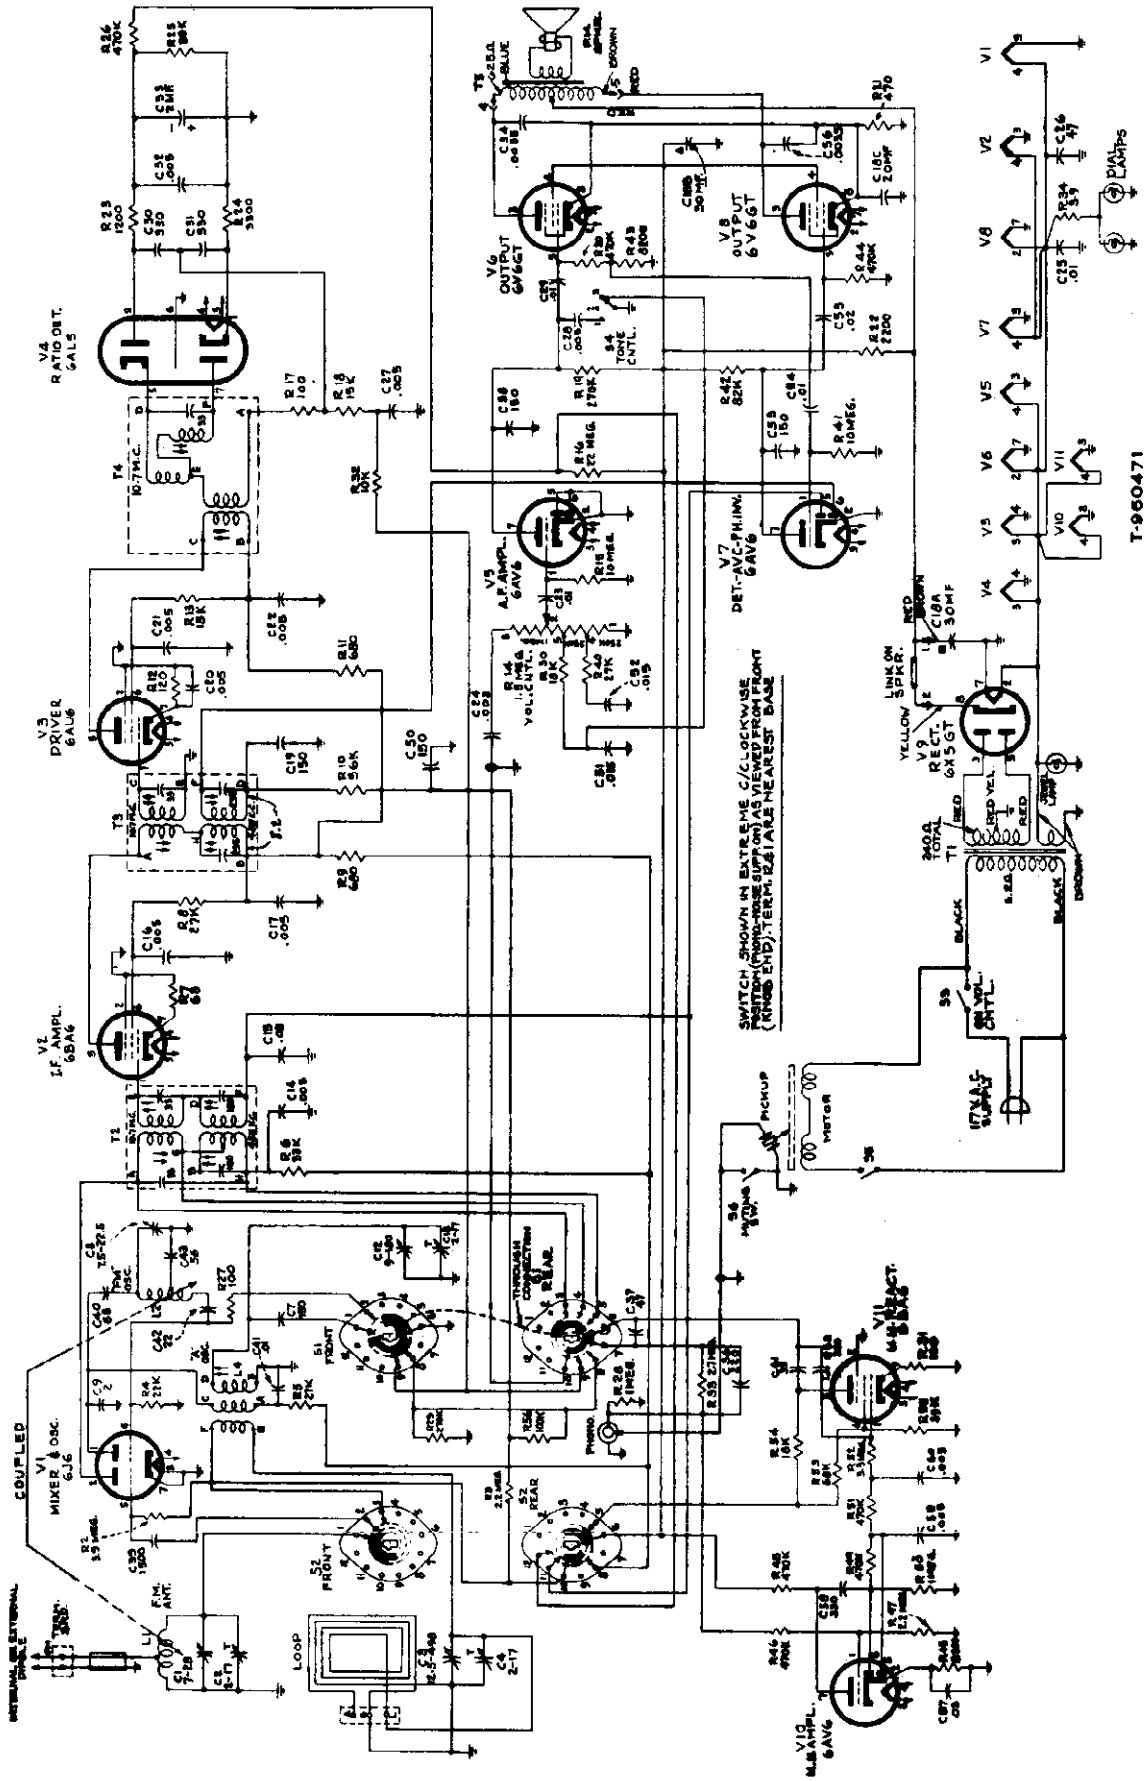
Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 615
*70137	Bracket—Dial bracket—L.H.—complete with drive cord pulley
*70136	Bracket—Dial bracket—R.H.—complete with drive cord pulley
71924	Capacitor—Ceramic, 56 mmf. (C5)
71614	Capacitor—Ceramic, 120 mmf. (C18)
70602	Capacitor—Tubular, .0025 mfd., 400 volts (C9, C12)
70646	Capacitor—Tubular, .0035 mfd., 1000 volts (C19, C20)
70601	Capacitor—Tubular, .002 mfd., 400 volts (C7)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C14, C16)
70572	Capacitor—Tubular, .015 mfd., 400 volts (C13)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C6, C10, C17)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C11, C15)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C8)
71976	Capacitor—Electrolytic, comprising 1 section of 20 mfd., 450 volts; 1 section of 30 mfd., 350 volts; and 1 section of 20 mfd., 25 volts (C21A, C21B, C21C)
*70133	Coil—Oscillator coil (L2, L3)
*70139	Condenser—Variable tuning condenser (C1, C2, C3, C4)
70342	Control—Volume control and power switch (R6, S2)
†72953	Cord—Drive cord (approx. 49" overall length required)
70930	Grommet—Rubber grommet to mount variable condenser (3 required)
71608	Indicator—Station selector indicator
*70138	Plate—Dial back plate
30868	Plug—2 contact female plug for Motor cable
12493	Plug—5 contact female plug for speaker cable
72602	Pulley—Drive cord pulley
	Resistor—Fixed composition, 330 ohms, ±10%, 1 watt (R19)
	Resistor—Fixed composition, 2200 ohms, ±10%, 2 watts (R20)
	Resistor—Fixed composition, 8200 ohms, ±10%, ½ watt (R17)
	Resistor—Fixed composition, 15,000 ohms, ±10%, 2 watts (R2)
	Resistor—Fixed composition, 18,000 ohms, ±10%, ½ watt (R4)
	Resistor—Fixed composition, 22,000 ohms, ±10%, ½ watt (R1)
	Resistor—Fixed composition, 27,000 ohms, ±10%, ½ watt (R5, R7)
	Resistor—Fixed composition, 56,000 ohms, ±10%, ½ watt (R8)
	Resistor—Fixed composition, 100,000 ohms, ±10%, ½ watt (R21)
	Resistor—Fixed composition, 270,000 ohms, ±10%, ½ watt (R10, R11, R13, R14)
	Resistor—Fixed composition, 330,000 ohms, ±10%, ½ watt (R3)
	Resistor—Fixed composition, 470,000 ohms, ±10%, ½ watt (R16, R18)
	Resistor—Fixed composition, 2.2 megohms, ±20%, ½ watt (R9)
	Resistor—Fixed composition, 10 megohms, ±20%, ½ watt (R12, R15)
*70135	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
35787	Socket—Phono input socket
31251	Socket—Tube socket
31418	Spring—Drive cord tension spring

STOCK No.	DESCRIPTION
*70134	Switch—Range switch (S1)
70128	Transformer—First I. F. transformer (T1)
70129	Transformer—Second I. F. transformer (T2)
70127	Transformer—Power transformer, 117 volt, 60 cycles (T4)
35969	Washer—"C" Washer for tuning shaft
	SPEAKER ASSEMBLIES 92569-1W RL 103-1
13867	Cap—Dust cap
36145	Cone—Cone and voice coil assembly
71560	Plug—5 prong male plug for speaker
71961	Speaker—12" P.M. speaker complete with cone and voice coil less output transformer and plug
71145	Suspension—Metal cone suspension
37899	Transformer—Output transformer (T3)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
71599	Bracket—Indicator lamp bracket
72437	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Indicator lamp jewel
70142	Clamp—Dial clamp
X1796	Cloth—Grille cloth
*73413	Decal—Control panel decal for blonde instruments
73084	Decal—Control panel decal for walnut or mahogany instruments
71966	Decal—Trade mark decal (Victrola)
71910	Decal—Trade mark decal (RCA Victor)
70141	Dial—Glass dial scale
72856	Grommet—Rubber grommet for mounting record changer (3 required)
30698	Hinge—Cabinet lid hinge (4 required)
72824	Knob—Radio-phono-tone switch knob — brown — for blonde instruments
71822	Knob—Radio-phono-tone switch knob—maroon—for walnut or mahogany instruments
72800	Knob—Tuning or volume control knob—brown—for blonde instruments
71821	Knob—Tuning or volume control knob—maroon—for walnut or mahogany instruments
11765	Lamp—Dial indicator or compartment lamp—Mazda 51
70140	Loop—Antenna loop complete
73109	Nut—Tee nut for mounting record changer (3 required)
31048	Plug—Pin plug for shielded pickup cable
73110	Screw—¼-20 fillister head screw for mounting record changer (3 required)
30900	Spring—Retaining spring for knobs
*73411	Support—Cabinet lid support—L.H.
*73412	Support—Cabinet lid support—R.H.

*This is the first time this Stock No. has appeared in Service Data.
† Stock No. 72953 is a reel containing 250 ft. of cord.

RADIO CORP. OF AMERICA MODEL 8V112, CHASSI
RC-616



Circuit Description

The chassis used in this receiver has a 6J6 tube (V1) (twin triode), one section of which is used as mixer and the other section as oscillator. The FM antenna coil and the FM oscillator coil are placed in such position as to provide coupling between them. A section of the AM oscillator coil is connected in series with the mixer grid input when the selector switch is in AM position.

Dual I-F transformers are used, each transformer containing both AM and FM windings. The I-F amplifier is V2 (6BA6).

The selector switch has five functions:

(1) Selection of tuning range.
(2) Selection of AVC supply voltages to be applied to the controlled tubes. Simple AVC is applied to the grids of V1 and V2 on AM. Delayed AVC is used on FM and is applied only to the grid of V2.
(3) Controls application of B+ voltage to V1, V2, V3 and V11.
(4) Controls audio input to volume control.
(5) Controls circuit loading of M.M. reactor tube V11 (6BA6).

The driver V3 (6AU6) and ratio detector V4 (6AL5) circuits are similar to those used in other RCA Victor AM-FM receivers.

The audio system is conventional. It consists of V5 (6AV6 a.f. amp.), V7 (6AV6 ph. inv.), V6 and V8 (6V6GT p. p. output).

The rectifier is V9 (6X5GT).

The Magic Monitor system uses V10 (6AV6 M. M. amp.) and V11 (6BA6 M. M. reactor).

Tuning Ranges

Standard Broadcast (AM)..... 540-1,600 kc.
Frequency Modulation (FM)..... 88-108 mc.

Intermediate Frequencies...AM—455 kc., FM—10.7 mc.

Tube Complement

(1) 6J6..... Mixer and Oscillator
(2) 6BA6..... I. F. Amplifier
(3) 6AU6..... Driver
(4) 6AL5..... Ratio Detector
(5) 6AV6..... A. F. Amp.
(6) 6V6GT..... Output
(7) 6AV6.....AM Det.—AVC—Ph. Inv.
(8) 6V6GT..... Output
(9) 6X5GT..... Rectifier
(10) 6AV6..... M. M. Amp.
(11) 6BA6..... M. M. Reactor

Power Supply Rating..... 115 volts, 60 cycles, 90 watts

Loudspeaker

Type 92569-5..... 12 in. P.M.
Voice coil impedance at 400 cycles..... 3.2 ohms

Tuning Drive Ratio..... 18:1 (9 turns of knob)

Dial Lamps (2)..... Type No. 51, 6-8 volts, 0.2 amp.

Jewel Lamp..... Type No. 51, 6-8 volts, 0.2 amp.

Power Output

Maximum..... 7 watts
Undistorted..... 6 watts

Record Changer (RP-178)

Record Capacity..... Twelve 10-in. or ten 12-in.
Turntable Speed..... 78 r.p.m.

Antennas:

These receivers have built-in antennas for standard broadcast (AM) and frequency modulation (FM) reception.

Under average conditions these antennas will provide satisfactory reception. However, provision is made for the use of external antennas if desired — connect as indicated below:

Ground: Connect external ground to "G" terminal.

AM Antenna: Connect a single wire antenna to terminal "A."

FM Antenna: Remove the built-in FM antenna lead from the "FM" terminals of the terminal board. Connect the transmission line of an external FM dipole antenna to these two "FM" terminals.

Alignment Procedure

CORRECT ALIGNMENT OF THE FM BAND REQUIRES THAT THE AM BAND BE ALIGNED FIRST

Alignment Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation. An output meter is also necessary to indicate minimum audio output during FM Ratio Detector alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

The FM i-f alignment may be checked by means of an FM sweep generator and cathode ray oscilloscope. Connect the output from the sweep generator, which is set to 10.7 mc., to the mixer grid (6J6 Pin No. 5), low side to chassis. Disconnect the 2 mfd. capacitor C33 from the Ratio Detector circuit.

Connect the high side of the oscilloscope to the junction of R25 and R26, low side to chassis. Adjust the sweep generator and oscilloscope to obtain the response curve.

The Ratio Detector characteristic may be viewed by connecting the oscilloscope across the volume control R14. Capacitor C33 should be re-connected before checking the Ratio Detector characteristic.

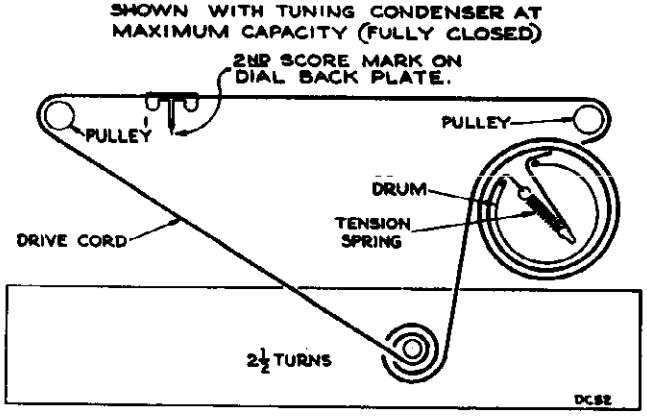
CRITICAL LEAD DRESS

1. Keep leads of C7 short.
2. Dress R27 away from range switch and pin No. 5 of V1.
3. The ground lead of pin No. 2 of V2 and V3 should be down against chassis. Its length is critical.
4. The AVC lead from R26 to range switch should be dressed against chassis and away from 6AU6 driver tube socket.
5. C43 should have short leads and the color code of the capacitor should go to the coil L4. The capacitor should be cemented down with polystyrene cement at the same time L2 is cemented.
6. The lead from the high side of the loop should be dressed away from tubes.
7. Lead from pin No. 2 of V1 to terminal "A" of 1st I. F. transformer should be dressed against the chassis.
8. Connect C40 directly between the gang condenser and pin No. 1 of V1.
9. Make all FM leads as short as possible.
10. Dress lead from pin No. 5 of V2 to terminal "A" of 2nd I. F. transformer down against chassis.
11. Dress resistor R15 near chassis base.
12. Dress all A. C. leads away from volume control.
13. The lead from "FM" terminal of antenna terminal board to L1 tap should be dressed away from V2.
14. The taps on L1 and L2 are critical. L1 tap should be ⅛ turn from the ground end. L2 tap should be 2½ turns from the gang condenser C8.
15. Dress C25 and C26 against the chassis with the shortest lead length possible.
16. The position of L1 and L2 is critical. L1 should be midway between V1 and the 1st I. F. transformer. The end of L2 should be approximately 3/16" from V1.

Dial Indicator

With the tuning condenser fully meshed (closed) the indicator should be set to the SECOND REFERENCE MARK from the left hand edge of the dial back plate.

Refer to the dial scale reproduction on page 7.



Dial Indicator and Drive Mechanism

AM Alignment

RANGE SWITCH IN BC POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	C3 in series with .01 mfd.	455 kc.	Quiet point at low freq. end.	AM windings.† T3 bottom core (sec.). T3 top core (pri.).
2				AM windings.† T2 top core (sec.). T2 bottom core (pri.).
3	"A" terminal of terminal board at rear of chassis in series with 220 mmf.	1400 kc.	1400 kc.	C13 osc. C4 ant.
4		600 kc.	600 kc.	L4 osc. (Rock gang.)
5	Repeat Steps 3 and 4.			

† Use alternate loading.

Alternate loading involves the use of a 47,000 ohm resistor to loa the AM plate winding while the AM grid winding of the SAM TRANSFORMER is being peaked. Then the grid winding is loade with the resistor while the plate winding is peaked. Only one windin is loaded at any one time. Remove the 47,000 ohm resistor after T and T2 have been aligned.

Oscillator frequency is above signal frequency on both AM and FM

FM Alignment

RANGE SWITCH IN FM POSITION — VOLUME CONTROL MAXIMUM

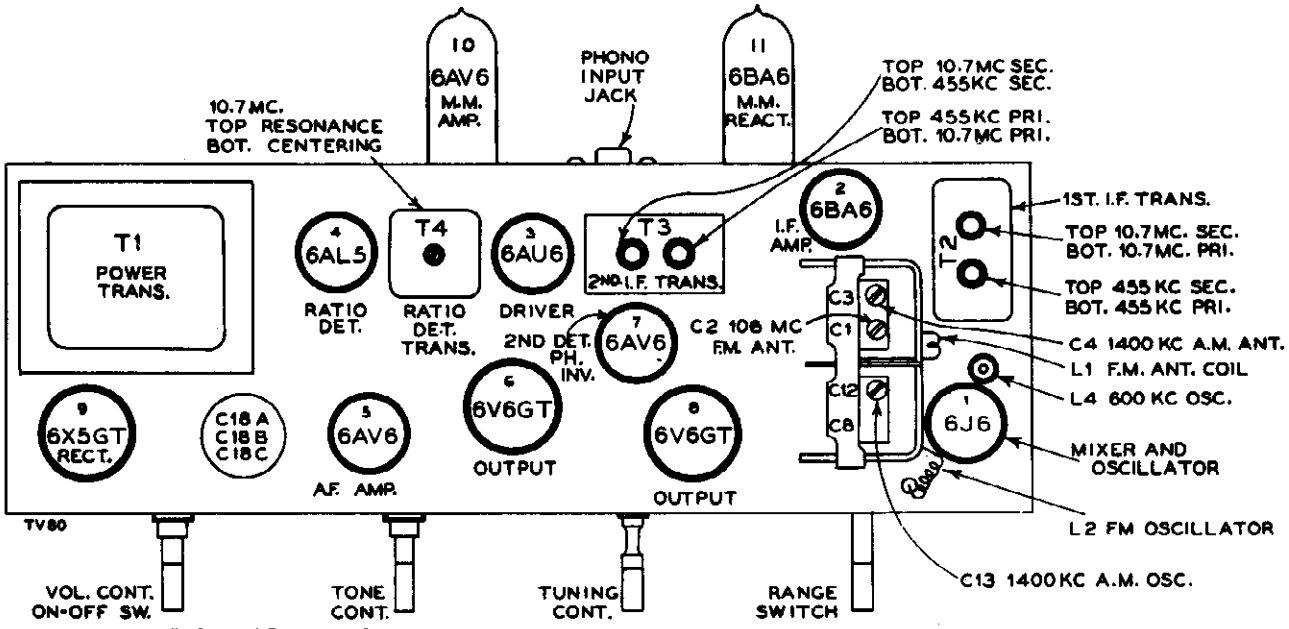
Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 2 mfd. capacitor C33 and the common lead to chassis. Turn gang condenser to max. capacity (fully meshed).			
2	Pin 1 of 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM (Approx. .05 volt).	Max. capacity (fully meshed).	T4 top core for max. d-c voltage across C33. T4 bottom core for min. audio output.*
3	FM ant. term. in series with a 300 ohm resistor. (Remove ant. lead from "FM" term.)	10.7 mc. Adjust to provide 2 to 3 volts indication on VoltOhmyst during alignment.		FM windings.†† T3 top core (sec.). T3 bottom core (pri.).
4				FM windings.†† T2 top core (sec.). T2 bottom core (pri.).
5		106 mc.	106 mc.	L2 osc.** C2 ant. Set C2 at max. capacity while adjusting L2.
6		90 mc.	90 mc.	L1 ant.** (Rock gang.)
7	Repeat Steps 5 and 6 until further adjustment does not improve calibration.			

* Two or more points may be found which lower the audio output At the correct point the minimum audio output is approached rapidly and is much lower than at any incorrect point.

†† Align T3 and T2 by means of alternate loading as explained under AM alignment. Use a 680 ohm resistor instead of a 47,000 ohm resistor and load the FM windings.

** L1 and L2 are adjustable by increasing or decreasing the spacing between turns.

MODEL 8V112 RADIO CORP. OF AMERICA



Tube and Trimmer Locations

Note: FM mixer and oscillator coils are adjustable by increasing or decreasing the spacing between turns. The position of the coils and location of the taps are critical (refer to "Critical Lead Dress").

SOCKET VOLTAGES

Voltages measured with Chanalyst or VoltOhmyst and should hold within ±20% with rated line voltage. Tuning condenser closed—no signal input.

Tube	Terminal	Voltage

MAGIC MONITOR

Circuit Description

The Magic Monitor circuit acts as a capacity shunt across the audio input to the volume control when the selector switch is turned to M. M. position. This shunt is variable, diminishing with increasing input level and increasing with increase of frequency. The phono signal input is applied to the grid of V10 (6AV6 M. M. amp.), is amplified and fed through a resistance-capacity network to the diode plates of V10 which rectifies it and produces a grid voltage on V11 in proportion to the level of the high frequencies contained in the audio signal.

Tests

(1) Feed a .04 volt 400 cycle signal from a low impedance source into the phono jack. Adjust the volume control for maximum output with selector switch in PHONO position. Set switch to M. M. The output level should decrease to approximately one-half.

(2) Repeat Step 1 except using 2 volt signal. The output level should decrease only slightly when the selector switch is turned to M. M. position.

(3) Repeat Step 2 except using 3,000 cycle signal. The output level should not decrease when the selector switch is turned to M. M. position.

(4) Repeat Step 3 except using .04 volt signal. The output level should decrease to approximately one-fourth when the selector switch is turned to M. M. position.

NOTE—2nd I.F. Transformer:

Some chassis may use 2nd I.F. trans. stamped 970435-5 (Stock No. 74019), the 455 k.c. windings have a d.c. resistance of 12 ohms each, the resonating capacitors are 150 mmf. instead of 235 mmf. They are interchangeable with transformers stamped 970435-2 (Stock No. 73363).

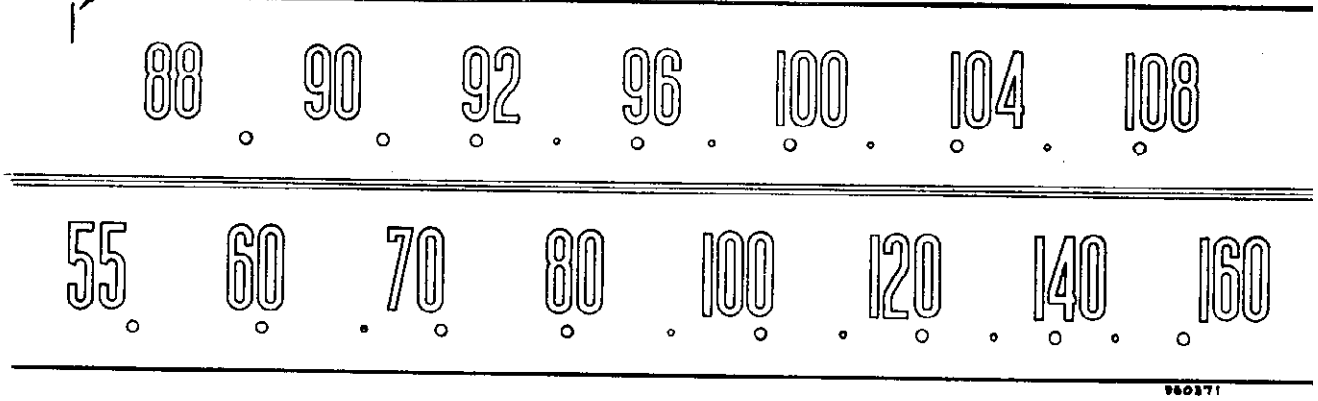
Magic Monitor Position



The dial scale drawing shown is a full size reproduction. It can be used as a reference in alignment procedure.

PHONO Position

Similar to that shown above.

Plate and screen supply (term. No. 5 of S2 rear) to V11 (6BA6 M. M. reactor) is disconnected. Signal circuit (term. No. 6 of S1 rear) to V11 is also disconnected. This removes the variable capacity shunt of V11 from the audio circuit.

	Resistor—Fixed, composition, 10 megohm, ±20%, ½ watt (R15, R41)
	Resistor—Fixed, composition, 22 megohm, ±20%, ½ watt (R16)
*73605	Shaft—Tuning knob shaft
31364	Socket—Dial or jewel lamp socket
73606	Socket—Tube socket, 7 prong, miniature, for tubes V1, V2 and V3
35787	Socket—Phono input socket
72516	Socket—Tube socket, 7 prong, miniature, for tubes V4, V5 and V7
73117	Socket—Tube socket, 7 pin, miniature, for tubes V10 and V11
31251	Socket—Tube socket, octal, for tubes V6, V8 and V9
72540	Spring—Drive cord spring
*73603	Support—Dial plate mounting support complete with pulley — R. H.
*73604	Support—Dial plate mounting support complete with pulley — L. H.
*73608	Switch—Range switch (S1, S2)
*73601	Transformer—Power transformer, 115 volts, 60 cycle (T1)
73745	Transformer—First I. F. transformer—dual (T2)
74019	Transformer—Second I. F. transformer—dual (T3)
73743	Transformer—Ratio detector transformer (T4)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92569-5W RL 103B5
13867	Cap—Dust cap
73934	Cone—Cone and voice coil assembly
31826	Plug—4 prong male plug for speaker
73635	Speaker—12" PM speaker complete with cone and voice coil less output transformer and plug (92569-5W)
71145	Suspension—Metal cone suspension
73636	Transformer—Output transformer (T5)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
71864	Antenna—FM antenna
*73880	Back—Cabinet back—burgundy—for mahogany or walnut instruments
*73881	Back—Cabinet back—tan—for blonde instruments
71599	Bracket—Jewel lamp bracket
73626	Bumper—Rubber bumper for carriage actuating link
72437	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Jewel lamp cap
*73613	Carriage—Record changer mounting carriage complete with runners
71892	Catch—Bullet catch and strike for speaker compartment or record storage compartment door
*73623	Check—Radio compartment door check
X1898	Cloth—Grille cloth for blonde instruments
X1897	Cloth—Grille cloth for mahogany or walnut instruments
*73764	Decal—Control panel decal for mahogany or walnut instruments
*73765	Decal—Control panel decal for blonde instruments
71984	Decal—Trade mark decal (RCA-Victor)
71986	Decal—Trade mark decal (Victrola)
*73628	Dial—Glass dial scale
*73627	Escutcheon—Dial scale escutcheon
11889	Grommet—Rubber grommet for front apron of chassis
*73614	Grommet—Rubber grommet to mount record changer (3 required)
37396	Grommet—Rubber grommet to mount speaker (3 required)
73735	Hinge—Hinge for phono compartment or radio compartment door (2 required for each door)
36817	Hinge—Record storage compartment door hinge (1 set)
36610	Hinge—Speaker compartment door hinge (1 set)
71822	Knob—Tone control or range switch knob—maroon—for mahogany or walnut instruments
72824	Knob—Tone control or range switch knob—brown—for blonde instruments
71821	Knob—Tuning or volume control knob—maroon—for mahogany or walnut instruments
72800	Knob—Tuning or volume control knob—brown—for blonde instruments
11765	Lamp—Dial or jewel lamp—Mazda 51
73616	Link—Actuating link assembly for record changer carriage—R. H.
73617	Link—Actuating link assembly for record changer carriage—L. H.
*73611	Loop—Antenna loop complete
*73869	Nut—Speed nut for "MM" plate
73109	Nut—Tee nut to mount record changer (3 required)
*73868	Plate—"Magic Monitor" nameplate
71819	Plate—Radio compartment door check mounting
30868	Plug—2 contact female plug for record changer power cable
31048	Plug—Pin plug for shielded pickup cable
72937	Pull—Phono compartment or radio compartment door pull (2 required for each door)
*73909	Pull—Speaker compartment or record storage compartment door pull
*73615	Screw—¼-20 x 1½" fillister head machine screw to mount record changer (3 required)
73618	Spring—Connecting spring between actuating link and record changer carriage
71818	Spring—Radio compartment door check spring
30900	Spring—Retaining spring for knobs
73185	Stop—Carriage mechanism stop (2 required)
70164	Stop—Stop for phono compartment, speaker compartment or record storage compartment door
73612	Track—Carriage mechanism track complete with mounting plate (2 required)

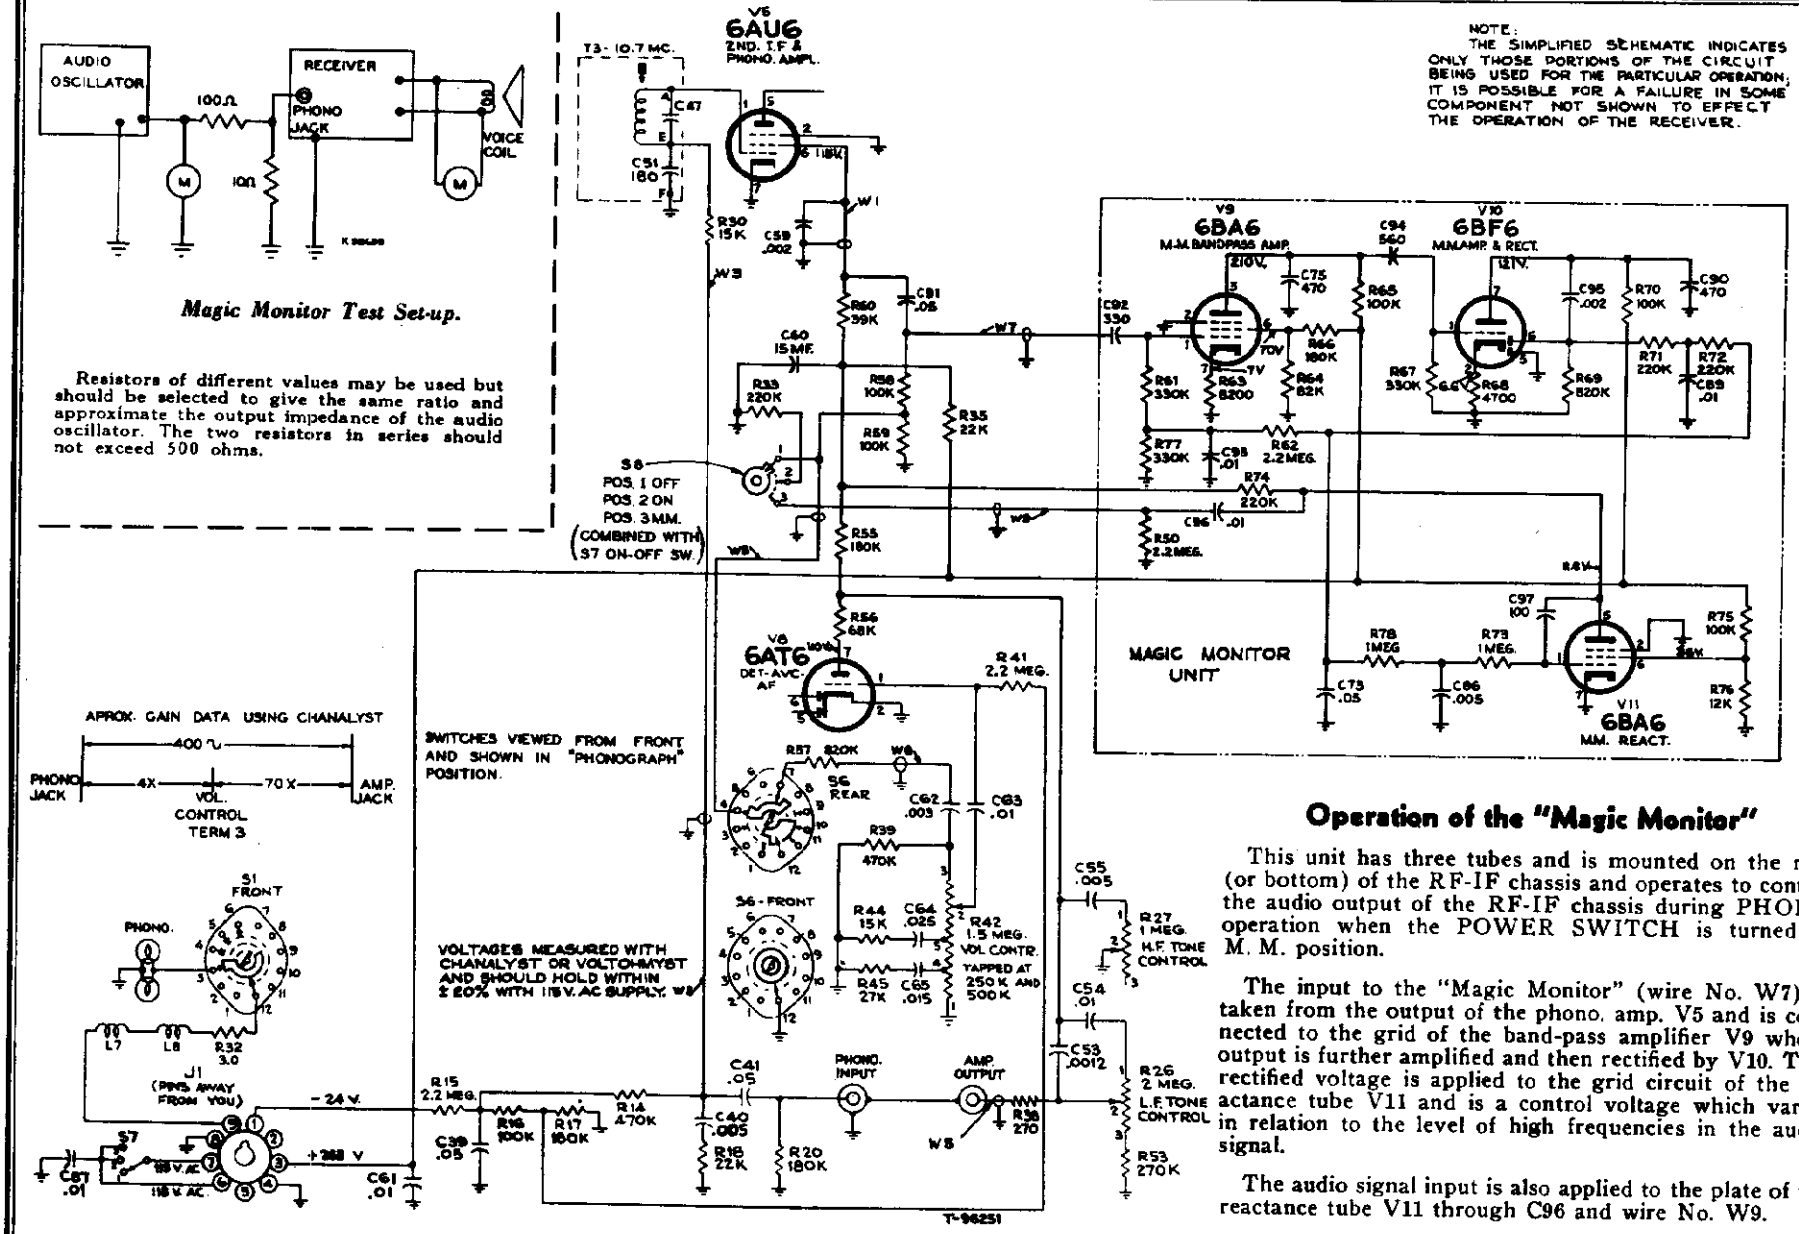
Simplified Schematic Diagram — FM Position.

Magic Monitor Test Set-up.

Resistors of different values may be used but should be selected to give the same ratio and approximate the output impedance of the audio oscillator. The two resistors in series should not exceed 500 ohms.



Simplified Schematic Diagram — PH Position.

Operation of the "Magic Monitor"

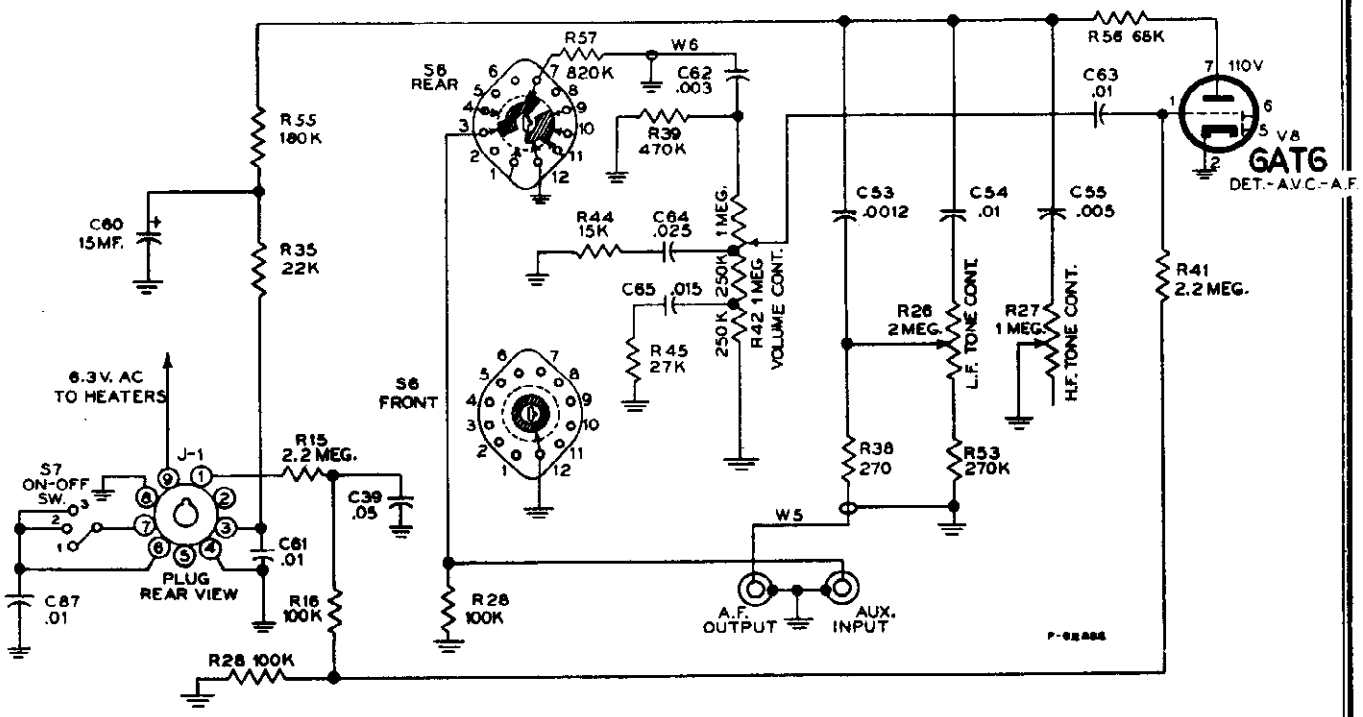
This unit has three tubes and is mounted on the rear (or bottom) of the RF-IF chassis and operates to control the audio output of the RF-IF chassis during PHONO operation when the POWER SWITCH is turned to M. M. position.

The input to the "Magic Monitor" (wire No. W7) is taken from the output of the phono. amp. V5 and is connected to the grid of the band-pass amplifier V9 whose output is further amplified and then rectified by V10. This rectified voltage is applied to the grid circuit of the reactance tube V11 and is a control voltage which varies in relation to the level of high frequencies in the audio signal.

The audio signal input is also applied to the plate of the reactance tube V11 through C96 and wire No. W9.

When the control voltage on V11 is below a predetermined level the tube will act as a shunt capacity between the audio signal and chassis thereby attenuating the high frequency portion of the audio signal.

MODEL 8V151 RADIO CORP. OF AMERICA



Simplified Schematic Diagram — ● Position. (AUX.).

Testing the Magic Monitor:

Any serious defects in Magic Monitor operation will be made evident by the following tests. An audio oscillator and an a-c voltmeter flat to 3,000 cycles are needed for the tests.

Procedure:

1. Set up the equipment as shown in Fig. 10. Although two voltmeters are shown, one can be used in both positions.
2. Turn the receiver function switch to PHONO and turn S8 to ON position. Set the audio oscillator to 400 cycles and adjust its output to 0.2 volt (measured across the oscillator output terminals). Adjust the receiver volume control for a reading of 1 volt (measured at the voice coil). There should be little or no change in receiver output when S8 is turned to "M.M." position.
3. Repeat Step 2 except using oscillator output of 1 volt, 400 cycles. There should be little or no change in receiver output when S8 is turned to "M.M." position.
4. Repeat Step 2 except using oscillator output of 1 volt, 3,000 cycles. There should be little or no change in receiver output when S8 is turned to "M.M." position.
5. Repeat Step 2 except using oscillator output of 0.2 volt, 3,000 cycles. When S8 is turned to "M.M." position the output should decrease to approximately 1/5 of that obtained with S8 in ON position.

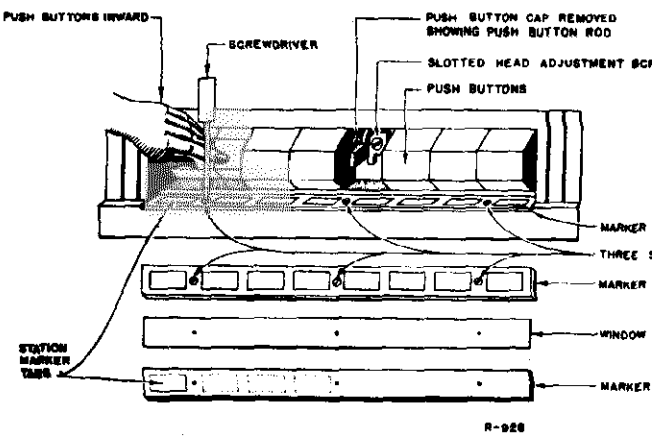
Push-Button Adjustment

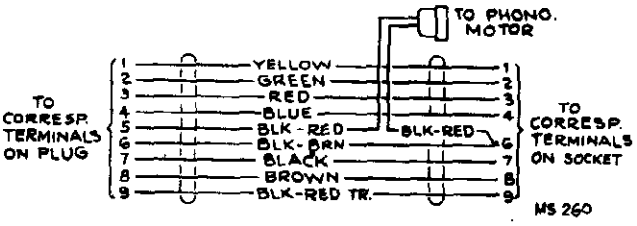
The push-buttons should be adjusted for eight favorite stations after the receiver is operating, and has had a 5 or 10 minute warm-up period.

Any standard broadcast or frequency modulation stations may be chosen. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

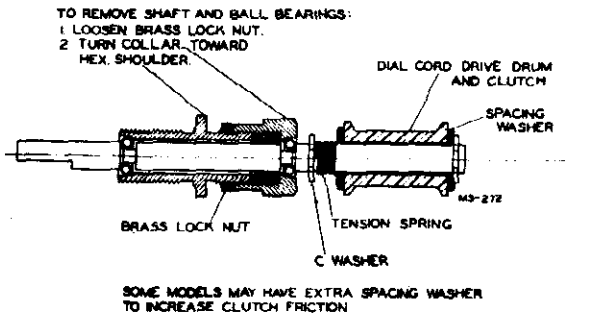
1. Remove the first PUSH-BUTTON (Just pull) and note the adjustment screw beneath.
2. Loosen the adjustment screw.
3. Manually tune very accurately for the desired station.
4. Push the PUSH-BUTTON rod in till it is against stop.
5. Tighten adjustment screw.
6. Make adjustment for the other buttons, setting up and checking each for the chosen station in a similar manner.
7. Recheck all PUSH-BUTTONS and reset if found necessary.



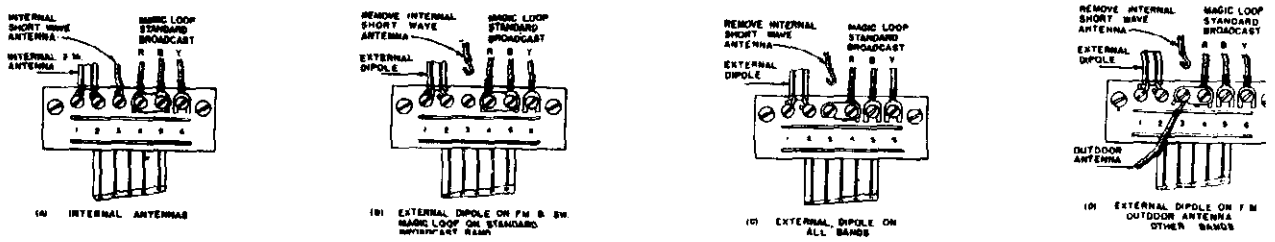
Push-Button set-up



Power Cable.
Some may not have the color code indicated.



Tuning Shaft and Clutch Assembly.



Antenna Terminal Board Connections

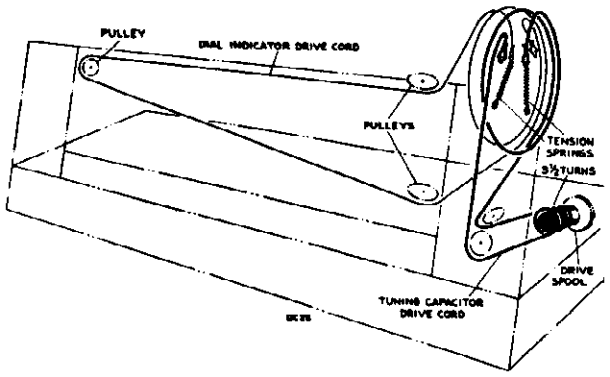
EXTERNAL ANTENNAS—If reception is not satisfactory on one or more of the three bands, using the built-in cabinet antennas, an external antenna may be used. The Magic Loop Antenna will usually provide sufficient pickup on the Standard Broadcast band, but if an external dipole is installed to improve reception on Frequency Modulation it may be used for Standard Broadcast and Short Wave as well. Connections are made to the antenna terminal board in the back of the cabinet. External antennas may be erected indoors or outdoors and should be oriented in direction for requirements of best reception. RCA Television Antenna, Stock No. 225 or 226, or the equivalent with 300-ohm transmission line is recommended for an external antenna.

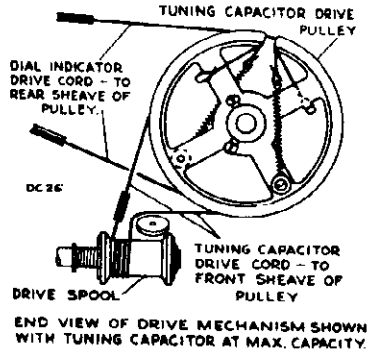
Figure 21 (A) shows the *Antenna Terminal Board* with connections for *internal* cabinet *antennas.*

Figure 21 (B) shows connections for the RCA Television Antenna replacing those for the *internal FM antenna* on terminals 1 and 2, and the *internal SW antenna* disconnected at terminal 3. The external dipole antenna is now the antenn for FM and SW bands.

Figure 21 (C) shows the additional change for connecti the Standard Broadcast band to make use of the extern RCA Television Antenna. The link across terminals 4 and 5 changed to terminals 4 and 3. The external antenna is no effective on all bands. Tighten terminals and be sure that t red, black and yellow leads (R.B.Y.) to terminals 4, 5 and are still in place and securely connected.

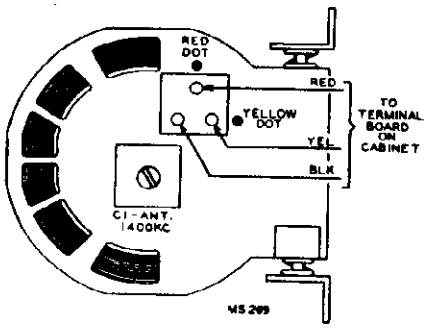
Figure 21 (D) shows connections for a separate outdo antenna on SW and SB reception, and the external dipole FM. This outdoor antenna should consist of a wire 30 to feet or so in length mounted in a convenient location as hig as possible. Connect lead-in from the antenna to terminal on the antenna terminal board. This outdoor antenna effective on SB and SW bands. If this connection mak the SB signal too strong, causing overload and distortio replace the link across terminals 4 and 5 as in Figure 21 (and (B). This outdoor antenna is now effective on SW onl



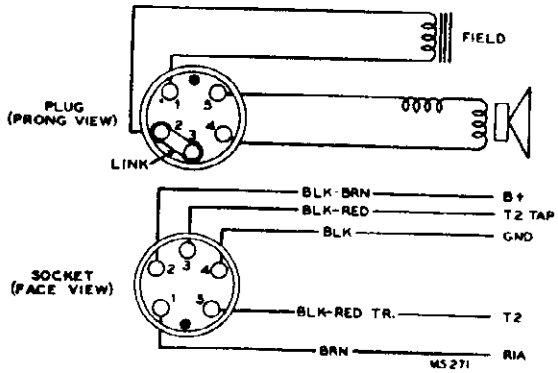


END VIEW OF DRIVE MECHANISM SHOWN WITH TUNING CAPACITOR AT MAX. CAPACITY.

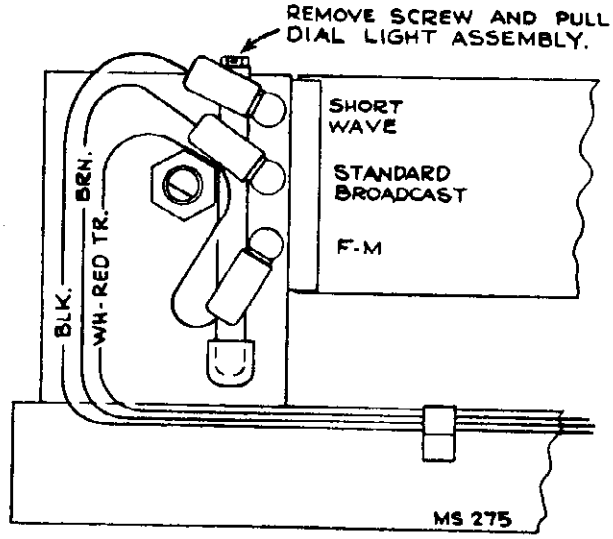
Dial Cord Assembly.



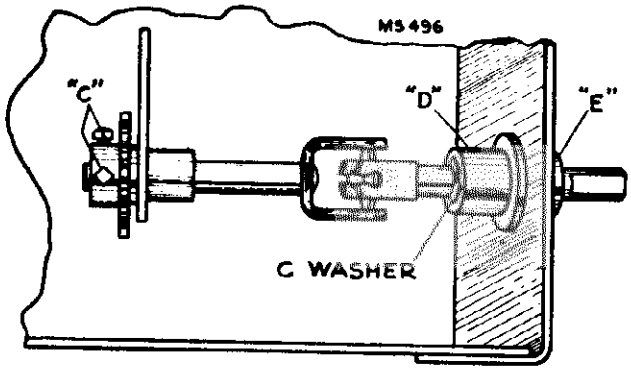
Loop Antenna.



Speaker Connections.



Dial Lamp Assembly.



Range Switch Coupling Shaft.

Removal of Dial Lamps

1. Remove the six control knobs.
2. Remove the four "T" bushings which hold the escutcheon to the control shafts—remove escutcheon.
3. Remove the screw which holds the dial light assembly to the chassis (accessible from back with radio compartment closed)—pull the assembly out of its retaining slot. (See Fig. 25.)

To Remove Shaft: Loosen square head set screws "C" in collar of gear. Remove nut "E" (on front apron of chassis) from bushing "D." Push shaft and bushing to the rear so that shaft and bushing are clear of the chassis apron. Flex the shaft and pull forward.

To Remove Bushing from Shaft: Remove "C" washer from shaft at inside end of bushing, push shaft through bushing to permit removal of "C" washer normally recessed inside bushing. Pull shaft through bushing to inside of chassis.

Circuit Description

Built-in antennas are provided for Standard Broadcast ("A" Band), Short Wave ("C" Band) and Frequency Modulation ("FM"); connected through the range switch to the R.F. amplifier tube (V1). The output of the R.F. amplifier and the oscillator (V3) is fed into the grid of the mixer tube (V2). The intermediate frequency output of the mixer is coupled through transformers T1 (10.7 mc.) and T2 (455 kc.) (series connected) to the 1st I.F. amplifier tube. The output of the I.F. amplifier is coupled through trans. T3 (10.7 mc.) and T4 (455 kc.) whose secondaries are connected to the grid of V5 (2nd I.F.) and the detector diode of V8 (AM Det.) respectively. The 10.7 mc. output of V5 is coupled through trans. T5 to the grid of the driver tube (V6) whose output is coupled through the driver trans. (T6) and the ratio detector trans. to the ratio detector tube (V7).

Simple A.V.C. is used on "A" and "C" bands, delayed A.V.C. is used on FM.

The audio voltages developed in the detector circuits of V7 (FM) and V8 (AM) are coupled through the range switch and volume control to V8 (AF amp.)

When the range switch is turned to PHONO position grid of V5 (this tube serves as 2nd I.F. on FM); the output of V5 (as phono. amp) is the screen grid (pin No. 6) and is coupled through the range switch and volume control to V8 (A.F. amp.) and also to the "Magic Monitor" which varies the audio output during phono operation. The audio output of V8 is coupled to the AMP output jack.

When the selector switch is turned to max. counter-clockwise position this instrument may be used as an audio amplifier. The audio input for this purpose is connected to the AUX jack (middle) at the rear (or bottom) of the chassis. The input from this jack is coupled through the range switch and volume control to the grid of V8.

Note: Plate voltage supplied to V5 (2nd I.F.) on FM only. Plate and screen voltages supplied to V6 (driver) on FM only. Plate and screen voltages supplied to V3 (osc.) on FM, A and C bands only.

The circuit of the A.F. amplifier chassis is conventional consisting of a 6SN7GT which serves as audio amplifier and phase inverter feeding into two 6F6G tubes connected in push-pull. A 5U4G rectifier supplies B+ voltage for both chassis (RK-121C and RS-123D).

ALIGNMENT PROCEDURE

Before aligning set, completely mesh the gang and set the dial pointer on the mechanical maximum calibration point at the extreme left hand end of the dial.

When making a complete alignment follow in proper sequence the tabulated form below.

If only a portion of the circuit is to be aligned select the portion required, followed by the remaining steps in the chart. Any adjustments made on the FM 10.7 mc. IF's make it necessary to realign the AM 455 kc. IF's.

For "A" and "C" band alignment use output meter across voice coil keeping Test Oscillator output as low as possible to prevent AVC action.

CRITICAL LEAD DRESS

(Make lead dress before alignment)

1. Lead from pin 5, tube V2, to terminal "C" on transformer T1 should be dressed close to chassis.
2. Leads to terminals "C" and "D" on transformer T2 should be dressed close together.
3. The following capacitors must be dressed close to the chassis with leads kept as short as possible: C32, C33, C66, C69, C79, and C80.
4. All FM coil connections must be soldered in exact place as the original. (One-sixteenth inch difference in length may be excessive).
5. Lead from pin 7, tube V8, must be dressed away from lead to terminal "D" of transformer T7.
6. ALL wiring in the receiver is critical as to length and placement. It is therefore important when servicing, that extreme care should be taken so as not to disturb more of the wiring than absolutely necessary.

Note: Keep tuning capacitor rotor grounding brushes clean and making good contact.

FM RATIO DETECTOR ALIGNMENT

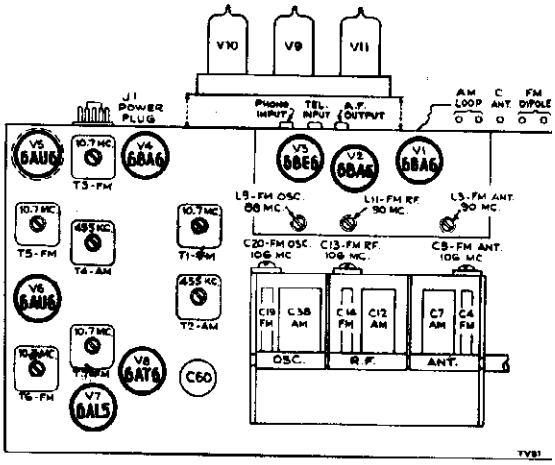
SET RANGE SWITCH TO FM POSITION

Steps	Connect High Side of Test Osc. To—	Tune the Osc. To—	Turn Vol. Cont. To—	Adjust
1.	Connect a 680 ohm Resistor between lugs D and E of the ratio detector transformer T7. Connect DC probe of a volt-ohmyst to the negative lead of the 5 mfd. Electrolytic capacitor C81. The common lead of the meter to chassis.			
2.	Driver grid pin 1, of 6AU6 (V6) in series with a .01 MFD capacitor.	10.7 MC 30% Mod. 400 Cycles AM	Maximum Volume	Driver transformer T6 for maximum DC voltage across C-81
3.	Remove Meter Leads and disconnect the 680 ohm resistor from D and E on T7. Connect two 68,000 ohm resistors (within 1% of each other) in series, across C81. Connect the common lead of the Voltohmyst to the center point of the 68,000 ohm resistors and the DC probe to contact No. 7 on rear of Switch wafer S6. Use the 30 volt scale.			
4.	Same as Step 2	Same as Step 2	Volume Control Maximum	†T7 Bottom core for Zero DC Balance on Voltohmyst ††T7 top core for minimum audio output. (Output meter across voice coil)
5.	Reconnect voltohmyst as in step 1, omitting the 680 ohm resistor.			
6.	Repeat step 2 omitting 680 ohms.			
7.	Remove all connections.			

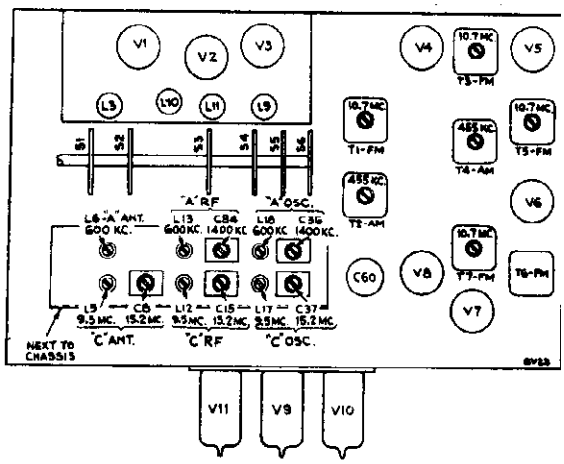
†Near the correct core position the zero point is approached rapidly and continued adjustment causes the indicated polarity to reverse. A slow approach to the zero point is an indication of severe detuning, and the bottom core should be turned in the opposite direction.

††The zero DC balance and the minimum AF output should occur at the same point: if such is not the case, the two cores should be adjusted until both occur with no further adjustment of either core. It may be advantageous to adjust both cores simultaneously, watching the volt-ohmyst, and an output meter connected across the voice coil for the point at which both zero DC and minimum output occurs.

Note:—Two or more points may be found which will satisfy the condition required in step 4. T7 top core should be correctly adjusted when approximately ⅛ inch of threads extend above the can, therefore, it is desirable to start adjustment with the top core in its furthest "in" position and turn out, while adjusting the bottom core, until the first point of minimum AF and minimum DC is reached.



Tube and Trimmer Locations — Top View.



Tube and Trimmer Locations — Bottom View.

ANT.—RF.—IF. ALIGNMENT

Steps	Connect the High Side of the Test Osc. to—	Connect Ground Side of the Test Osc.	Tune the Osc. To—	Radio Dial Tuned to—	Adjust

"FM" IF Alignment

1.	Connect the DC probe of a voltohmyst to the negative lead of the 5 MFD electrolytic capacitor C 81, and the common lead of the meter to chassis ground				
2.	Mixer grid pin #1 of 6BA6, (V2) in series with a .01 MFD capacitor (Adjust test osc. output for 6-10 volts developed across C81) (Range switch in FM position) (Use very short lead)	To RF Tube shelf ground near mixer tube(use very short leads)	10.7 MC 30% modulated at 400 cycles AM.	Max. cap. (Fully meshed)	*T5, T3, T1 top and bottom cores alternately loading primary & secondary of each transformer with 680 ohms while the opposite side of the same transformer is being adjusted. Adjust all transformers for maximum voltage across C81.

*This method is known as alternate loading which involves the use of 680 ohm resistor to load the plate winding while the grid winding of the same transformer is being peaked. Then the grid winding is loaded with 680 ohm resistor while the plate winding is being peaked.

When the windings are loaded, it is necessary to increase the 10.7 MC input since the gain will decrease and the voltage across C81 will be less

MODEL 8V151 RADIO CORP. OF AMERICA

ANT—RF—IF—ALIGNMENT (Continued)

Steps	Connect the High Side of the Test Osc. to—	Connect Ground Side of the Test Osc.	Tune the Osc. To—	Radio Dial Tuned to—	Adjust
"AM" IF Alignment					
3.	Mixer grid pin #1 of (V2) in series with a .01 MFD Capacitor. (Turn band switch to "A" or "C" band)	To chassis ground	455KC	High Freq. end of Dial	**Top and bottom Cores of T2 and T4. (For maximum voltage across voice coil)
"C" Band OSC.—RF.—ANT. Alignment					
4.	"C" Band Ant. Terminal #3 Through a dummy Ant. comprising a 150 ohm resistor in series with a 25 to 30 mmf capacitor	To Chassis ground	15.5 MC	15.5 MC	Osc.—C37*** RF.—C15 Ant.—C8 (For maximum voltage across voice coil)

"A" Band OSC.—RF.—ANT.					
7.	High Side (Red Lead) of Loop Primary with link open through a Dummy Ant. comprising a 200 mmf. Capacitor	To Chassis ground	1400 KC	1400 KC	Osc.—C36 RF.—C84 Ant.—C1 (For maximum voltage across voice coil)
8.			600 KC	600 KC	Osc.—L18 RF—L13 Ant.—L6 (For maximum voltage across voice coil)
9.	Repeat steps 7 and 8 for Max. output.				

**It is necessary to alternately load the primary and secondary of each 455 KC I. F. transformer with 10,000 ohms while the opposite side of the same transformer is being adjusted.

***To guard against the possibility of alignment of L17 and C37 to image frequencies, tune the test oscillator to 15.5 MC and turn the radio dial to 15.5 MC. Then adjust the test oscillator to 16.41 MC (image frequency). By increasing the test oscillator output, a signal should be heard.

Tune the test oscillator to 9.5 MC and turn the radio dial to 9.5 MC, then adjust the test oscilliator to 10.41 MC (image frequency). By increasing the test oscillator output, a signal should be heard.

(If these image frequencies cannot be heard, the set is incorrectly aligned, therefore repeat steps 4 and 5)).

Steps	Connect the High Side of the Test Osc. to—	Connect Ground Side of the Test Osc.	* Tune the Osc. To—	Radio Dial Tuned to	Adjust
"FM" Band OSC.—RF.—ANT. Alignment					
10.	FM antenna terminal #1 in series with a 120 ohm resistor	To FM antenna terminal #2 in series with a 120 ohm resistor	106 MC	106 MC	Osc.—C20 for maximum voltage across C81.

38401	Control—Tone control—L.F. (R26)
71596	Control—Volume control (R42)
72987	Cord—Manual drive cord (approx. 42" overall required) or indicator drive cord (approx. 30" overall required)
71941	Coupling—F.M. coupling unit (L16, C17, R5)
71654	Dial—Glass dial scale—F.M.
71653	Dial—Glass dial scale—Standard Broadcast
71652	Dial—Glass dial scale—Short Wave
71805	Drum—Tuning condenser drive drum
71800	Gear—12 tooth gear fastened to selector switch coupling shaft
71801	Gear—18 tooth gear fastened to selector switch shaft
35844	Gear—Scissor gear for tuning capacitor
71799	Grommet—Rubber grommet to mount R.F. unit cradle (6 required)
70429	Grommet—Rubber grommet to mount tube socket (4 required)
72674	Grommet—Rubber grommet for chassis front mounting (2 required)
72069	Grommet—Rubber grommet for chassis rear mounting (2 required)
71647	Guide—Indicator slide guide
71832	Indicator—Station selector indicator
11765	Lamp—Dial lamp—Mazda 51
11891	Lamp—Pilot lamp—Mazda 44
71962	Pinion—Pinion and shaft for tuning capacitor
71963	Plate—Bearing plate for tuning capacitor pinion
72984	Plate—Connecting plate for selector switch extension shafts
71644	Plate—Dial back plate only, less dial window, dials, supports, indicator slide, indicator and pulleys
71648	Pulley—Idler pulley (2 required) or indicator cord pulleys
71650	Pulley—Manual tuning shaft cord pulley
71636	Receptacle—9 prong male plug for power cable (J1)
71637	Receptacle—AMP-AUX-PHONO jacks
72323	Resistor—Wire wound, 3 ohms, ½ watt (R32)
	Resistor—Fixed, composition, 10 ohms, ±20%, ½ watt (R54)
	Resistor—Fixed, composition, 100 ohms, ±10%, ½ watt (R21, R22)

	Resistor—Fixed, composition, 2.2 megohm, ±10%, ½ watt (R15, R41, R47, R50, R62)
	Resistor—Fixed, composition, 3.9 megohm, ±10%, ½ watt (R8)
	Resistor—Fixed, composition, 22 megohm, ±20%, ½ watt (R23)
71798	Screw—No. 8—32 x 5/32" set screw
71965	Screw—Push arm locking screw
71812	Shaft—Manual tuning shaft less spring and pulley
*73726	Shaft—Selector switch coupling shaft—switch end
*73727	Shaft—Selector switch coupling shaft—knob end—less threaded bushing
72951	Shield—Lead tube shield
71833	Socket—Dial lamp socket—R.H.
71834	Socket—Dial lamp socket—L.H.
71931	Socket—Pilot lamp socket
71850	Socket—Tube socket complete with base and shield
73117	Socket—Tube socket
72516	Socket—Tube socket, miniature
71649	Spring—Coil spring for manual tuning shaft

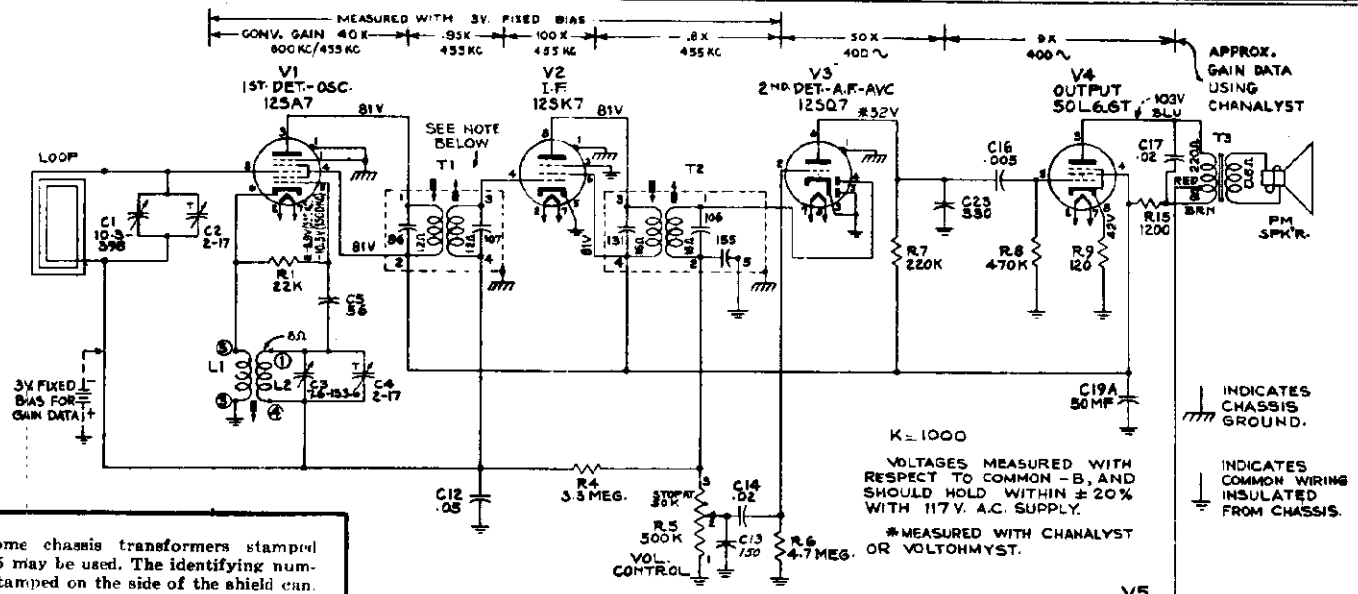
MODEL 8V151 RADIO CORP. OF AMERICA

Replacement Parts (Continued)

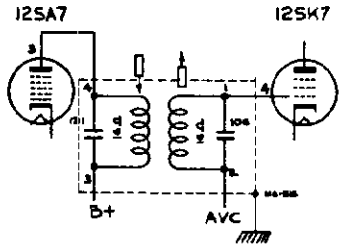
Stock No.	DESCRIPTION
71936	Spring—Drive cord spring
33622	Spring—Push button arm return spring
*73658	Switch—"Magic Monitor" and power switch (S7, S8)
71802	Switch—Selector switch (S1, S2, S3, S4, S5, S6)
71645	Support—Glass support (rubber) (2 required)
71845	Transformer—First I.F. transformer — F.M. (T1) (C28, C30)
71846	Transformer—First I.F. transformer — A.M. (T2) (C29, C31)
71847	Transformer—Second I.F. transformer — F.M. (T3) (C45, C47, C51)
71848	Transformer—Second I.F. transformer — A.M. (T4) (C46, C48, C49, C50)
71849	Transformer—Third I.F. transformer — F.M. (T5) (C56, C57)
71935	Transformer—Driver transformer (T6) (C70)
71934	Transformer—Ratio detector transformer (T7) (C72, C74)
37435	Washer—"C" washer for holding threaded bushing to selector switch shaft
31608	Washer—Spring washer for drive cord pulleys or idler pulley
71875	Washer—Spring washer for chassis front mounting
2917	Washer—Spring washer for selector switch coupling shaft and bushing (knob-end) or manual tuning shaft
71810	Window—Dial window (clear glass)
	AMPLIFIER ASSEMBLIES RS 123D
70646	Capacitor—Tubular, .0035 mfd., 1,000 volts (C5, C6)
70631	Capacitor—Tubular, .01 mfd., 600 volts (C3, C4)
70632	Capacitor—Tubular, .02 mfd., 600 volts (C8)
72596	Capacitor—Tubular, .05 mfd., 200 volts (C7)
31323	Capacitor—Electrolytic, 16 mfd., 150 volts (C2)
72955	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 450 volts; 1 section of 50 mfd., 400 volts; and 1 section of 40 mfd., 25 volts (C1A, C1B, C1C)
11765	Lamp—Jewel lamp—Mazda 51
18469	Plate—Mounting plate (bakelite) for electrolytic capacitor
12493	Plug—5 contact female plug for speaker cable
	Resistor—Fixed, composition, 2,700 ohms, ±10%, ½ watt (R3, R9)
	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ watt (R4)
	Resistor—Fixed, composition, 27,000 ohms, ±10%, ½ watt (R5)
	Resistor—Fixed, composition, 47,000 ohms, ±20%, ½ watt (R11)
	Resistor—Fixed, composition, 220,000 ohms, ±20%, ½ watt (R6, R7, R12)
71660	Resistor—Voltage divider, comprising 1 section of 180 ohms, 3.5 watts, 1 section of 2,520 ohms, 3.97 watts, and 1 section of 2,760 ohms, 9.3 watts (R1a, R1b, R1c)
	Resistor—Fixed, composition, 1 megohm, ±20%, ½ watt (R10)
35787	Socket—Audio input socket
71659	Socket—9 prong power socket (J1)
31364	Socket—Jewel lamp socket
31319	Socket—Tube socket
37048	Transformer—Power transformer, 115 volts, 60 cycle (T1)
71661	Transformer—Output transformer (T2)
	SPEAKER ASSEMBLIES 92567-2W RL 70R1
13867	Cap—Dust cap
71147	Clamp—Clamp to hold metal cone suspension (2 required)
71146	Coil—Field coil—1,060 ohms
11469	Coil—Neutralizing coil
36145	Cone—Cone complete with voice coil
31539	Plug—5 prong male plug for speaker
71144	Speaker—12" EM speaker complete with cone and voice coil less plug
71145	Suspension—Metal cone suspension
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
72555	Antenna—Dipole antenna
*73714	Back—Cabinet back—burgundy—for mahogany or walnut instruments
*73715	Back—Cabinet back—tan—for blonde instruments
71599	Bracket—Jewel lamp bracket
71874	Bushing—Bushing and washer for large knobs
*73626	Bumper—Rubber bumper for record changer carriage actuating link
71884	Button—Push button
71863	Cable—5 wire moulded lead-in cable
72583	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Pilot lamp jewel
38684	Capacitor—Mica trimmer, 2-20 mmf. (C1)
*73695	Carriage—Record changer mounting carriage complete with runners
71892	Catch—Bullet catch and strike for lower doors
72434	Check—Radio compartment door check
X1813	Cloth—Grille cloth for mahogany or walnut instruments
X1666	Cloth—Grille cloth for blonde instruments
71966	Decal—Trade mark decal (Victrola)
71910	Decal—Trade mark decal (RCA-Victor)
*73716	Escutcheon—Escutcheon only less window, screen and marker strips for mahogany instruments
*73717	Escutcheon—Escutcheon only less window, screen and marker strips for walnut instruments
*73718	Escutcheon—Escutcheon only less window, screen and marker strips for blonde instruments
*73712	Gasket—Rubber gasket—tan—for under escutcheon for blonde instruments
*73713	Gasket—Rubber gasket—black—for under escutcheon for mahogany or walnut instruments
*73870	Grille—Metal grille for mahogany or walnut instruments
*73873	Grille—Metal grille for blonde instruments
*73699	Grommet—Rubber grommet for mounting record changer (4 required)
*73702	Grommet—Rubber grommet for loop mounting (2 required)
16058	Grommet—Rubber grommet for speaker mounting (3 required)
*73871	Hinge—Speaker compartment door or record storage compartment door hinge (2 required for each door)
73735	Hinge—L.H. hinge for phono compartment door or R.H. hinge for radio compartment door
*73751	Hinge—R.H. hinge for phono compartment door or L.H. hinge for radio compartment door
*73711	Knob—Selector switch or power switch knob—brown—for blonde instruments
71822	Knob—Selector switch or power switch knob—maroon—for mahogany or walnut instruments
72761	Knob—Tone control knob—brown—for blonde instruments
71883	Knob—Tone control knob—maroon—for mahogany or walnut instruments
72118	Knob—Volume control or tuning knob—brown—for blonde instruments
71821	Knob—Volume control or tuning knob—maroon—for mahogany or walnut instruments
*73616	Link—Actuating link assembly for record changer carriage—R.H.
*73617	Link—Actuating link assembly for record changer carriage—L.H.
71862	Loop—Antenna loop complete (L1, L15, C1)
71969	Marker—Station markers
72765	Nut—Speed nut to fasten transparent screen to escutcheon (2 required)
71879	Plate—Backing plate for transparent screen
71881	Plate—Call letter marker plate
71819	Plate—Radio compartment door check mounting plate
30868	Plug—2 contact female plug for power cable
30870	Plug—2 prong male plug for power cable
32641	Plug—3 prong male plug for loop cable
31048	Plug—Pin plug for shielded pickup cable
*73872	Pull—Door pull
71878	Screen—Transparent screen (Victrola indicator)
36422	Socket—3 contact socket for loop cable
*73618	Spring—Connecting spring between link and record changer carriage
*73697	Spring—Conical spring for mounting record changer
71818	Spring—Radio compartment door check spring
30900	Spring—Retaining spring for knobs
71867	Spring—Retaining spring for push button
73185	Stop—Metal stop for record changer carriage
72936	Stop—Stop for lower doors
70164	Stop—Stop for phono compartment door
71880	Strip—Backing strip for call letter marker plate
*73612	Track—Record changer carriage mechanism track complete with mounting plate (2 required)
71814	Washer—Rubber washer for radio compartment door check
71882	Window—Window for call letter markers

†Stock No. 72987 is a spool containing 150 feet of cord.

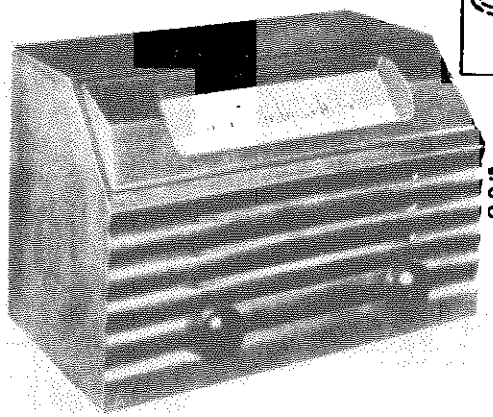
*This is the first time that this Stock No. has appeared in Service Data.

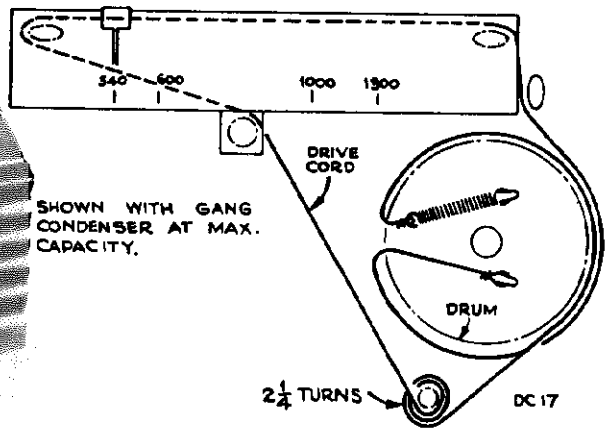


In some chassis transformers stamped 970441-5 may be used. The identifying number is stamped on the side of the shield can. The schematic diagram below shows the connections, d-c resistance and shunt capacitors of transformers stamped 970441-5.



Frequency Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc
Power Output
Undistorted ..... 1.0 watt
Maximum ..... 1.5 watts
Tube Complement
(1) RCA-12SA7 ..... Converter
(2) RCA-12SK7 ..... I.F. Amplifier
(3) RCA-12SQ7 ..... 2nd Det., A.V.C., and A.F. Amplifier
(4) RCA-50L6GT ..... Power Output
(5) RCA-35Z5GT ..... Rectifier
Pilot Lamp ..... Mazda No. 51, 6-8 volts, 0.2 amp.
Loudspeaker
Type ..... 4" x 6" PM
V. C. Impedance ..... 3.4 ohms at 400 cycles
Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC ..... 80 watts





SHOWN WITH GANG CONDENSER AT MAX. CAPACITY.

Dial-Indicator and Drive Mechanism

MODEL 8X53

RADIO CORP. OF AMERICA

Alignment Procedure

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn receiver the volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and mounted above the pointer for reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

Dial Backing Plate.—In the event that only the chassis is returned for service, the marks on the dial backing plate may be used during alignment; refer to the Dial Indicator and Drive Mechanism drawing for corresponding frequencies.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand reference mark on the dial backing plate.

For additional information refer to booklet, "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	T2 Top & bottom 2nd. I-F trans.
2	Stator of C1 through 0.1 mfd.			*T1 Top & bottom 1st. I-F trans.
3	Short wire placed near loop antenna	1,300 kc	1,300 kc	C4 (osc.) C2 (ant.)
4		600 kc	600 kc "A" Band	L2 (osc.) Rock gang
5	Repeat steps 3 and 4			

*Do not readjust T2 when test oscillator is connected to C1.

Critical Lead Dress

1. Dress all heater leads next to chassis.
2. Dress power cord away from volume control and audio circuits.
3. Dress capacitor (C14) toward switch and parallel to chassis length.
4. Dress capacitor (C16) back against rear chassis apron.
5. Dress capacitor (C17) over and towards 50L6 socket perpendicular to capacitor (C14) and (C16).
6. Dress pilot lamp leads over second I-F transformer and away from tubes.
7. Dress blue lead from output transformer against front apron and away from I-F leads.

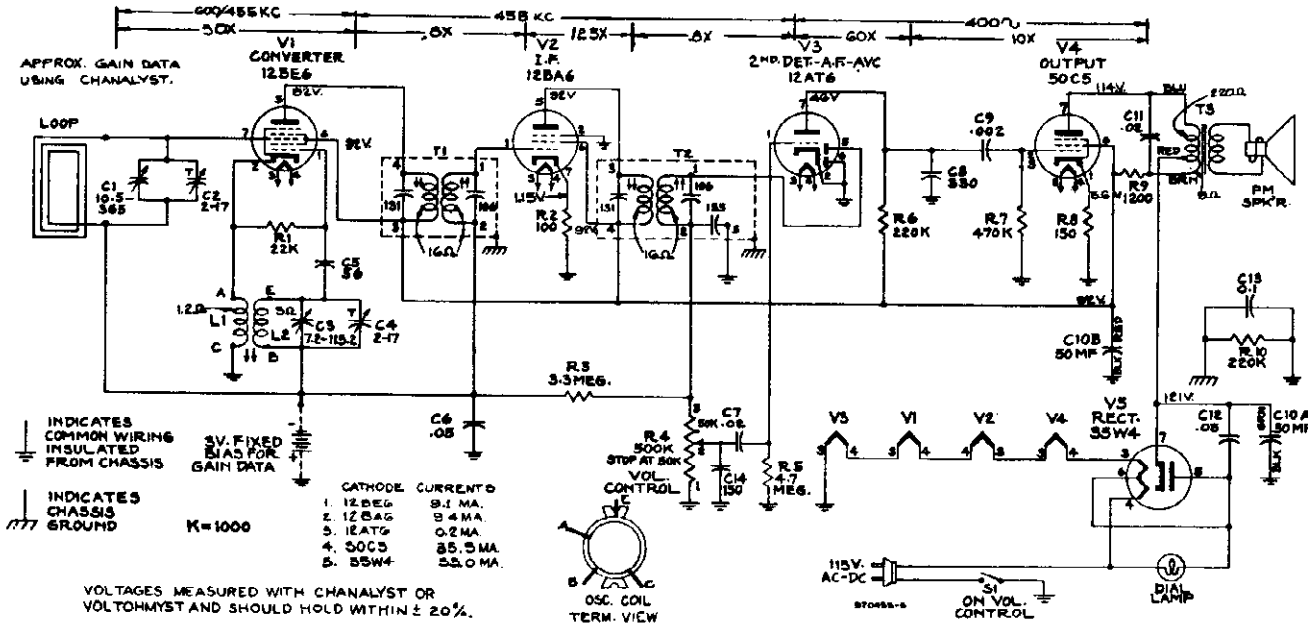
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLY 922258-1
70470	Speaker—4" x 6" elliptical speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order by referring to model number of instrument, and number stamped on speaker.
	MISCELLANEOUS
*73209	Back—Cabinet back
70398	Clamp—Dial clamp (1 set)
*X1660	Cloth—Grille cloth
70476	Dial—Glass dial scale
11771	Foot—Rubber foot (4 required)
71821	Knob—Control knob—maroon
30900	Spring—Retaining spring for knobs

*THIS IS THE FIRST TIME THIS STOCK NUMBER HAS APPEARED IN SERVICE DATA



Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

For additional information refer to booklet "RCA Victor Receiver Alignment."

NOTE.—If the speaker should be removed in servicing, its position should be checked when re-assembling. The distance between the front of the speaker and the rear chassis apron should be maintained at 3½ inches.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12BA6 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	T-2 (top and bottom) 2nd I-F trans.
2	Stator of C1 through 0.1 mfd.			T-1 (top and bottom) 1st I-F trans.
3	Short wire placed near loop to radiate signal.	1,600 kc	1,600 kc	C4 (osc.)
4		1,400 kc	1,400 kc	C2 (ant.)
5		600 kc	600 kc	L2 (osc.) Rock gang
6		Repeat steps 3, 4 and 5.		

*Do not readjust T-2 when test oscillator is connected to C1.

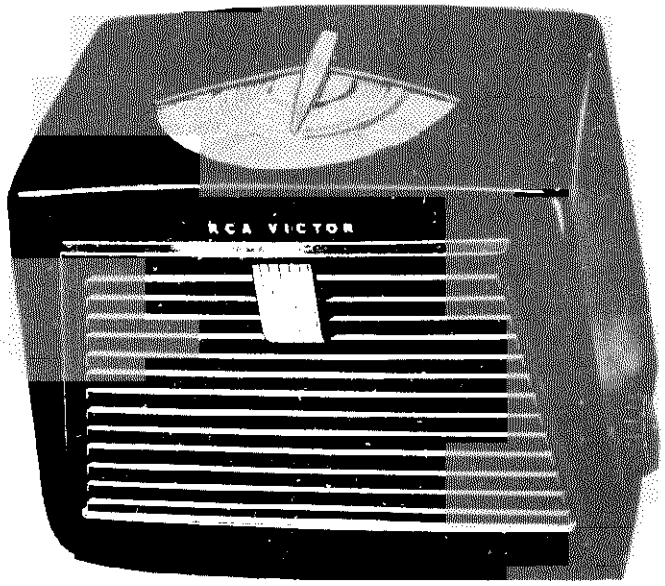
RADIO CORP. OF AMERICA



Specifications

Tuning Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc
Power Output
Undistorted ..... 1.0 watt
Maximum ..... 1.4 watts
Tube Complement
(1) RCA-12BE6 ..... Converter
(2) RCA-12BA6 ..... I.F. Amplifier
(3) RCA-12AT6...2nd Det., A.V.C., and A.F. Amplifier
(4) RCA-50C5 ..... Output
(5) RCA-35W4 ..... Rectifier
Pilot Lamp ..... Mazda No. 51, 6-8 volts, 0.2 amp.
Loudspeaker (92577-1)
Type ..... 4-inch PM
V. C. Impedance ..... 3.2 ohms at 400 cycles

Cabinet Dimensions
Height ..... 5⅝" Width ..... 7⅞" Depth ..... 5"

Power Supply Rating
115 volts, AC, 50 or 60 cycles, or DC ..... 30 watts

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Critical Lead Dress

1. Dress all heater leads close to chassis.
2. Dress output plate bypass capacitor C11 inside of terminal board.
3. Dress all exposed leads away from each other and away from chassis.

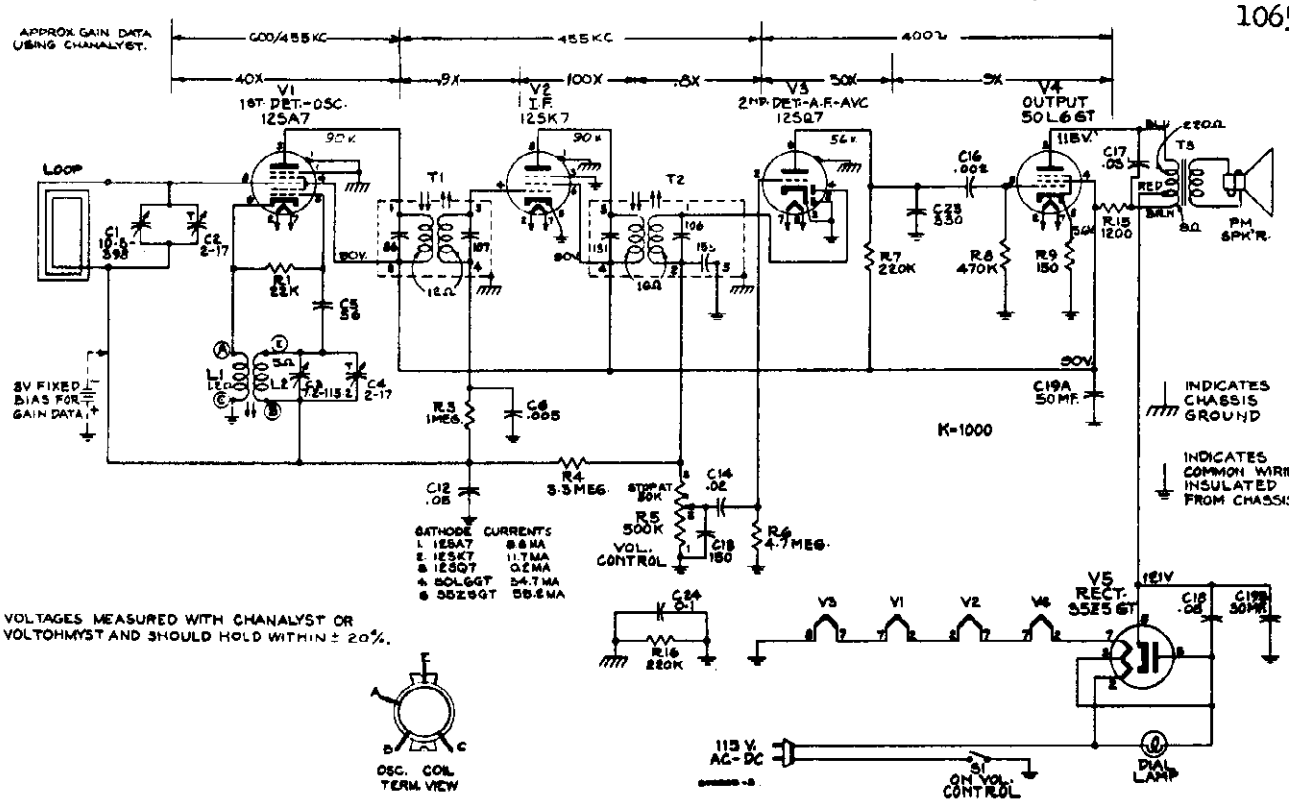
RADIO CORP. OF AMERICA

MODELS 8X541, 8X542, 8X547; CHASSIS RC-106 106!



Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscilloscope are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

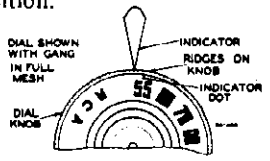
Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

Dial Centering:

If the mounting of the tuning condenser has been disturbed, it may be necessary to adjust its position after replacing the chassis in the cabinet. This may be done in the following manner:

1. Install chassis and tighten the three mounting screws.
2. Replace tuning knob.
3. Loosen the two screws which hold the tuning condenser mounting bracket to the chassis.
4. Adjust the position of the tuning condenser mounting bracket so that the tuning knob may be rotated without binding on the cabinet. With tuning condenser plates fully meshed the dial should be in the position indicated below.
5. The two screws should then be tightened to maintain this position.

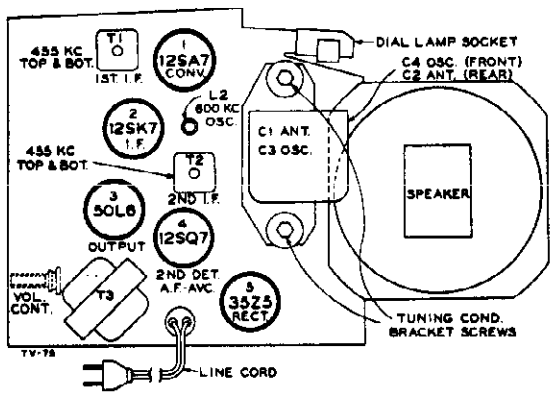


Dial and Indicator

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1600 kc end of dial	T2 (Top and bottom) 2nd I-F trans.
2	Stator of C1 through 0.1 mfd.			*T1 (top and bottom) 1st I-F trans.
3	Short wire placed near loop to radiate signal	1600 kc	1600 kc	C4 (osc.)
4		1400 kc	1400 kc	†C2 (ant.)
5		600 kc	600 kc	L2 (osc.) Rock gang
6		Repeat steps 3, 4 and 5.		

*Do not readjust T2 when test oscillator is connected to C1.

†When adjusting C2 (ant. trimmer) it is necessary to have the loop in the same position and spacing as it will have when assembled in the cabinet. This spacing is 3¼" from chassis loop.



Tube and Trimmer Locations

Alignment Procedure

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn receiver the volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be removed from the cabinet and mounted above the pointer for reference during alignment. The extreme left hand mark of the Standard Broadcast scale must be in line with the left hand mark on the dial backing plate.

Dial Backing Plate.—In the event that only the chassis is returned for service, the marks on the dial backing plate may be used during alignment; refer to the Dial Indicator and Drive Mechanism drawing for corresponding frequencies.

Dial Pointer.—With the gang condenser in full mesh the dial pointer should be set to the left hand reference mark on the dial backing plate.

For additional information refer to booklet, "RCA Victor Receiver Alignment."

ALIGNMENT TABULATION RC-1064

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	T2 Top & bottom 2nd. I-F trans.
2	Stator of C1 through 0.1 mfd.			*T1 Top & bottom 1st. I-F trans.
3	Short wire placed near loop antenna	1,300 kc	1,300 kc	C4 (osc.) C2 (ant.)
4		600 kc	600 kc "A" Band	L2 (osc.) Rock gang
5	Repeat steps 3 and 4			

* Do not readjust T2 when test oscillator is connected to C2.

Critical Lead Dress

1. Dress blue and green leads of both I-F transformers back in shield cans, leaving them as short as possible.
2. Dress all heater leads next to chassis.
3. Dress power cord toward output transformer away from volume control and audio circuits.
4. Dress capacitor (C14) toward switch and parallel to chassis length.
5. Dress capacitor (C16) back against rear chassis apron.
6. Dress capacitor (C17) over and towards 50L6 socket perpendicular to capacitor (C14) and (C16).
7. Dress pilot lamp leads over second I-F transformer and away from tubes.
8. Dress blue leads from output transformer against front apron and away from I-F leads.
9. Dress contact on oscillator section of gang condenser back away from oscillator coil adjustment.

Alignment Procedure

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (117v./117v.) may be necessary for the receiver if the test oscillator is also AC operated.

Dial Pointer.—With the tuning condenser in full mesh the dial pointer should be adjusted to approx. 17.0° counterclockwise from the vertical position. It should be adjusted before re-assembling the bezel to the cabnet. Check on actual reception of stations.

Dis-assembly.—To remove bezel assembly:

Remove the two knobs and the four hex head screws in the feet, pull the bottom of the bezel outward and upward.

To remove chassis from cabinet:

Remove bezel assembly as described above, remove the dial by prying assembly outward on the bottom edge, remove the pointer by pulling straight to the front, remove the dial lamp, remove the round head screws which hold the chassis to the cabinet.

For additional information refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	12SK7 I-F grid through 0.1 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	L8 and L9 2nd I-F transformer
2	Stator of C2 through 0.1 mfd.			L6 and L7 1st I-F transformer
3	Ant. lead in series with 200 mmfd.	1,620 kc	full clock-wise	C3 (osc.)
4		1,400 kc	1,400 kc signal	C1 (ant.)
5		600 kc	600 kc signal	L5 (osc.) Rock gang
6	Repeat steps 3, 4 and 5.			

* Do not readjust L8 or L9 when test oscillator is connected to C2.

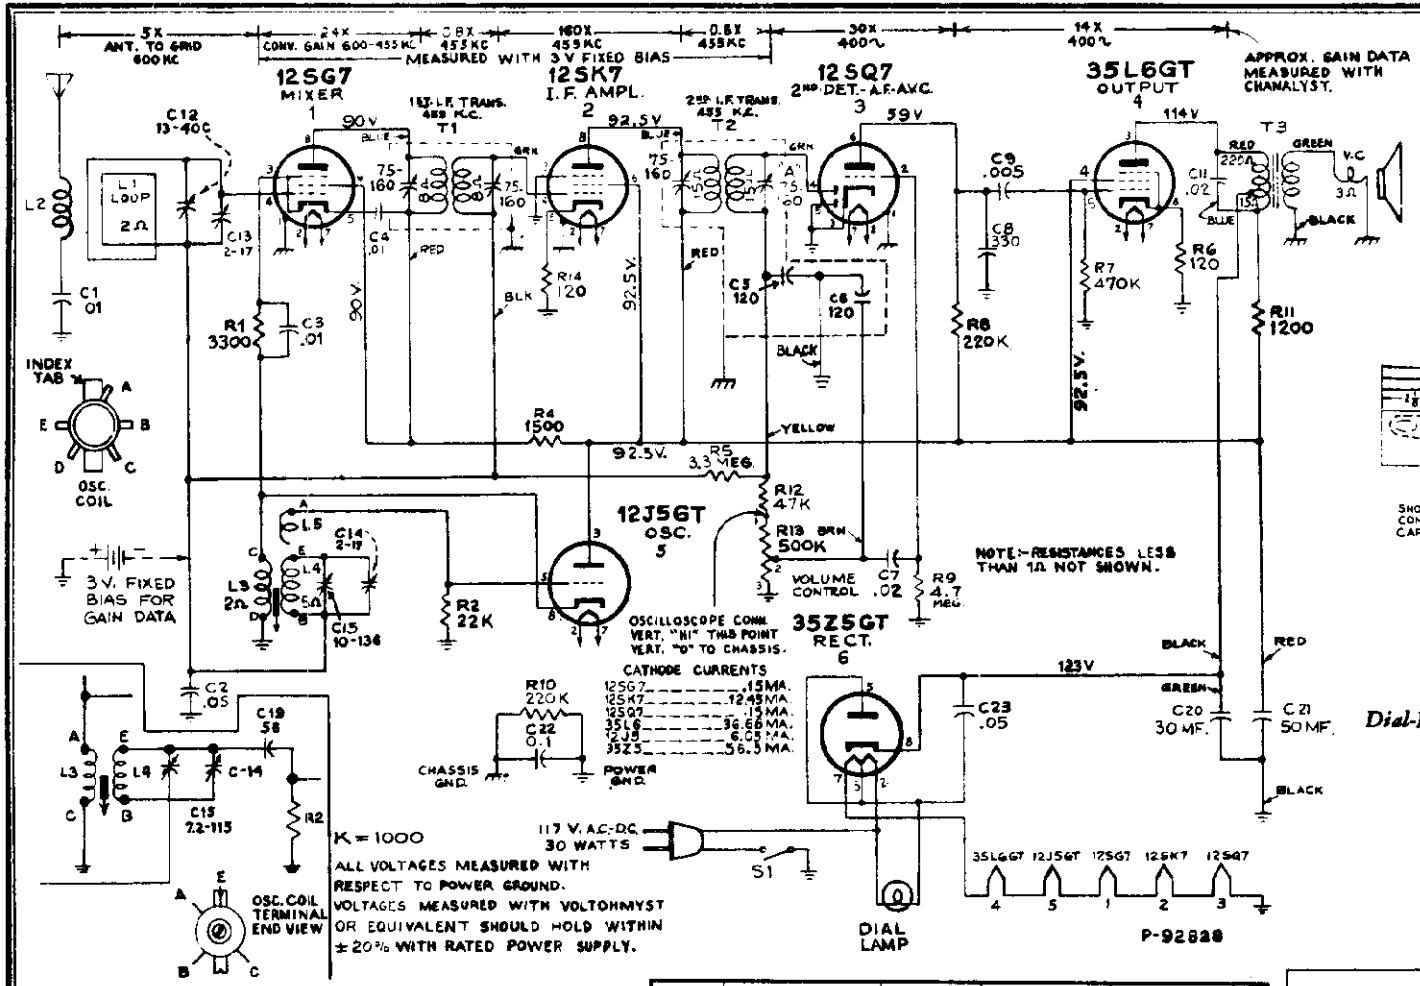
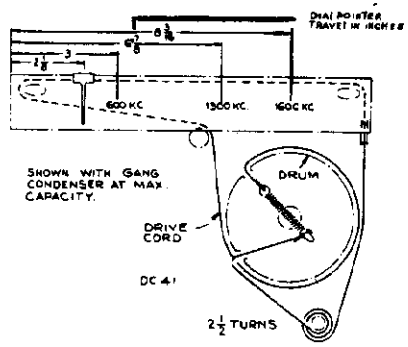
31480	Lamp—Indicator lamp—Mazda #47
*73728	Screen—Ventilating screen for back of cabinet for 75X11, 75X14 & 75X15
*73729	Screen—Ventilating screen for back of cabinet for 75X12 & 75X16
14270	Spring—Retaining spring for knobs

* THIS IS THE FIRST TIME THAT THIS STOCK NO. HAS APPEARED IN SERVICE DATA.
† STOCK NO. 72953 IS A REEL CONTAINING 250 FEET OF CORD.



Oscillator Circuit—
Chassis No. RC-1058A

Otherwise identical to Chassis No. RC-1058, except C12 (10-398)



Dial-Indicator and Drive Mechanism

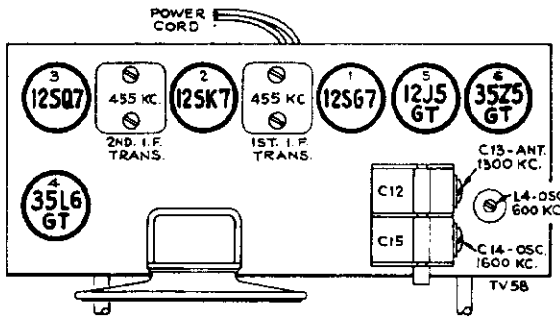
Alignment Procedure

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf capacitor to common "—B." Keep the output signal as low as possible to avoid AVC action.

Output Meter.—Connect leads between speaker voice coil and chassis. Turn volume control to maximum.

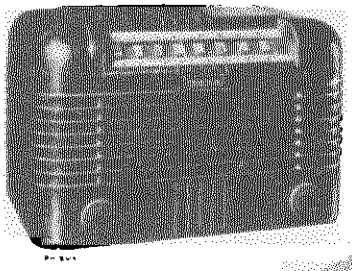
Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates closed). Adjust indicator to 2⅛" from left hand edge of dial back plate.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	Stator of C-12 in series with .01 mfd.	455 kc	Quiet-point 1,600 kc end of dial	Sec. and pri. 2nd I-F trans.
2				Sec. and pri. 1st I-F trans.
3	Ant. lead in series with 200 mmfd.	1,600 kc	1,600 kc	C14 (osc.)
4		1,300 kc	1,300 kc	C13 ant.
5		600 kc	600 kc	L4 (osc.) Rock in
6	Repeat steps 3, 4 and 5.			

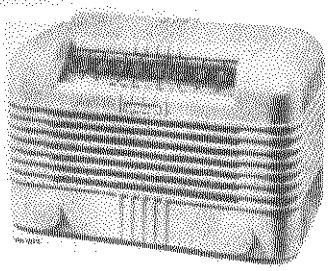


Tube and Trimmer Locations

MODELS 76ZX11, 76ZX12 RADIO CORP. OF AMERICA



76ZX11
(Walnut)



76ZX12
(Ivory)

Critical Lead Dress

1. Dress output plate bypass capacitor (C-11 .02 mf) against chassis.
2. Dress 35L6GT plate lead (red) against chassis and away from volume control, leads and terminals.
3. Dress audio coupling capacitor (C-7 .02 mf) away from 35L6GT heater leads.
4. Dress 2nd i-f yellow and brown leads away from output plate bypass capacitor (C-11, .02 mf) and away from all heater leads.
5. Dress blue and green leads of both i-f transformers back in shields leaving exposed lengths as short as possible.

Specifications

Frequency Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc

Power Output
Undistorted ..... 1.0 watt
Maximum ..... 1.5 watts

Tube Complement
(1) RCA Radiotron 12SG7 ..... Mixer
(2) RCA Radiotron 12SK7 ..... I.F. Amplifier
(3) RCA Radiotron 12SQ7 ..... 2nd Det., A.V.C., and A.F. Amplifier
(4) RCA Radiotron 35L6GT ..... Power Output
(5) RCA Radiotron 12J5GT ..... Oscillator
(6) RCA Radiotron 35Z5GT ..... Rectifier

Loudspeaker (92572-2)
Type ..... 5-inch PM
V. C. Impedance ..... 3.2 ohms at 400 cycles
Cabinet Dimensions ..... Height, 7¾; Width, 12⅛; Depth, 6¾

Power Supply Rating
105-125 volts, AC, 50 or 60 cycles, or DC ..... 30 watts
Pilot Lamp ..... type 51, 6-8 volts, 0.20 amp.
Tuning Drive Ratio 14.5:1

POWER SUPPLY POLARITY.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC-1058—RC-1058A
*73172	Capacitor—Ceramic, 56 mmfd., (C19)—for RC-1058A
72571	Capacitor—Mica, 330 mmfd. (C8)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C9)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C1, C3, C4)
70611	Capacitor—Tubular, .01 mfd., 400 volts (C7, C11)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C2, C23)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C22)
39152	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C20, C21)
*73704	Coil—Oscillator coil (L3, L4, L5)—for RC-1058
*73163	Coil—Oscillator coil (L3, L4)—for RC-1058A
*72991	Condenser—Variable tuning condenser complete with drive pulley (C12, C13, C14, C15)—for RC-1058
*73171	Condenser—Variable tuning condenser, complete with drive pulley (C12, C13, C14, C15)—for RC-1058A
38410	Control—Volume control and power switch (R13, S1)
72953	Cord—Drive cord (approx. 50" overall length)
72283	Grommet—Rubber grommet to mount tuning condenser (3 required)
37068	Indicator—Station selector indicator
*73030	Loop—Antenna loop complete (L1, L2)
*72872	Plate—Dial back plate complete with drive cord pulleys
72602	Pulley—Drive cord pulley
	Resistor—Fixed composition, 120 ohms, ±10%, ½ watt (R6, R14)
	Resistor—Fixed composition, 1200 ohms, ±10%, 1 watt (R11)
	Resistor—Fixed composition, 1500 ohms, ±20%, ½ watt (R4)
	Resistor—Fixed composition, 3300 ohms, ±20%, ½ watt (R1)
	Resistor—Fixed composition, 22,000 ohms, ±10%, ½ watt (R2)
	Resistor—Fixed composition, 47,000 ohms, ±20%, ½ watt (R12)
	Resistor—Fixed composition, 220,000 ohms, ±20%, ½ watt (R8, R10)
	Resistor—Fixed composition, 470,000 ohms, ±20%, ½ watt (R7)
	Resistor—Fixed composition, 3.3 megohms, ±20%, ½ watt (R5)
	Resistor—Fixed composition, 4.7 megohms, ±20%, ½ watt (R9)
*72886	Shaft—Tuning knob shaft
34449	Socket—Lamp socket
37605	Socket—Tube socket, moulded
32299	Socket—Tube socket—wafer
31418	Spring—Drive cord tension spring
70411	Transformer—First I. F. transformer (T1)
70412	Transformer—Second I. F. transformer (T2, C5, C6)
36800	Transformer—Output transformer (T3)
35969	Washer—"C" washer for tuning shaft
	SPEAKER ASSEMBLY 92572-2W RL 101-3
72201	Speaker—5" P.M. speaker complete with cone and voice coil
	MISCELLANEOUS
39953	Back—Cabinet back for 76ZX11
70409	Back—Cabinet back for 76ZX12
Y1429	Cabinet—Brown plastic cabinet for 76ZX11
Y1430	Cabinet—Ivory plastic cabinet for 76ZX12
36890	Clamp—Dial clamp—L.H.
36891	Clamp—Dial clamp—R.H.
*72903	Dial—Glass dial scale
37831	Fastener—Push fastener to hold cabinet back (1 set)
36886	Knob—Control knob—ivory—for 76ZX12
*72981	Knob—Control knob—maroon—for 76ZX11
11765	Lamp—Dial lamp—Mazda #51
30900	Spring—Retaining spring for knobs

Control Positions

MODEL 77U, CHASSIS RC-1057A

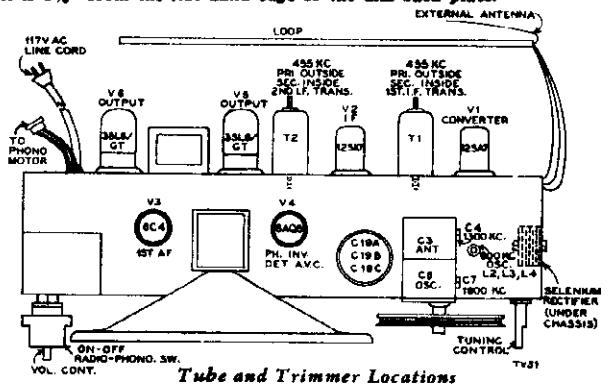
RADIO CORP. OF AMERICA

Alignment Procedure

CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING CHASSIS FROM CABINET.
Take off both wooden strips on bottom of cabinet by removing wood-screws before loosening chassis bolts.

CRITICAL LEAD DRESS.—
1. Dress output plate bypasses as near chassis as possible.
2. Dress all filament leads down to chassis.
3. Dress all exposed leads away from each other and away from chassis to prevent short circuits.
4. Dress R-6 away from shield.
5. Dress AVC resistor away from R-18 and R-14.
6. Dress output plate leads down to chassis.
7. Dress R-18 away from R-15.
8. Dress R-16 away from V4 socket.
9. Dress R-10 away from V4 socket.
10. Dress high side of line cord down to front apron.
11. Dress lead of C-5 which connects to phono input away from side of chassis.

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer so that it is 3⅝" from the left hand edge of the dial back plate.



Tube and Trimmer Locations

Tubes 6C4 and 6AQ6 may be replaced by removing the sloping panel (remove four wood screws) in the front of the record changer compartment. Before removing the chassis from the cabinet it is advisable to loosen the two hex screws holding the speaker horizontally. This will allow the chassis to be removed and replaced easily. When the chassis is replaced the dial lights should be adjusted so as not to be visible from the front of the cabinet, and yet to give correct dial lighting. Move the speaker so it is flush against the baffle before retightening the hex nuts. The chassis mounting board should be flush against the front of the cabinet, and the chassis mounting holes should be centered over the holes in the board.

Output Meter.—Connect meter across speaker voice coil. Turn volume control clockwise to radio maximum high position (3) for alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	Pri. & Sec. 2nd I.F. transformer
2	1st Det. grid in series with .01 mfd.			Pri. & Sec. 1st I.F. transformer
NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET				
3	Antenna terminal in series with 220 mmfd.	1,600 kc	1,600 kc	C7 (osc.)
4		1,400 kc	1,400 kc	C4 (ant.)
5		600 kc	600 kc	Osc. Coil L2, L3 Rock gang
6	Repeat steps 3, 4, & 5 if necessary			

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf capacitor to common "—B". Keep the output signal as low as possible to avoid a-v-c action.

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 1057A
70407	Button—Plug button to cover holes for I. F. transformers' adjustment
39622	Capacitor—Mica, 56 mmf. (C21)
70600	Capacitor—Tubular, .001 mfd., 400 volts (C20, C22)

38403	Control—Volume control (R7)
72953	Cord—Drive cord (approx. 52" overall length)
70392	Cord—Power cord and plug
70397	Gear—Power, radio and phono switch gear
73014	Gear—Volume control gear—less spring
72283	Grommet—Rubber grommet to mount tuning condenser (3 required)
*73015	Indicator—Station selector indicator
73010	Loop—Antenna loop complete (L1)
*73006	Plate—Dial back plate complete with (3) pulleys
30868	Plug—2 contact female plug for motor cable
*73009	Rectifier—Selenium rectifier (SR1)
*73038	Resistor—Normal value 66 ohms with positive temperature coefficient (R18)
	Resistor—Fixed composition, 82 ohms ±10%, 1 watt (R17)
*73072	Resistor—Normal value 95 ohms @38°C with negative temperature coefficient (R21)
	Resistor—Fixed composition, 1200 ohms, ±10%, 1 watt (R14)
	Resistor—Fixed composition, 1800 ohms, ±10%, ½ watt (R13)
	Resistor—Fixed composition, 12,000 ohms, ±10%, ½ watt (R16)
	Resistor—Fixed composition, 22,000 ohms, ±20%, ½ watt (R2)
	Resistor—Fixed composition, 82,000 ohms, ±10%, ½ watt (R19)
	Resistor—Fixed composition, 100,000 ohms, ±10%, ½ watt (R6)
	Resistor—Fixed composition, 220,000 ohms, ±20%, ½ watt (R1, R10, R11, R22)
	Resistor—Fixed composition, 270,000 ohms, ±10%, ½ watt (R5)
	Resistor—Fixed composition, 390,000 ohms, ±10%, ½ watt (R3)
	Resistor—Fixed composition, 470,000 ohms, ±20%, ½ watt (R12)
	Resistor—Fixed composition, 470,000 ohms, ±10%, ½ watt (R15)
	Resistor—Fixed composition, 1.5 megohms, ±10%, ½ watt (R20)
	Resistor—Fixed composition, 3.3 megohms, ±20%, ½ watt (R4)
	Resistor—Fixed composition, 10 megohms, ±20%, ½ watt (R8, R9)
*73012	Shaft—Tuning knob shaft
*73103	Shield—Tube shield for miniature tubes (2 required)
*72998	Socket—Dial lamp socket and lead assembly
35787	Socket—Phono input socket
72516	Socket—Tube Socket, miniature
37605	Socket—Tube socket, molded
70390	Spring—Drive cord tension spring
70396	Spring—Volume control gear tension spring
*73011	Switch—Power, radio and phono switch (S1, S2)
73036	Transformer—First I. F. transformer (T1)
73037	Transformer—Second I. F. transformer (T2)
*73008	Transformer—Output transformer (T3)
33726	Washer—"C" washer for tuning knob shaft
34457	Washer—Spring washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92573-1K
72728	Cone—Cone and voice coil assembly
72727	Speaker—5"x7" PM speaker complete with cone and voice coil
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
71105	Cable—Shielded pickup cable
73017	Clamp—Dial clamp (2 required)
X1660	Cloth—Grille cloth
*73051	Decal—Styling line decal (2 required)
71966	Decal—Trade mark decal (Victrola)
71984	Decal—Trade mark decal (RCA Victor)
*73039	Dial—Glass dial scale
72894	Foot—Rubber mounting foot (4 required)
72856	Grommet—Rubber grommet to mount record changer (3 required)
*73052	Handle—Cabinet lid handle
72692	Hinge—Cabinet lid hinge (2 required)
*73016	Knob—Power, radio and phono switch knob
73065	Knob—Tuning knob
73078	Knob—Volume control knob
11765	Lamp—Dial lamp
14270	Spring—Retaining spring for knobs
71824	Stud—Stud and screw to mount lid hinge (1 set)
*73050	Support—Cabinet lid support

DIAL INDICATOR AND DRIVE MECHANISM

SIMPLIFIED SCHEMATIC DIAGRAM

MODEL 710V2

RADIO CORP. OF AMERICA

Alignment Procedure

Alignment Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation below. An output meter is also necessary to indicate minimum audio output during alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations, except as stated in FM alignment, connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

Calibration Scale.—The dial scale printed in this service note may be temporarily attached to the chassis for quick reference during alignment.

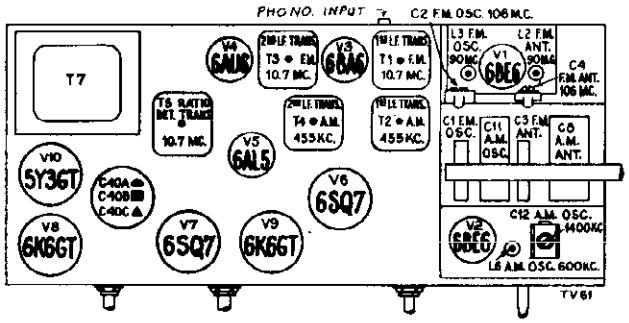
Using Printed Dial Scale.—

1. Cut out the printed dial scale, or, make a tracing of the scale.
2. With gang at full mesh the pointer should be set to the first reference mark from the left hand end of the dial backing plate.
3. Place the printed dial scale or the tracing under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the dial scale in place.

Note.—It is not recommended that the glass dial scale in the cabinet be removed as an alignment reference. This glass dial scale is fastened to the bezel with sheet metal lugs bent over the scale to hold it in place. Removing the glass dial scale will necessitate bending the lugs, resulting in their weakening and subsequent breakage.

Critical Lead Dress

1. Dress capacitor C5 near chassis base.
2. Dress lead from pin 5, V-1, to terminal C, of transformer T1, as near bottom of FM shelf as possible.
3. The lead from capacitor C24 to the high side of the volume control must be dressed next to chassis along front apron.
4. Dress resistors R32 & R33 near chassis base.
5. Dress all A.C. leads away from volume control.
6. Solder FM antenna coil primary leads to terminal board with as short a lead length as is practical.
7. Make all FM leads as short as possible.
8. The lead from pin 2, V-3, to chassis ground must be dressed as close to base and as near to the back apron as possible. This lead provides degeneration for the IF stage and neither its length nor the point at which it is grounded to the chassis should be changed.
9. Dress all leads away from the 8300 ohm resistors R34 and R35.



TOP VIEW OF CHASSIS

The FM i-f alignment may be checked by means of an FM sweep generator and cathode ray oscilloscope. Connect the output from the sweep generator, which is set to 10.7 mc., to the FM 1st Det.-Osc. grid (6BE6 Pin No. 7) low side to chassis. Disconnect the 5 mfd. capacitor C34 from the Ratio Detector circuit.

Connect the high side of the oscilloscope to the junction of R27 and R28, low side to chassis. Adjust the sweep generator and oscilloscope to obtain the response curve.

The Ratio Detector characteristic may be viewed by connecting the oscilloscope across the volume control R22. Capacitor C34 should be re-connected before checking the Ratio Detector characteristic.

FM Alignment

RANGE SWITCH IN FM POSITION—VOLUME CONT. MAXIMUM

Steps	Connect sig. gen.	Sig. gen. output	Turn radio dial to—	Adjustment for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 5 mfd. capacitor C34 and the common lead to chassis. Turn gang condenser to max. capacity (fully meshed).			
2	High side to Pin 1 of driver tube 6AU6 in series with .01 mfd. low side to chassis	10.7 mc. modulated 30% 400 cycles AM (Approx. .1 volt)	Max. capacity (fully meshed)	T5 top core for max. d-c voltage across C34. T5 bottom core for min. audio output
3	High side to one FM ant. term. in series with .01 mfd. Low side to the other FM ant. term.	10.7 mc. 30% modulation, 400 cycles AM. Adjust to provide 2 to 3 volts indication on VoltOhmyst during alignment.		†Using alternate loading: T3 bottom core (sec.) T3 top core (pri.) T1 bottom core (sec.) T1 top core (pri.)
4	High side to one FM ant. term. in series with a 120 ohm resistor. Low side to the other FM ant. term in series with a 120 ohm resistor.	106 mc	106 mc	C2 osc. C4 ant.
5		90 mc	90 mc	L3 osc. L2 ant.
6	Repeat Steps 4 and 5 until further adjustment does not improve calibration.			

†Alternate loading involves the use of a 680 ohm resistor to load the plate winding while the grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 680 ohm resistor after T3 and T1 have been aligned.

AM Alignment

(Correct alignment of the 455 kc. IF requires that the 10.7 mc. IF be aligned previously)

RANGE SWITCH IN BC POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	AM converter grid 6BE6 V-2 in series with .01 mfd.	455 kc	Quiet point at low freq. end.	†T4 top core (sec.) †T4 bottom core (pri.)
2				†T2 bottom core (sec.) †T2 top core (pri.)
3	"A" terminal of terminal board at rear of chassis in series with 200 mmf. (link open)	1400 kc	1400 kc	C12 osc. C 7 ant. (loop)
4		600 kc	600 kc	L6 osc. (Rock gang)
5	Repeat Step 3.			
6	After chassis and loop have been installed in cabinet, adjust C7 for max. output on a weak station near 1400 kc.			

†Align T4 and T2 by means of alternate loading as explained under FM alignment. Use a 47,000 ohm resistor instead of a 680 ohm resistor.

Oscilator frequency is above signal frequency on both AM and FM.

Type Pickup	Crystal
Record Capacity	Twelve 10-in., Ten 12-in.

Circuit Description

Model 710V2 has individual built-in antennas for FM and AM coupled to individual 1st Det.-Osc. tubes (6BE6 V1 and V2). The outputs of these two tubes are connected to separate IF transformers (T1 and T2) whose secondaries are in series and connected to the IF amplifier tube (6BA6 V3). The output of V3 is connected to separate IF transformers (T3 and T4) whose primaries are in series. The secondary of T3 (FM IF) is connected to the driver tube (6AU6 V4). The secondary of T4 (AM IF) is connected to the AM second detector (6SQ7 V6). The output of the driver tube (V4) is coupled thru the ratio detector transformer (T5) to the FM ratio detector tube (6AL5 V5).

The audio outputs of the AM second detector and the FM ratio detector are connected thru a section of the range switch to the volume control input.

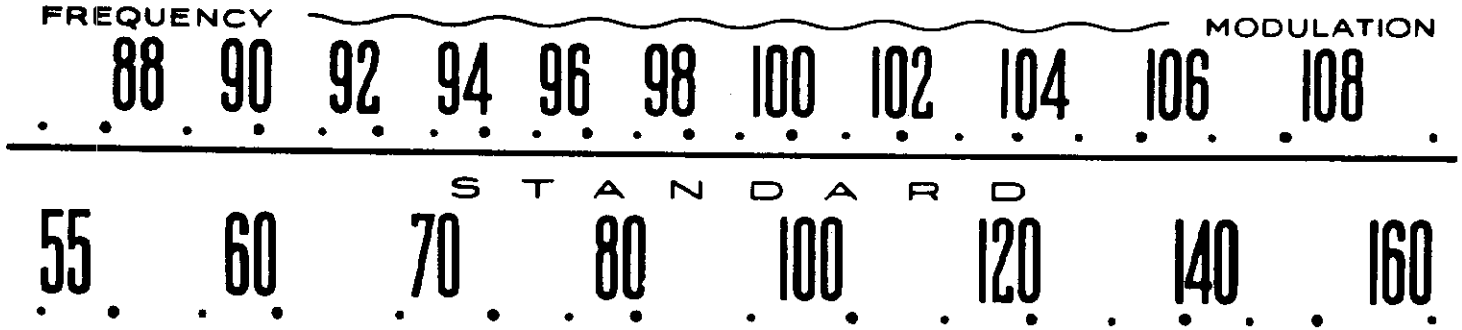
The B+ supply (+245 V) to the plates and screen grids of V1 and V2 is controlled thru a section of the range switch.

Simple AVC is used on AM and is applied to both the IF amplifier (V3) and the AM 1st detector (V2). Delayed AVC is used on FM and is applied only to the IF amplifier (V3). The AVC distribution is controlled thru a section of the range switch.

Antennas

Under conditions of normal field strength and interference, the RCA Victor antennas installed inside the cabinet will be effective for Frequency Modulation and Standard Broadcasts.

If reception is not satisfactory on one or both of the bands using the built-in cabinet antennas, one or two external antennas may be used. Connections are made to the antenna terminal boards in the back of the cabinet. External antennas may be erected indoors or outdoors and should be oriented in direction for requirements of best reception. RCA Television Antenna Stock No. 225 or 226 or the equivalent with 300 ohm transmission line is recommended for an FM external antenna. In this case, disconnect the two leads at the two terminals marked "FM" and attach the ends of the two lead wires from the RCA Television Antenna transmission line in their places. To replace the Standard Broadcast antenna, connect the lead-in from the antenna to terminal A. This antenna should consist of a wire 30 to 60 feet or so in length, mounted in a convenient location as high as possible. A ground connection to G should not be necessary but a flexible wire to a waterpipe or other good ground may be used.



DIAL SCALE

The dial scale drawing shown is a full size reproduction. It can be used as a reference in alignment procedure.

MODEL 710V2

RADIO CORP. OF AMERICA

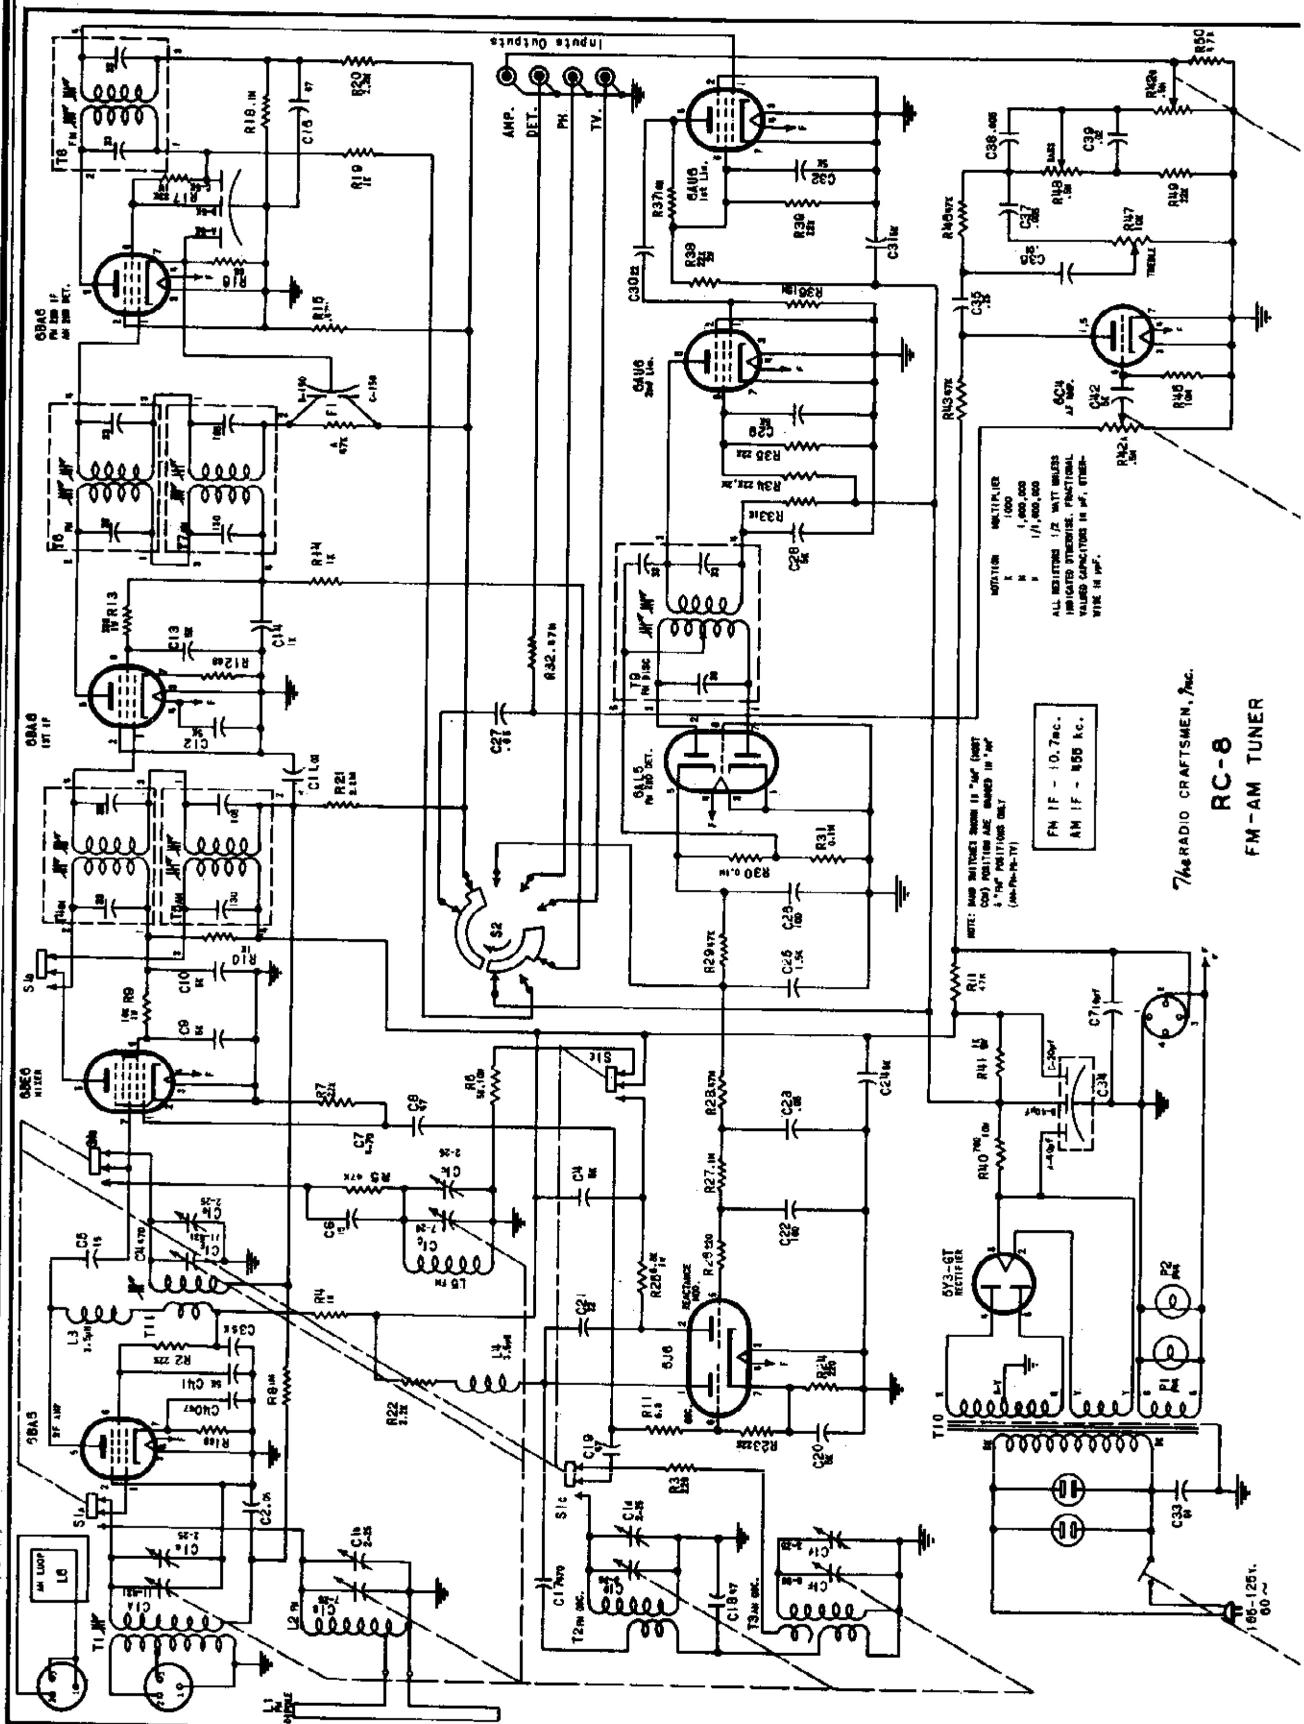
Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 613A
*73107	Board—"F.M." board—antenna end
*73106	Board—Two (2) contact terminal board for transmission line—chassis end
72046	Capacitor—Mica trimmer, 2.5-13mmf. (C2)
71808	Capacitor—Adjustable, 3-35 mmf. (C4)
72334	Capacitor—Adjustable, 4-70 mmf. (C12)
72570	Capacitor—Ceramic, 27 mmf. (C5)
39042	Capacitor—Ceramic, 47 mmf. (C41)
71924	Capacitor—Ceramic, 56 mmf. (C13)
71614	Capacitor—Ceramic, 120 mmf. (C9, C39)
39640	Capacitor—Mica, 330 mmf. (C6, C32, C33)
39642	Capacitor—Mica, 390 mmf. (C10)
70646	Capacitor—Tubular, .0035 mfd., 1000 volts (C42, C43)
73186	Capacitor—Tubular, .001 mfd., 400 volts (C23)
72573	Capacitor—Tubular, .003 mfd., 400 volts (C25)
72874	Capacitor—Moulded paper, .003 mfd., 600 volts (C35)
72490	Capacitor—Tubular, .005 mfd., 200 volts (C19, C29, C30, C31, C44)
71553	Capacitor—Tubular, .005 mfd., 400 volts (C17, C18, C20, C21)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C24, C37)
72120	Capacitor—Tubular, .015 mfd., 200 volts (C27, C28)
71923	Capacitor—Tubular, .01 mfd., 200 volts (C26, C45)
71925	Capacitor—Tubular, .01 mfd., 400 volts (C14, C16, C22)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C38)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C36)
71551	Capacitor—Tubular, .05 mfd., 200 volts (C15)
72121	Capacitor—Electrolytic, 5 mfd., 50 volts (C34)
72052	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 450 volts, 1 section of 30 mfd., 350 volts and 1 section of 40 mfd., 25 volts (C40A, C40B, C40C)
72335	Coil—Antenna coil—F.M.—complete with adjustable core and stud (L1, L2)
72336	Coil—Oscillator coil—F.M.—complete with adjustable core and stud (L3)
72333	Coil—Oscillator coil—"A" band—complete with adjustable core and stud (L6)
72574	Coil—Filament choke coil (L7)
72059	Condenser—Variable tuning condenser (C1, C3, C8, C11)
70342	Control—Volume control and power switch (R22, S3)
†72953	Cord—Drive cord (approx. 82" overall required)
70392	Cord—Power cord and plug
72069	Grommet—Rubber grommet for rear mounting feet (2 required)
71799	Grommet—Rubber grommet to mount R.F. shelf (3 required)
71608	Indicator—Station selector indicator
71607	Plate—Dial back plate
30868	Plug—2 contact female plug for motor cable
12493	Plug—5 contact female plug for speaker cable
72602	Pulley—Drive cord pulley
	Resistor—Fixed composition, 10 ohms, ½ watt (R40)
	Resistor—Fixed composition, 47 ohms, ±10%, ½ watt (R9)
	Resistor—Fixed composition, 68 ohms, ±10%, ½ watt (R15)
	Resistor—Fixed composition, 100 ohms, ±5%, ½ watt (R18)
72865	Resistor—Wire wound, 560 ohms, 2 watt (R39)
	Resistor—Fixed composition, 820 ohms, ±5%, ½ watt (R27)
	Resistor—Fixed composition, 910 ohms, ±5%, ½ watt (R25)
	Resistor—Fixed composition, 1000 ohms, ±20%, ½ watt (R6, R17)
	Resistor—Fixed composition, 2200 ohms, ±20%, 1 watt (R11)
	Resistor—Fixed composition, 3300 ohms, ±10%, 2 watt (R34, R35)
	Resistor—Fixed composition, 6800 ohms, ±10%, 1 watt (R5)
	Resistor—Fixed composition, 8200 ohms, ±10%, ½ watt (R36)
	Resistor—Fixed composition, 8200 ohms, ±10%, 1 watt (R4)
	Resistor—Fixed composition, 10,000 ohms, ±10%, ½ watt (R26)
	Resistor—Fixed composition, 15,000 ohms, ±10%, ½ watt (R19)
	Resistor—Fixed Composition, 18,000 ohms, ±10%, 2 watt (R7)
	Resistor—Fixed composition, 22,000 ohms, ±10%, ½ watt (R2, R3)
	Resistor—Fixed composition, 22,000 ohms, ±10%, 1 watt (R10)
	Resistor—Fixed composition, 27,000 ohms, ±10%, ½ watt (R23, R24)
	Resistor—Fixed composition, 33,000 ohms, ±10%, ½ watt (R16)
	Resistor—Fixed composition, 100,000 ohms, ±10%, ½ watt (R20)
	Resistor—Fixed composition, 270,000 ohms, ±10%, ½ watt (R13, R14, R30, R31)
	Resistor—Fixed composition, 470,000 ohms, ±10%, ½ watt (R37, R38)
	Resistor—Fixed composition, 1 megohm, ±20%, ½ watt (R1)
	Resistor—Fixed composition, 1 megohm, ±10%, ½ watt (R21)
	Resistor—Fixed composition, 1.5 megohm, ±20%, ½ watt (R28)
	Resistor—Fixed composition, 2.2 megohm, ±20%, ½ watt (R8, R12)
	Resistor—Fixed composition, 10 megohm, ±20%, ½ watt (R32, R33)
	Resistor—Fixed composition, 22 megohm, ±20%, ½ watt (R29)
72055	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
35787	Socket—Phono input socket
72516	Socket—Tube socket—miniature
31251	Socket—Tube socket—octal
31418	Spring—Drive cord tension spring
*73104	Support—Dial back plate support—R.H.—complete with four (4) drive cord pulleys
*73105	Support—Dial back plate support—L.H.—complete with one (1) drive cord pulley
72060	Switch—Rang switch (S1)
71603	Switch—Tone control switch (S2)
72887	Transformer—First I.F. transformer—F.M. (T1)
71625	Transformer—First I.F. transformer—A.M. (T2)
72888	Transformer—Second I.F. transformer—F.M (T3)
71631	Transformer—Second I.F. transformer—A.M. (T4)
72889	Transformer—Ratio detector transformer (T5)
71975	Transformer—Power transformer—117 volt, 60 cycle (T7)
35969	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92569-1W or 92569-1W1
13867	Cap—Dust cap
36145	Cone—Cone and voice coil assembly—(2.2 ohm voice coil)
71560	Plug—5 prong male plug for speaker
71961	Speaker—12" PM speaker complete with cone and voice coil less output transformer and plug (92569-1W)
71145	Suspension—Metal cone suspension
37899	Transformer—Output transformer (T6)
	SPEAKER ASSEMBLIES 92569-1W2
13867	Cap—Dust cap
72828	Cone—Cone and voice coil assembly—(6 ohm voice coil)
71560	Plug—5 prong male plug for speaker
71145	Suspension—Metal cone suspension
*73242	Transformer—Output transformer (T6)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
72555	Antenna—Di-pole antenna
71599	Bracket—Pilot lamp bracket
72583	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Pilot lamp jewel
71892	Catch—Record storage compartment door catch and strike
71820	Check—Radio compartment door check
X1752	Cloth—Grille cloth
73088	Decal—Control panel decal
71910	Decal—Trade mark decal (RCA Victor)
71966	Decal—Trade mark decal (Victrola)
72682	Dial—Glass dial scale
72861	Escutcheon—Dial escutcheon less dial
*73181	Grille—Metal grille
11889	Grommet—Rubber grommet for radio chassis mounting strap (2 required)
73024	Hinge—Radio compartment door hinge (2 required)
36817	Hinge—Record storage compartment door hinge—L.H. (1 set)
36610	Hinge—Record storage compartment door hinge—R.H. (1 set)
71821	Knob—Control knob
11765	Lamp—Dial or jewel lamp—Mazda 51
*73108	Loop—Antenna loop complete (L4, L5, C7)
70546	Mounting—One set of hardware to mount record changer consisting of four (4) upper springs and four (4) lower springs
71819	Plate—Mounting plate for door check
30870	Plug—2 prong male plug
73034	Pull—Record storage compartment door pull (2 required)
72556	Pull—Record changer compartment or radio compartment door pull (2 required)
*73184	Runner—Record changer motor board runner—R.H.
*73183	Runner—Record changer motor board runner—L.H.
*73185	Stop—Metal stop for motor board runners (2 required)
72936	Stop—Record storage compartment door stop
71818	Spring—Radio compartment door check spring
30900	Spring—Retaining spring for knob
*73182	Track—Record changer compartment track (2 required)
*73248	Washer—Flat washer (1" square) to mount record changer (4 required)

*This is the first time this Stock No. has appeared in Service Data.

†This is a reel containing 250 ft. of cord, order from your distributor by specifying Stock No. and length required.

THE RADIO CRAFTSMEN INC.



ALIGNMENT PROCEDURE

To set pointer, completely mesh tuning capacitor and align pointer with last reference mark at low frequency end of dial. Volume control should be in maximum clockwise position. Bass and treble controls should be in maximum counter-clockwise position. Output of signal generator should be no higher than necessary to obtain an output reading. Low side of signal generator and indicating meter should be connected directly to chassis at all times. Use an insulated screw driver with 1/16" thick blade for adjusting IF transformers.

Operation	Signal Generator			Band Switch Position	Dial Setting	Indicating Meter	Adjust	Indication
	Coupling	Freq.	Modulation					
1.	.01μf to pin 7 (grid) 6BE6	455kc	400cps AM	AM (most CCW)	point of no interference	AC voltmeter across audio output	T7,T5 top & bottom	maximum deflection
2.	220μμf to loop ant. socket pin 2.	1500kc	400cps AM	AM (most CCW)	1500kc	AC voltmeter across audio output	C1a,C1e,C1f	maximum deflection
3.	220μμf to loop ant. socket pin 2.	600kc	400cps AM	AM (most CCW)	tune for maximum response	AC voltmeter across audio output	T1, T11	maximum deflection
4.	Repeat steps 2 and 3							
5.	.01μf to pin 7 (grid) 6BE6	10.7mc	none	FM (1 pos. CW from most CCW)	point of no interference	neg. DC VTVM to output of diode filter (F1)	T8,T6,T4 top & bottom	maximum deflection
6.	.01uf to pin 7 (grid) 6BE6	10.7mc	none	FM (1 pos. CW from most CCW)	point of no interference	neg. DC VTVM across C25	T9 top	zero volts
7.	300 Ω (carbon) to top FM ant. post	104mc	400cps FM	FM (1 pos. CW from most CCW)	104mc	AC voltmeter across audio output	C1d,C1c,C1b, T9 bottom	maximum deflection

ELECTRICAL SPECIFICATIONS

Power supply . . . . . 105-125 V., 60 cycle AC

Power Consumption . . . . . 100 watts

Tuning Range . . . . . (AM) 535 - 1620 kc.

(FM) 88 - 108 mc

Intermediate Frequency . . . . . (AM) 455 kc.

(FM) 10.7 mc

Antennas . . . . . (AM) low-impedance loop

(FM) 300-ohm folded dipole

Output Impedance . . . . . 47,000 ohms

Sensitivity . . . . . (AM) 5 microvolts

(30% mod., 0.5 V. output) . . . . . (FM) 8 microvolts

STAGE GAIN MEASUREMENTS

Location	AM		FM	
Ant. to RF grid	600 kc.	2X	100 mc.	1.2X
RF grid to Conv. grid	600 kc.	10X	100 mc.	
Conv. grid to 1st IF grid	600 - 455 kc.	50X	100 - 10.7 mc.	20X
1st IF grid to 2nd IF grid	455 kc.	110X	10.7 mc.	30X
2nd IF grid to 3rd IF grid			10.7 mc.	25X
Audio grid to output plug	400 cps.	1.5X	400 cps.	1.5X

Dial Cord Drive

Top reading in AM position, bottom italic reading in FM
DC Voltages measured with vacuum-tube voltmeter
AC Voltages measured at 1,000 ohms per volt.
Socket connections are shown as bottom views.
Measured values are from socket pin to common negative.
Line voltage maintained at 117 volts for voltage readings.
Nominal tolerance on component values makes possible a variation of ± 10% in voltage.
Voltage measurements are with no signal applied.

C31	18X608	5K µµf 400v ceramic	B+IF bypass
C32	18X608	5K µµf 400v ceramic	1st lim. screen bypass
C33	18X210	0.01 µf 600v paper	line bypass
C34A	18S003	40 µf 400v dry electrolytic	filter
B		40 µf 400v	filter
C		20 µf 300v	filter
C35	18X209	0.25 µf 200v paper	AF coupling
C36	18X208	0.01 400v paper	tone compensation
C37	18X211	0.005 400v paper	tone compensation
C38	18X211	0.005 400v paper	tone compensation
C39	18X202	0.02 400v paper	tone compensation
C40	18X604	47 µµf 500v ceramic	RF cathode bypass
C41	18X608	5K µµf 400v ceramic	RF screen bypass
		FILTER	
F1A	18X609	47K 1/2 watt carbon resistor	AM det. filter
B		150 µµf 400v ceramic cap.	
C		150 µµf 400v ceramic cap.	
		RF COILS	
L1	7X401	300Ω polyethylene twin lead	FM dipole Ant.
L2	5A210	RF auto transformer	FM ant. coil
L3	5S402	3.5 µh RF choke	FM RF plate load
		RF COILS - Continued	
L4	5S402	3.5 µh RF choke	FM osc. choke
L5	5A209	RF coil	FM RF inductor
L6	5B603	Low impedance loop	AM antenna
		PILOT LITES	
P1	15X003	#44 6-8v, 0.15a, bayonet	blue bead
P2	15X003	#44 6-8v, 0.15a, bayonet	blue bead
		RESISTORS	
		ohms watts	
R1	23X016	68 1/2 carbon	Cathode bias
R2	23X021	22K 1/2 carbon	screen dropping
R3	23X017	220 1/2 carbon	parasitic suppressor
R4	23X019	1K 1/2 carbon	RF plate decoupling
R5	23X022	47K 1/2 carbon	FM mixer grid
R6	23X606	5K 10 wire-wound	voltage regulation
R7	23X021	22K 1/2 carbon	mixer osc. grid
R8	23X026	1M 1/2 carbon	AVC decoupling
R9	23X203	10K 1 carbon	screen dropping
R10	23X019	1K 1/2 carbon	FM mixer plate decouplin
R11	23X022	47K 1/2 carbon	filter
R12	23X016	68 1/2 carbon	cathode bias
R13	23X206	33K 1 carbon	screen dropping
R14	23X019	1K 1/2 carbon	1st IF plate decoupling
R15	23X025	0.47M 1/2 carbon	AM det. load
R16	23X016	68 1/2 carbon	cathode bias
R17	23X206	33K 1 carbon	screen dropping
R18	23X023	0.1M 1/2 carbon	1st lim. grid
R19	23X019	1K 1/2 carbon	2nd IF plate decoupling
R20	23X027	2.2M 1/2 carbon	AVC decoupling
R21	23X027	2.2M 1/2 carbon	AVC decoupling
R22	23X011	2.2K 1/2 carbon	osc. plate load
R23	23X021	22K 1/2 carbon	osc. grid
R24	23X017	220 1/2 carbon	cathode bias

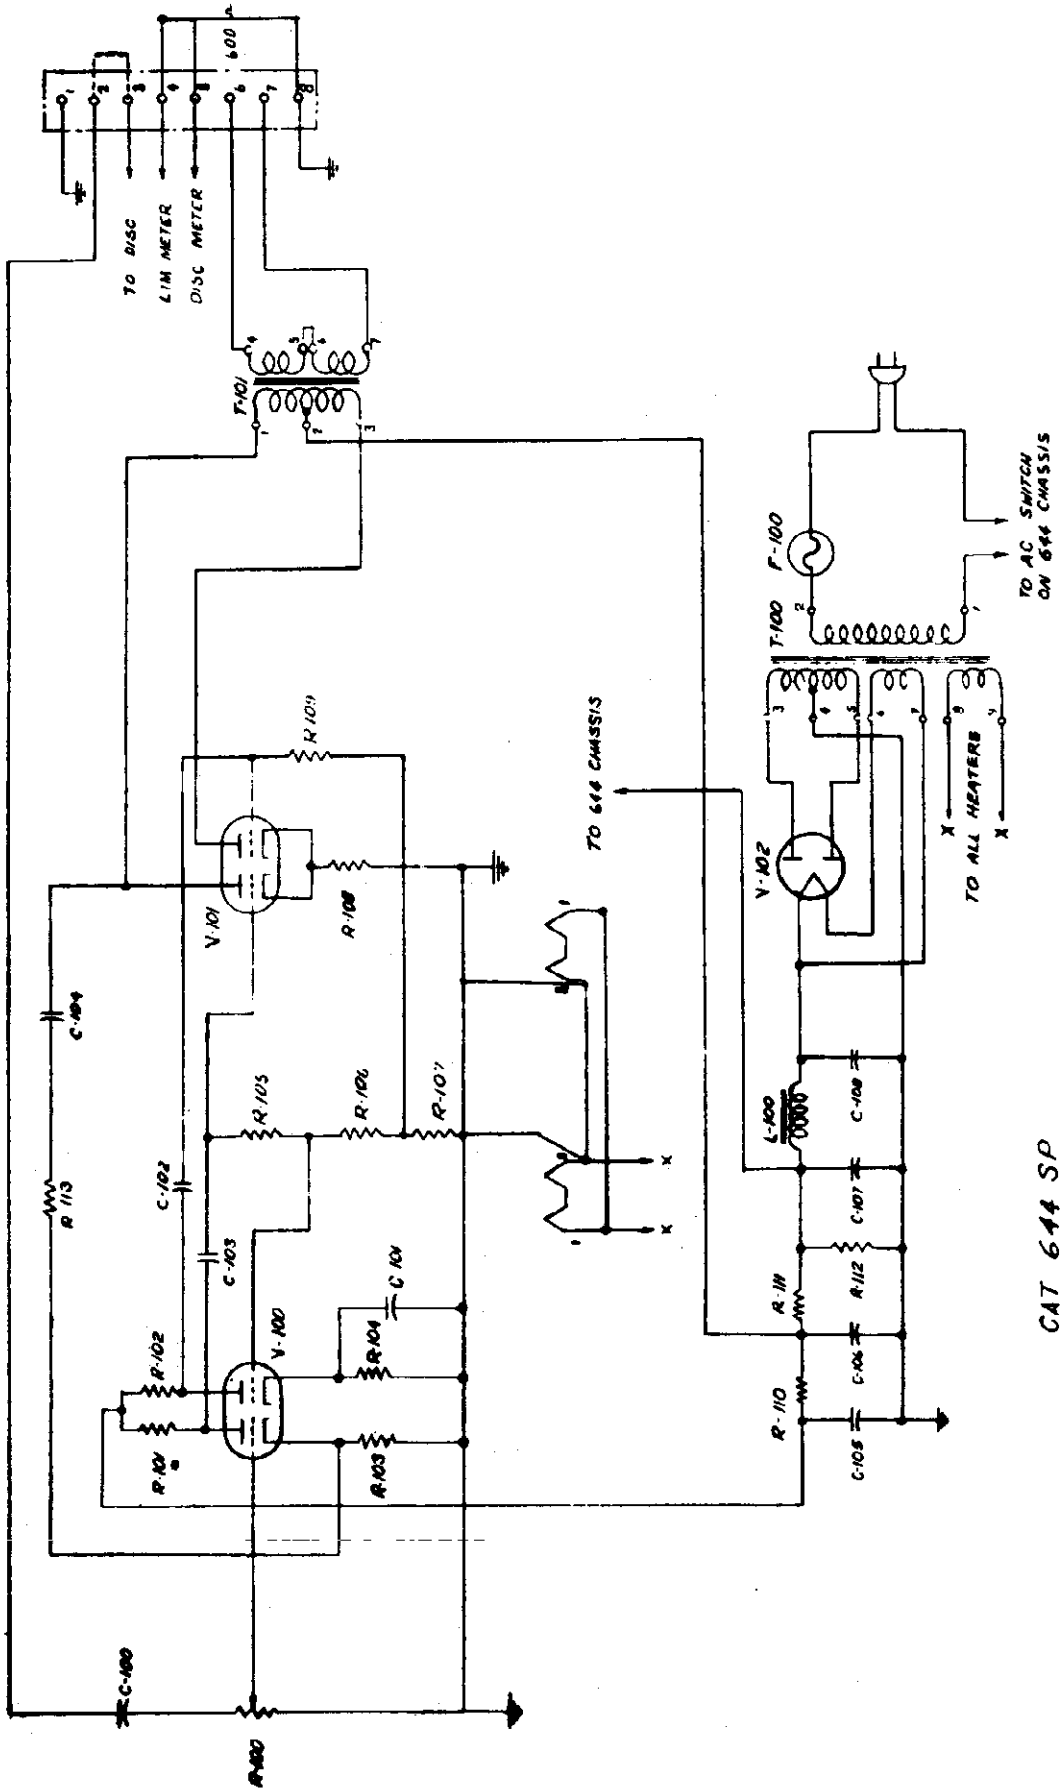
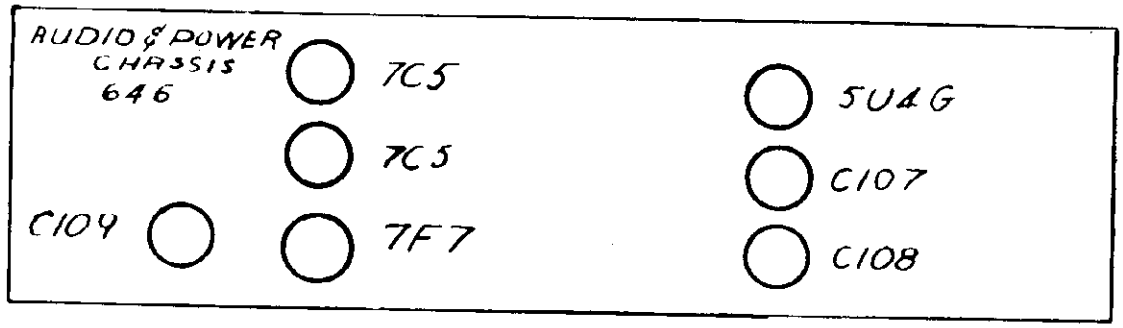
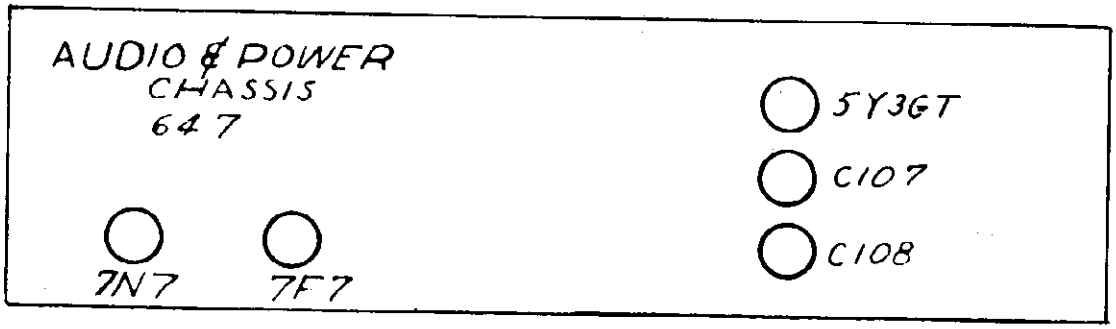
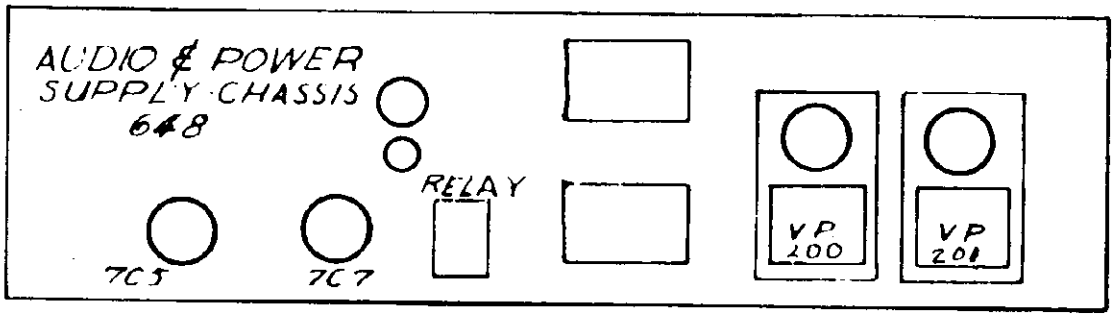
RADIO ENGINEERING LABS., INC.

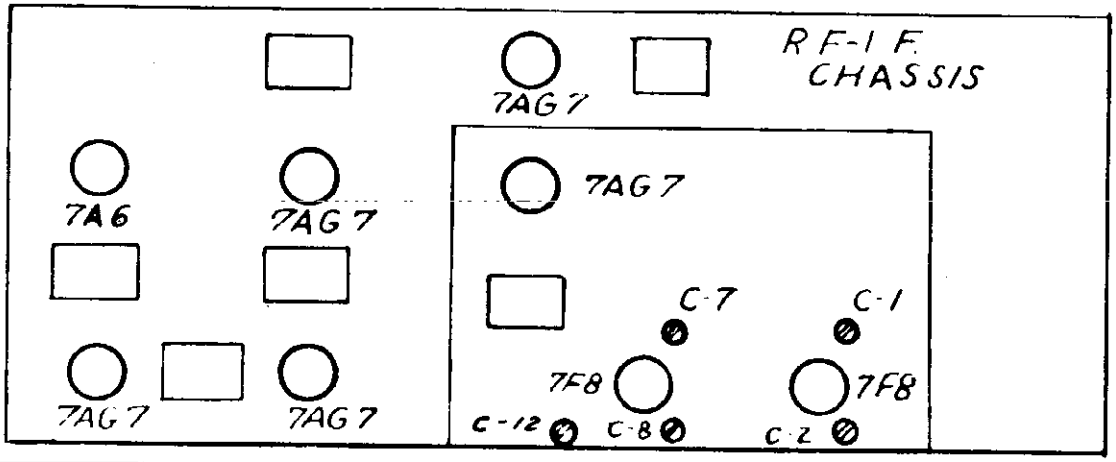


CHASSIS TUBE AND TRIMMER LAYOUT









These receivers are single superheterodyne units of orthodox circuit and design. As with all VHF receiving equipment, performance is dependent on correct installation, particularly the associated antenna and lead-in system.

The nominal impedance at the antenna terminals (marked A - A) is 150 ohms, Both 70 and 300 ohm lines may be used here without serious mismatch consequences. Whether or not the ground terminal (marked G) is used depends on local conditions. Because of uncertainties in this connection and because the input circuit coupling is fairly tight, the latter is not precisely tracked at the factory. For very weak signals or for technical use at any one frequency, these circuits may be trimmed up by adjusting C2, for the 88 to 108 band, and C1 for the 44 to 50 band. These are accessible at the top of the chassis and are located as shown in the tube layout sketch.

For convenience in tuning and rough measuring the circuits are adjusted so tha one small division of the TUNE meter corresponds to a frequency shift of about 20 kilocycles, and so that the steps of the RF GAIN control are roughly ten to 1 each. Indications on the SIGNAL meter are approximately linear. Both these meters may be supplemented externally by use of the connections on the rear te: minal board. The TUNE meter is 25-0-25 microamperes, and the SIGNAL is 0-1 milliampere.

To use external meters, remove the strap between terminals 4 and 5 and the ground bus from terminal 5, then connect the TUNE meter between terminals 5 an 1 (ground) and the SIGNAL meter between terminal 4 and 1. If only one of thes meters are connected externally, the terminal for the second meter must be connected to terminal 1.

The output of the detector is directly available at the rear at terminals 3 (high) and 1 (ground). This is at a fairly high impedance and not more than 50 micro-microfarads should be placed across this pair unless C33 (part of the standard de-emphasis network) is reduced correspondingly. The audio amplifier may be used by connecting to 2 (high) and 1 (ground). The terminals present to AC about one megohm and 30 micro-microfarads. For the 646, about 2.0 volts R.M.S. at these terminals gives full output of the audio amplifier.

The 646 and 647 receivers are designed for operation at 115 volts. They shoul not be operated permanently on lines higher than 125 volts. The 648 receiver requires at least 5.8 volts DC at the indicated terminals. They are connected for negative ground. If the vehicle has a positive ground system the vibrator <u>must</u> be reoriented according to the legend on the top of the Vibrapacks.

The maximum audio output of the 646 receiver is ten watts into either 500 or 8 ohms (mismatch up to 2 to 1 here is not generally aurally serious). The maximum output of the 647 receiver is + 18 DBM into 600 or 150 ohms. This receiv is connected for 600 ohm load; to use with 150 ohm load the output transformer should be restrapped by replaceing strap from 5 to 6 by a strap from 4 to 6 and another from 5 to 7. The maximum audio output of the 648 receiver is 4 watts into 6 ohms.

The RME-84 is an eight tube superheterodyne communication type receiver. It has a continuous tuning range from .54 megacycles to 44 megacycles in four overlapping bands. The bandspread dial provides 1000 arbitrary divisions on each range.

Specifications

Power Supply: 115 volts, 60 cycle, single phase
Power Consumption: 62 watts at 117 volts
Audio Output: 1.1 watts
Audio Frequency Responses 100 to 3,500 cycles ± 3db
Overall Cabinet Dimensions:

Height	Depth	Length
9-3/8"	9-3/4"	18"

Weight: 28 pounds

Tube Complement

	Type	Use	Schematic Circuit Symbol
1.	7B7	R.F. Amplifier	V1
2.	7S7	Mixer and Oscillator	V2
3.	7B7	1st I.F. Amplifier	V3

7.	6G6G	Output Amplifier	V7
8.	5Y3G	Rectifier	V8

Antenna

The terminals on the rear apron marked "A-A-G" are for the antenna and ground connections. When the receiver leaves the factory there is a jumper between the ground post (Marked G) and the adjacent antenna post. Good results may be obtained by connecting a wire 50 to 75 feet long to the other "A" post. If a 2 wire feeder system is used the jumper is removed and the two feeders are connected to "A" and "A". The input impedance between these points is approximately 300 ohms. A ground may be connected to the "G" post if it improves reception.

OPERATION AND CIRCUIT DETAILS

Introduction

The purpose of this book is to familiarize the operator with the RME-84, that he may realize the maximum results and enjoyment from his receiver. Each control on the RME-84 has a definite function. The following paragraphs briefly describe them.

Tuning Dial

The RME-84 tuning mechanism features a spring loaded gear, engaged by a planetary driven pinion. The pre-loading eliminates backlash. Bandspread logging is obtained by using the figures on the illuminated translucent dial visible through the window in the center of the megacycle scale. The 200 divisions on this dial are calibrated from zero to 100. The dial makes 5 complete revolutions as the

megacycle pointer travels from one end of the scale to the other. This dial is used in conjunction with the innermost half circle, calibrated from 0 to 4, on the megacycle scale. While the red pointer is covering one of the megacycle scale sections the bandspread dial makes one complete revolution. After a station has been heard it can be logged accurately by using the two sets of figures.

For example, if a station is heard on band II with the pointer in section 3 of the megacycle scale and with the bandspread dial at 28, that station is definitely logged as 328 because it will always be found at 328 on band II. Or, if a station is logged at 173 on band III, it is always tuned in on band III by turning the tuning knob until the red pointer is section I of the megacycle scale and until 73 comes upon the bandspread dial.

Elimination of the bandspread condenser necessary in an electrical bandspread system lowers the losses in the R.F. circuit and gives greater gain and stability.

Standby Switch

The second control from the left is the standby switch, used to make the receiver inoperative without turning off the line switch. It also turns on the beat frequency oscillator for CW reception.. There are three positions and reading clockwise they are marked CW, TR, and PH. The first position makes both receiver and beat frequency oscillator operative for CW reception. The second position makes the set inoperative while leaving it warmed up, as during a transmitting period, by disabling the RF and IF stages of the receiver. The third position provides for phone reception without the beat frequency oscillator.

Beat Oscillator PITCH Control.

The pitch of the beat frequency may be varied by means of the control labeled B.O. Pitch. The beat frequency oscillator is indispensible in the reception of CW signals and is an aid in locating weak phone carriers.

AUDIO GAIN

The AUDIO GAIN Control in the center of the control panel adjusts the audio volume to the desired level.

Best CW reception is usually obtained with this control well advanced (clockwise) and the gain of the receiver controlled by the RF gain control.

LINE Switch and TONE Control

The LINE TONE Control turns the receiver on and off. As the control is turned clockwise the line switch will close. Continued turning of the knob controls the tone by increasing the high frequency response.

Band Selector Switch

The BAND SELECTOR Switch selects the frequency range desired. The range of the receiver is divided into 4 bands. The range covered by each band is as follows:

Band I	.540	to	1.65	MC (American Broadcast)
Band II	1.65	to	5.	MC
Band III	5.	to	15.	MC
Band IV	15.	to	44.	MC

Actually these figures do not represent the full range of each band since there is considerable overlap between the end of one band and the start of the next.

Radio Frequency GAIN Control

Counter clockwise rotation of this control reduces the gain of the receiver manually. Automatic control of the receiver gain is fully effective only when the R.F. GAIN control knob is rotated to and set at its maximum clockwise position.

Noise Limiter

An AUTOMATIC NOISE LIMITER is incorporated in the receiver circuit. No adjustment is required. The circuit is of a type that automatically adjusts itself to maximum effectiveness.

IMPORTANT

The action of the noise limiter is such that a slight amount of distortion is introduced on the signal. Therefore when it is desirable to do so the noise limiter may be switched out of the circuit. This is controlled by the slide switch just below the control panel. When the switch is to the left the limiter is out of the circuit.

Automatic Volume Control

AVC is obtained by feeding a portion of the signal rectified by the 7K7 tube back to the grids of the RF and IF tubes. As the RF gain is rotated counterclockwise the AVC action becomes subordinate to the bias developed in the cathodes by this control. The AVC is fully effective only when the RF gain control is in the extreme clockwise position. AVC is removed when the standby switch (3.4) is turned to CW.

Power Supply

The RME-84 is provided with very flexible power requirements. The standard receiver operates from 115 volts AC, 50-60 cycles. On special order it may be had for 115 or 230 volts, 25 to 60 cycle operation. All models may be operated from A and B batteries, or vibropack. The octal plug on the rear apron must be in place for AC operation. It is removed and replaced by a battery cable for battery operation. The 5Y3G rectifier supplies current through pi-section filter. This filter is also in the circuit when the battery cable is used, simplifying converter or vibropack requirements.

Battery Operation

The RME-84 is designed for econimical battery operation. The standard RME-84 has an octal socket on the rear apron into which is inserted a shorting plug when operating on AC. For battery operation the shorting plug is removed and battery cable is plugged into the socket. The battery cable is not supplied with the 84 but may be purchased separately or made up from the schematic diagram.

Battery requirements are as follows: "A" battery 6V at 1.5 amperes. "B" battery, 135 volts with a tap at 90 volts. The "B" battery drain is 32 milliamperes. The "A" battery drain may be reduced to 1.2 amperes by removing the dial lamps.

When operating on batteries all of the controls function normally. The re-

ceiver is turned on and off by means of the power switch on the LINE TONE CONTROL.

IMPORTANT

THE LINE CORD MUST BE DISCONNECTED FROM THE AC SUPPLY BEFORE ATTEMPTING TO CONNECT FOR BATTERY OPERATION.

MAINTENANCE AND SERVICE

No maintenance work of importance is required on this unit. It is suggested that periodic cleaning of the equipment be done, including blowing out any accumulated dust with a suitable air stream.

UNLESS IT IS DEFINITELY ESTABLISHED THAT ALIGNMENT IS INCORRECT, NO ADJUSTMENTS OF THE TUNED CIRCUITS SHOULD BE MADE.

Equipement required is a signal generator, an INSULATED screwdriver, and an output meter unless the receiver has an "R" meter.

In this paragraph, and following paragraphs on alignment the "meter" referred to is either the output meter or the "R" meter, whichever is used. A difference in procedure required is as follows:

When the R meter is used, the R.F. gain is turned full clockwise, all other operating conditions are normal.

When using an audio output meter it is necessary to ground the AVC line, and it may be necessary to reduce the R.F. gain control setting to avoid overloading the first stages of the receiver with strong signal inputs. The meter may be clipped across the voice coil windings of the speaker, both terminals of which are accessible through the lid of the cabinet. The AVC may be removed from the receiver by turning the STANDBY switch to CW. This will also turn on the beat frequency oscillator. Since it is undesirable to have the BFO on while aligning the receiver, the BFO tube (V6) should be removed from the socket. It must, of course, be replaced while aligning the BFO.

I.F. Alignment

The I.F. frequency of the RME-84 is 455 KC. The bandswitch should be turned to band I. The tuning dial should be turned to the low frequency end (.55 MC) and the hot lead from the signal generator clipped to the lug on the detector (center) section of the tuning condenser. With the signal generator set at 455 KC each padder on the 1st, 2nd and 3rd I.F. transformers is carefully adjusted for maximum response as indicated on the meter.

B.F.O. Alignment

With the signal generator connected as for aligning I.F. circuits, turn the stand-by switch to CW and set "B.O. PITCH" control pointer vertical. With an insulated screwdriver adjust BFO padder until zero beat is obtained.

R.F. Alignment

Alignment of the radio frequency section of the receiver will affect, principally, the calibration of the receiver. Within certain limits this, of course, will also affect the sensitivity. Small variations in frequency (up to 2%) will not

materially reduce the sensitivity of the receiver although they will, of course, show up as variations in the calibration as indicated by the setting of the MAIN TUNING DIAL. Correction of any variation of calibration can be made by following the suggestions outlined in the following paragraphs.

All adjustments are made from the top of the chassis. The proper points for each band are marked on figure 3. There are 18 of them, plus one used only on band IV and accessible from the rear apron.

High frequency beat is used on all bands, that is, the oscillator is 455 KC higher in frequency than the signal received.

If sufficient input is used, a given signal can be received at two points on the tuning dial. There is 910 KC difference in frequency between these points. The true signal is the one received at the higher frequency dial reading while the image or "Low-beat" signal is received with the dial reading 910 KC lower in frequency. The circuits must be aligned to the true signal.

When using a signal generator or test oscillator to align the receiver, a resistor of about 300 ohms should be inserted between the signal generator and the antenna terminal. This will prevent misaligning of the RF stage caused by connecting the receiver input, the low impedance output of the signal generator.

Band I includes frequencies between 540 and 1650 KC. For Band I there are two frequency adjustments for adjusting the dial to the proper calibration.

The first step is to choose a station or a signal of accurately known frequency on the low frequency end of the range (for example 600 KC) and set the main tuning scale to read this frequency. If the signal is not tuned in when the scale indicates its frequency it may be brought in by adjusting the oscillator coil core. This may be done with a small screwdriver at the point marked "BAND I OSC. Lo". Another station or signal is now selected near the high frequency end of the range (for example 1400 KC). If this signal is not heard when the dial is accurately set to its frequency it may be brought in by adjusting the padder under the large hole marked "BAND I OSC. Hi" by means of an insulated trimmer tool. When this signal is accurately brought in as indicated by a maximum reading on the meter, the low frequency test point should be readjusted if it has changed. It may be necessary to go back and forth several times until both frequencies are accurately calibrated.

When the calibration is correct the R.F. circuits can be aligned. The two marked "Band I Mixer Lo" and "Band I RF Lo" are adjusted for maximum meter reading on the low frequency end of the band (such as 600 KC); and the trimmers marked "Band I Mixer Hi" and "Band I RF Hi" are used to obtain maximum output at the high frequency end, such as 1400 KC. It may be necessary to repeat these adjustments for perfect alignment. The oscillator calibration of any band must be done first, and should not be changed while making the other adjustments.

The procedure on Band II is the same as for Band I. Adjust "Band II Osc.Lo" at approximately 1.9 MC and "Band II Osc. Hi" around 4.5 to 5 MC; then tune the mixer and RF stages.

Band III and IV differ in that there is no "Lo" end adjustment, the inductance of the coils being accurately adjusted at the factory. Band III is therefore set at only one frequency, preferably at the high end. Band IV may be adjusted at about 30 MC.

The trimmer accessible through the hole in the rear of the chassis affects only the extreme low end of Band IV and should not be disturbed unless absolutely necessary. It will determine calibration only between 14 and 17 MC, and will also affect sensitivity of the set through that region of Band IV.

This receiver features the latest in post-war engineering design. It employs 10 tubes plus a rectifier in an AM-FM superheterodyne circuit. Four of the tubes are the dual-purpose type giving the set 15-tube performance. The tuning ranges are:

A.M. — 540 Kc. to 1700 Kc.
F.M. — 88 Mc. to 108 Mc.

The receiver has two built-in antennas; a loop antenna for the AM broadcast band and a folded dipole for the FM broadcast band. Provisions are made for external antenna connections. The easy-to read "slide-rule" type dial is illuminated when the set is on; a dial pointer of red plastic reflects illumination from the two pilot lights. A high ratio drive on the tuning condenser provdies smooth tuning. High Fidelty reproduction on FM and AM is the result of well-engineered circuits and the use of high quality parts.

Tube Complement:

1 Type 6BA6—FM RF Amplifier.
1 Type 7F8—FM Mixer, Oscillator.
1 Type 7AH7—1st IF Amplifier.
1 Type 6SH7—FM Detector Driver.
1 Type 7A6—FM Detector.
1 Type 6SQ7/GT—AM Det., A.V.C. and 1st Audio Amplifier.
1 Type 7F7—2nd Audio, Phase Inverter.
2 Type 7C5—Push-pull Power Amplifiers.
1 Type 5Y3—Rectifier.
1 Type 7Q7—AM Mixer Oscillator.

Power:

This receiver operates on 105-125 volts, 60 cycle, AC. Do not plug this radio receiver into a direct current socket. Power consumption is 80 watts.

ALIGNMENT PROCEDURE FOR A.M.:

Equipment Required:

a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch to AM. Advance volume control to full volume setting.
2. Connect output meter across voice coil.
3. Connect the Signal Generator across the broadcast band antenna section of the variable condenser. The "high" side of the Generator should connect to the stator section and the "ground" side to the frame or chassis. Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I.F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.
4. Connect the "high" side of the Generator to the antenna terminal with a 200 mmf condenser inserted in series. Connect the "ground" side of the Generator to the chassis. Tune receiver to 60 on the dial, adjust Signal Generator to 600 kc. Adjust the BC padder and the BC antenna coil for maximum deflection on the output meter. Use a weak signal.
5. Tune receiver to 160 on the dial. Adjust Signal Generator to 1600 kc. Adjust BC oscillator and BC antenna trimmers for maximum output.
6. Repeat operations 4 and 5.

V ALIGNMENT PROCEDURE FOR F.M.:

Note: Points A, B, C, D, E, F, G, and H are noted on circuit diagram.

Points B, C, and D have been brought out to the unused contacts of the speaker socket at the rear of the chassis.

Equipment Required:

a) High frequency Signal Generator with 88-108 Mc tuning range.
b) Signal Generator capable of delivering .1V at 10.7 mc.
c) Audio output meter.
d) D.C. vacuum tube voltmeter with zero center scale.

a. Ratio Detector Alignment:

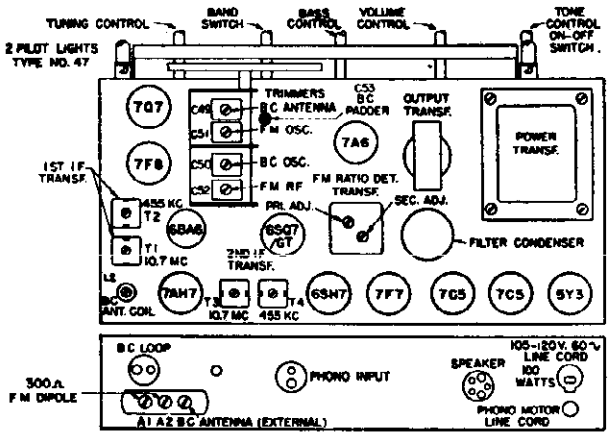
1. Connect V.T.V.M. across points "B" and "C" (A.V.C. Voltage).
2. Feed 10.7 mc unmodulated R.F. signal into 6SH7 grid (point A) through .01 μfd. condenser. This signal should be .1 volt.
3. Adjust primary of Ratio Detector (T-5) for maximum voltage indication on V.T.V.M.
4. Connect zero centered V.T.V.M. across points "B" and "D".
5. Adjust secondary of Ratio Detector (T-5) for zero indication.
6. Tune 10.7 mc Signal Generator higher in grequency (about 200 kc) until maximum voltage reading is obtained on V.T.V.M.; note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the Det. (T-5) until the detector voltages are about equal on either the high or low side of 10.7 mc.

b. 10.7 I.F. Alignment:

1. Shunt a 1,000-ohm carbon resistor across the primary of the detector (T-5) (Points G and H).
2. Connect output meter across speaker voice coil.
3. Volume and tone controls at maximum clockwise position.
4. Connect 10.7 mc (modulated 30% signal generator through .01 μfd. condenser across point "F" and ground.
5. Adjust secondary, then primary of (T-3) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)
6. Connect 10.7 mc 30% modulated signal generator across point "E" and ground.
7. Adjust secondary, then primary of (T-1) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)
8. Remove 1000-ohm shunting resistor from across primary of (T-5).

c. Oscillator and R.F. Alignment:

1. Connect V.T.V.M. across "B" and "C" (A.V.C. voltage).
2. Connect 108 mc signal generator to FM antenna terminals. If generator impedance is low, put one 150-ohm carbon resistor in series with each of the generator leads. Tune receiver dial to 108 mc.
3. Adjust FM oscillator trimmer (C-51) for maximum V.T.V.M. reading.
4. Adjust FM R.F. trimmer (C-52) for maximum V.T.V.M. reading. During alignment reduce input signal to maintain A.V.C. voltage at 2 V.
5. Repeat steps 3 and 4.
6. Feed a 90 mc signal into antenna terminals (as in C-2), tune receiver dial to signal.
7. Adjust spacing of FM R.F. coil (L-4) for maximum V.T.V.M. reading at 90 mc. During alignment reduce input signal to maintain A.V.C. voltage at 2 V.
8. Repeat steps 2 and 4 if necessary.



Tube and Trimmer Locations.

MODEL T5000

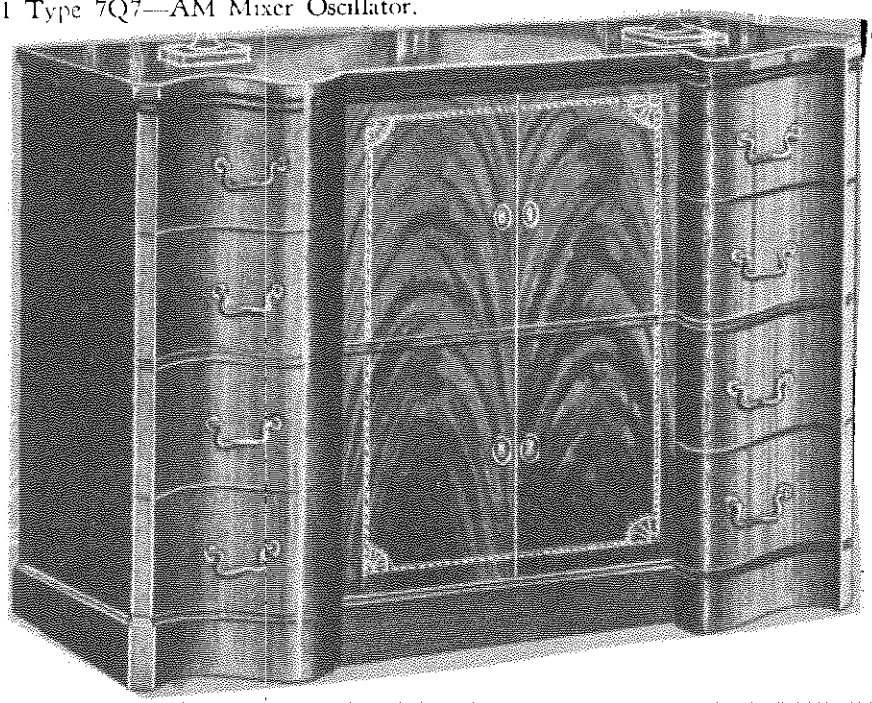
Tube Complement:

1 Type 6BA6—FM RF Amplifier.
1 Type 7F8—FM Mixer, oscillator.
1 Type 7AH7—1st IF Amplifier.
1 Type 6SH7—FM Detector Driver.
1 Type 7A6—FM Detector.
1 Type 6SQ7/GT—AM Det., A.V.C. and 1st Audio Amplifier.
1 Type 7F7—2nd Audio, Phase Inverter.
2 Type 7C5—Push-pull Power Amplifiers.
1 Type 5Y3—Rectifier.
1 Type 7Q7—AM Mixer Oscillator.



This receiver features the latest in post-war engineering design. It employs 10 tubes plus a rectifier in an AM-FM superheterodyne circuit. Four of the tubes are the dual-purpose type giving the set 15-tube performance. The tuning ranges are:

A.M. — 540 Kc. to 1700 Kc.
F. M. — 88 Mc. to 108 Mc.

The receiver has two built in antennas; a loop antenna for the AM broadcast band and a folded dipole for the FM broadcast band. Provisions are made for external antenna connections. The easy-to-read "slide-rule" type dial is illuminated when the set is on; a dial pointer of red plastic reflects illumination from the two pilot lights. A high ratio drive on the tuning condenser provides smooth tuning. High Fidelity reproduction on FM and AM is the result of well-engineered circuits and the use of high quality parts.

ALIGNMENT PROCEDURE FOR A.M.:

Equipment Required:

a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch to AM. Advance volume control to full volume setting.

2. Connect output meter across voice coil.

3. Connect the Signal Generator across the broadcast band antenna section of the variable condenser. The "high" side of the Generator should connect to the stator section and the "ground" side to the frame or chassis. Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I.F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.

4. Connect the "high" side of the Generator to the antenna terminal with a 200 mmf condenser inserted in series. Connect the "ground" side of the Generator to the chassis. Tune receiver to 60 on the dial, adjust Signal Generator to 600 kc. Adjust the BC padder and the BC antenna coil for maximum deflection on the output meter. Use a weak signal.

5. Tune receiver to 160 on the dial. Adjust Signal Generator to 1600 kc. Adjust BC oscillator and BC antenna trimmers for maximum output.

6. Repeat operations 4 and 5.

ALIGNMENT PROCEDURE FOR F.M.:

Note: Points A. B. C. D. E. F. G. and H are noted on circuit diagram.

Points B, C, and D have been brought out to the unused contacts of the speaker socket at the rear of the chassis.

Equipment Required:

a) High frequency Signal Generator with 88-108 Mc tuning range.
b) Signal Generator capable of delivering .1 V at 10.7 mc.
c) Audio output meter.
d) D.C. vacuum tube voltmeter with zero center scale.

a. Ratio Detector Alignment:

1. Connect V.T.V.M. across points "B" and "C" (A.V.C. Voltage).

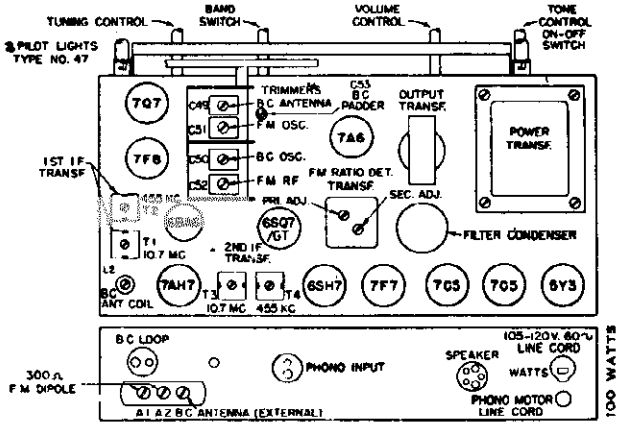
2. Feed 10.7 mc unmodulated R.F. signal into 6SH7 grid (point A) through .01 μfd. condenser. This signal should be .1 volt.

3. Adjust primary of Ratio Detector (T-5) for maximum voltage indication on V.T.V.M.

4. Connect zero centered V.T.V.M. across points "B" and "D".

5. Adjust secondary of Ratio Detector (T-5) for zero indication.

6. Tune 10.7 mc Signal Generator higher in frequency (about 200 kc) until maximum voltage reading is obtained on V.T.V.M.; note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the Det. (T-5) until the detector voltages are about equal on either the high or low side of 10.7 mc.



Tube and Trimmer Locations.

b. 10.7 I.F. Alignment:

1. Shunt a 1,000-ohm carbon resistor across the primary of the detector (T-5) (Points G and H).

2. Connect output meter across speaker voice coil.

3. Volume and tone controls at maximum clockwise position.

4. Connect 10.7 mc (modulated 30% signal generator through .01 μfd. condenser across point "F" and ground.

5. Adjust secondary, then primary of (T-3) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

6. Connect 10.7 mc 30% modulated signal generator across point "E" and ground.

7. Adjust secondary, then primary of (T-1) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

8. Remove 1000-ohm shunting resistor from across primary of (T-5).

c. Oscillator and R.F. Alignment:

1. Connect V.T.V.M. across "B" and "C" (A.V.C. voltage).

2. Connect 108 mc signal generator to FM antenna terminals. If generator impedance is low, put one 150-ohm carbon resistor in series with each of the generator leads. Tune receiver dial to 108 mc.

3. Adjust FM oscillator trimmer (C-51) for maximum V.T.V.M. reading.

4. Adjust FM R.F. trimmer (C-52) for maximum V.T.V.M. reading. During alignment reduce input signal to maintain A.V.C. voltage at 2 V.

5. Repeat steps 3 and 4.

6. Feed a 90 mc signal into antenna terminals (as in C-2), tune receiver dial to signal.

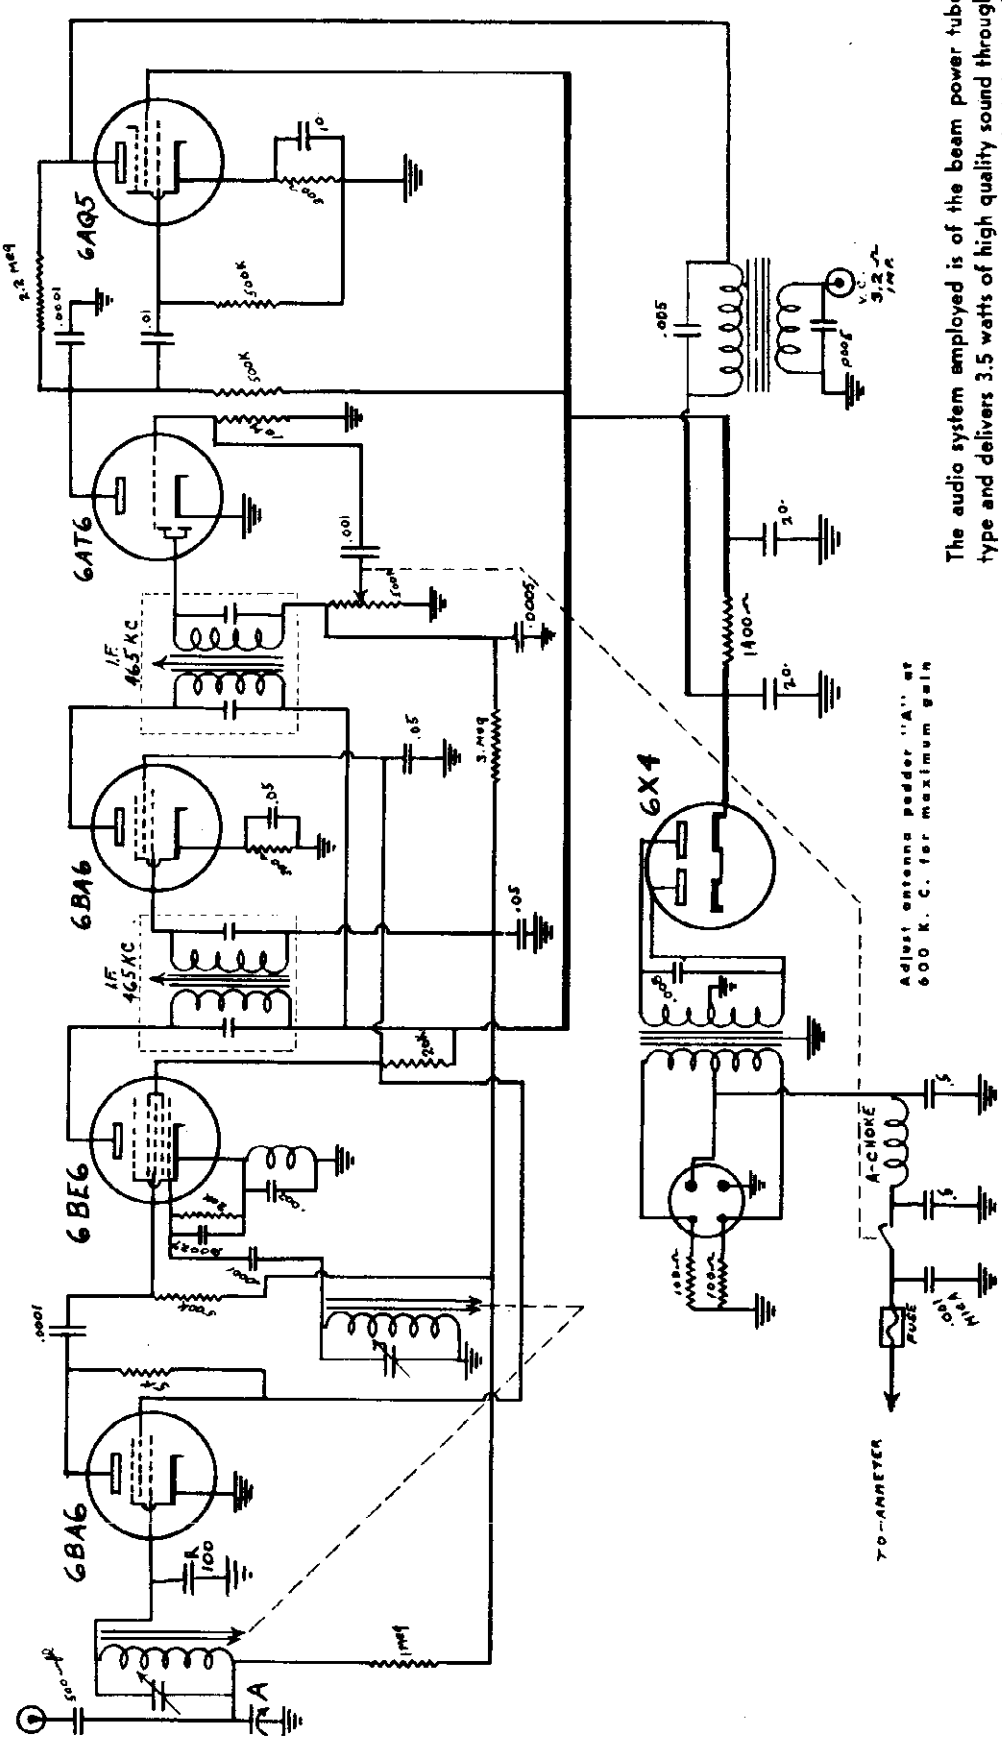
7. Adjust spacing of FM R.F. coil (L-4) for maximum V.T.V.M. reading at 90 mc. During alignment reduce input signal to maintain A.V.C. voltage at 2 V.

8. Repeat steps 2 and 4 if necessary.

Power:

This receiver operates on 105-125 volts, 60 cycle, AC. Do not plug this radio receiver into a direct current socket. Power consumption is 80 watts.

RADIO & TELEV. PRODUCTS CO. MODEL 47602



The audio system employed is of the beam power tube type and delivers 3.5 watts of high quality sound through a 6 inch Alnico V-PM speaker which is supplied along with the necessary mounting hardware and baffle for most automobiles.

This auto radio can be mounted in practically all widely sold automobiles.

The circuit employed in the 47602 is of the Superheterodyne type, foremost in the radio world of today. It consists of a 6 miniature tube radio chassis featuring: High sensitivity, permeability tuning and high fidelity in an efficient compact size.

ANTENNA

A shielded antenna cable (30 mmf. capacity) with bayonet connector plug is required.

The plug on the antenna cable is inserted in the socket at the side of the radio case. The wire at the other end of the cable is connected to the antenna.

Low Capacity Antenna

This radio is designed for a low capacity car antenna. The total capacity of antenna and shielded cable should be 40 to 70 mmf.

The following procedure has been found to be effective in reducing motor noise to a satisfactory level in most cars. Follow the steps in the order given. Additional procedure, which may be required in exceptional cases of motor noise, is not covered here and will be found by referring to current literature on this subject.

GENERATOR CONDENSER—A generator condenser is required in all cases. Connect the condenser lead to the battery terminal of the generator. The case and mounting strap connect the other side of the condenser to ground. This unit must, therefore, be well grounded at its mounting.

CAUTION—In cars with automatic regulators, it is important not to connect the condenser across the field terminal. Most manufacturers at the present time have a recommendation for the proper post at which to connect the condenser.

DISTRIBUTOR SUPPRESSOR—A distributor suppressor will be required in most cases. Remove the high tension lead to the distributor. Insert a distributor suppressor and connect the wire to the other end of the suppressor. If this is not practical, cut the high tension lead close to the distributor and use a wood screw end type distributor suppressor in this line.

Withdraw Antenna Cable Plug

Turn on the radio and start the motor.

If motor noise is heard, proceed as follows:

BONDING CABLES, STEERING COLUMN, ETC.—Try grounding to the fire wall all cables and tubing which pass through it such as oil lines, gas lines, etc. It is also possible for the steering column, foot pedals, and brake lever to carry interference to the back of the fire wall at which point it may affect the radio. By means of a file, contact can be established between any of these parts and the fire wall or frame in order to determine whether such a ground will reduce the noise. To bond the parts to the fire wall or frame, clean the point of contact, wrap a length of one inch braided shielding around the part, and solder the connection. Then solder the end of the shielding to the fire wall or frame or ground it under a screw head if one is convenient.

Sufficient play should be left in the bonding shielding so that movement of the parts will not loosen this shielding.

Then Reinsert Antenna Cable Plug

If motor noise is heard when the antenna cable is reconnected, proceed as follows until the noise is satisfactorily reduced:

BYPASS CONDENSERS—Try a .5 mfd. bypass condenser from the ammeter to ground and see if interference is reduced. Install this condenser permanently if there is an improvement.

In like manner, try a .5 mfd. condenser from car fuse to ground, switch to ground, tail light and stop light connections to ground, windshield wiper and various other 6 volt connections to ground, noting what effect these condensers have on the noise pickup.

Try a .5 mfd. condenser between the point at which the dome light lead leaves the pillar post and ground.

Try a .5 mfd. condenser from the "Hot" side of the coil primary to ground.

The electric gauges used for oil, water, and gas are often a source of interference and bypass condensers should be tried. The condenser should usually be connected to the end of the line nearest the measuring device rather than at the instrument panel.

HIGH AND LOW TENSION LEADS—In some cases, the high and low tension leads between the coil and distributor are run close together. In some cars, they are in the same conduit. If this is the case, remove the low tension lead from this conduit. In any event, keep the high and low tension leads as far apart from each other as possible.

If separating the two leads is not sufficient, shield and ground the shield of the low tension lead.

GROUNDING MOTOR AND OTHER PARTS—The motor must, in every case, be well grounded to the frame of the car. If it is not, use a very heavy braided lead for this purpose, similar to a storage battery ground lead. In like manner, it may be necessary to check the grounding of the metal fire wall, instrument panel, transmission, radiator, hood, and muffler to the frame of the automobile. To obtain a good electrical connection, scrape off the paint, if necessary, at the point where ground contact is made.

PEENING ROTOR ARM—In extreme cases of motor noise, it is advisable to peen the distributor rotor arm, that is, increase the length of the arm by using a small machinist's hammer. This will lessen the gap between the rotor arm and the stationary contacts thus reducing the spark. Be sure, after peening the arm, that it does not strike the stationary contacts.

SPARK PLUG SUPPRESSORS—If motor noise persists, spark plug suppressors must be installed. One suppressor is put on each plug. These are not regularly supplied with the radio and must be purchased extra. Ninety-five per cent of all cars will not require spark plug suppressors. Care should be taken that a good mechanical and electrical connection is made between the spark plugs, suppressors, and plug wires.

WHEEL OR BRAKE STATIC—To determine if noise is being caused from this source, set the car in motion; then with the motor shut off and the clutch disengaged, apply the brakes. If the noise stops, the source of the static is in the wheels. The use of a front or rear wheel static eliminator will generally end the trouble.

MODEL A-23 RADIO WIRE TELEVISION

GANGING OF AC-DC SEVEN TUBE SUPERHETERODYNE

APPARATUS:

Signal Generator having output frequencies from 20 megacycles to 150 kilocycles.
Output Meter.
Small tools such as screwdriver, 1/4" wrench, etc.

GANGING OF THE I.F. AMPLIFIER:

The signal generator should be adjusted to 456 kilocycles, its output should be adjusted to some medium value and connected directly (no dummy antenna being used) to the grid of the first detector which is the first tube on the left hand side of the receiver when facing the front of the receiver. With this connection made and the volume control turned on a signal should be indicated on the output meter. This should be adjusted to approximate half scale reading and the adjustments of the trimming condensers in the I.F. transformers made. The last intermediate frequency transformer, which is the transformer furthest to the rear of the receiver on the right hand side. These two circuits should be ganged for maximum amplitude as indicated by the output meter and output of the signal generator should be decreased from time to time as the ganging operation progresses so that it is not over loaded. After carefully ganging the last transformer the second transformer should be ganged. The ganging operation should be carried on as before and then the first transformer, which is the transformer on the right hand front corner of chassis, should be ganged. It is often desirable to go over this procedure a second time because slight variations of one circuit tend to detune other circuits and the operation will be found to have been more accurately made if the whole ganging sequence pertaining to the I.F. amplifier is gone over a second time.

The sensitivity of the I.F. amplifier after it is correctly ganged should be in the neighborhood of 8 to 10 microvolts.

GANGING OF OSCILLATOR AND PRESELECTOR CIRCUITS:

(Broadcast Band)

The output of the signal generator should now go through a standard dummy antenna and be connected to antenna and ground posts of the radio chassis. The signal generator should be set at 1400 kilocycles, the wave change switch should be set on its fourth position and the dial set so that No. 4 band reads 1400 kilocycles. At this point the trimming condenser on the first section of the variable condenser should be trimmed until a signal is indicated on the output meter. After correctly peaking this signal, the two preselector trimming condensers occurring on the second and rear sections of the variable condenser should be trimmed, for maximum output. The dial reading of the receiver and the signal generator should now be changed to 600 kilocycles and the reciprocal trimmer for the broadcast band, which is the trimming adjustment occurring at the left upper position of the four trimmers on the front of the chassis, should be varied until the 600 kilocycle signal is indicated on the output meter. The signal generator and the receiver should again be tuned to 1400 kilocycles and the trimming adjustment on the first section of the variable condenser retuned for maximum amplitude at 1400 kilocycles. The signal generator and receiver should now be tuned to 1000 kilocycles and the sensitivity at this point checked. This completes the ganging for the broadcast band.

(Police Band No. 3)

The signal generator should be set at 4 megacycles, the wave change switch changed to the No. 3 position and the receiver tuned in the vicinity of the dial reading on the No. 3 band of 4 megacycles where the signal will be found. After peaking this signal on the output meter by means of dial tuning, the No. 3 band preselector adjustment should be peaked - this will be found on the under side of the receiver and it will be that adjustment mounted on the small coil which is nearest the rear of the receiver. In making these preselector adjustments on the higher frequencies, it is often desirable to continuously sweep the tuning of the receiver back and forth across the receiver and note the amplitude of the output meter, continuously trimming the preselector circuit because at these higher frequencies a change in preselector tuning will affect the oscillator tuning to some extent. After this adjustment is made the signal generator and receiver should be adjusted to 1.5 megacycles and the left lower adjustment to the left of the wave change switch should be adjusted until the signal peaks on the output meter. The signal generator and receiver should again be set to the 4 megacycle reading then checked for amplitude.

(No. 2 Band)

The signal generator should now be adjusted to 10 megacycles and the wave change switch be in the No. 2 position and the tuning adjustment of the radio receiver swept back and forth in the vicinity of ten megacycles until the signal peaks on the output meter. The center adjustment of the three adjusting trimmers underneath the chassis should now be adjusted for maximum amplitude on the output meter after which the signal and receiver should be tuned to 4 megacycles and the left lower adjustment on the left hand side of the wave change switch should be adjusted until the signal peaks on the output meter.

(No. 1 Band)

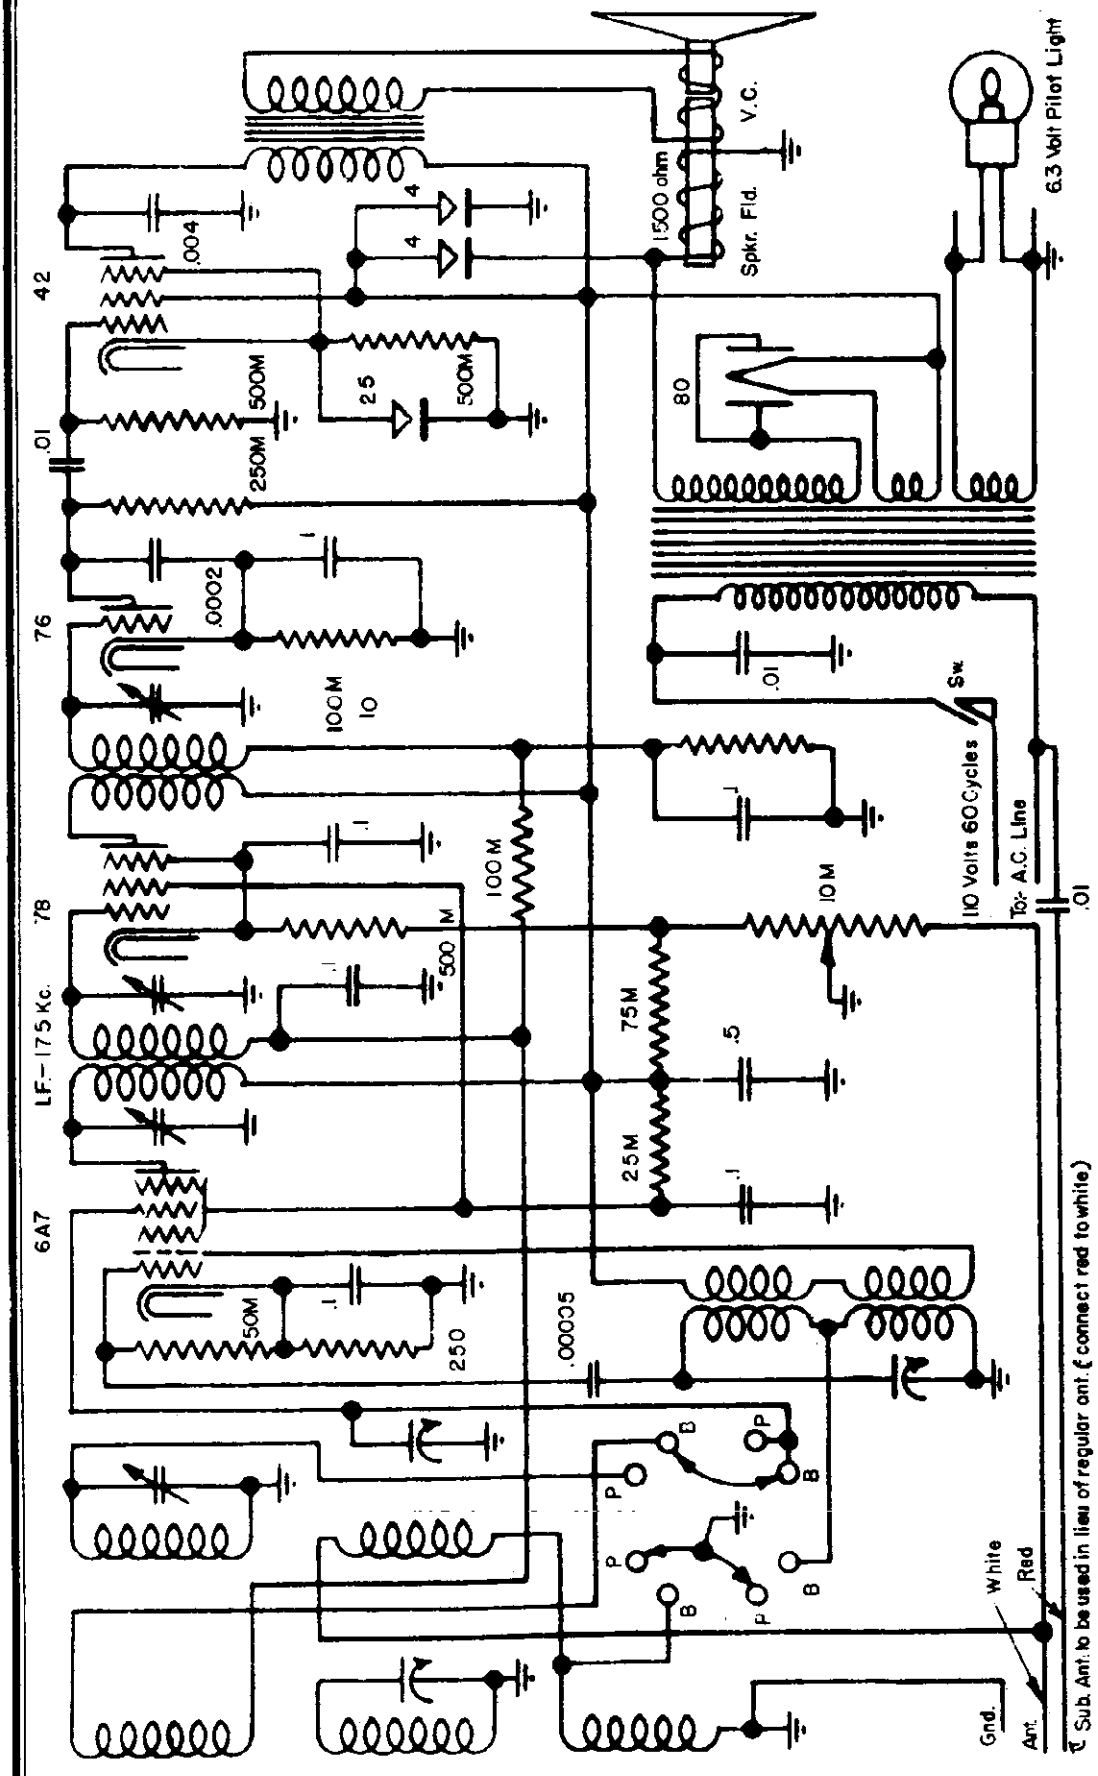
The signal generator should be adjusted to a frequency of 20 megacycles and the wave change switch placed in its No. 1 position. The tuning adjustment of the radio receiver should be swept back and forth in the vicinity of 20 megacycles until the signal peaks on the output meter after which the adjusting trimmer nearest the front chassis skirt should be adjusted for maximum amplitude.

(No. 5 Long Wave Band)

The signal generator and tuning adjustment on the radio should be adjusted to 350 kilocycles and the wave change switch be in its No. 5 position and the adjustment located underneath the chassis near the left hand front corner should be adjusted until the signal is indicated on the output meter, after which the adjustment on the coil on top of the receiver chassis immediately to the left of the variable condenser should be adjusted for maximum amplitude. The signal generator and the tuning adjustment on the radio chassis should be adjusted to 150 kilocycles and the adjustment furthest to the left above and to the left of the wave change switch should now be adjusted until the signal peaks on the output meter. The signal generator and radio chassis should again be adjusted to 350 kilocycles and the first adjustment compensated for any change that the last adjustments may have had on it.

MODEL A-41

RADIO WIRE TELEVISION



WAVE BAND SWITCH

This receiver affords operation on the broadcast band and also on the policy band, extending from 4 megacycles to 1.5 megacycles. With the switch turned to the left, operation will be afforded on the broadcast band. When it is turned to the right, or clockwise, the police band is connected and all police stations, commercial phone stations and amateur stations operating on the 80 meter and 150 meter band will be received.

ALIGNMENT PROCEDURE

Do not attempt the following adjustments unless thoroughly familiar with the alignment procedure of modern superheterodyne circuits and in possession of all necessary equipment.

To align the Model A-41

Short antenna to ground. Short oscillator section of 3 gang tuning condenser. Connect a signal generator tuned to 175 K.C. thru a .00025 mfd. condenser to grid of first detector tube. Signal generator and receiver grounds should be connected together. Connect output meter to output of amplifier tube. With volume control at maximum, adjust signal generator attenuator for minimum visible deflection on output meter. Adjust I.F. trimmer condensers for maximum deflection on output meter. When I.F. is aligned, remove shorts from oscillator condenser and antenna. Using same procedure as in aligning I.F.'s, now connect signal generator tuned to 1400 K.C. to antenna lead. Adjust trimmer condensers on three gang condenser for correct calibration and maximum output.

To align receiver on policy band, tune three gang condenser to a 4000 K.C. signal from generator, and adjust police band trimmer till maximum sensitivity is noted on output meter. Band Switch is on "Police Band" position during this alignment.

INSTRUCTIONS FOR INSTALLATION AND OPERATION

CURRENT: This receiver operates on AC (Alternating Current) only on frequencies from 40 to 60 cycles.

VOLTAGE: Any line voltage from 105 to 260 volts may be used. This model is equipped with 2 Universal Transformers for filament and plate supply, with five taps marked as follows:- 115, 135, 150, 220, 250. Access to this tap changer is obtained by lifting off the box-like black cover on top of the transformer. The lug attached to the flexible lead is then moved to the point which corresponds most nearly to the line voltage available. The cover is then snapped back into place. Unless otherwise specified, the receiver is always connected to the 115 volt tap (suitable for 105 to 125 volts). Before inserting the line plug, be sure to ascertain what the line voltage is and connect to the correct tap. Be sure to set both transformers for the corrected voltage..

ANTENNA:- While this receiver will operate extremely well with almost any kind of antenna, it is desirable to have a good antenna installation in order to obtain best results on all bands. The exact length is not of any great importance. A short well insulated antenna with properly soldered connections may give results much better than a longer antenna which is poorly installed. Best results will be obtained with an All-Wave Doublet Antenna which has been especially designed for this receiver, and which can be obtained from your dealer. Detailed instructions for the antenna installation are enclosed with this kit. Proper installation will result in reduction of noise and more consistent and dependable short-wave reception.

ANTENNA CONNECTION:- Three antenna terminals are provided marked A-1-A-2 and G. If a doublet antenna is used, the two lead-in wires or the two leads from the transformer are connected to A-1 and A-2, and a ground to G. (This ground may be unnecessary in certain cases.) If however, the usual type of antenna with only one lead-in is used, this is connected to A-1. A2 and G are connected together by a wire and both to a ground connection.

WAVE BANDS:- The wave bands covered by this receiver are as follows:

		Kilocycles	or Megacycles	Meters
(1)	Ultra Short Wave	36.25	18	8.125-16.6
(2)	Foreign & American Short Wave, Airplanes	18	5.2	16.6 57.5
(3)	Police, Amateur, Airplanes	5.2	1.6	57.5- 18.7.5
(4)	Broadcast	1600-540		187.5- 554
(5)	Long Wave	343-142		872 - 2100

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted except by an experienced serviceman and only after all other possible causes of faulty operation have first been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave bands is required. Either a suitable output meter or the cathode-ray tuning indicator may be used for indicating the effects of adjustments. It is necessary, in all of the ensuing procedure, that the signal generator be attenuated as much as possible.

I.F. ADJUSTMENT - The i.f. transformers are housed in the polished metal shield on the chassis. The location of these transformers is indicated in the accompanying diagram. The trimmers are on the tops of the transformer cans. The first and second i.f. transformers have two trimmers each and the detector coupling transformer has only one trimmer. These trimmers are adjusted at 456 kc. for maximum gain. In making this adjustment, the oscillator (rear) section of the tuning condenser should be short-circuited. and the signal generator connected between the grid cap of the 6A8 and the ground post of the receiver. The selectivity switch should of course be in the high selectivity position.

SHORT WAVE BAND - With the output from the signal generator connected across the aerial and ground terminals of the receiver, and the volume control in position for maximum volume, the oscillator trimmer for this band is adjusted for maximum response as indicated by the 6E5. This adjustment must be made with the dial set at exactly 17 mc., otherwise the calibration will be off. The series padder for this band should then be adjusted by setting the signal generator at a frequency of 5.5 megacycles and tuning the signal in on the receiver. The tuning condenser is rotated slightly back and forth as the padder screw is adjusted for maximum output. The 17 mc. adjustment should then be rechecked. If the dial calibration is off, the procedure should be repeated again.

ULTRA SHORT WAVE BAND - The trimmers for this band are adjusted at 36 megacycles in the manner described above. They are located on the under side of the chassis and are not shown on the chassis layout diagram. There are only two trimmers for this band, the oscillator operating on a harmonic of another band.
POLICE BAND ADJUSTMENT - The trimmers for this band are adjusted at 4.8 megacycles in the manner described and the series padder at 1.7 mc. exactly as indicated in the SHORT WAVE BAND ADJUSTMENT procedure.
BROADCAST BAND - The adjustments for this band are as described above. The trimmers are adjusted at 1400 kc. and the padder at 600 kc.
LONG WAVE BAND - The adjustments for this band are made in the prescribed manner, the trimmers being adjusted at 340 kc. and the padder at approximately 150 kc.
A.V.C. AMPLIFIER ADJUSTMENT - The a.v.c. has a separate amplifier which is tuned as follows: The signal generator is set at 1400 kc. and the signal tuned in on the receiver, as indicated by the minimum opening in the 6E5 beam. The a.v.c. trimmer is then adjusted to give the WIDEST opening in the beam. The receiver is then carefully retuned and the adjustment repeated.
BEAT NOTE OSCILLATOR ADJUSTMENT - A weak signal from the signal generator is tuned in on the receiver as indicated by the minimum opening in the 6E5 beam. The beat oscillator switch is then turned on. An audible note should be heard whose pitch may be varied by adjusting the screw on the small square can on the left side of the chassis. This should be so adjusted that when the station is tuned in exactly, no beat is heard (zero beat). If no beat note is audible when first turned on, rotation of this same screw should bring in the note.

VOLTAGE TABLE

All voltages are measured between socket terminals and chassis: set in operation: volume control full on; antenna disconnected. voltmeter sensitivity - 1000-ohms-per volt. Line voltage measured:- 115.0 Power Consumption: 250 watts

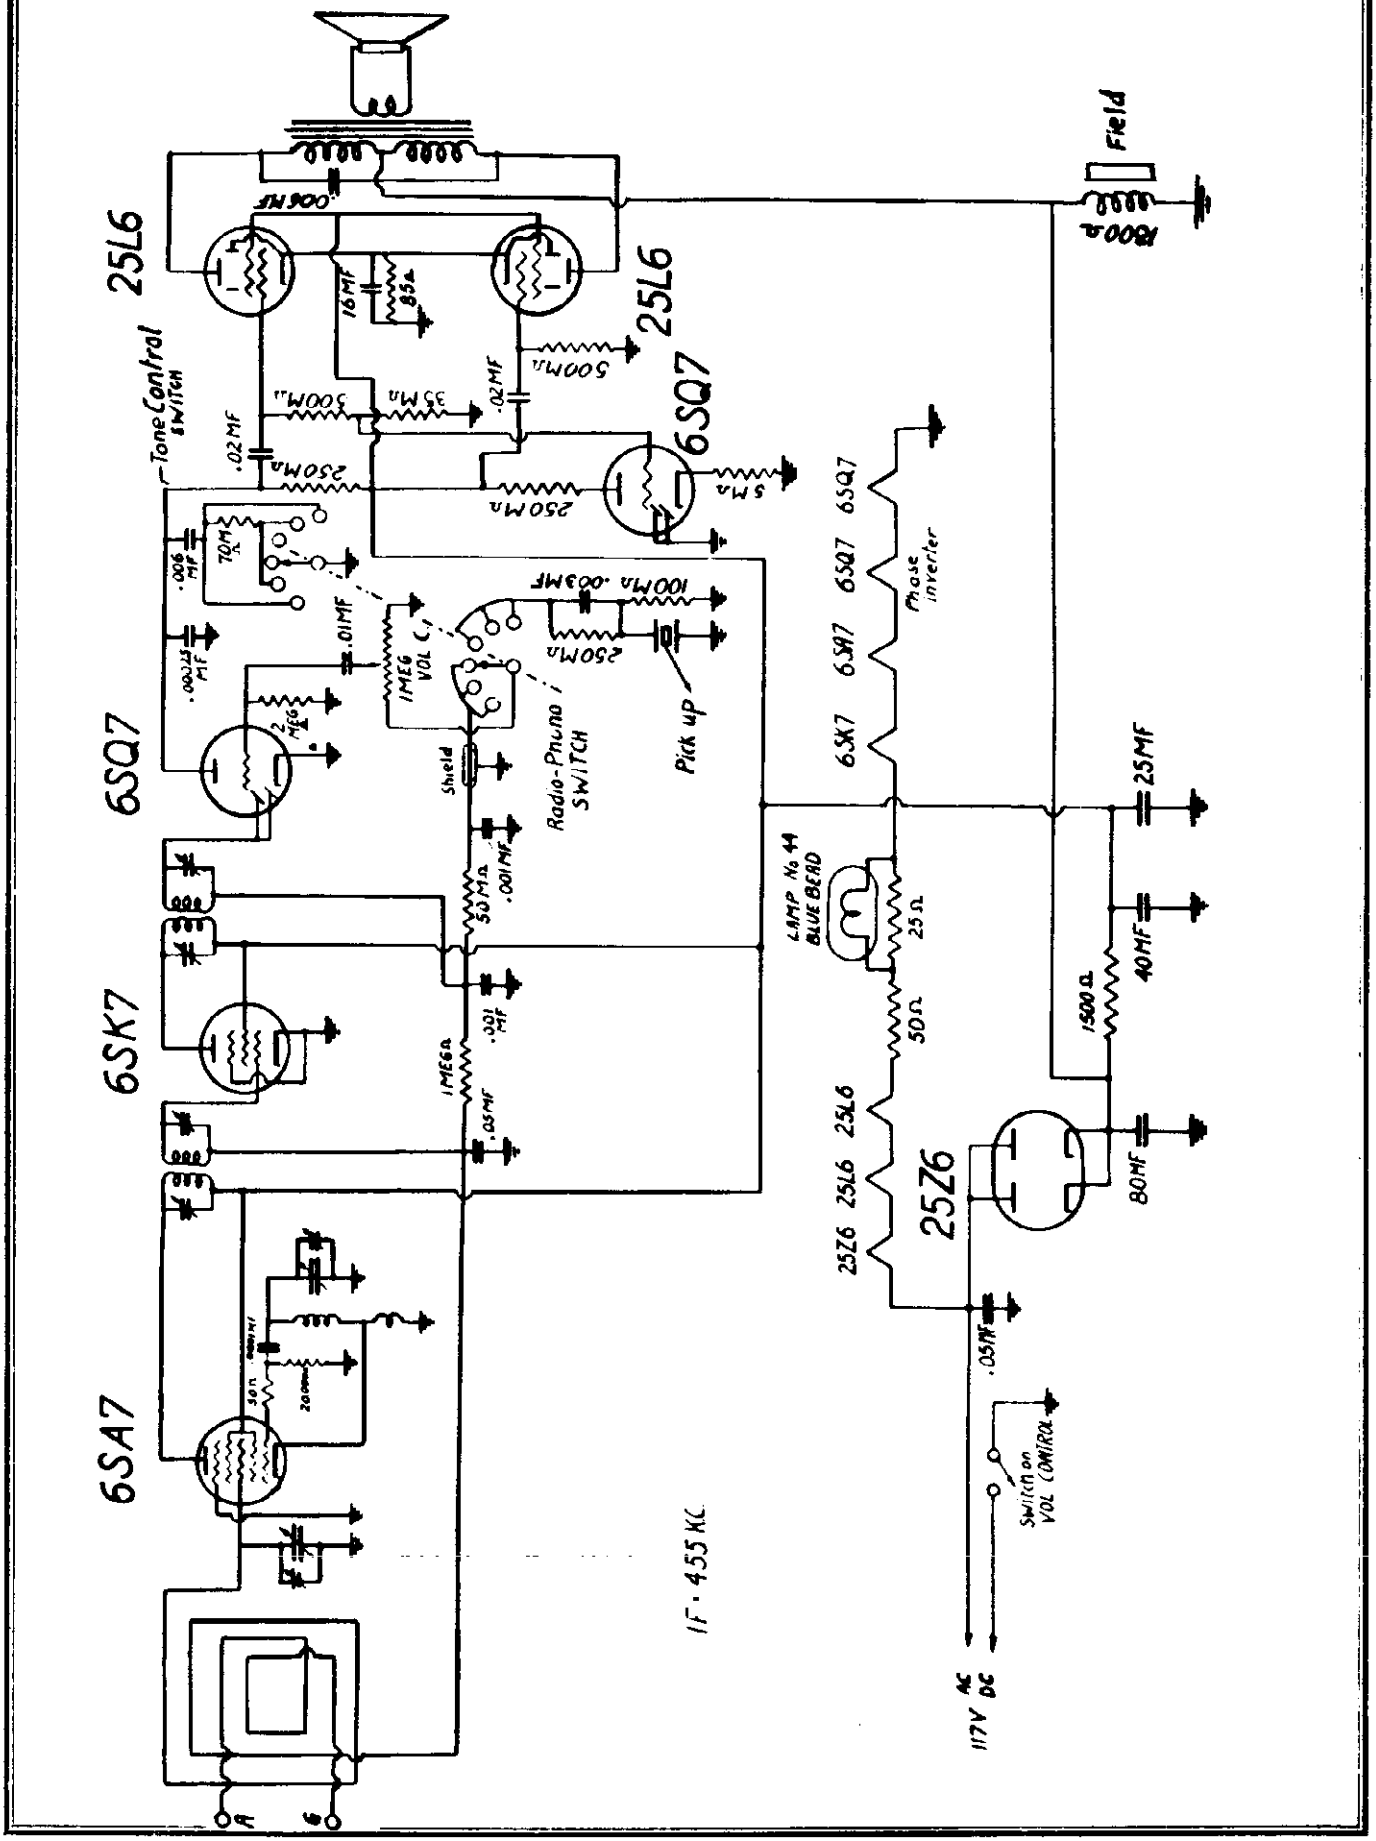
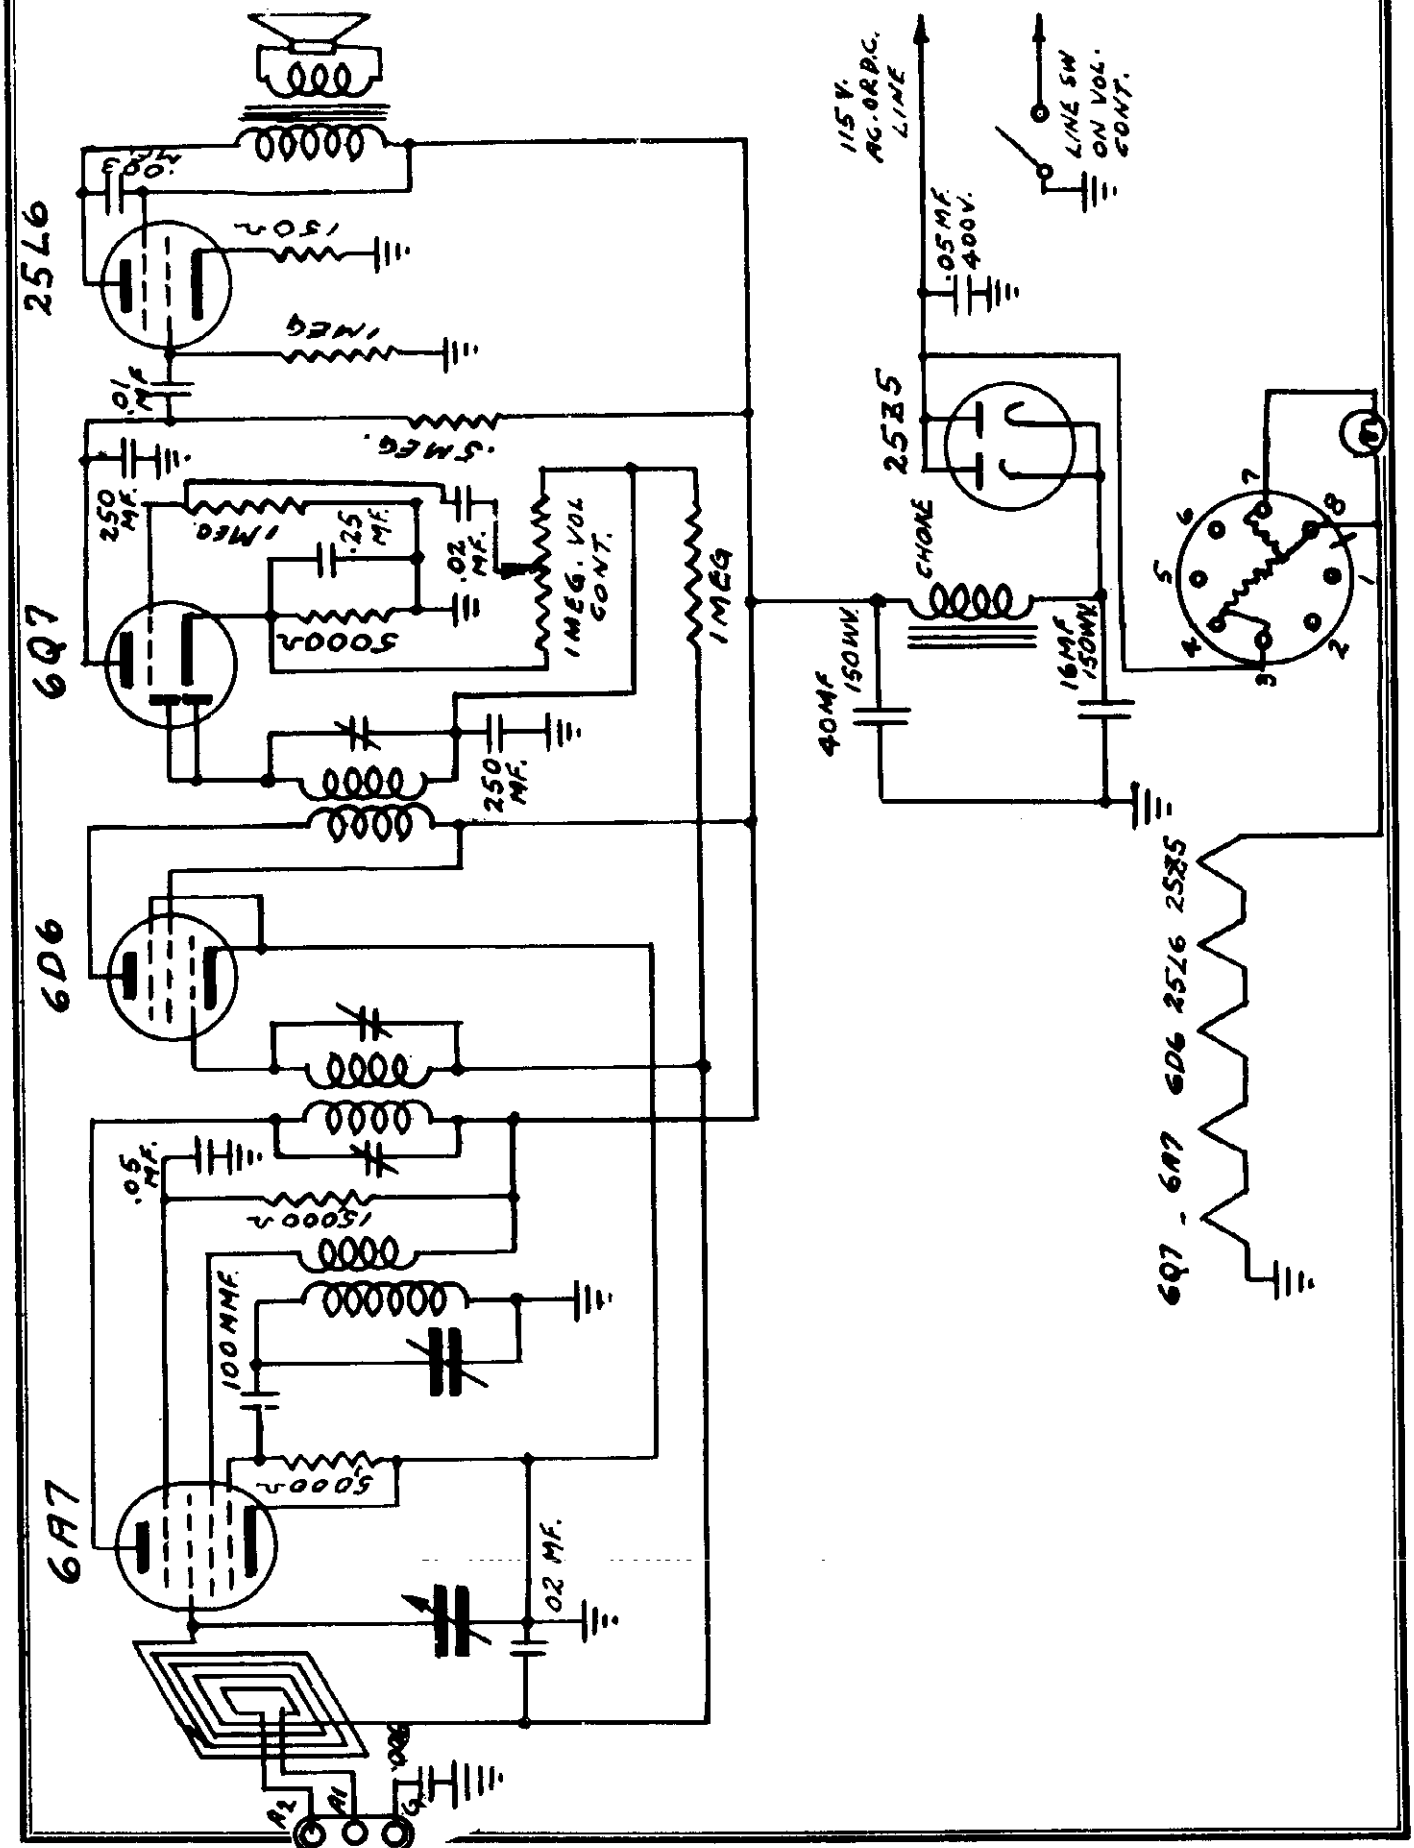
RADIO WIRE TELEVISION MODEL C104



MODELS CC24, CC25 RADIO WIRE TELEVISION



SERVICE INSTRUCTIONS

Realignment of this receiver should not be attempted unless all other possible causes have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave bands, and an output meter for indicating the effect of adjustments are required.

During the alignment procedure all adjustments should be made under the following conditions:

1) Line voltage as indicated on instruction sheet.

2) Volume and Tone control at maximum volume positions.

3) Minimum Input from signal generator.

If this procedure is not adhered to, all adjustments will appear very broad. This is due to the action of the automatic volume control.

I.F. ADJUSTMENT

The signal generator is set at 456KC and is connected to the grid of the converter tube (6A7) through a .5 MFD condenser. Be sure to connect a resistor of approximately 25,000 OHMS between the converter grid and ground so that the grid circuit is at ground potential for D.C.

The Input I.F. transformer trimmers are adjusted for maximum output as indicated by the output meter connected across either the voice coil or the primary coil of the loud speaker.

The Output I.F. transformer trimmer is located underneath the chassis. Adjust the trimmer for maximum output as indicated on the output meter. The Input I.F. should now be re-checked for maximum output.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to a loop antenna consisting of about five turns of "bell" wire making a circle a foot in diameter. This loop should be VERY LOOSELY coupled to the receiver loop and should not be less than one foot from the receiver.

Set the signal generator at 1500KC and tune the receiver until a response is indicated on the output meter with signal generator set at 1500KC. Rock the gang condenser while adjusting the oscillator trimmer condenser for maximum output.

The dial pointer should co-incide with the 1500KC mark on the dial. If it does not, check other calibration points at both ends of the scale before re-setting the pointer.

OPERATING INSTRUCTIONS

This receiver is designed for operation on 117-125V, AC or DC, unless otherwise noted on the back of the cabinet. Serious damage to the receiver may result from attempts to operate it from any other source.

RANGE

540-1850 Kilocycles (or 555-162 Meters)

Consult radio publications and newspapers for listings of stations.

DIAL

The scale on the dial is calibrated in kilocycles.

CONTROLS

There are two control knobs on the front of the cabinet:

1. Power-Volume Control- This is the knob at the left-hand side of the cabinet. A twist to the right (clockwise) turns on the current. Turning the knob further increases the volume.

2. The tuning Control - The right-hand knob operates the tuning pointer and selects stations.

TUNING

Turn the Power-Volume Control on and advance half way. Allow the tubes to warm up for about a minute. Then select your station on the dial by means of the tuning control knob. Carefully regulate both knobs until best reception is obtained. Turn the receiver to its best position for intercepting the signals.

ANTENNA

The enclosed loop antenna gives best pick-up of the waves from a direction at right angles to the plane of the loop. It may be advantageous to turn the set end-on to interfering stations and the front and back in line of desired stations. By slowly twisting the receiver round, a best position for reception may always be found.

On the back of the cabinet there is an oval-shaped terminal board for attachment of an external antenna. If you use the set in a "stationary" position, and where station signal intensities are low, it is advisable to connect the A-1 and G binding posts to ground and a small antenna wire to the A-2 post. If too large an antenna is used, excessive signal intensities will be fed into the receiver. The resulting overload will manifest itself as a "gargling" sound when a station is tuned in.

If a "doublet" type of antenna is used, connect the leads to the A-1 and A-2 posts and the G post to ground.

BAND-SWITCH SHOWN
AT 2ND POSITION CLOCKWISE
SHORT WAVE BAND
2.1 - 6.4 MC.

SERVICE INSTRUCTIONS

In case of faulty operation of the receiver, first make sure that the antenna and ground are in good condition and properly attached to the receiver. Then determine if any of the tubes are faulty. In case of trouble within the receiver itself, the circuit diagram shown on the opposite page will be useful to the service man in locating and correcting the trouble.

I. F. Alignment:

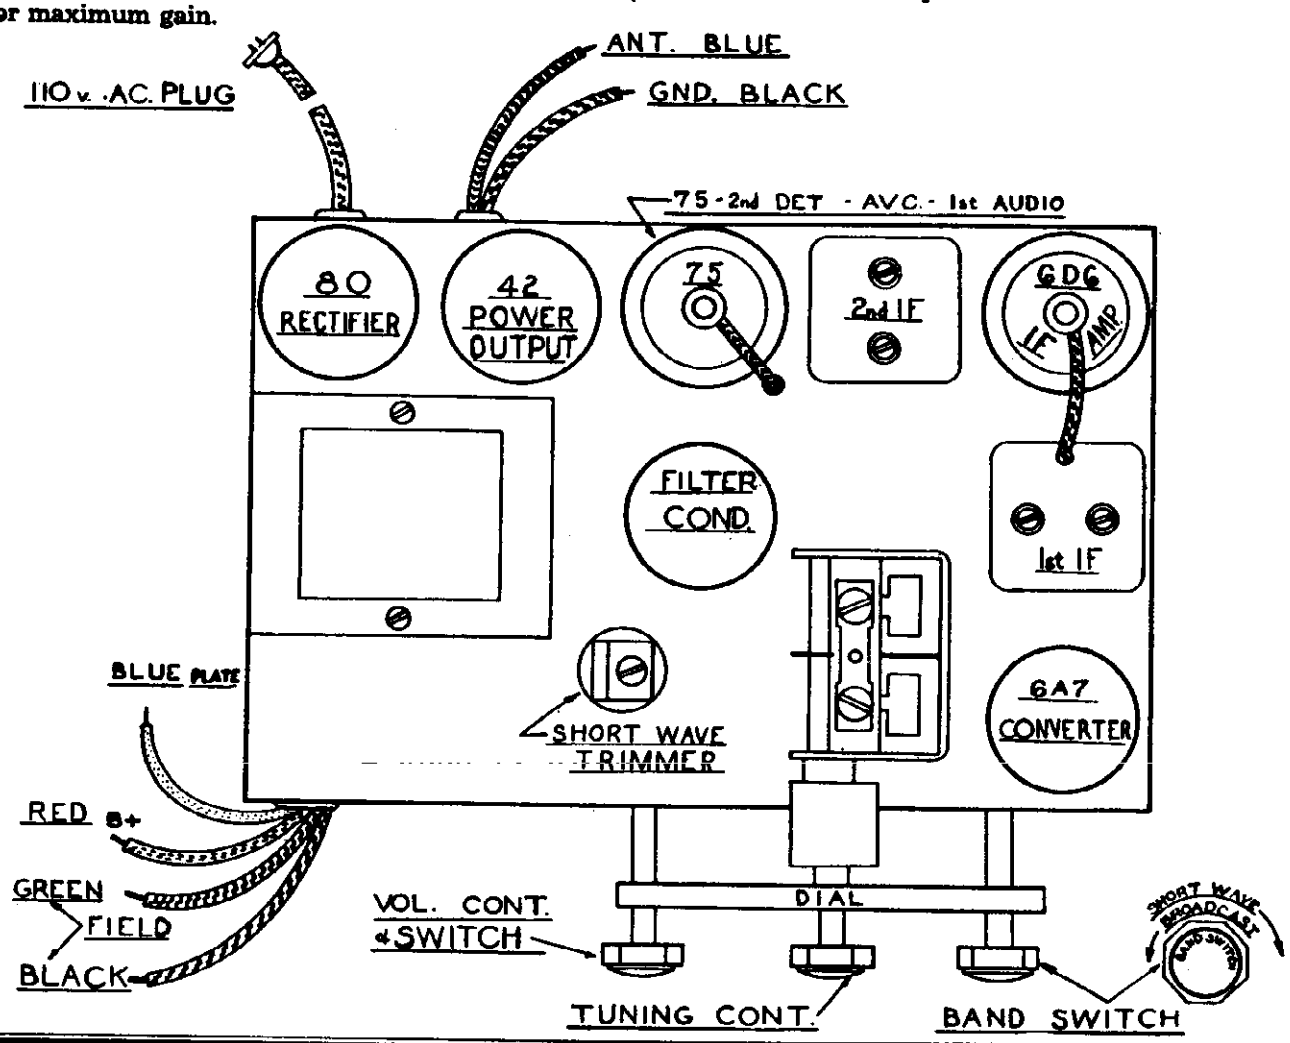
Connect a test oscillator or signal generator through a .1 mfd. condenser to the grid of the 6A7 tube and set the oscillator to 456 KC. Use an output meter connected to the speaker if possible, to obtain the most accurate adjustments. Peak each I.F. stage to maximum response, reducing the output of the oscillator as far as possible for final adjustments.

R. F. Alignment:

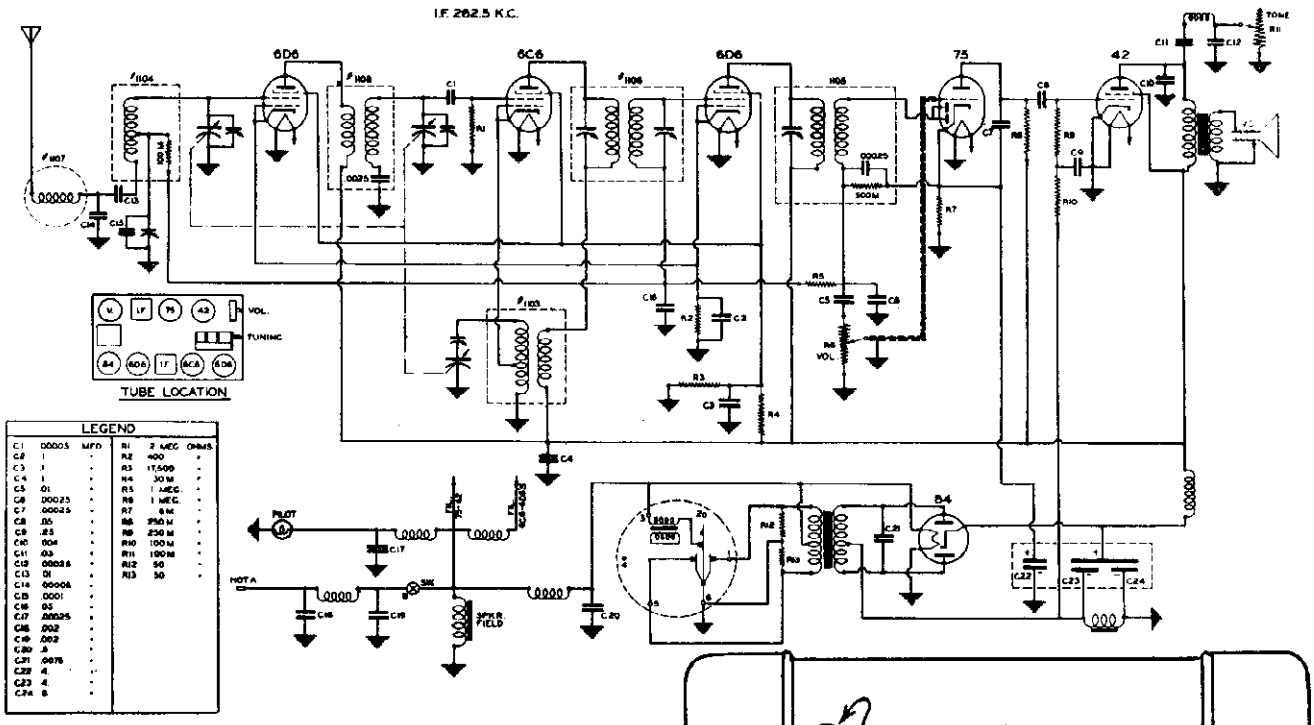
With the test oscillator set to 1720 KC and connected to the antenna wire of the receiver through a .00025 mfd condenser, switch the receiver to the broadcast band and set the pointer at the end of travel on the right (at the 1700 KC end). Adjust the rear trimmer on the top of the variable condenser, for maximum gain. Then set the test oscillator at 1400 KC and tune in this signal on the receiver as though tuning a station. If an adjustment at this point is necessary on your set, you will have a trimmer condenser to adjust on top of the variable condenser at the front; this is adjusted for maximum gain.

Now adjust the test oscillator to 600 KC and tune in this signal. Adjust the padder condenser (which is adjusted through the right hand end of the chassis) in the following manner: turn the dial slowly and repeatedly back and forth across the signal while adjusting the padder. Adjust for maximum gain.

Now switch the receiver to short wave. With the test oscillator set at 6 megacycles, tune in this signal on the receiver. Then adjust the short wave trimmer (which is located on top of the coil above the chassis) for maximum gain.



MODELS D45, D46 RADIO WIRE TELEVISION



I. F. ALIGNMENT:

With volume control on full and variable gang condenser at maximum capacity, attach test oscillator lead in series with a .1 mfd. condenser to stator of R. F. section of gang condenser (center section). Set test oscillator at 262.5 KC and adjust I.F. trimmers for maximum output as indicated on an output meter connected across voice coil of speakers or from plate and screen of 42 tube.

Set test oscillator to 600 KC and adjust oscillator padding (located on bakelite strip, 2nd from front). Also adjust 600 KC antenna padding condenser (located on bakelite strip, 1st condenser). Reset test oscillator to 1400 KC and readjust antenna and R. F. trimmers.

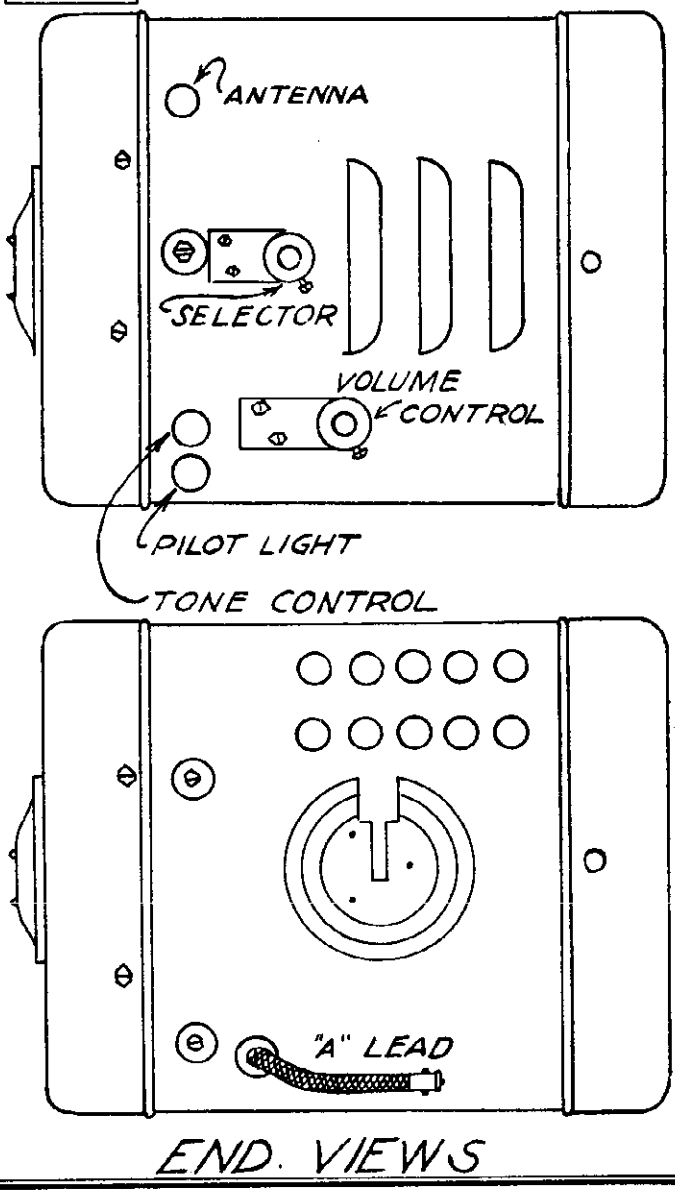
R. F. ALIGNMENT:

Set test oscillator at 1550 KC and connect through a 150 mmf. condenser to antenna of reciever. Rotate variable gang condenser to minimum capacity and back off slightly. Adjust trimmer on oscillator section of gang condenser (third section from shaft end) to resonance indicated by maximum output. Re-set test oscillator of 1400 KC and rotate variable condenser until oscillator signal is picked up. Adjust antenna trimmer (front section) and R. F. trimmer (center section) to resonance.

ANTENNA ADJUSTMENT:

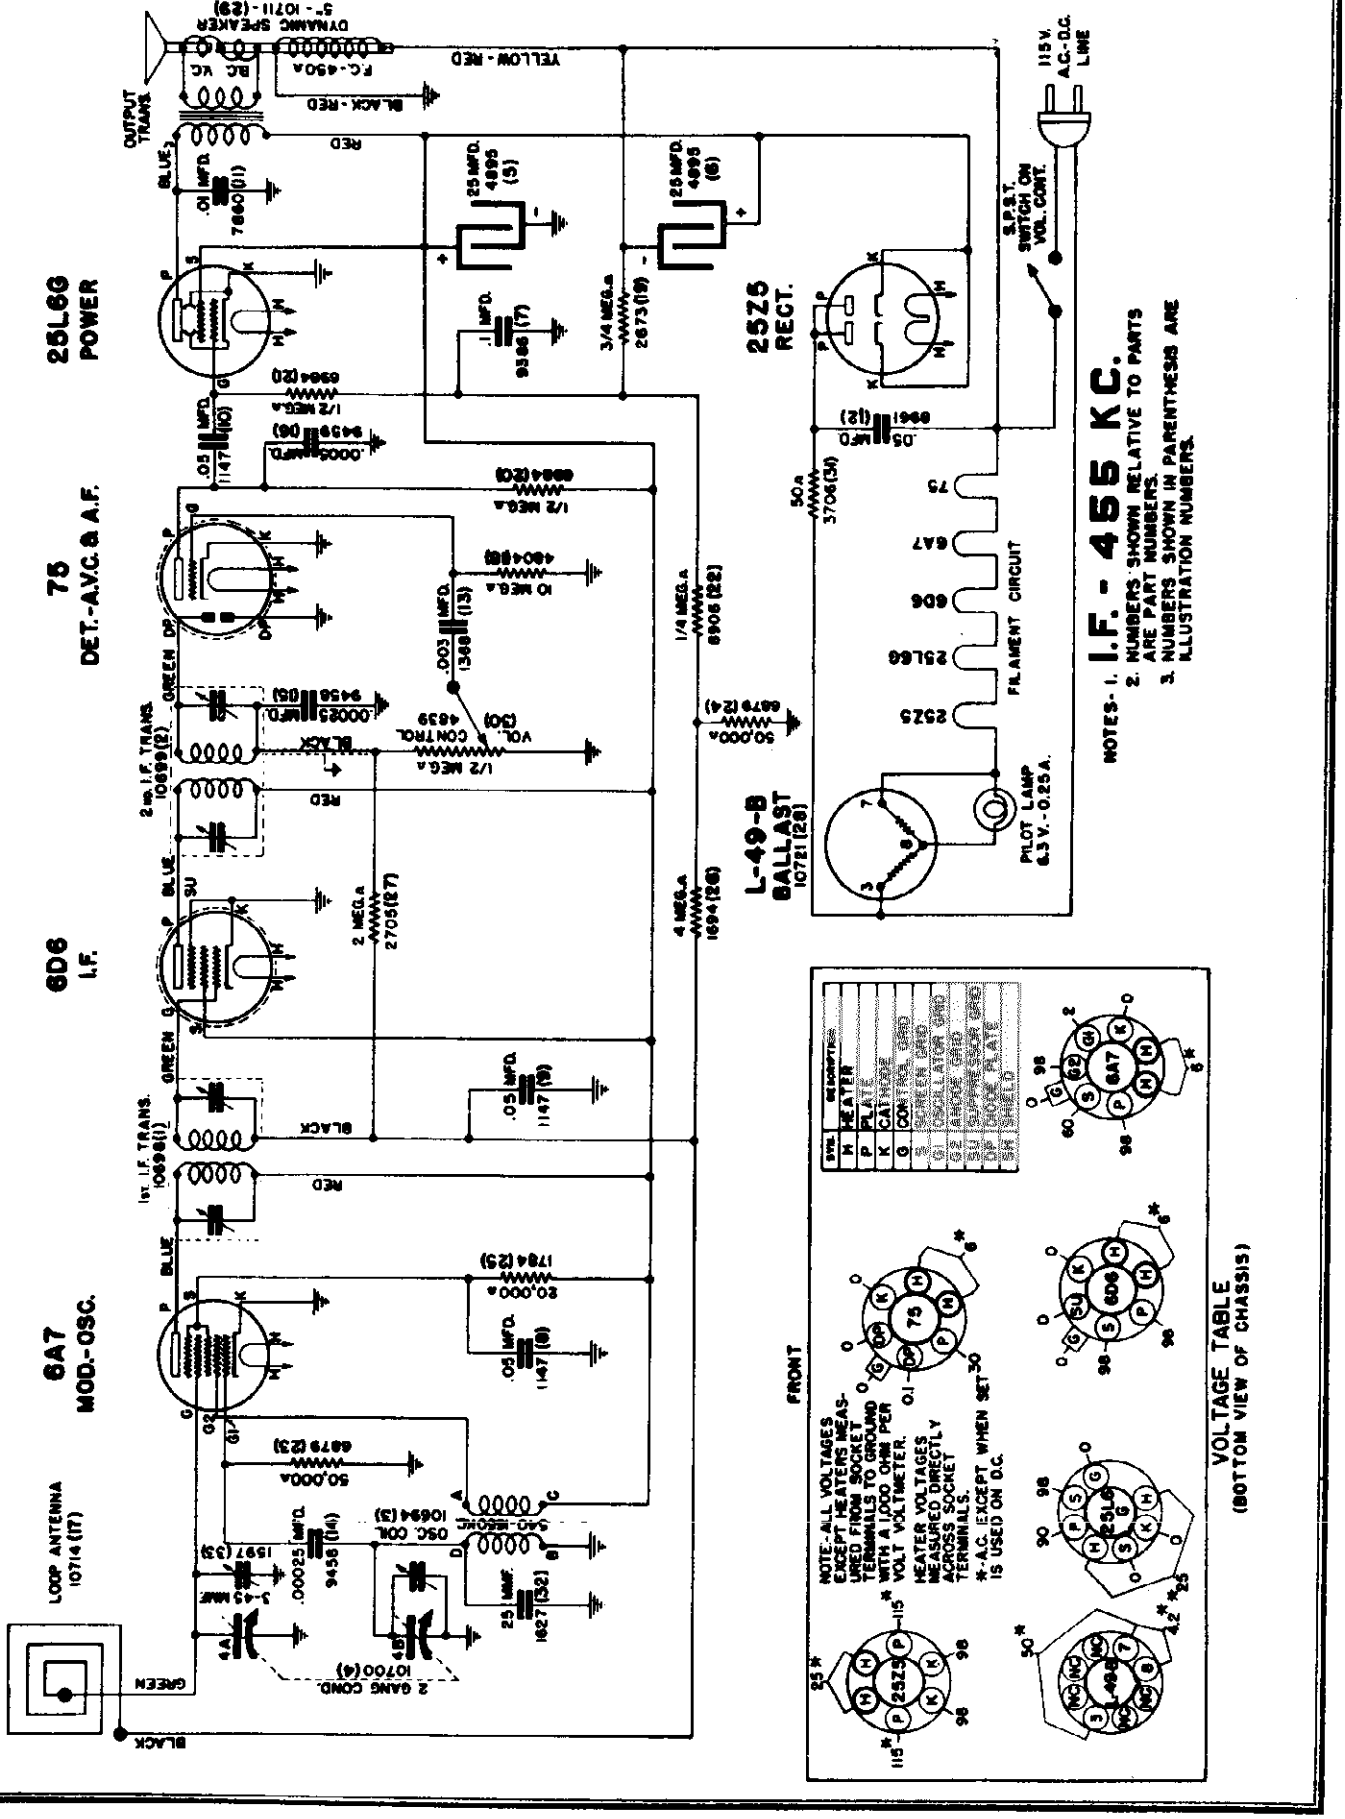
When set is in operation, tune to a station on or about 1400 KC and adjust antenna trimmer to maximum volume. This trimmer is accessable by removing the plug button on the front cover of the receiver.

Proper adjustment of this trimmer matches the particular antenna used in the auto to the receiver which increases the sensitivity of the receiver.



RADIO WIRE TELEVISION

MODELS E76, E77



ALIGNMENT PROCEDURE IN TABULATED FORM

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use, an accurately calibrated test oscillator with some type of output measuring device.

IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME APPROXIMATE POSITION IN THE BACK OF CHASSIS IT WILL BE IN WHEN THE SET IS IN THE CABINET AND THE BACK ATTACHED.

When adjusting 1650 K.C. oscillator trimmer and 1400 K.C. antenna trimmer, couple test oscillator to set loop by placing lead from high side of test oscillator on top of or near set loop. Be sure that neither the loop or test oscillator lead moves during alignment.

DO NOT ATTACH LOW SIDE OF TEST OSCILLATOR TO RECEIVER—LEAVE UNCONNECTED.

Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below—and:
I. F. Any point where no interfering signal is received	455 K. C.	.02 MFD condenser	High side to grid terminal of 6A7 tube DO NOT REMOVE CAP.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
(1) Exactly 1650 K. C.	Exactly 1650 K. C.	None	Lay lead on top of or close to loop	Adjust 1650 K. C. oscillator trimmer for maximum output.
(2) Approx. 1400 K. C.	Exactly 1400 K. C.	None	Lay lead on top of or close to loop	Adjust 1400 K. C. antenna trimmer for maximum output.

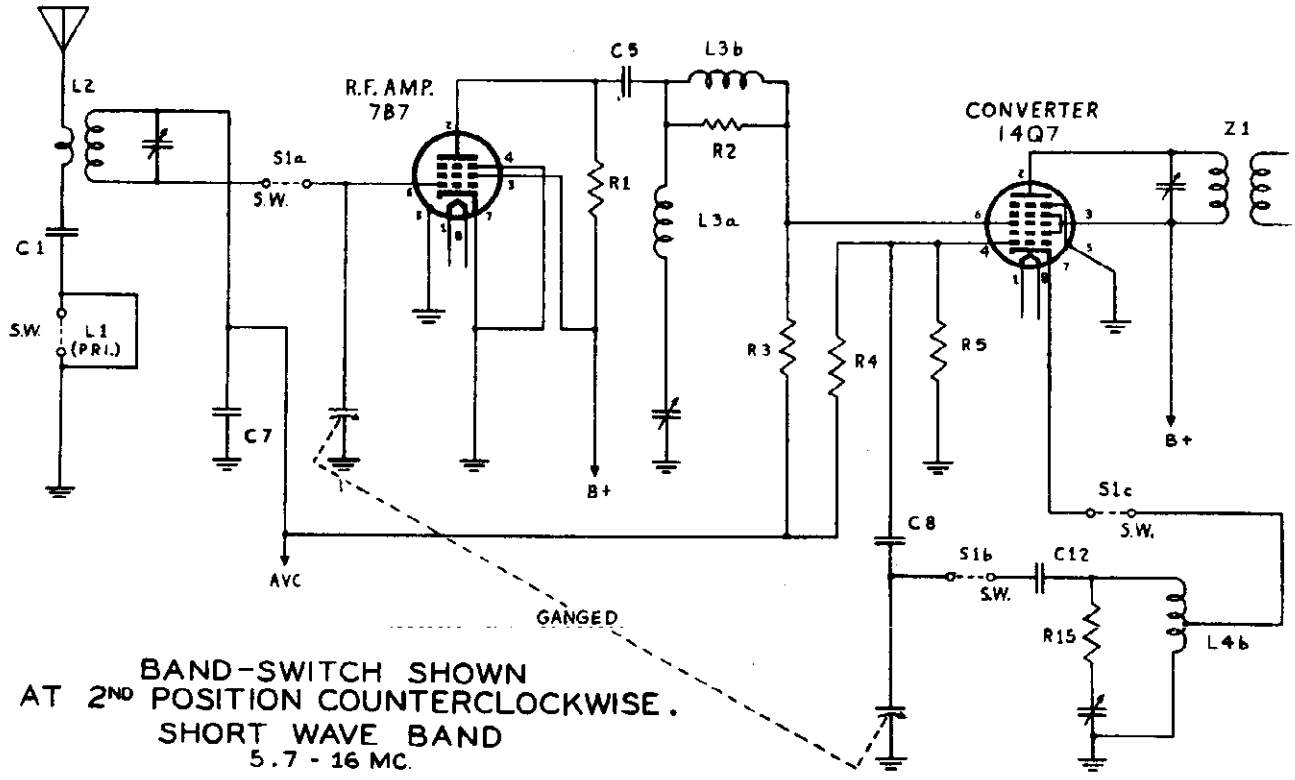
BAND-SWITCH SHOWN AT 1ST POSITION. BROADCAST BAND

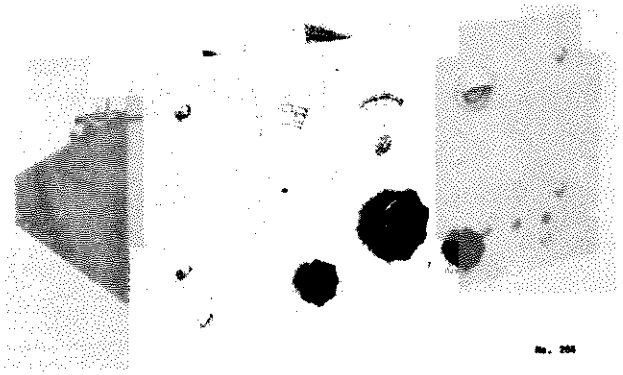


BAND-SWITCH SHOWN AT 2ND POSITION COUNTERCLOCKWISE. SHORT WAVE BAND 5.7 - 16 MC.

The MI-13154 radio features a circuit design utilizing over coupled i.f.transformers. Certain alignment procedures must be followed to insure proper adjustment of the r.f. and i.f. stages.

A. I.F. ALIGNMENT

1. Full mesh on gang condenser.
2. V.T.V.M. connected at juncture of R-27 and R-28.
3. Connect signal generator in series with .02 mfd. condenser to pin 4 of V-6. Set generator at 455 k.c.
4. Tune T-9 top and bottom for maximum signal on V.T.V.M.
5. Move signal generator connection to pin 4 of V-5.
6. Now shunt terminals B and D (top of T8) with a 3900 ohm ½ watt resistor and tune the primary (bottom slug) of T8. Remove 3900 ohm resistor.
7. Now shunt terminals F and G (bottom of T8 and tune the secondary (top slug) of T8. Remove 3900 ohm resistor.
8. Follow the same procedure for T-7.
9. Move signal generator to pin 4 of V-4 and follow same procedure for T-6 and T-5.
10. Move signal generator to pin 8 of V-3 and tune for maximum signal on V.T.V.M.

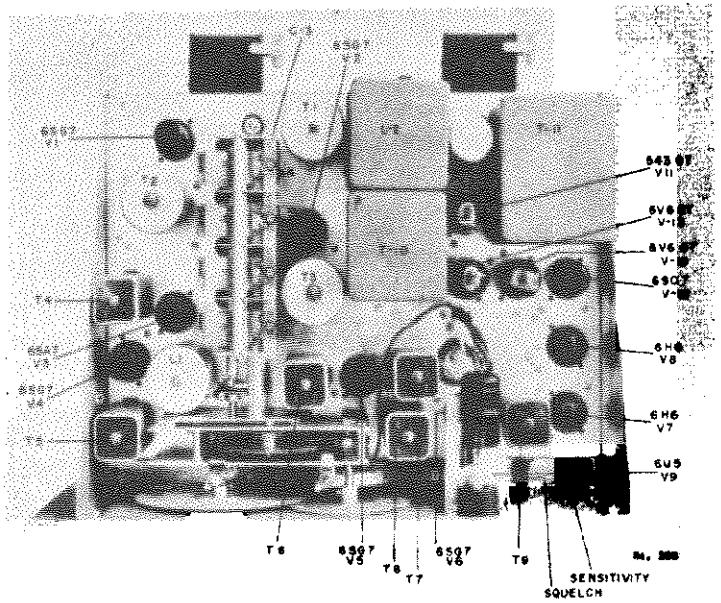


B. R.F. ALIGNMENT

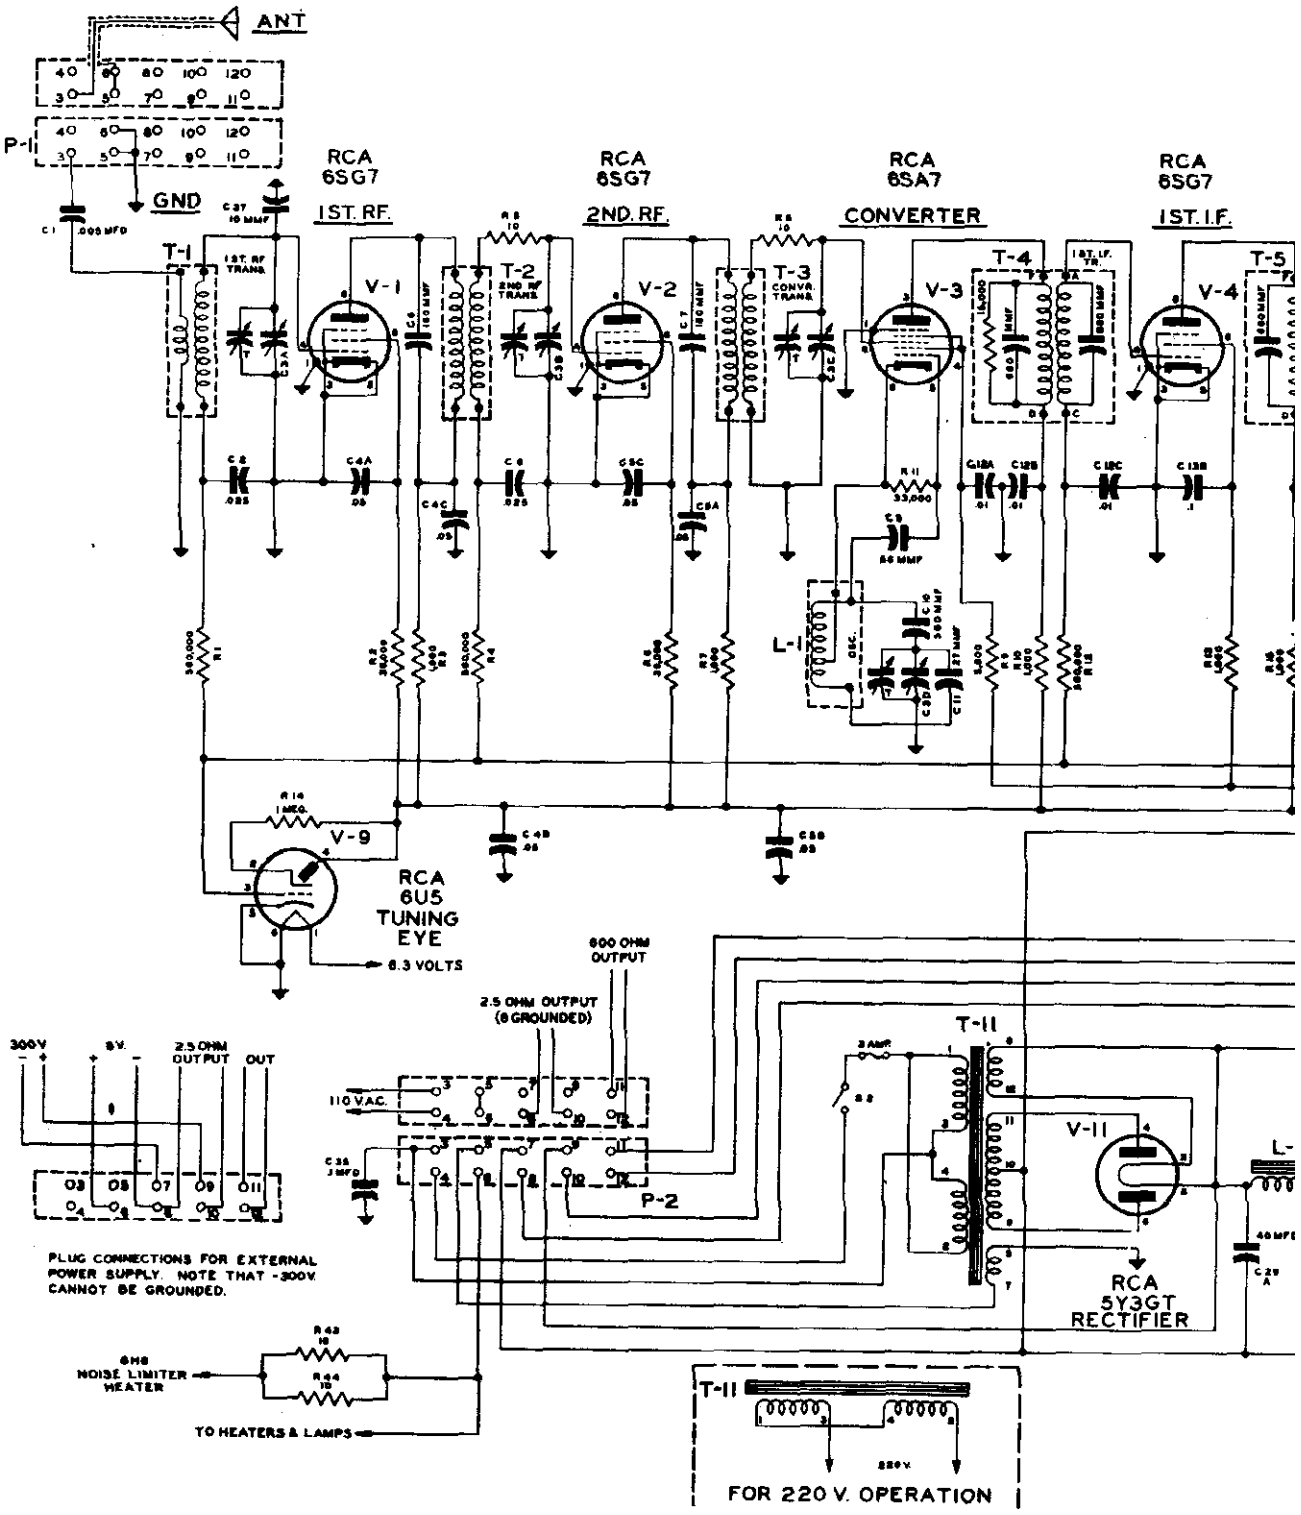
"Connect signal generator in series with 500 mmfd. condenser to pin 3 of plug P-1 and then follow procedures 1 through 5.

1. Turn oscillator L-1 to 535 k.c. (Condenser full mesh.)
2. Move condenser full out and tune C-3D to 1600 k.c.
3. Return condenser to 550 k.c. and tune C-1, T-1, T-2, and T-3 for maximum.
4. Move condenser to 1400 k.c. and tune C-3A, C-3B, and C-3C for maximum.
5. Return condenser to 535 k.c. and retune L-1.

This completes alignment. Check receiver on local signal with 70' antenna. Normal receiver should develop 18-20 volts on V.T.V.M.



MI-13154 - Tube and Parts Location

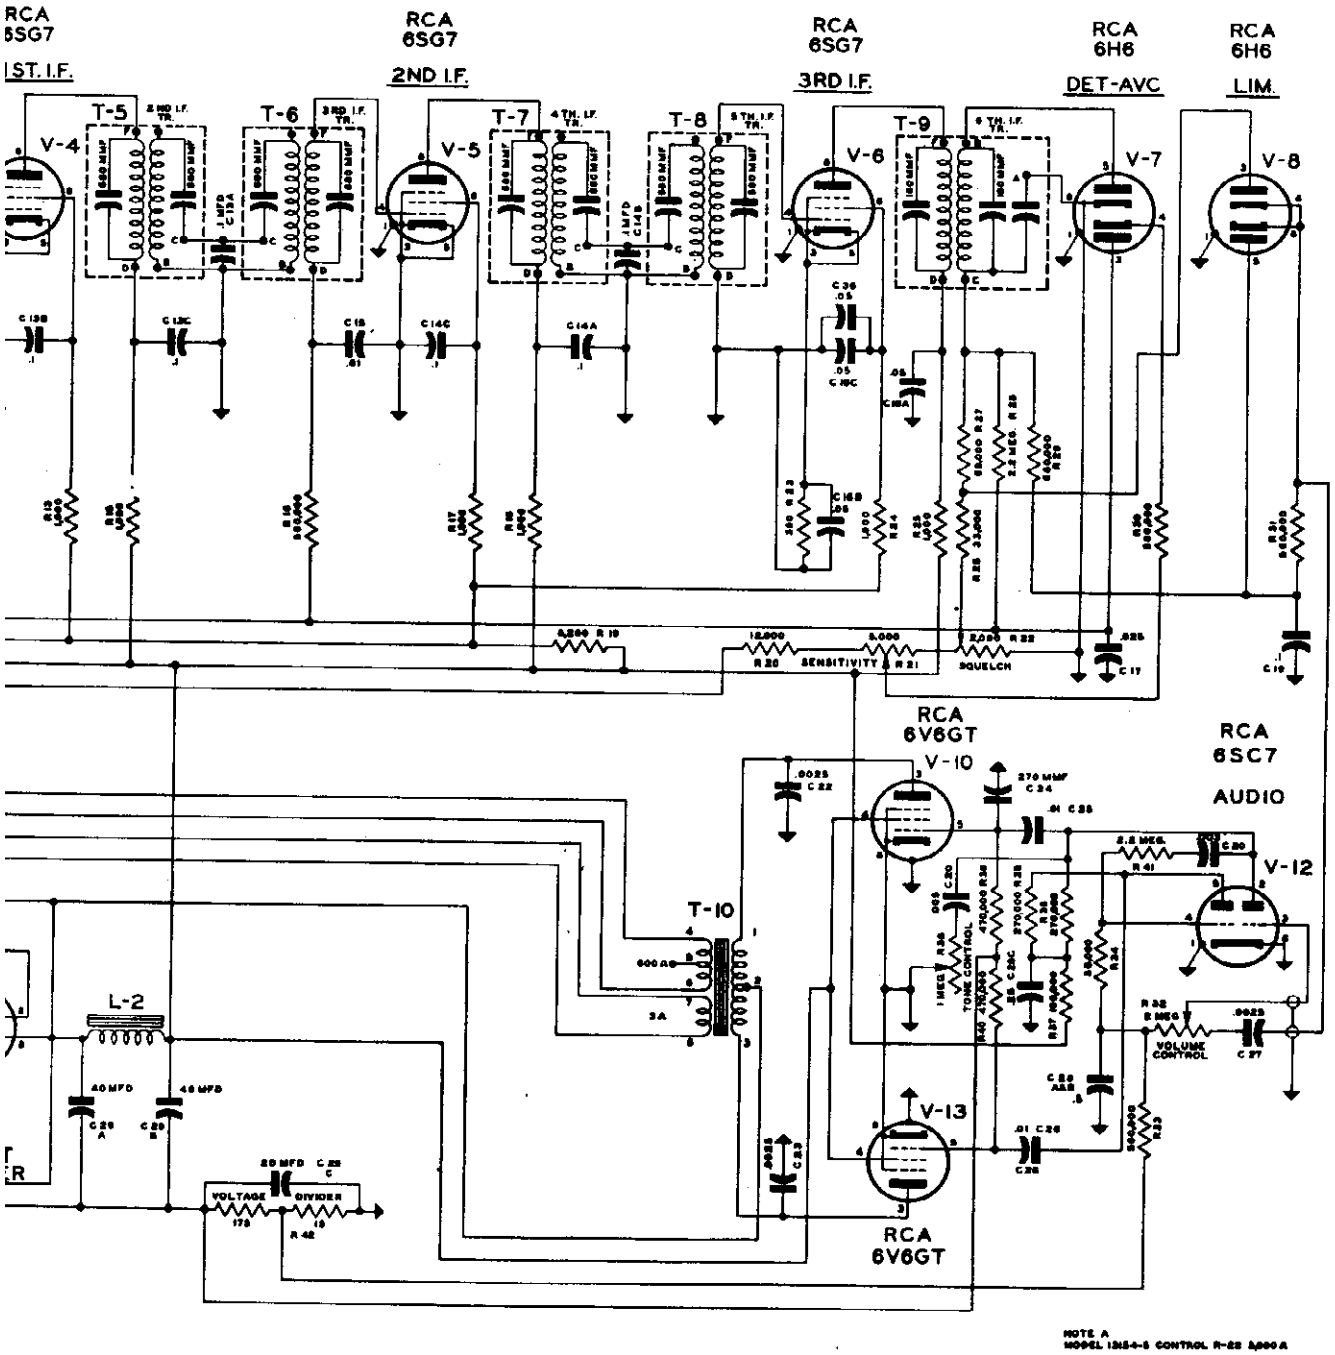


CHANGES

1. SENSITIVITY CONTROL CHANGE

a. For improved squelch action and greater sensitivity control on early models change R-21 to 10,000 ohms and R-20 to 6800 ohms 1/2 watt. (MI-13154-10 receivers incorporate the above.)

b. In actual operation set the squelch control full on (counter-clockwise) and then reduce sensitivity



control (counter-clockwise) until noise level drops to an acceptable point. This adjustment should be accomplished with the receiver not tuned to any station.

c. For improved TUNING EYE operation move yellow lead from juncture of R-1 and pin A of T-6 to pin 5 of tube V8.

APPLICATION — RAILROAD AND SPECIAL SERVICE

Voltage Rating	110/220 volts, 50/60 cycle
Power Consumption	115 watts
Fuse Rating	3 amps.
Power Output 2% RMS Harmonic Distortion	12 watts
Power Output (maximum)	15 watts
Sensitivity	1.5-2.0 microvolts
Antenna input	70 ohms, 250-800 mmfd.

TUBE COMPLEMENT:

1	RCA-6SG7 1st RF	1	RCA-6H6 Detector AVC
1	RCA-6SG7 2nd RF	1	RCA-6H6 Limiter
1	RCA-6SA7 converter	1	RCA-6SC7 audio driver

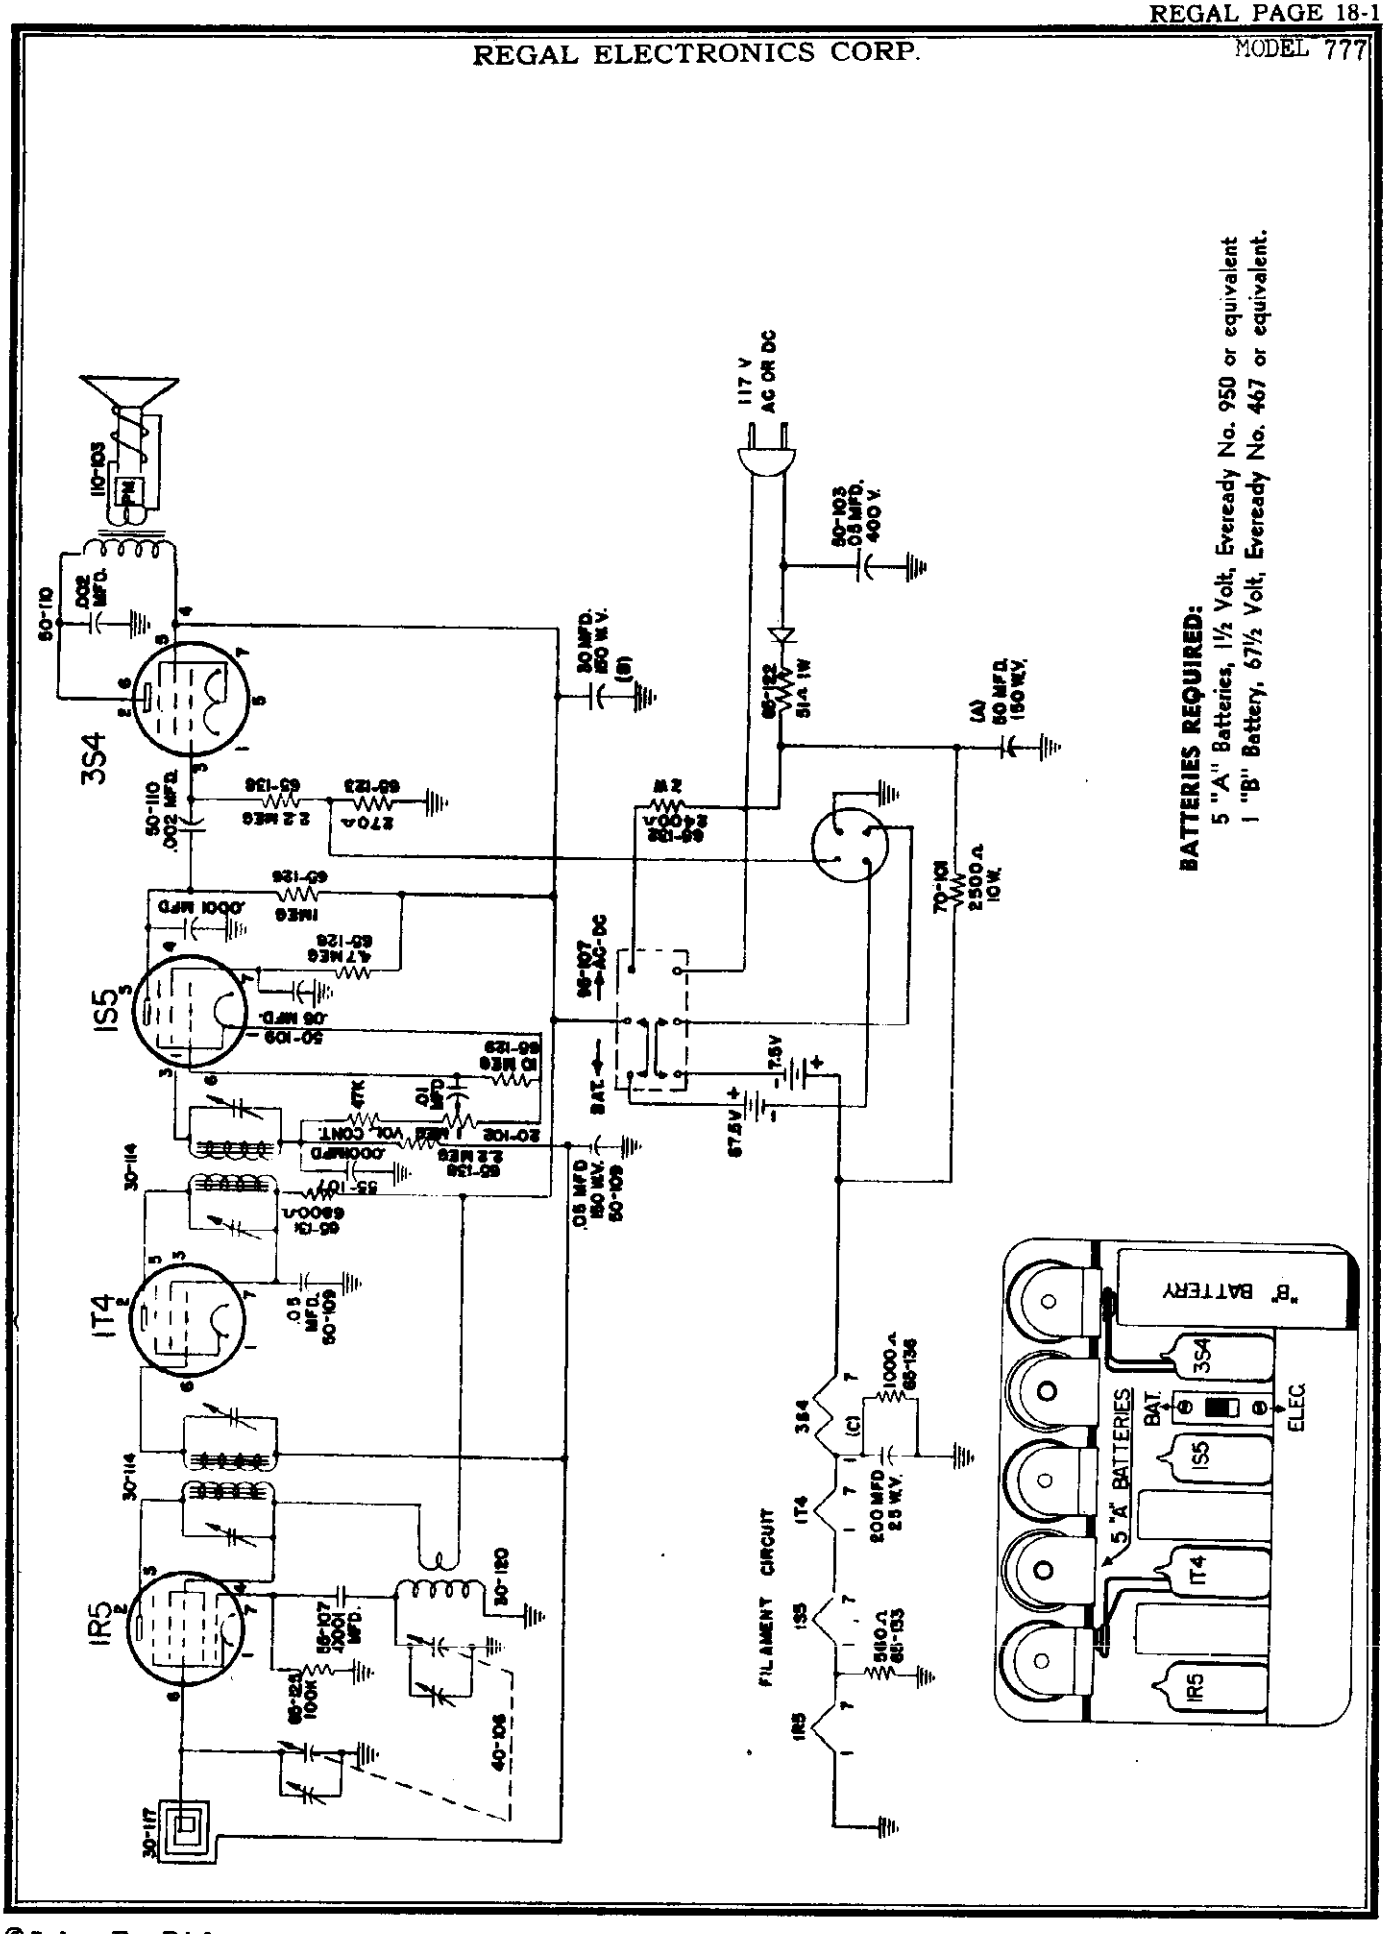
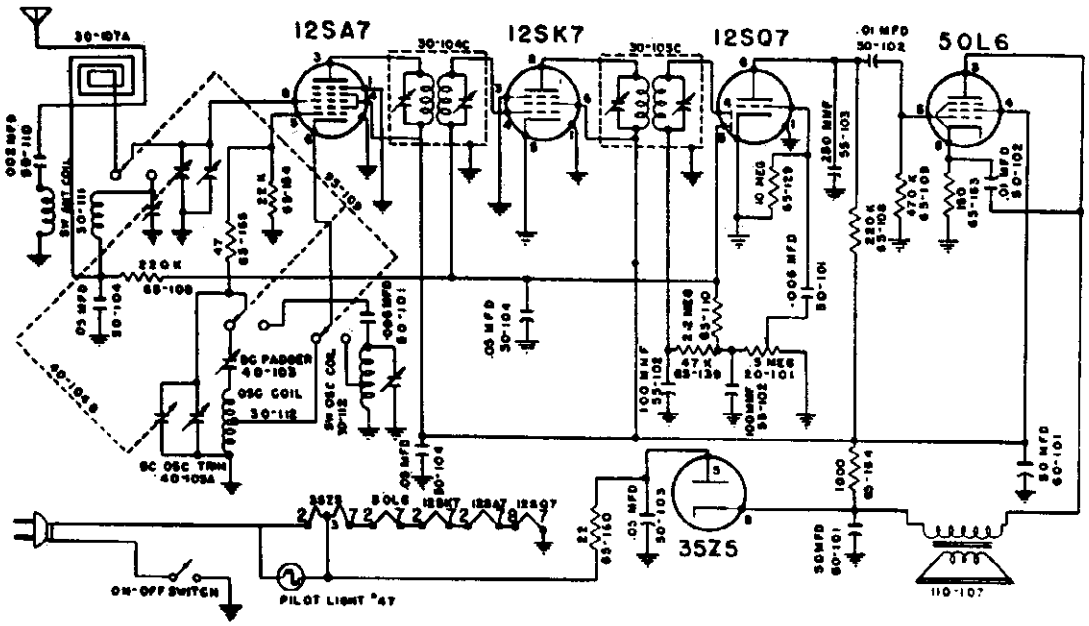
REGAL ELECTRONICS CORP. MODEL 777

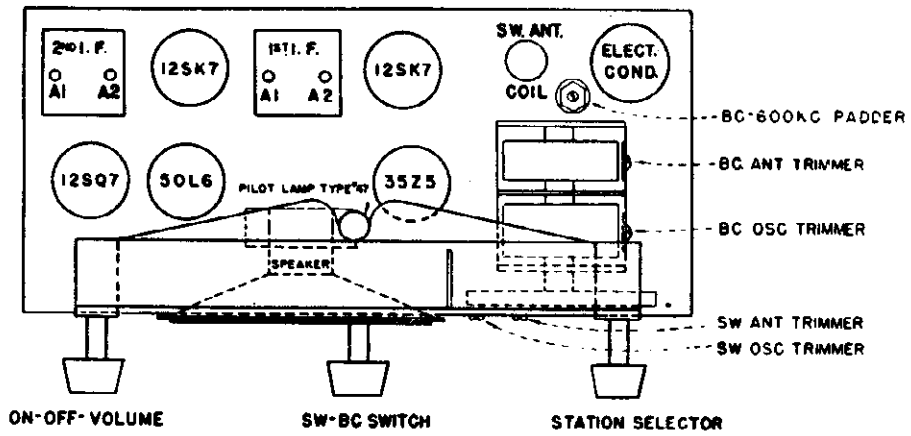


MODEL 7152

REGAL ELECTRONICS CORP.



BAND SWITCH SHOWN IN BC (CENTER CLOCKWISE) POSITON



This Model is a 5 tube 2 band superheterodyne which will give reception over a wide range, including standard broadcast and foreign shortwave. The tuning range of the broadcast frequency is 540 to 1650 kilocycles, or 560 to 182 meters. The short wave frequency is 5.8 to 18.3 megacycles, or 16 to 49 meters, which includes the following: 16, 19, 25, 31, 39 and 49 meter bands.
This radio is designed for convenient use in any location within range of a standard outlet receptacle. It will operate on 105 to 125 volts, 50 to 60 cycles alternating current, or on 105 to 125 volts direct current.

ELECTRICAL SPECIFICATIONS

The circuit is a superheterodyne employing 9 tuned circuits for maximum sensitivity and selectivity, with automatic volume control (AVC), beam power output system. The tube complement consists of (1) 12SA7 as a converter, (1) 12SK7 if amplifier, (1) 12SQ7 detector AVC and first audio amplifier, (1) 50L6 beam power amplifier and (1) 35Z5 rectifier.

(See diagram on back for location of tubes)

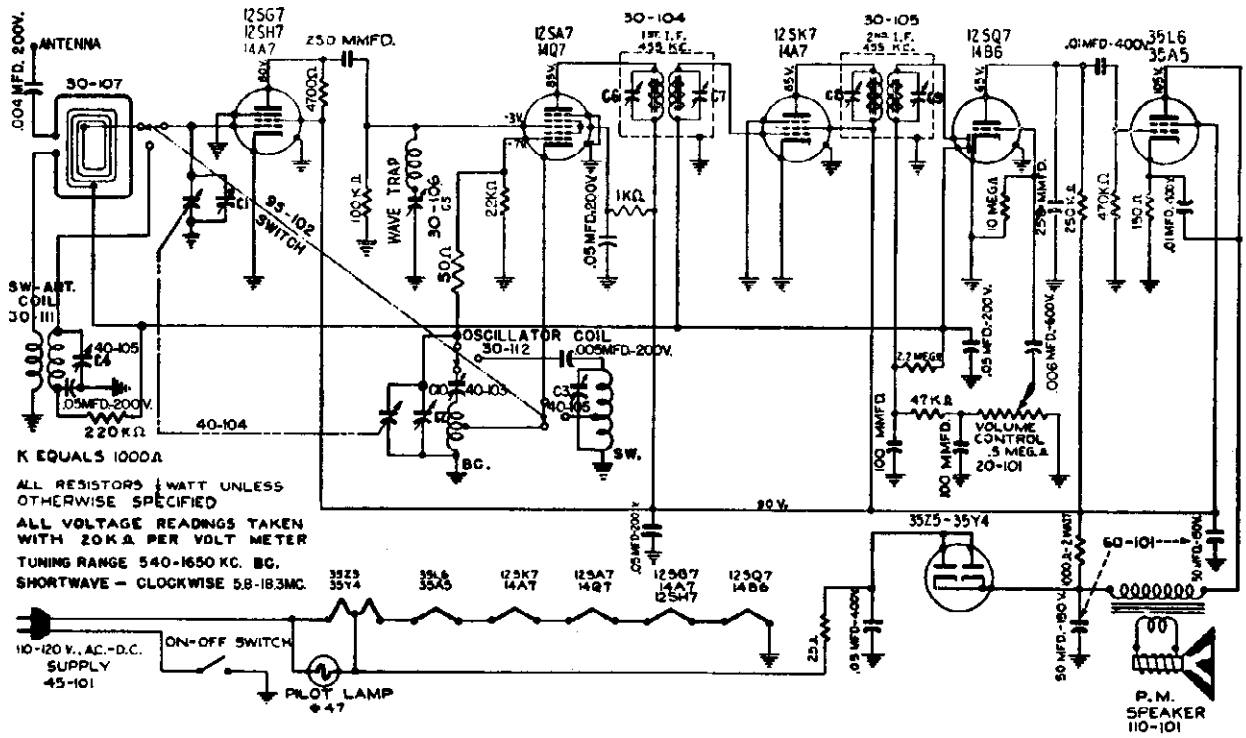
If your set does not work check your tubes. Make sure each tube is in its socket and also make sure the pilot light works.

INSTALLATION

Antenna

The loop Antenna in this receiver will give good reception under normal conditions. It is directional and the best position may be obtained by slowly rotating the receiver in different directions until the signal volume is at its strongest. For better results on weak signals and for foreign reception connect a good outside Antenna. A connection is provided at the rear of the receiver for connecting an outdoor Antenna.

REGAL ELECTRONICS CORP. MODEL 7162



The Model 7162 is a 6 tube 2 band superheterodyne which will give reception over a wide range, including standard broadcast and foreign shortwave. The tuning range of the broadcast frequency is 540 to 1650 kilocycles, or 560 to 182 meters. The short wave frequency is 5.8 to 18.3 megacycles, or 16 to 49 meters, which includes the following: 16, 19, 25, 31, 39 and 49 meter bands.

This radio is designed for convenient use in any location within range of a standard outlet receptacle. It will operate on 105 to 125 volts, 50 to 60 cycles, alternating current, or on 105 to 125 volts direct current.

ELECTRICAL SPECIFICATIONS

The circuit used is a superheterodyne employing 9 tuned circuits for maximum sensitivity and selectivity, with automatic volume control (AVC), beam power output system, IF wave trap, and a URF stage (untuned radio frequency stage). The tube complement consists of (1) 12SG7, 12SH7, or 12SK7 in the RF stage, (1) 12SA7 as a converter, (1) 12SK7 if amplifier, (1) 12SQ7 detector AVC and first audio amplifier, (1) 35L6 or 50L6 beam power amplifier and (1) 35Z5 rectifier.

Antenna

The loop Antenna in this receiver will give good reception under normal conditions. It is directional and the best position may be obtained by slowly rotating the receiver in different directions until the signal volume is at its strongest. For better results on weak signals and for foreign reception connect a good outside Antenna. A connection is provided at the rear of the receiver for connecting an outdoor Antenna.

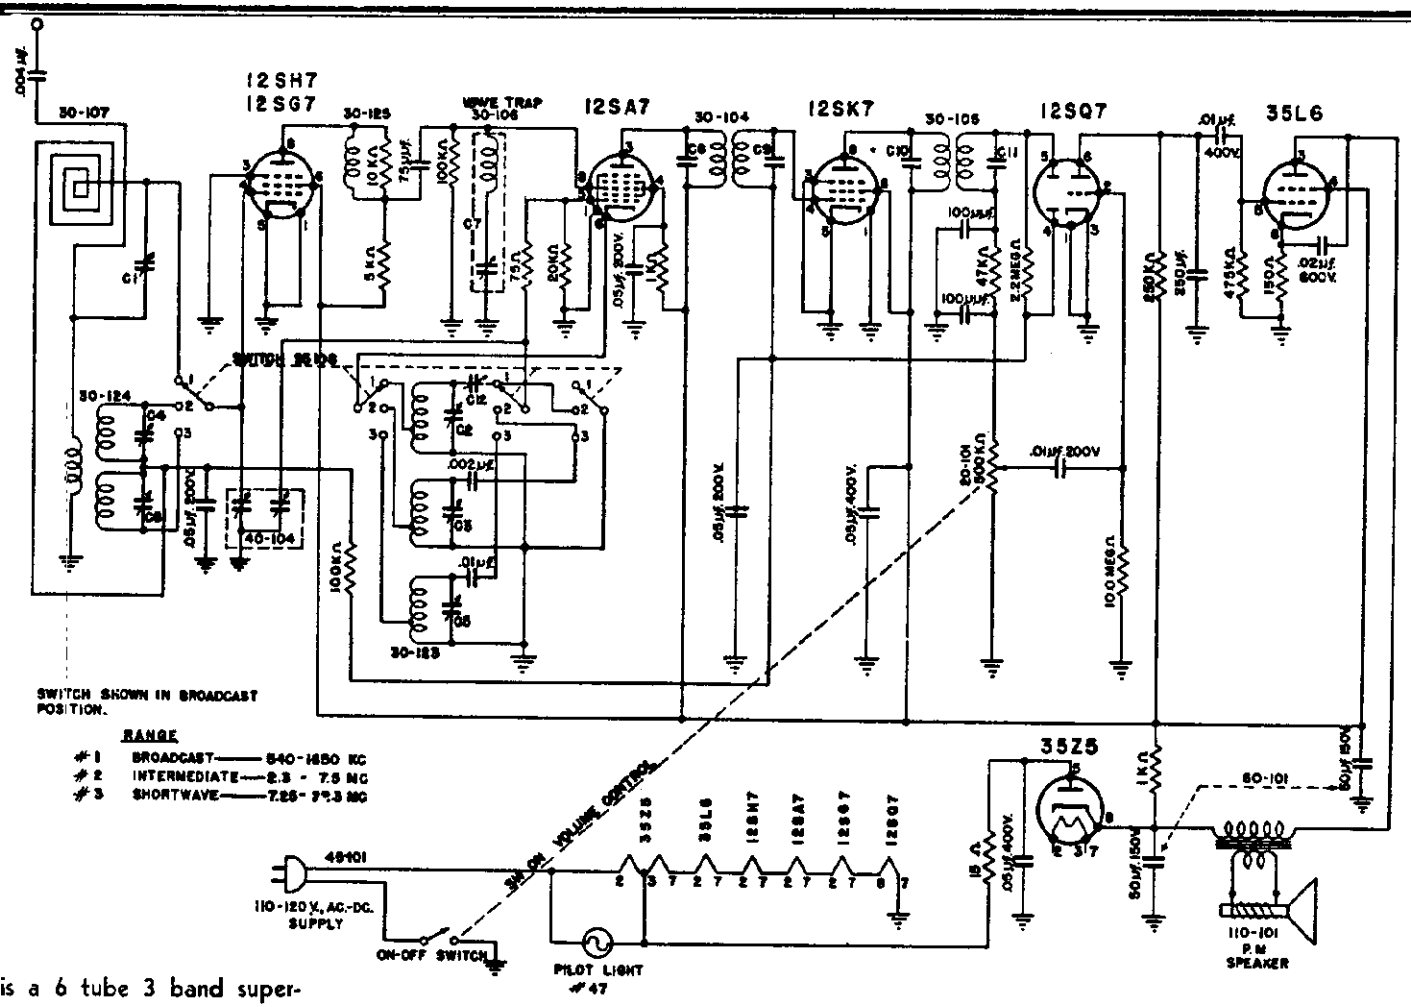
VOLTAGES TAKEN WITH 20KΩ PER VOLT METER WITH CHASSIS GROUND, AT 1000KC.



The Model 7163 is a 6 tube 3 band superheterodyne which will give reception over a wide range, including standard broadcast, intermediate short wave, and foreign short wave. The tuning range of the broadcast frequency is 540 to 1650 kilocycles, or 560 to 182 meters. The intermediate short wave frequency is 2.3 to 7.5 megacycles, or 130.0 to 40.0 meters, and the foreign short wave frequency is 7.25 to 22.3 megacycles or 41.5 to 13.5 meters. This receiver covers the following meter bands, 13, 16, 19, 25, 31, 49, 60, 90, and 125.

This radio is designed for convenient use in any location with range of a standard outlet receptacle. It will operate on 105-125 volts, 50-60 cycles, alternating current, or 105-125 volts direct current.

ELECTRICAL SPECIFICATIONS

The circuit of the 7163 is a superheterodyne employing 11 tuned circuits for maximum sensitivity and selectivity, with automatic volume control (AVC) beam power output system, IF wave trap, and a URF stage (untuned radio frequency stage). The tube complement consists of (1) 12SG7 or 12SH7 in the RF stage, (1) 12SA7 as a converter, (1) 12SK7 amplifier, (1) 12SQ7 detector AVC and first audio amplifier, (1) 35L6 beam power amplifier and (1) 35Z5 rectifier.

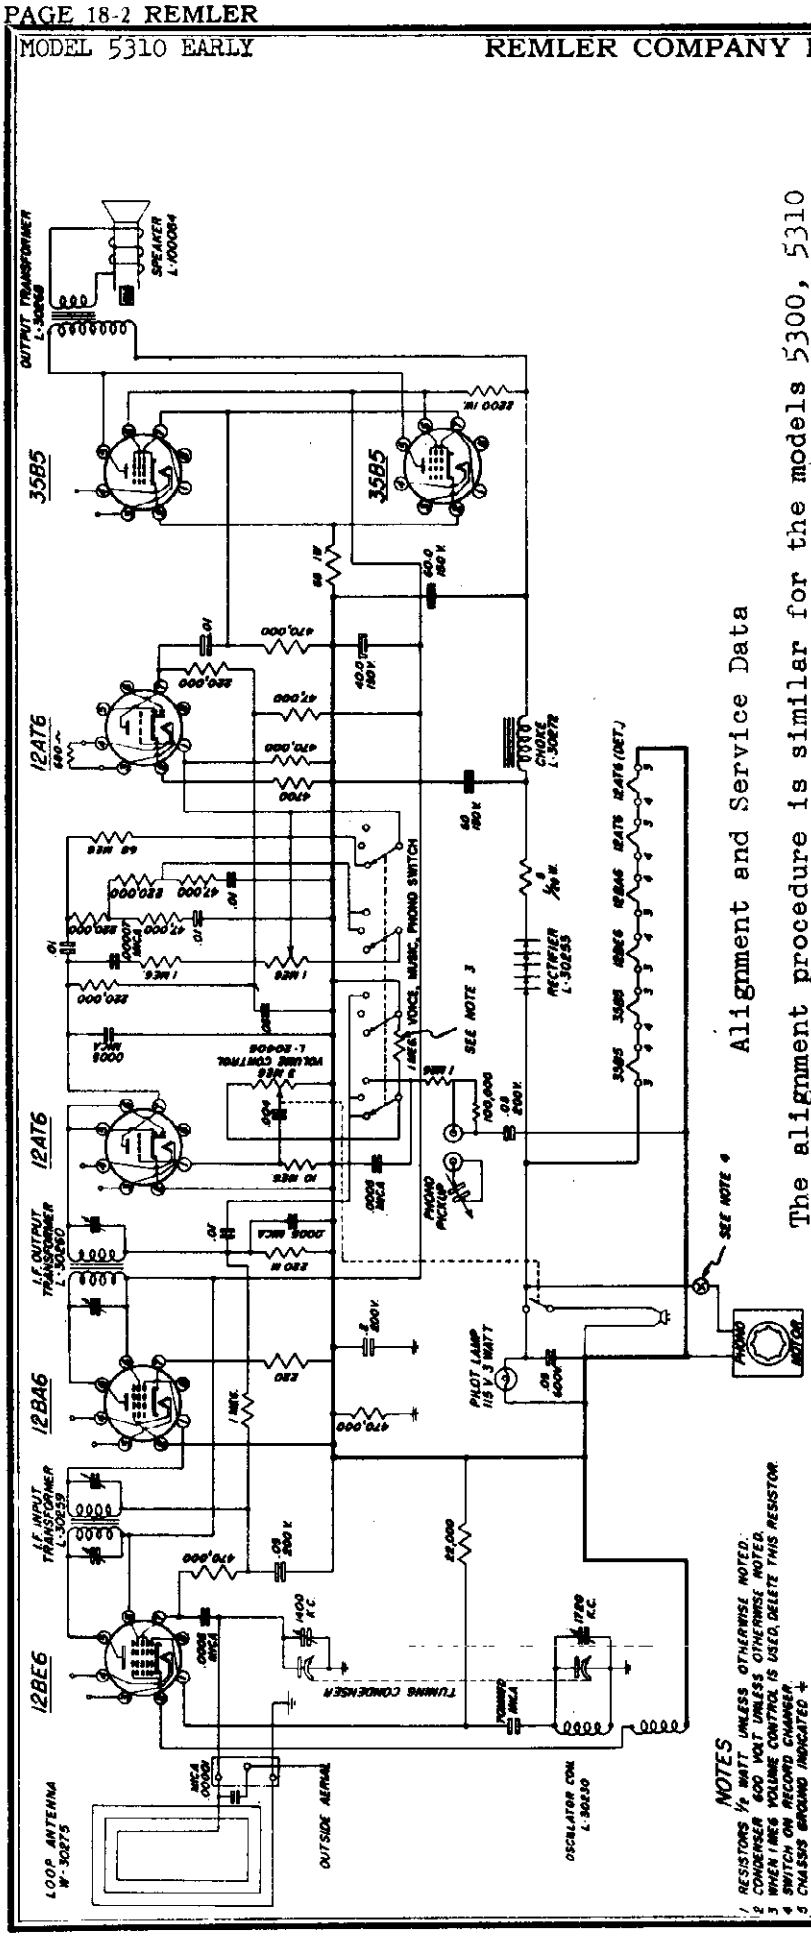
REMLER COMPANY LTD.



Alignment and Service Data

The alignment procedure is similar for the models 5300, 5310 5400 and 5500 series. Intermediate frequency is 450 KC.

The oscillator should track at 545 KC (closed gang) and 1635 KC (open gang). The voltage across the grid resistor should run within limits of 4 to 8 volts negative throughout the dial.

Tune R.F. at 590 KC, 1090 KC and 1500 KC. The position of the loop with respect to the chassis must be maintained as within the cabinet for all alignment. If sensitivity is low on low end of dial, increase the oscillator 70 mmf to 100 or 150 mmf.

For I.F. Oscillation, check for 100 ohms I.F. Cathode resistance. This may be increased if found necessary.

On the 5500 series, if the residual hum level is too high, dress volume control loads away from A.C.

On the 5310, to decrease residual hum, increase the 30 K bias filter resistor.

GENERAL DESCRIPTION

1. GENERAL

These instructions cover the installation, operation and servicing of the Scott Export Radio Receiver.

THEY SHOULD BE READ AND STUDIED WITH GREAT CARE BEFORE THE INSTALLATION OR OPERATION OF THE RECEIVER IS ATTEMPTED IN ORDER THAT OPTIMUM PERFORMANCE MAY BE OBTAINED.

The receiver employs twelve tubes and covers the frequency range of 0.54 to 1.6 megacycles and 3.2 to 23.5 megacycles in four frequency bands.

The Scott Export Radio Receiver is designed for operation from a 115 volt DC source of 115 volt 60 cycle single phase AC source. Power consumption is 78 watts.

All operating controls are mounted on the front panel of the receiver. Power, antenna, ground, audio output, record player input and fuses are located at the rear of the receiver.

2. DESCRIPTION

2.1 General

The Scott Export Radio Receiver is a superheterodyne type receiver. The electrical circuits employed for signal reception on all frequency ranges comprise one stage of R.F. amplification, first detector or mixer, a separate high frequency oscillator, two stages of intermediate frequency amplification operating at 455 kilocycles, a diode type second detector, two stages of resistance coupled audio amplification, and a push pull audio frequency power output stage. The second detector utilizes one set of elements of a dual diode, the other set of elements is utilized to supply AVC voltage to the RF and IF amplifiers. One half of a twin triode tube is utilized as the 1st audio amplifier, the other half of the twin triode is utilized in an efficient peak noise limiter circuit. A self contained power supply provides the necessary DC voltages for operation of the receiver from either an AC or DC power source. Inverse feedback is incorporated in the output audio amplifier to reduce hum and provide better audio response.

2.2 Frequency Range

The receiver covers the frequency range of 0.54 to 23.5 megacycles in four bands as follows:

Band	Frequency Range
1	0.54 - 1.6 megacycles
2	3.2 - 8.4 megacycles
3	8.2 - 14.4 megacycles
4	14.2 - 23.5 megacycles

2.3 Audio Output Connections

The audio output transformer is mounted on the receiver chassis. The secondary of this transformer is connected to a two terminal strip marked "SPEAKER" mounted on the rear of the chassis. The loudspeaker is connected to this terminal strip by means of the two conductor cable fastened on the speaker. The voice coil impedance of the loudspeaker is 8 ohms. The maximum undistorted audio output is 2.16 watts measured across an 8 ohm load.

2.4 Antenna Connections

The antenna terminal strip is mounted at the rear of the receiver for antenna and ground connections.

The input circuit of the receiver is primarily designed for operation with a separate antenna not used for other equipment. A conventional single wire antenna will suffice. It should be well insulated and erected as high as possible. The recommended minimum overall length of antenna and lead-in is fifty feet. The antenna proper should be erected out in the open as much as possible.

In an installation having a simple antenna-ground combination, connect the antenna lead-in to the outer antenna terminal and the ground lead to the terminal marked "GND". Then connect a jumper wire between the center antenna terminal and the ground terminal.

When a doublet type antenna, such as the Scott Super Double Doublet, is used the two lead-in conductors should be connected to the two terminals marked "ANT" and the ground wire to the terminal marked "GND".

CAUTION: When connecting the ground wire between the receiver and the water pipe or other ground point remove the power plug from the wall receptacle as a slight shock may be felt if the plug is left in with the polarity reversed.

2.5 Power Requirements

The radio receiving equipment is designed to operate from either 115 volts DC or 115 volts 60 cycle single phase AC. Line current at 115 volts is .62 amperes. The nominal power consumption at 115 volts AC or DC is 78 watts.

Connection to the power source should be made through the plug and cord attached to the receiver. When the receiver is used on a DC power source the correct polarity must be observed or the receiver will not operate. After the receiver has been connected and turned on if it fails to operate after warming up, reverse the power plug to obtain the correct polarity.

When the receiver is used on an AC power source the polarity is not important. It may be desirable, however, to reverse the power plug in some installations to reduce hum.

The fuse in the power supply line is mounted adjacent to the power input at the rear of the receiver. The fuse mounting is of such design that the fuse, which is of the cartridge type, is replaceable without the use of tools, and without the necessity for the removal of the receiver chassis from its cabinet.

2.6 Record Player Connections

Provision is made at the rear of the chassis for connection of a record player pickup of the high-impedance type. A low impedance pickup may be used with the proper matching transformer.

2.7 Tube Complement

The vacuum tubes employed in the Scott Export Radio Receiver are as follows:

Symbol	Tube Type	Function
V-101	6K7	R. F. Amplifier
V-102	12J5GT	H. F. Oscillator
V-103	12SA7	First detector mixer
V-104	12SK7	First IF Amplifier
V-105	12SK7	Second IF Amplifier
V-106	12H6	Second Detector, AVC
V-107	12SN7GT	First Audio, Noise Limiter
V-108	12SN7GT	Second Audio, Phase Inverter
V-109	25L6GT	Output Audio Amplifier
V-110	25L6GT	Output Audio Amplifier
V-111	1629	Tuning Indicator
V-112	25Z6GT	Rectifier

3. CONSTRUCTION

The Scott Export Radio Receiver is furnished with a complete set of escutcheons and hardware for mounting the receiver in the cabinet. If it is desired to house the receiver in a custom installation or any cabinet built to the customers specifications Figure 3 shows the cut-out dimensions for the front panel and loudspeaker baffle board. The following table gives the dimensional outlines of the receiver chassis and loudspeaker and lists the weight of each unit.

Width	Depth	Height	Weight
Receiver Chassis			
16 5/8"	16 7/8"	10 1/2"	35 lbs.
Loudspeaker			
12 1/4" dia.	5 1/4"	-	6 lbs.

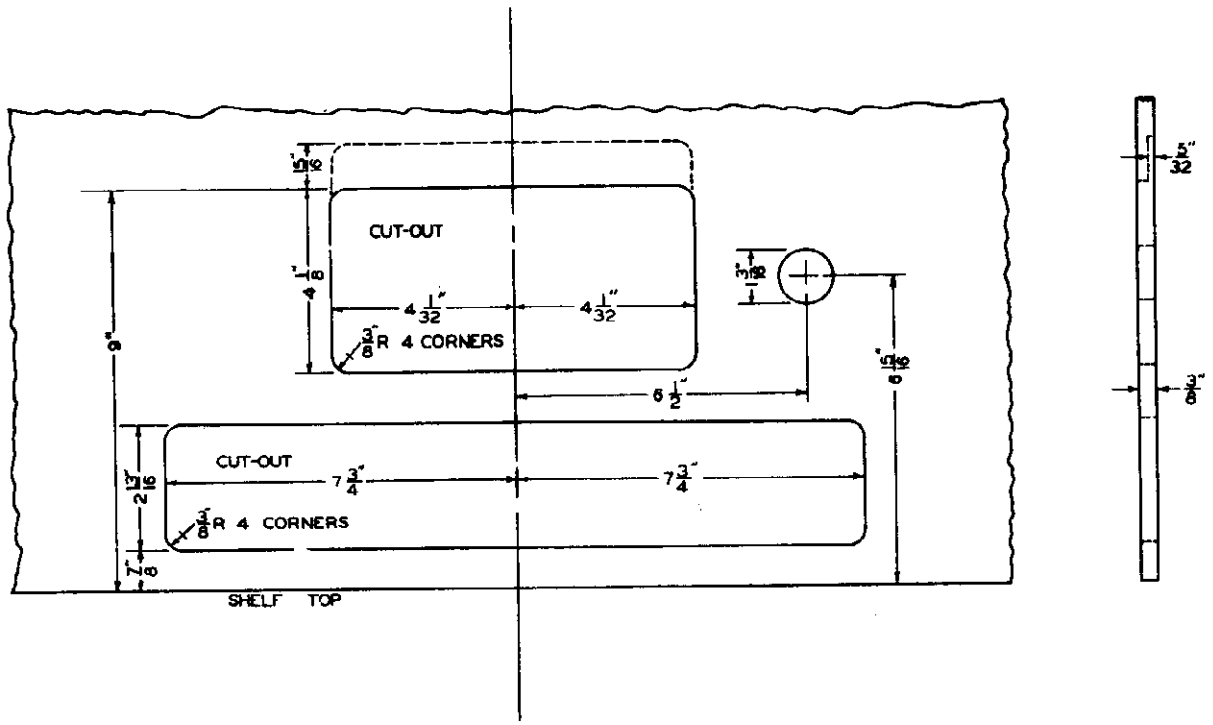

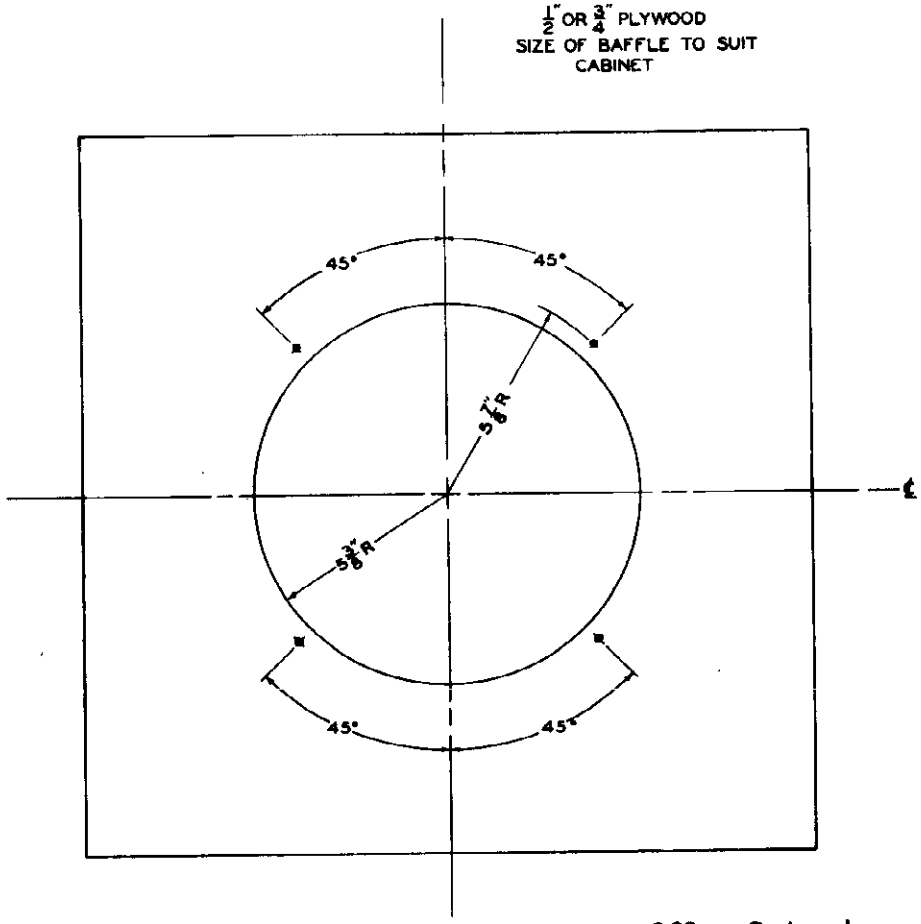

Figure 3 Panel and Speaker Baffle Cutouts

CIRCUIT DESCRIPTION

4. GENERAL

The actual schematic diagram of the Scott Export Radio Receiver is shown in Figure 7. For purposes of illustration, it will be assumed that the circuits are set up as for signal reception on Band 1 (.54 - 1.6 MC) as shown in the diagram. The following description will refer therefore, to the symbol numbers of the circuit elements of this band. It shall be assumed that unless otherwise noted, the description will be equally applicable to Bands 2 - 3 - 4.

5. SIGNAL FREQUENCY CIRCUITS

Signal input to the receiver through antenna terminal E-120 is connected to the primary winding of antenna input transformer T-101 by switch S-101A. Wave trap inductor L-101 is provided to attenuate signals at IF frequency (455 KC). This circuit is tuned by series connected capacity C-101 and tuned to 455 KC by adjustable iron core E-114. An electrostatic shield, at ground potential, separates the secondary winding from the primary winding. The secondary winding together with variable air dielectric capacitor C-104 (A and B) constitutes the first tuned circuit. Transfer of r-f signal, at the resonant frequency of this tuned circuit, from the antenna to the control grid of R.F. amplifier tube V-101, is accomplished by inductive coupling through antenna input transformer T-101. Variable capacitor C-104 is a two section capacitor, both sections being connected in parallel on Bands 1 and 2 by means of switch S-101B. On Bands 3 and 4 capacitor section C-104A is switched out of the circuit and C-104B alone used. Variable capacitor C-104 is ganged with variable capacitor C-117 to provide uni-controlled tuning of the receiver. The secondary winding of transformer T-101 is provided with an adjustable iron core for inductance trimming and a shunt connected variable trimmer capacitor C-106. These trimmer elements permit the accurate alignment of the tuned circuit at both ends of the frequency band and are accessible for adjustment as shown in Figure 2. The high potential end of the tuned circuit is connected to the control grid of R.F. amplifier tube V-101 by switch S-101B and through coupling capacitor C-103. The low potential end of the tuned circuit is returned to ground bus. The d-c bias return from the control grid of R.F. amplifier tube V-101 to the A.V.C. line is closed through resistor R-101.

Plate potential from the high voltage d-c line is applied to the plate of R.F. amplifier tube V-101 through decoupling resistor R-109, bypassed to ground by capacitor C-134C and through R.F. transformer T-105 primary. Screen potential is applied through resistor R-103 bypassed by capacitor C-111B. The suppressor is connected to the cathode. Initial grid bias is obtained by means of cathode resistor R-102 bypassed by capacitor C-111A. One side of the heater of V-101 connects to the heater of V-108, the other side connects to the heater of V-107.

The amplified signal from the plate of R.F. amplifier tube V-101 is transferred to the signal grid of mixer tube V-103, through R. F. transformer T-105. The primary of T-105 is untuned, the secondary winding together with variable capacitor C-117 (A and B) constitute the second and final tuned circuit operating at signal frequency. The high potential end of the tuned circuit is connected to the signal grid of mixer tube V-103 by switch S-101C through coupling capacitor C-116. The low potential end of the tuned circuit connects to ground bus. Adjustable iron core E-106 and parallel connected trimmer capacitor C-112 are provided for purposes of circuit alignment. The DC bias return from the control grid of mixer tube V-103 to the AVC line is closed through resistor R-104 bypassed to ground bus by capacitor C-159.

Screen potential from the high voltage DC line is applied to the screen of mixer tube V-103 through resistor R-108 bypassed to ground by capacitor C-134A. The suppressor is internally connected to the shell of the tube. Initial bias is obtained by means of cathode resistor R-106 bypassed to ground by capacitor C-120B.

6. HIGH FREQUENCY OSCILLATOR CIRCUITS

The high frequency oscillator circuit is of the "electron-coupled" type. The tuned circuit consists of tapped inductor T-109, shunted with variable trimmer capacitor C-125 and is tuned by variable capacitor C-117 (C and D). Inductor T-109 is provided with an adjustable iron core for inductance adjustment. Fixed capacitor C-124 shunted by variable trimmer capacitor C-123 is provided to modify the tuning of the H.F. oscillator so that it will maintain a fixed frequency difference of 455 kilocycles with respect to the signal frequency when tuning capacitors C-104, C-117AB and C-117CD are varied from minimum to maximum capacity. The oscillator circuits are aligned on the high side of the signal circuits on Bands 1 and 2 and on the low side of the signal circuits on Bands 3 and 4 as outlined in Paragraph 21.

The high potential end of the tuned circuit is connected to the control grid of H.F. oscillator tube V-102, through switch S-101D and fixed capacitor C-122. This grid is returned to the ground bus through resistor R-110. The low potential end of the tuned circuit is also returned to the ground bus. The cathode of the H.F. oscillator tube V-102 is connected to the tap of inductor T-109 through switch S-101D and through coupling capacitor C-121 to the oscillator injector grid of mixer tube V-103. This grid is returned to ground bus through resistor R-107. The plate of the H.F. oscillator tube V-102 is connected to the high voltage DC line through resistor R-111 and bypassed to ground by capacitor C-132A. One side of the heater circuit of the H.F. oscillator tube V-102 connects to the heater of V-105 bypassed to ground bus by capacitor C-132C. The other side of the heater connects to the heater of V-104.

7. I.F. AMPLIFIER CIRCUITS

The signal frequency arriving at the control grid of mixer tube V-103 and the H. F. oscillator frequency arriving at the injector grid of this tube are mixed (or heterodyned) and the resultant difference frequency (455 kilocycles) is fed to the input of the I.F. amplifier.

Transfer of IF signal from the plate of the mixer tube V-103 to second detector tube V-106 is accomplished by inductive coupling through IF transformers T-113, T-114, T-115 and amplified by tubes V-104 and V-105. First IF transformer T-113 consists of two tuned circuits, primary and secondary with the secondary tuned circuit operating in conjunction with switch S-102A and a tapped tertiary winding, to provide five degrees of selectivity by changing the coefficient of coupling with the primary circuit. The primary and secondary windings are each tuned to 455 kilocycles by fixed capacitors C-136 and C-137 and adjustable iron cores E-115 and E-116. These cores are accessible for adjustment through the top of the shield can for E-116 and at the bottom of the receiver for E-115. The high potential end of the primary tuned circuit connects to the plate of mixer tube V-103 through a shielded conductor while the low potential end connects to the high voltage DC line through resistor R-112, bypassed to ground by capacitor C-135C. The high potential end of the secondary tuned circuit is connected to the grid of first IF amplifier tube V-104 while the low potential end is connected to the AVC line through resistor R-113, bypassed to ground bus by capacitor C-144A. DC potential from the high voltage DC line is applied to the screen of first IF amplifier tube V-104 through resistor R-115, bypassed to ground by capacitor C-144B. Plate potential is applied through resistor R-116 bypassed by capacitor C-139C. Initial cathode bias is obtained through resistor R-114, bypassed to ground by capacitor C-135A. The suppressor is connected to the cathode. One side of the heater of the first IF amplifier tube V-104 is connected to the heater of V-102. The other side of the heater connects to the heater of mixer tube V-103.

Second IF transformer T-114 is identical to first IF transformer with respect to design, construction, and operating characteristics, accordingly, except for differences in symbol designations. The circuit description of first IF transformer T-113 is applicable to this transformer.

The circuit arrangement of second IF amplifier tube V-105 is the same, except for symbol designations as for first IF amplifier tube V-104 except that the grid is returned to ground bus instead of AVC. One side of the heater of second IF amplifier tube V-106 connects to the heater of V-102. The other side of the heater connects to the heater of V-111.

Third IF transformer T-115 consists of a tuned primary circuit and an untuned secondary. The primary circuit consists of the primary winding shunted by a fixed capacitor C-142 and permeability tuned by iron core E-119 which is accessible for adjustment at the bottom of the chassis. Plate potential is applied to the plate and screen of second IF amplifier tube V-105 through resistor R-118, bypassed to ground by capacitor C-139B. The high potential end of the secondary winding feeds the second detector diode while its low potential end connects to ground bus through diode load resistor R-119 and filter resistors R-120 and R-121.

8. SECOND DETECTOR CIRCUITS

Tube V-106 is a dual diode tube, one section V-106A, is used as a second detector, the plate of which is connected to the high potential end of the secondary winding of the third IF transformer T-115. The cathode is connected to ground bus, thus the tube acts as a half wave rectifier.

The second section, V-106B of twin diode V-106, is utilized as an AVC diode. Signal is fed from the primary of IF transformer T-115 to the plate of V-106B through capacitor C-150. This plate is returned to ground bus through load resistor R-129. Bias is applied to the cathode of V-106B to delay AVC action so that on weak signals the AVC is inoperative and the full sensitivity of the receiver may be utilized. The voltage developed across load resistor R-129 as a result of the demodulating action of AVC diode V-106B, is filtered by resistor R-127 and capacitor C-119A and the resultant DC voltage is used to control the gain of amplifier tubes V-101, V-103, V-104. The degree of control being dependent on the strength of the incoming signal.

DC potential from the AVC diode is further filtered by resistor and capacitor C-119B and applied to the control grid of electron-ray indicator V-111. This DC voltage regulates the shadow angle of the electron-ray tube to indicate when the receiver is tuned to resonance with the received signal.

9. NOISE LIMITER CIRCUIT

One section of twin triode V-107 is utilized as a peak noise limiter. When the noise limiter switch SW3 is set at "ON" position voltage from the second detector diode is applied to the grid of V-107A through a filter consisting of R-122 and C-119C, the time constant of this filter is long enough so that normal variations in modulation will not affect the input voltage yet short enough so that variations on voltage due to signal fading will be followed, thus providing automatic adjustment of the noise limiter circuit for different carrier levels.

Under normal conditions the cathode of V-107A is negative with respect to the ground bus by the voltage drop across R-119, R-120 and the grid is held more negative by the voltage drop across R-120 while the plate is positive by the voltage drop across R-123 in the cathode of the AVC diode V-106B.

Under these conditions the plate to cathode resistance is very high and very little conduction takes place until the modulation reaches approximately 85%. When the current through the diode load is suddenly greatly increased by a pulse of "Noise voltage" the cathode of V-107A will go more negative and the plate more positive but the grid will remain at the original potential due to the time constant of the filter R-122, C-119C. The cathode now becomes more negative than the grid, and the plate to cathode resistance becomes very low and bleeds off the peak voltage developed by the noise pulse.

10. A. F. AMPLIFIER CIRCUITS

The A.F. voltage developed across the diode load resistor R-119 as a result of the demodulating action of second detector diode V-106A, is applied to the control grid of first A.F. amplifier tube V-107B, through capacitor C-145 and A.F. gain potentiometer R-125.

Switch S-103 operates to transfer the audio input to volume control R-125 and hence the input circuit of the first A.F. amplifier tube V-107B, from the second detector circuit to "PHONO" terminals E-121 to permit the operation of the audio amplifier system of the receiver with a high impedance record player pick-up. Low impedance pick-ups may also be employed provided that their connection to terminals E-121 are made through suitable matching transformers.

Amplification of the A.F. signals from the second detector is accomplished by resistance-capacity coupling between first A.F. amplifier tube V-107B and output power amplifier tubes V-109 and V-110. Transfer of audio frequency energy from the plate of output amplifier tubes V-109 and V-110, to loud speaker terminal E-122 is accomplished through output transformer T-117 which matches the plate impedance of the tube with the 8 ohm output load with which the receiver is designed to work.

DC potential is applied to the plate of first A.F. amplifier tube V-107B through plate load resistor R-130 and filter resistor R-131, bypassed to ground bus by electrolytic capacitor C-148. Bias is applied to the cathode through resistor R-126 which returns to ground bus. One side of the heater of V-107 connects to the heater of V-101, the other side connects to one side of the power line.

A.F. signal from the plate of first audio tube V-107B, is transferred to the grid of second audio tube V-108 through capacitor C-147 and series resistor R-132. The grid of V-108B is returned to ground bus through resistor R-133.

The grid of V-108A is returned to ground bus through resistor R-135. DC potential is applied to the plate of V-108A through resistor R-137 and to the plate of V-108B through resistor R-136. Bias is provided for V-108B through resistor R-134 and for V-108A through resistor R-135 bypassed by C-149.

A.F. signal is transferred from the plate of V-108B to the grid of V-109 through capacitor C-152 and from the plate of V-108A to the grid of V-110 through capacitor C-153. The grid of V-109 is returned to ground bus through load resistors R-139, R-140 and filter resistor R-142. The grid of V-110 is returned to ground bus through load resistor R-140 and filter R-142. Resistors R-139 and R-140 in series are utilized as a voltage divider to supply the proper amount of audio signal to the grid of V-108A so that the signal output from the plates of V-108A and V-108B will be equal and 180 degrees out of phase thus providing push-pull signal input to the grids of the output tubes V-109, V-110.

DC potential is applied to the plates of output amplifier tubes V-109 and V-110 through output transformer T-117 primary which is center-tapped. The cathodes of V-109 and V-110 are returned to ground bus, through resistor R-143 bypassed by capacitor C-154. One side of the heater of V-109 connects to the heater of V-108, the other side connects to the heater of V-110, the other side of the heater of V-110 connects to the heater of V-112.

AF signal from the plate of V-109 is fed back to the cathode of V-108B through resistor R-138 and capacitor C-155 in series. This feedback arrangement is provided to supply more constant voltage output at the loudspeaker terminals thus providing more uniform frequency response from the loudspeaker.

Variable potentiometer R-152 and series connected capacitor C-151 constitute the control for regulating the fidelity of the audio amplifier system of the receiver. The series combination is connected from the plate of 1st audio tube V-108B to ground bus.

Output transformer T-117 is provided to transfer the A.F. signal from the audio amplifier of the receiver to the loudspeaker connections.

11. RECTIFIER POWER CIRCUITS

The Scott Export Radio Receiver is designed for AC-DC operation, therefore, no power transformer is used. The heaters of all tubes are connected in series in two circuits. In one circuit V-101, V-107, V-108, V-110, V-109 and V-112 are connected in series with resistor R-105. The other heater circuit consists of V-102, V-106, V-105, V-103, V-104 and V-111 in series with resistor R-151.

Rectifier tube V-112 is utilized to supply DC potential for operation of the receiver when used with an AC power source. The pulsating DC potential from the cathodes of V-112 is filtered by iron core inductor L-102 and electrolytic capacitors C-156, C-157 and C-158.

The two lamps used for lighting the dial scale are connected in series across resistor R-150. If one of these lamps burns out, both lamps will go out until the defective lamp is replaced.

NOTE: WHEN REPLACING THESE LAMPS MAKE CERTAIN THE REPLACEMENT LAMP IS RATED AT 6-8 VOLTS .25 AMP OR BLUE BEAD TYPE.

INSTALLATION AND INITIAL ADJUSTMENTS

12. UNPACKING THE EQUIPMENT

After unpacking the equipment, it should be inspected for any possible damage that might have resulted from careless handling in transit. Make certain that all vacuum tubes are firmly seated in their sockets.

13. INSTALLATION

The necessary hardware for installing the receiver and loudspeaker in the cabinet is included in the chassis carton.

The loudspeaker should be installed first, and is accomplished by placing the speaker on the four bolts which are already fastened into the speaker baffle. The speaker is then fastened down using the four nuts and washers furnished. NOTE: DO NOT draw the speaker down too tight against the baffle as the frame may be distorted and misalign the voice coil.

The escutcheons for the dial and tuning indicator should be mounted next, centering the escutcheons in the panel cutout provided and fastening them down with the small wood screws provided.

The receiver can now be mounted in the cabinet, pushing it forward until the knob escutcheon plate hits the back of the panel. Then center the dial calibration scale in the escutcheon opening and fasten the receiver in place using the right and left hand brackets and wood screws furnished. These brackets are mounted at the rear corners of the chassis. Connect the two speaker leads to the terminals marked speaker, the power connection and antenna connections are made as outlined below.

14. CONNECTIONS TO RECEIVER

14.1 Power Connections

The receiver may be operated from a 115 volt DC supply or 115 volts 60 cycle single phase power source. Connection to the power source should be made by means of the plug and cord furnished with the receiver. CAUTION: When a DC power source is used, if the power plug is inserted in the wall receptacle with the wrong polarity the set will not operate. Therefore when operating the receiver on DC power if the receiver fails to work after being turned on, reverse the power plug. On an AC power source the receiver will operate with the plug inserted either way, although in some instances the hum level may be lower if the plug is inserted one way.

14.2

Antenna and ground connections are made to the receiver through the terminal strip furnished on the receiver. Connections should be made as outlined in Paragraph 2.4.

14.3 Loudspeaker Connections

Terminals are provided at the rear of the receiver for connection of the loudspeaker which has an input impedance of 8 ohms. It is not necessary to observe polarity when connecting the loudspeaker.

14.4 Record Player Connections

A record player pickup may be connected to the terminals marked "PHONO" located at the rear of the chassis. If the pickup is high impedance such as a crystal, direct connection may be made. If the pickup is low impedance, a matching transformer must be used.

14.5 Installation Inspection

Before turning the receiver on, inspect all connections to ascertain that they have been properly made. Then set the panel controls as follows:

1. Sensitivity control set at zero.
2. Tone control set at maximum.
3. Volume control set at zero.
4. Band selector control set to frequency band in which signals are desired.
5. N.L. control to center "OFF" position.
6. Selectivity control to No. 1 position.

The equipment is now ready for operation and is turned on by means of switch S-104 when set at "Power" position.

Section IV OPERATION

15. OPERATION OF CONTROLS

All switches and controls (with the exception of the main tuning control) of the radio receiver are identified by panel engraving.

For reception of broadcast signals the following procedure should be followed:

1. Set Power switch to "Power" position.
2. Set Band Selector control to frequency band in which the desired signal is located.
3. Set Selectivity control at No. 1 position.
4. Set N.L. control to "OFF" position.
5. Set Sensitivity control to maximum position.
6. Advance Volume control to suitable noise level.

7. Tune the receiver to the approximate station frequency by means of the main tuning control. Slowly rotate the tuning knob back and forth until the signal is properly tuned in as indicated by tuning indicator tube.

8. Adjust the Volume control to the proper output level.

9. Adjust the Tone control to the desired position to eliminate background noise.

When the Sensitivity control is turned counterclockwise the sensitivity of the receiver is decreased. By turning this control back the inter-station noise level can be cut down or eliminated when it is desired to receive the more powerful local stations.

If conditions of reception are such that peak noise levels interfere with received signals, the N.L. control should be set to the N.L. "ON" position. Under these conditions the peak noises will be chopped off and signals may be received through heavy interference.

In order to widen the IF selectivity and pass a wider band of frequencies for better fidelity, the Selectivity control should be set at No. 2, 3, 4 or 5 position to suit conditions.

CORRECTIVE MAINTENANCE

16. When servicing the Export Radio Receiver the first step should be a complete check of all tubes. This can be accomplished easily by replacing one at a time with tubes of known good quality. All tubes which are not defective should be reinserted in the socket from which they were taken. Failure of a vacuum tube in the receiver may reduce the sensitivity, cause intermittent operation or cause the receiver to be completely inoperative. Since the heaters of the vacuum tubes in the receiver are connected in series, in two strings, if one tube in a string burns out all the tubes in that string will be inoperative until the defective tube is replaced.

17. FAILURE OF THE RADIO RECEIVER

In case of failure or breakdown of the receiver the fault must first be localized in one portion of the circuit. This can be accomplished by observation of some peculiar action of one of the controls or by checking the receiver against test data tabulated in Tables 1 and 2. It must be remembered that resistance or voltage checks will not positively locate certain faults. For instance, an open circuited by-pass capacitor will not appear in point to point resistance tests and may introduce regeneration or oscillation in certain circuits which effect the stage gain of other circuits. Similarily, a short circuit occuring in a low resistance inductor will not appear in a point to point resistance test and if the short appears in an R.F. coil, a false indication of the necessity for realignment may result.

Table 3 TROUBLE LOCATION CHART

Symptom	Cause	Remedy
Weak or dead on all bands	Blown fuse	Replace from spares
	Defective tube	Replace from spares or stock
	Dial lamp burned out	Replace from spares
	Socket voltages wrong	Check associated bypass capacitors
		Check continuity of wiring and components
		Check resistors and switch contacts
	No signal	Check receiver stage by stage
		Check for disconnected or broken antenna connections
Weak or dead one band only	No signal	Check all coils on specific band
		Check switch contacts
Noisy Reception	Defective tube	Tap all tubes lightly and replace any that are noisy
	Defective antenna	Check antenna installation and connection
	Defective component	Tap all components lightly with insulated rod, check carefully suspected parts
Oscillation	Defective tube	Replace tubes one at a time
	Open bypass capacitor	Connect good capacitor across suspected unit, temporarily. Replace defective unit
Hum	Defective tube	Replace tubes one at a time
	Defective filter capacitor	Replace defective unit
	Defective bypass capacitor	
	Improper power source connection	Reverse power input connection

Bypass or filter capacitors, which develop poor internal connections or which become open-circuited, will cause decreased sensitivity and/or poor stability. An open unit can be located by temporarily connecting a good capacitor in parallel with the unit under suspicion. Failures of any bypass or filter capacitor may seriously overload resistors of associated circuits. Overloads of sufficient magnitude to permanently damage a resistor will cause the painted surface of the resistor to be scorched, making the defective unit easy to locate by visual inspection.

Loose connections, causing intermittent or noisy operation, and which cannot be found by point to point resistance tests, can usually be located by individually testing each circuit element, or by tapping or shaking the component under suspicion, when the receiver is adjusted for normal operation.

18. VOLTAGE AND RESISTANCE TESTS

Table 1 lists the tube socket voltages for various settings of the controls. All voltages are measured between the GROUND BUS and socket terminals. Voltage measurements listed are made with an electronic voltmeter such as the voltohmyst using the scale that can be most easily read. The receiver should be connected for normal operation and the controls adjusted as listed in Table 1. Line voltage should be 115 volts AC or DC. Resistance measurements are listed in Table 2. All resistance measurements are made between ground bus and terminal. The most suitable scale for the measurement being taken, should be used. The receiver should be disconnected from the power source with controls adjusted as listed in Table 1.

19. ALIGNMENT DATA

Should realignment of the Scott Export Radio Receiver become necessary, the following alignment data should be carefully studied before making any circuit adjustments. It is important that the operator understand the functions of each circuit element so that correct alignment may be made quickly and accurately.

All alignment and measurements may be made with a signal generator capable of producing both a 30% 400 cycle modulated signal or an unmodulated signal between 400 kilocycles and 25 megacycles and a General Radio Type 583A or equivalent output meter. For RF alignment and measurements at the antenna input a Standard RMA dummy antenna as shown in Figure 4 should be used.

Before proceeding with the alignment of any circuit of the receiver, the chassis must be removed from the cabinet, and the bottom cover plate of the chassis removed. For IF alignment the bottom cover shield of the oscillator-converter compartment must be removed.

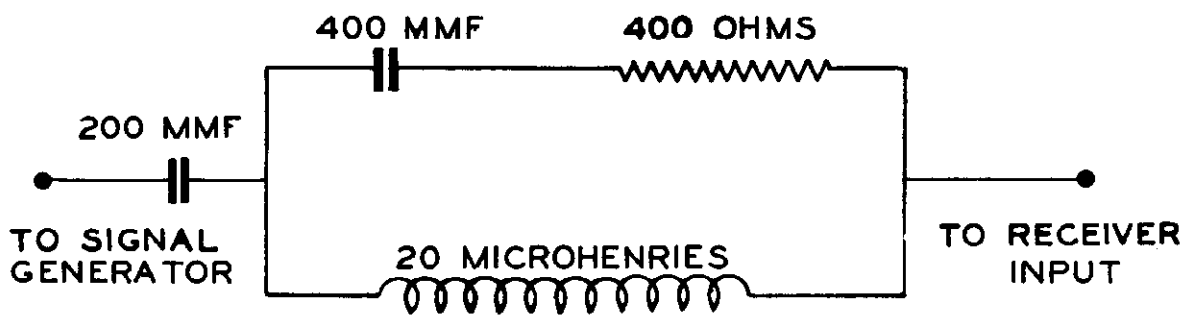

Figure 4 Schematic Diagram RMA Standard Dummy Antenna

The receiver must be connected to a 115 volt AC or DC power source and the controls set as follows unless otherwise noted.

Control	Position	Control	Position
Power Switch	Power	Tone	Maximum
Sensitivity	Maximum	Band Selector	As Noted
Volume	As Noted	N.L. Control	Off
		Selectivity	Sharp (1)

The complete alignment of the radio receiver may be divided into three steps.

1. I.F. Amplifier Alignment
2. High Frequency Oscillator Alignment
3. Radio Frequency Amplifier Alignment

NOTE: THE CIRCUITS MUST BE CHECKED IN THE ABOVE ORDER WHEN COMPLETE ALIGNMENT IS NECESSARY.

20. I.F. AMPLIFIER ALIGNMENT

The intermediate frequency of the radio receiver is 455 kilocycles.

Tuning adjustments are provided in each I.F. transformer. These adjustments consist of adjustable iron cores and are designated by symbol numbers E-115 to E-119 inclusive as indicated on Schematic Diagram, Figure 7.

The high potential lead of the signal generator should be connected to the control grid (terminal No. 8) of the mixer tube V-103 through a .01 mfd. capacitor and the ground lead to any metal part of the chassis.

The frequency of the signal generator should be carefully adjusted to 455 kilocycles modulated 30% at 400 cycles and the signal input to mixer tube V-103, adjusted to provide a reading on the output meter. Starting with the Third I.F. transformer the trimmers should be adjusted in the following order: E-119, E-118, E-117, E-116 and E-115.

NOTE: IT IS ESSENTIAL THAT THE INPUT SIGNAL FROM THE SIGNAL GENERATOR, BE KEPT BELOW THE THRESHOLD OF OPERATION OF THE AUTOMATIC VOLUME CONTROL. EXCESSIVE SIGNAL INPUTS WHICH WILL CAUSE OVERLOAD OF EITHER THE SECOND DETECTOR OR AUDIO CIRCUITS SHOULD ALSO BE AVOIDED.

The performance of the I.F. amplifier can be checked against the following data. For an audio output of .5 watt across an 8 ohm load (2 volts) the following input values should not be exceeded, if the I.F. amplifier is in proper operating condition.

V-103 grid	50	Microvolts
V-104 grid	1000	Microvolts
V-105 grid	50000	Microvolts

21. R. F. AND H. F. OSCILLATOR ALIGNMENT

CAUTION: READJUSTMENT OF THE H.F. OSCILLATOR CIRCUIT TRIMMERS SHOULD NOT BE ATTEMPTED UNTIL AFTER THE NEED FOR SUCH READJUSTMENT HAS BEEN POSITIVELY ESTABLISHED.

Table 3 gives the alignment frequency, trimmer adjustment and nominal sensitivity for each of the four frequency bands.

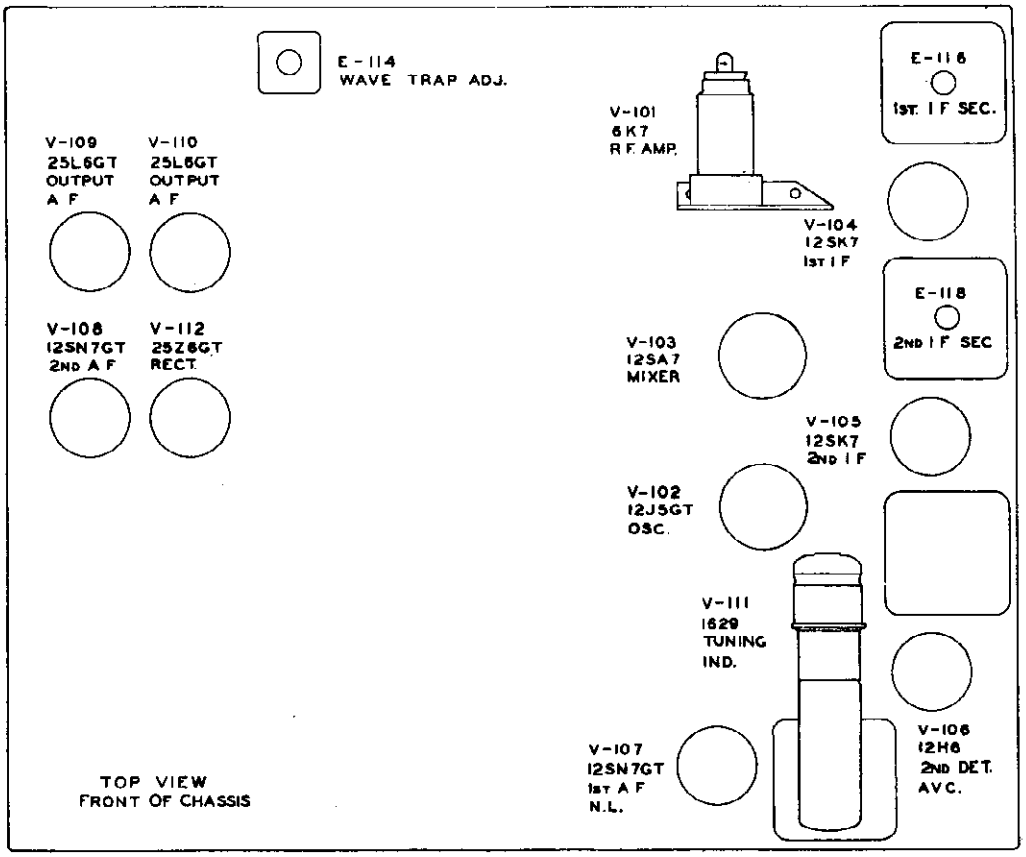
The signal generator should be connected through a Standard RMA dummy antenna to the antenna-ground input terminals. A 400 cycle, 30% modulated signal should be used. The receiver controls should be adjusted as listed in Paragraph 19 with the band selector control set to the desired frequency band.

It is important that the H.F. oscillator circuits operate at a higher frequency than that of the RF amplifier circuit on Bands 1 and 2 and at a lower frequency than the RF amplifier circuits on Bands 3 and 4. The correct operating point can be checked by leaving the signal generator set at the alignment frequency and on Bands 1 and 2 the image signal should appear 910 KC lower in frequency on the dial if the oscillator is correctly aligned. On Bands 3 and 4 the image should appear 910 KC higher in frequency on the dial. It may be necessary to increase the signal output of the generator in order to pickup the image signal.

The following general procedure should be employed in the alignment of the H.F. oscillator and R.F. amplifier circuits. Set signal generator to high frequency alignment point of desired band. Set radio dial to high frequency alignment point and adjust corresponding trimmer adjustments for maximum output. Repeat this procedure for the low frequency alignment point.

The alignment of the R.F. and oscillator circuits may be considered satisfactory if the signal input necessary to produce a 500 milliwatt output, measured across an 8 ohm load at the speaker terminals, does not exceed the values given in Table 3.

EXPORT RECEIVER SCOTT RADIO LABS., INC.



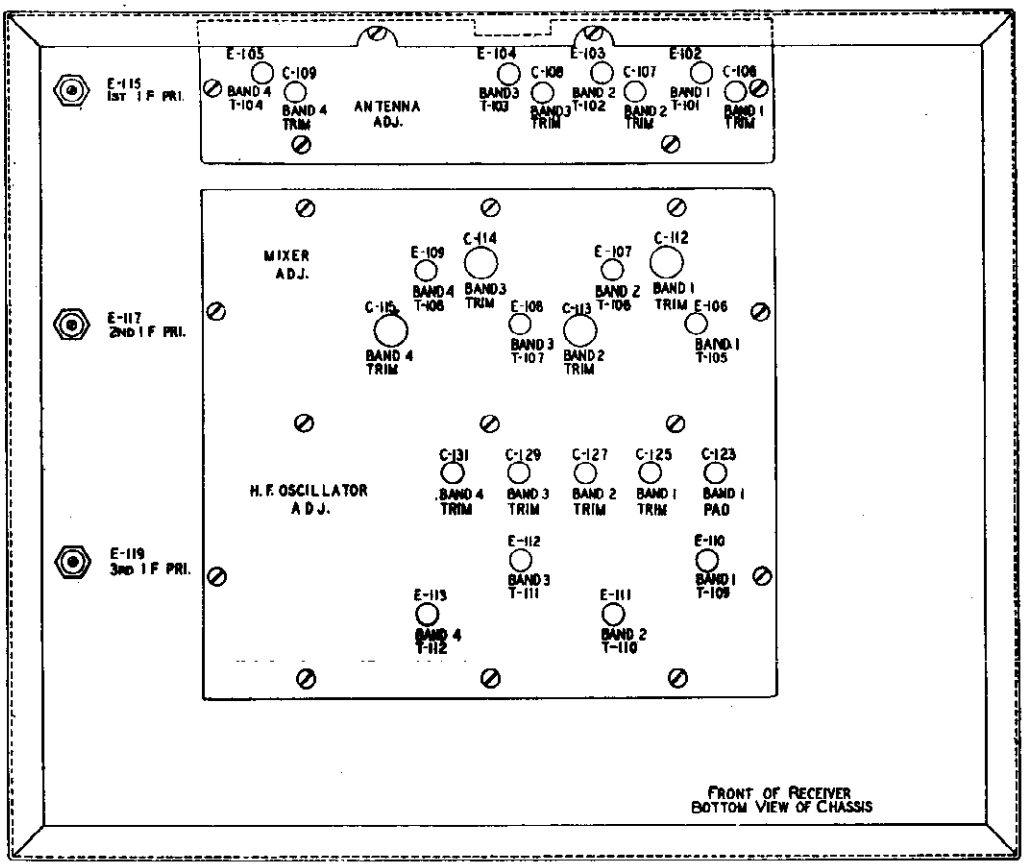


Figure 5 Trimmer Positions and Tube Location

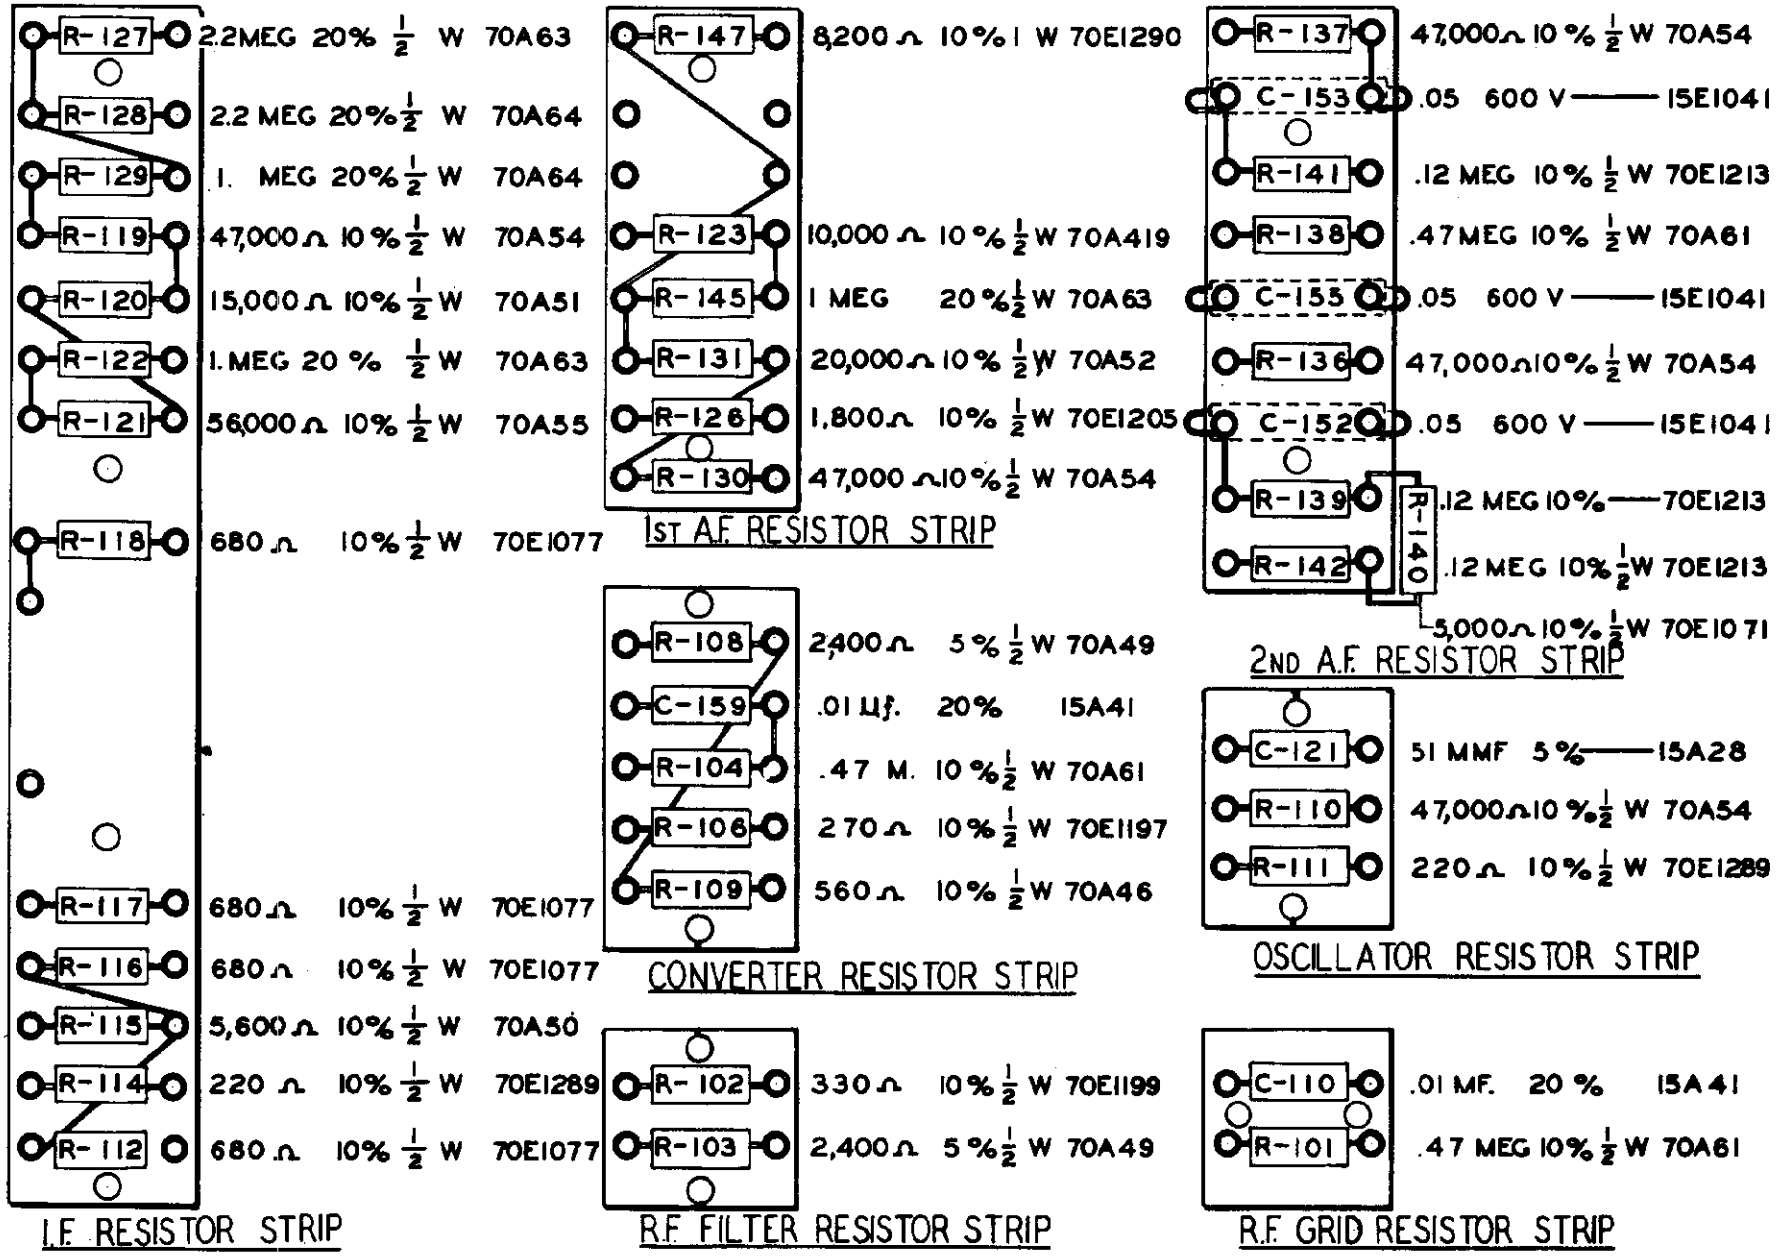

Figure 6 Resistor Strip Layout

Sensitivity measurements are made at a 10 to 1 signal to noise ratio as follows:

With the signal generator and receiver set to the same frequency, turn off the signal generator modulation; adjust the signal generator output to 10 microvolts; adjust the A.F. gain control on the receiver to give an output reading of 50 milliwatts, .63 volts across an 8 ohm load. Turn the signal generator modulation on and adjust the signal generator output control to give an output reading from the receiver of .5 watt (2 volts). Repeat this procedure as a check. Then the output reading of the signal generator will be the sensitivity of the receiver at a 10 to 1 signal to noise ratio.

NOTE: The sensitivity control should be set at maximum position when making the above measurements.

C-122	T-109 fixed pad	Capacitor, variable air trimmer, min.cap. 6.5 MMF, max.cap. 100 MMF, 28 plates ¼" hex adj. shaft with screwdriver slot	15B862
C-123	T-109 trimmer	Capacitor, silver mica, 560 MMF 5%, 500 V DC wkg., bakelite case, pigtail leads	15E1283
C-124	T-110 fixed pad	Capacitor, variable air trimmer, min.cap. 3 MMF, Max.cap. 25 MMF, 7 plates, ¼" hex adj. shaft with screwdriver slot	15A18
C-125	T-110 trimmer	Capacitor, silver mica, 3000 MMF 5%, 500 V DC wkg., bakelite case, pigtail leads	15A38
C-126	Bypass from case of C-139 to ground bus.	Same as C-125	
C-127	T-111 trimmer	.005 MF mica 300 V DC wkg.	15E1263
C-128	Ground bus to chassis bypass at V-102	Same as C-125	
C-129	T-112 trimmer	Same as C-110	
C-130	Section "A", V-102 plate bypass	Same as C-125	
C-131	Section "B", V-102 plate filter	Same as C-119	
C-132	Section "C", heater bypass at V-102 socket		
C-132A	T-104 secondary shunt		
C-132B			
C-132C			
C-133		Capacitor, silver ceramic, 20 MMF 10%, 500 V DC wkg., N.P.O.	15B864

Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
	CAPACITORS (Continued)		
C-134 C-134A C-134B C-134C	Section "A",V-103 screen bypass Section "B", +B bus bypass Section "C", V-101 plate return bypass	Same as C-119	
C-135 C-135A C-135B C-135C	Section "A", V-104 cathode bypass Section "B", sensitivity control bypass Section "C", V-103 plate bypass	Same as C-119	
C-136	T-113 primary tuning	Same as C-101	
C-137	T-113 secondary tuning	Capacitor, silver mica, 240 MMF 5%,500 V DC wkg., bakelite case, pigtail leads	15B602
C-138 C-138A C-138B	Section "A", ground bus to chassis bypass at V-106 Section "B", ground bus to chassis bypass at Pin 8 of V-107	Capacitor, paper, 0.1/0.1 MFD 600 V DC wkg., bathtub container, 1 13/16" long x 1" wide x 7/8" high,mounting centers 2 1/8"	15E2573
C-139 C-139A C-139B C-139C	Section "A", V-105 cathode bypass Section "B", V-105 screen and plate filter Section "C", V-104 plate filter	Same as C-119	
C-140	T-114 primary tuning	Same as C-137	
C-141	T-114 secondary tuning	Same as C-137	
C-142	T-115 primary tuning	Capacitor, silver mica, 100 MMF 5%, 500 V DC wkg.,bakelite case, pigtail leads	15A428
C-143	V-106A diode filter	Capacitor, mica 100 MMF 10% 500 V DC wkg., bakelite case, pigtail leads	15A29
C-144 C-144A C-144B	Section "A", V-104 grid return bypass Section "B", V-104 screen filter	Capacitor,paper, .05/.05 MF 10%, 600 V DC wkg, bathtub container, hermetically sealed	15A11
C-145	S-103 to volume control R-125 coupling	Same as C-102	
C-146	AVC diode cathode bypass	Same as C-143	
C-147	V-107B plate to V-108B grid coupling	Capacitor, paper,.05 MF 10% 600 V DC wkg.,tubular paper case, pigtail leads	15E1041

SCOTT RADIO LABS., INC.

Parts List By Symbol Designation.

Symbol Desig.	Function	Description	Part Number
		HARDWARE (Continued)	
H-102	Band change switch shaft coupling	Same as H-101	
H-103	Selectivity switch shaft coupling	Same as H-101	
H-104	Dial to main tuning capacitor coupling	Coupling,insulated,for 3/8" dia. and 1/4" dia. shaft, 1 1/8"long, 1 25/32" dia., phenolic insulator ring	25E2580
H-105	Single and double unit main tuning capacitor coupling	Coupling, insulated, for 3/8"dia.shaft, 1" long x 1 25/32" dia., phenolic insulating ring	25A301
H-106	#8 set screw wrench	Wrench, 5/64"x 1 7/8"long for #8 hollow head set screws	94B810
H-107	Main tuning capacitor coupling	Coupling, flexible for 3/8" dia., shaft, 1" long x 1 25/32" dia.	25E2430
		INDICATING DEVICES	
I-101	Dial lamp	Lamp, 6-8 volt, 0.15 amp miniature bayonet base	49E899
I-102	Dial lamp	Same as I-101	
		JACKS AND RECEPTACLES	
J-101	Fuse holder for power input fuse	Receptacle, extractor type, fuse holder, mounts in 1/2" hole	67A192
		INDUCTORS RF AND AF	
L-101	455 KC wavetrap	RF inductor,195 T 7/41 litz wire,universal wound, 0.51 MH at 1000 CPS DC resistance 5.87 ohms 10%includes C-101	20E2379
L-102	Power supply filter choke	Filter reactor, 4.5 H at 3 V 60 CPS with 150 MA DC., DC resistance 70 ohms, 2060 turns #28 E wire, hermetically sealed	17E1339
		LOUDSPEAKERS	
LS-101	Loudspeaker	Loudspeaker, 12 inch PM, 8 ohm voice coil, 3 ft wire leads with terminal lugs	85E2418A

Parts List By Symbol Designation

Symbol Desig.	Function	Description	Part Number
		MECHANICAL PARTS, SHAFTS	
O-101	Selectivity switch extension shaft	Shaft, 1/4" dia. x 10 1/4" long, flat on 2 sides, .187 thick, steel	79E1356
O-102	Band change switch shaft	Shaft, 1/4" dia. x 9 1/2" long, flat on 2 sides, .187 thick, steel	79E1357
O-103	Band change switch shaft for antenna section	Shaft, 1/4" dia. x 3 1/8" long, flat on 2 sides, .187 thick, PBG bakelite, wax impregnated	79E2425
		PLUGS	
P-101	Power input plug	Plug, 2 contact, male	65B679
		RESISTORS	
R-101	V-101 grid return	Resistor, composition, 0.47 meg 10%, ½ watt, pigtail terminals	70A61
R-102	V-101 cathode bias	Resistor, composition, 330 ohms 10%, ½ watt, pigtail terminals	70E1199
R-103	V-101 screen filter	Resistor, composition, 2400 ohms 5%, ½ watt, pigtail terminals	70A49
R-104	V-103 grid return	Same as R-101	
R-105	Not used		
R-106	V-103 cathode bias	Resistor, composition, 270 ohms 10%, ½ watt, pigtail terminals	70E1197
R-107	V-103 oscillator grid return	Resistor, composition, 20000 ohms 5%, ½ watt, pigtail terminals	70A52
R-108	V-103 screen filter	Same as R-103	
R-109	V-101 plate filter	Resistor, composition, 560 ohms 10%, ½ watt, pigtail terminals	70A46
R-110	V-102 grid return	Resistor, composition, 47000 ohms 10% ½ watt, pigtail terminals	70A54
R-111	V-103 plate load	Resistor, composition, 220 ohms 10%, ½ watt, pigtail terminals	70E1289
R-112	V-103 plate filter	Resistor, composition, 680 ohms 10%, ½ watt, pigtail terminals	70E1077

1. INTRODUCTION

1.1 These instructions cover the installation, operation, and servicing of the Model SLR-12-A Radio Receiving Equipment. THEY SHOULD BE READ AND STUDIED WITH GREAT CARE BEFORE THE INSTALLATION OR OPERATION OF THE EQUIPMENT IS ATTEMPTED IN ORDER THAT OPTIMUM PERFORMANCE MAY BE OBTAINED.

2. GENERAL DESCRIPTION

2.1 The Model SLR-12-A Radio Receiving Equipment is suitable and is primarily intended for use aboard marine vessels of all types. It is equally suitable for use at Radio shore stations.

2.2 The receiving equipment covers the frequency ranges of 0.53 to 1.60 and 5.55 to 15.60 megacycles in three frequency bands. It is specifically designed to provide optimum performance and high quality reception of voice or tone modulated radio frequency signals, on all frequency bands, by head telephone or loud speaker methods. For this reason, no beat frequency oscillator for the reception of radio telegraph signals is provided.

2.3 Special circuits and features are incorporated in the Model SLR-12-A Radio Receiving Equipment to preclude its oscillator feeding voltages into the antenna circuit and radiating interferences which could be detected by sensitive radio receiving or radio direction finding equipments in the same, or close vicinity.

2.4 The receiving equipment is designed for a-c operation, being equipped with a self-contained rectifier type power supply for supplying all operating voltages required from an a-c source of 110/125 volts, 58/62 cycles, single phase, such as the Model 262 Inverter.

2.5 The audio frequency output circuits of the receiving equipment are designed to permit the use of one pair of standard head telephones separately or in conjunction with a suitable local loud speaker, of the permanent magnet type, coupled to the equipment by means of either a 600 ohm or 5000 ohm matching transformer.

2.6 The Model SLR-12-A Radio Receiving equipment consists of three major units, the Radio receiver mounted in a metal cabinet, a 115 volt D.C. to 115 volt A.C., 250 Watt inverter, and a loudspeaker of the permanent magnet type.

2.7 The equipment is supplied with one set of vacuum tubes contained within the Radio Receiver. Two instruction books and one set of spare tubes are also supplied with each equipment.

2.8 The net weights and overall dimensions of the major unit of the complete equipment are listed in Par. 8.16.

3. DESCRIPTION OF MAJOR UNIT

3.1 The Model SLR-12-A Radio Receiver is a 12 tube superheterodyne covering the frequency ranges of 0.53 to 1.60 and 5.55 to 15.60 megacycles in three frequency bands, as follows:

BROADCAST BAND
0.53 to 1.60 MEGACYCLES
SHORT WAVE BAND-1
5.55 to 9.55 MEGACYCLES
SHORT WAVE BAND-2
9.20 to 15.60 MEGACYCLES

3.2 This major unit employs the cabinet type of construction, with the cabinet suitably shock mounted and designed for top of table or bench mounting. The chassis design and construction are such that the chassis may be mounted in a standard, cabinet type, relay rack. However, this type of mounting is not recommended for installations where the equipment will be subjected to severe shock or vibration, owing to the fact, that it can be accomplished only with the sacrifice of the shock mounting feature.

3.3 The major unit contains, on a single chassis, all apparatus, (including power supply) necessary for taking energy from an antenna, amplifying and converting such energy into intermediate frequency energy, amplifying the intermediate frequency energy and then demodulating such energy into audio frequency energy for delivery, through an audio frequency amplifier to a phone jack on the front operating panel and/or one of three sets of loud speaker terminals at the rear of the chassis.

3.4 The electrical circuits of the Model SLR-12-A Radio Receiver employed for signal reception on all frequency ranges, com-

prises one stage of radio frequency amplification, first detector (or mixer), high frequency oscillator, two stages of intermediate frequency amplification operating at 455 kilocycles, a diode type second detector two stages of resistance coupled audio frequency amplification and an audio frequency power output stage. The second detector utilizes one set of elements of a dual diode; the other set of elements is utilized for an efficient noise limiter circuit. Inverse feedback is incorporated, within the audio output circuits, to maintain a relatively constant voltage across the primary of the output transformer, when the output load is varied upon connection of one or more amplifier type loud speakers across the secondary winding of the output transformer which also feeds the front panel mounted phone jack.

3.5 The power supply section of the Model SLR-12-A Radio Receiver, which is employed for supplying the necessary operating voltages for the receiver circuits, is designed for operation from a 110/125 volt, 58/62 cycle, single phase source of a-c power. The power supply includes a power transformer with r-f input filter and primary fuse, two vacuum tube rectifiers, and a two-section a-f filter.

3.6 Four audio output circuits are provided:

(1) A phone jack is mounted on the front panel and is supplied from one of three output windings on the audio output transformer. This winding is directly connected to one pair of speaker terminals at the rear of the chassis and to the phone jack through an attenuation network which limits the maximum available power at the phone jack to approximately 30 milliwatts. The phone jack is provided for monitoring purposes, by head telephone methods, since the equipment is primarily intended for loud speaker signal reproduction.

(2) The pair of speaker terminals, referred to in (1), above, is provided for the connection of the audio output of the Radio Receiver to a system of remotely installed, parallel connected Speaker Amplifiers. The output winding on the audio output transformer supplying these terminals, as well as the phone jack, is capable of supplying, by virtue of the inverse feedback associated with the audio output stage of the receiver, substantially constant voltage at the speaker terminals for any variation in load impedance from 60 to 600 ohms.

(3) A second pair of speaker terminals at the rear of the receiver chassis is supplied from a separate output winding on the audio output transformer. These terminals are provided for the connection of a high quality, permanent magnet type, locally installed loud speaker having a self-contained input transformer designed to match the 600 ohm impedance of the audio output transformer winding supplying the speaker terminals. The maximum undistorted audio power available at these terminals is nominally 2 watts.

(4) A third pair of speaker terminals, also supplied from a separate output winding on the audio output transformer, provides for the connection, at the rear of the receiver chassis, of a high quality, permanent magnet type, locally installed loud speaker having a self-contained input transformer designed to match the 5000 ohm impedance of the winding supplying the terminals. The maximum undistorted audio power available at these terminals is nominally 2 watts.

(5) FOR ANY INSTALLATION, ONLY ONE OF THE THREE SETS OF SPEAKER TERMINALS MAY BE EMPLOYED AT ANY ONE TIME FOR SUPPLYING AUDIO POWER TO LOUD SPEAKER CIRCUITS. This does not preclude the use of a head telephone set for monitoring while the required loud speaker system is in operation.

3.7 A concentric jack, Type 49120, is mounted at the rear of the chassis of the Radio Receiver for antenna and ground connection. A hole in the rear of the cabinet provides access to the jack. A concentric plug, Type 49121A, which mates with the concentric jack is furnished as part of the complete Model SLR-12-A Equipment, but with no antenna or ground leads attached.

3.8 A power receptacle and mating plug are also provided at the rear of the chassis for a-c power input connection. No power input cable is furnished.

3.9 The fuse, in the primary circuit of the power supply, is mounted adjacent to the power input receptacle at the rear of the receiver chassis. The fuse mounting is of such design that the fuse, which is of the miniature cartridge type, is replaceable without the use of tools, and without the neces-

sity for the removal of the receiver chassis from its cabinet.

3.10 Facilities are also provided, in the form of separate auxiliary terminals at the rear of the receiver chassis and a suitable switching arrangement, for connecting a phonograph pickup to the input circuits of the audio frequency amplifier. With the necessary switching completed, the radio frequency circuits are rendered ineffective during operation of the audio frequency circuits in conjunction with a phonograph pickup.

4. TUBE COMPLEMENT

4.1 The vacuum tubes employed in the Model SLR-12-A Radio Receiver are as follows:

Symbol	*Commercial Type*	*Function*
V-101	6K7	R.F. Amplifier
V-102	6J5	H.F. Oscillator
V-103	6SA7	First Detector and MIXER
V-104	6SK7	First I.F. Amplifier
V-105	6SK7	Second I.F. Amplifier
V-106	6H6	Second Detector, A.V.C.
V-107	6J5	First A.F. Amplifier
V-108	6SJ7	Second A.F. Amplifier
V-109	6K6GT	A.F. Power Output
V-110	6E5	Tuning Indicator
V-111	6X5GT	Rectifier (Full Wave)
V-112	6X5GT	Rectifier (Full Wave)

5. POWER REQUIREMENTS

5.1 The Model SLR-12-A Radio Receiving Equipment is designed for operation from a 110/125 volt, 58/62 cycle, single phase power source. The line current at 115 volts is .74 amperes. The nominal power consumption at 115 volts is 85 watts.

6. ANTENNA REQUIREMENTS

6.1 The input circuit of the Model SLR-12-A Radio Receiver is primarily designed for operation with a separate antenna not used for other equipment. A conventional single wire antenna will suffice since the antenna requirements are not critical. Such a single wire antenna should be spaced at least six feet away from any parallel stay, mast, or stack. It should be well insulated and should be erected as high as possible. The recommended minimum overall length of antenna and lead-in is fifty feet. The antenna proper (not including lead-in) should be at least fifty feet in the clear. A one-half megohm static-drain resistor should be permanently installed between the antenna and ground.

6.2 In an installation having a simple antenna-ground combination, solder the antenna lead-in to the retaining nut for the jack socket of the Type 49121A concentric plug. Connect the ground lead to the terminal provided for this purpose and mounted adjacent to the Type 49120 concentric jack af the rear of the receiver chassis.

7. INSTALLATION

7.1 The Model SLR-12-A Equipment, with its Radio Receiver equipped with one full complement of vacuum tubes, one Type 49121A concentric antenna-ground connecting plug, and one female power input plug, is shipped in a single wooden packing box. Two instruction books, one Model 262 Inverter, one loudspeaker, and one set of spare vacuum tubes, are also contained in the same packing box.

7.2 After unpacking the equipment it should be inspected for any possible damage that might have resulted from careless handling in transit. Make certain that all vacuum tubes in the Radio Receiver are firmly seated in their respective sockets. Inspection of the chassis and vacuum tubes may be readily effected upon the removal of the chassis from its cabinet. This is accomplished by removing two screws in the rear of cabinet, then loosening the four thumb screws and removing their respective retaining plates at either side of the front operating panel. The chassis may then be drawn out of the cabinet by pulling on the two handles on the front panel.

7.3 The mounting base, to which the shock mounts for the Radio Receiver are attached, should be drilled with four mounting

holes. The location and size of the mounting holes should be such as permit the use of sufficiently large screws or bolts to provide a secure mounting for the Radio Receiver when the mounting base is fastened on the top of an operating table or bench. Such security should predicate freedom from loosening or "tearing away" of the mounting screws or bolts when the equipment is subjected to strains resulting from vessel rolling in heavy seas.

7.4 In planning an installation, care should be exercised to provide adequate clearance from the back of the Radio Receiver to the bulkhead or nearest obstruction in order to provide access to the power input plug, the antenna-ground concentric plug, speaker output or phonograph input terminals, fuse, or the movement of feeder cables when withdrawing the chassis from the cabinet for servicing, vacuum tube replacement, or inspection.

7.5 Make connection to the proper 110/125 volt, 58/62 cycle, single phase, a-c power source by means of a suitable, two conductor, cable for connecting the power source with plug P-102 which is then inserted in receptacle E-106 at the rear of the receiver chassis.

7.6 Make antenna connections in accordance with Section 6, Antenna Requirements. The antenna lead, or shielded patch cable, should be soldered to plug P-101 in accordance with previously described methods.

7.7 A loudspeaker of the permanent magnet type is supplied with the equipment, this speaker should be connected to the 600 ohm terminals E-104 by means of the two conductor cable supplied with the speaker. Where two or more loud speakers are to be connected to the receiver, terminals E-105 should be used, the load applied to these terminals may be varied from 60 ohms to 600 ohms with only a 2 D.B. change in output. Where speakers are installed more than twenty five feet from the receiver the connecting cable should be shielded.

7.8 The loudspeaker should be mounted to the bulkhead or some flat surface by means of the attached brackets, the speaker can then be rotated to the desired position and fastened by tightening the screws holding the brackets to the side of the speaker case.

7.9 The model 262 inverter supplied with the equipment is used to supply 115 volts A.C. from a 115 volt D.C. source. It will supply 250 watts which is sufficient for both the SLR-12-A Radio Receiver and a record player when used. The Power cable from the SLR-12-A receiver should be plugged into receptacle E-201 on the Inverter, Plug P-201 attached to the Inverter should then be plugged into a 115 volt D.C. source, the Inverter is then ready to operate and may be turned on and off with the power switch on the front panel of the Inverter. The Inverter is protected against Overload by fuse F-201 rated at 10 amperes, 25 volts, the Vibrator Unit of the Inverter is of the Plug-in type and is easily replaced after removing the case from the unit.

7.10 A phonograph pick-up may be connected, through a suitable matching transformer, to terminals E-102 at the rear of the chassis. These terminals are marked PHONO and GND for convenience in making the desired connections.

7.11 The equipment is now ready for operation and is turned on by means of toggle switch S-201 on the front panel of the Inverter, switch S-103 on the front panel of the Receiver should be left on.

7.12 The Radio Receiver may be mounted with other units of the same type in a common cabinet type relay rack in such installations as, for example, at Radio shore stations where the problem of vibration is relatively unimportant. This is accomplished by removing the receiver chassis from its cabinet and securing the chassis on the relay rack by its front panel, using the same holes in the edges of the panel for the securing screws as for the original securing thumb screws. It is essential that a cabinet type relay rack be employed in order to preclude the accumulation of dust on the chassis mounted components, and in the tuning drive mechanism. This method of installing the Model SLR-12-A Equipment does not abrogate the contents of Paragraphs 7.5 to 7.12, inclusive, except as they might be qualified with respect to certain minor details.

8. CONSTRUCTION

8.1 The Model SLR-12-A Radio Receiver is primarily designed for top of table or bench mounting. It is furnished with its chassis housed in a metal cabinet supported from its mounting base with rubber shockmounts at the four bottom corners of the cabinet. The front panel, to which the chassis is secured, forms the enclosure for one side of the cabinet. The general appearance and type of construction employed are shown in Figures 1 and 2.

8.2 The cabinet is of fabricated construction with ventilating louvers in its two sides and clearance apertures in the rear for access to the antenna and power input receptacles, fuse, and speaker and phonograph feeder connection terminals.

8.3 The chassis assembly is rigidly secured to the front panel. All component items, exclusive of those mounted on the front panel, entering into the construction of the Radio Receiver, are mounted either on top or underneath the chassis structure. The chassis and front panel form a basic assembly capable of being inserted or withdrawn from the cabinet, as a unit.

8.4 When the chassis assembly is housed in the cabinet, it is secured to the cabinet by the front panel through the use of eight knurled, captivated type, thumb screws which pass through four slots in opposite edges of the panel and engage with suitable inserts in the flanged sides of the front opening of the cabinet. The captivated type thumb screws are retained, when loosened, in groups of four in removable angles which also serve as "trim," for the front side corners of the cabinet, by concealing the mounting screw slots in the front panel. Two handles are conveniently arranged on the front panel to permit the insertion or removal of the chassis assembly without subjecting any of the operating controls to strain.

8.5 The construction of the chassis assembly and the arrangement and mounting of the component parts are clearly depicted in Figures 3 to 6, inclusive. All vacuum tubes are accessible from the top side of the chassis upon removal of the chassis from the cabinet. The design and construction of the chassis assembly, and the arrangement of the component items mounted thereon, provides a high degree of accessibility to all items for inspection, servicing, or replacement. A bottom cover plate, not shown in Figures 5 & 6, completely encloses the bottom of the chassis proper. It is provided as an added shielding feature, and for the protection of the under side chassis mounted components against damage due to careless handling. It is secured to the chassis with machine screws so that it is readily removable, as and when necessary to make repairs or to effect replacement of chassis mounted components.

8.6 The receiver panel layout is shown in Figure 1, and the location and functions of the various controls are described in Section 10, Operating Instructions.

8.7 The Model SLR-12-A Radio Receiver is especially designed to minimize radiation from the high frequency oscillator. This is accomplished by isolating the antenna input circuits from the first detector (or mixer) and the high frequency oscillator circuits, through the use of extensive shielding and filtering, and by the employment of a type of construction which reduces, to practical limits, undesirable circuit coupling by virtue of circulating currents in common shields.

8.8 A separate shielded compartment, designed as a complete sub-assembly and easily detachable, as such, from the chassis for inspection and servicing of the component parts which it houses, contains all the circuit elements between the antenna input and the signal grid of the R.F. amplifier tube. This sub-assembly, as pictured in Figures 3 to 6, inclusive, is mounted at the rear center of the chassis, and is centrally disposed, above and below the chassis, through an aperture in the chassis. The compartment is grounded at only one point on the chassis and since the mounting flanges are insulated from the chassis this ground constitutes the only grounding for the compartment. Details of the construction of the shielded compartment and the arrangement and mounting of the component parts, which it contains, are shown in Figure 8. The figure depicts an oblique rear view of the shielded compartment with the sides removed or opened to display the internal components. The compartment, as pictured, is inverted with respect to its normal position in the receiver.

8.9 A second shielded compartment, constructed and mounted in the same manner as for that containing the antenna circuit elements, but larger in overall dimensions, contains all of the circuit elements from the R. F. amplifier tube to the 1st I. F. amplifier input transformer, and includes also, all circuit elements associated with the high frequency oscillator. This compartment, as pictured in Figures 3 to 6, inclusive, is mounted on the chassis between the front panel and the compartment containing the antenna input circuit elements. The arrangement and mounting of the circuit components are depicted in Figure 7 which portrays an oblique view of the sub-assembly with the bottom cover plate removed to show the disposition of the internal circuit components. This view depicts the sub-assembly in an inverted position with respect to its normal position in the receiver. Circuit components, associated with the compartment sub-assembly, and not visible in Figure 7, are shown in Figure 4 which shows the two compartment sub-assemblies, described above, mounted in their normal positions, but with their top shield cover plates removed.

8.10 Insulated mechanical couplings are employed for joining together the shafts of the tuning capacitors and band selector

switches in the two shielded compartments. These couplings are shown in Figures 3 to 6 inclusive. The R.F. amplifier tube is mounted in a horizontal position in a socket which is provided with a clamp for securing the tube in place. The socket is mounted on one side wall of the large compartment and all wiring thereto is contained within the shielded compartment. The vacuum tube then projects into the side of the compartment containing the antenna circuit components, and connection to the signal grid cap is made within the confines, of this compartment. The internal shields in the vacuum tube isolates the signal grid circuit from the plate circuit, and, in effect, completes the shielding of the antenna circuit compartment so that these circuits are electrically isolated from the plate circuit of the R.F. amplifier tube, insofar as stray coupling from the high frequency oscillator is concerned.

8.11 Removable cover plates, secured with thumb screws, are provided on the two shielded compartments for access to the vacuum tubes contained within. Similar cover plates on the bottoms of the shielded compartments are secured with conventional machine screws. Either the top or bottom cover plate, as described above, must be removed for access to the circuit trimmers of the R.F. amplifier, 1st detector and high frequency oscillator, since it was not possible to provide access holes in the plates, themselves, without compromising the shielding integrity of the receiver.

8.12 The secondary windings of the antenna coupling transformers feeding the grid of the R.F. amplifier tube are provided with individual adjustable iron cores for inductance trimming, and adjustable mica dielectric trimmer capacitors for capacity trimming during circuit alignment. Adjustment of the trimmer capacitors is afforded through access holes in the rear of the shielded compartment housing these transformers. Corresponding holes in the rear of the chassis and cabinet permits the adjustment of the trimmer capacitors, as a final adjustment, in the installation of the equipment for optimum performance with the specific antenna employed, without the necessity for the removal of the receiver chassis from its cabinet. Access to the adjustable iron cores is provided upon the removal of the top cover plate of the shielded compartment containing the antenna coupling transformers.

8.13 The r-f transformers, coupling the plate of the R.F. amplifier tube with the signal grid of the first detector, are each provided with both inductance trimmers, in the form of adjustable iron cores, and capacity trimmers in the form of adjustable mica dielectric trimmer capacitors, for purposes of alignment, of these circuits with the high frequency oscillator circuits. Access to all trimmers, either capacitive or inductive, is afforded upon the removal of the bottom cover plate from the shielded compartment containing these transformers.

8.14 The inductors employed in the high frequency oscillator circuits are similarly provided with adjustable powdered iron cores, and adjustable, air-dielectric trimmer capacitors for inductance and capacity trimming. These adjustable trimmers, together with "padder" capacitors, permit the "tracking" of the high frequency oscillator circuits with the R.F. amplifier circuits. The "padder" capacitors are, except for the BROADCAST BAND, of the fixed, molded phenolic, mica dielectric type. In the excepted case, an adjustable, air-dielectric capacitor is employed in parallel with the fixed capacitor. All adjustable trimmer and "padder" capacitors are accessible for adjustment upon the removal of the bottom cover plate of the compartment containing these circuit elements.

8.15 The cabinet, front panel and mounting base of the Radio Receiver have a standard black wrinkle finish. All metallic parts which enter into the construction of the chassis are finished with a suitable plating or paint to provide; first, a high degree of protection to these parts against the deleterious effects of corrosion; and second, a chassis assembly presenting a pleasing appearance.

8.16 The dimensions and weights of the Radio Receiver are as follows:

(1) *Dimensions:*

	Chassis in Cabinet	*Chassis Only*
Length	20.50 inches	19.00 inches
Depth	18.50 inches	18.50 inches
Height	13.75 inches	10.50 inches

(2) *Weights:*

Chassis in Cabinet — 103 pounds
Chassis Only — 79 pounds

9. CIRCUIT DESCRIPTION

9.1 GENERAL

9.11 The actual schematic diagram of the Model SLR-12-A Radio Receiver is shown in Figure 9. For purposes of illustration, it will be assumed that the circuits are set up as for signal reception on SHORT-WAVE BAND-2, as depicted in the diagram. The following description will refer, there-

fore, to the symbol numbers of the circuit elements of the band as, or when, pertinent to the description. It shall be assumed that, unless otherwise specifically noted, the description will be equally applicable to SHORT-WAVE BAND-1 and the BROADCAST BAND.

9.2 Signal Frequency Circuits

9.21 Signal input to the receiver through concentric jack J-103 is connected to the primary winding of antenna input transformer T-103 by switch S-102E. An electrostatic shield, at ground potential, separates the secondary winding from the primary winding. The secondary winding together with variable, air dielectric capacitor C-156 and series capacitor C-134, constitutes the first tuned circuit. Transfer of r-f signal, at the resonant frequency of this tuned circuit, from the antenna to the control grid of R.F. amplifier tube V-101, is accomplished by inductive coupling through antenna input transformer T-103. Variable capacitor C-156 is ganged with variable capacitors C-144A and C-144B to provide uni-controlled tuning of the receiver. Capacitor C-134 is shorted out for the BROADCAST BAND and its selection and proper connection is controlled by switch S-102D. The secondary winding of transformer T-103 is provided with adjustable iron core E-123, for inductance trimming, and a shunt connected, variable, mica dielectric capacitor C-151 for capacity trimming. These trimmer elements permit the accurate alignment of the tuned circuit with the succeeding tuned circuit, at both ends of the frequency band, and are accessible for adjustment, as described under Section 8. The high potential end of the tuned circuit is connected to the control grid of R.F. amplifier tube V-101 by switch S-102D and through coupling capacitor C-123. The low potential end of the tuned circuit is returned to ground. The d-c bias return from the control grid of R.F. amplifier tube V-101 to the A.V.C. bus is closed through grid resistor R-135.

9.22 Plate potential from the high voltage d-c bus is applied to the plate of R.F. amplifier tube V-101 through decoupling filter resistor R-112, by-passed to ground by capacitor C-109B, and r-f inductor L-101. Screen potential, also obtained from the high voltage d-c bus, is applied to the screen through a decoupling filter consisting of filter resistor R-126 and by-pass capacitor C-109C. The suppressor is connected to the side of the heater circuit which is operated at ground potential. Initial grid bias is obtained by means of cathode resistor R-109, by-passed by capacitor C-109A.

9.23 The amplified signal voltage from the plate of R.F. amplifier tube V-101 is applied to the primary winding of R.F. transformer T-106, through coupling capacitor C-124, by switch S-102C. The low potential end of the primary winding is returned to ground. The secondary winding of transformer T-106, together with variable, air dielectric tuning capacitor C-144A and series connected capacitor C-135 (the latter employed for the same purpose and in the same manner as capacitor C-134), constitute the second and final tuned circuit operating at the signal frequency. Transfer of signal energy from the plate circuit of R.F. amplifier tube V-101 to the control grid of first detector tube V-103 is accomplished by inductive coupling through R.F. transformer T-106 and by the connection of the high potential end of the tuned circuit to the control grid of first detector tube V-103 by switch S-102C, through coupling capacitor C-125. The low potential end of the tuned circuit connects to ground. Adjustable iron core E-126 and parallel connected (variable) mica dielectric trimmer capacitor are associated with the tuned circuit for purposes of circuit alignment and are accessible for adjustment as described in Section 8. The d-c bias return from the control grid of first detector tube V-103 to the A.V.C. bus is closed through grid resistor R-136.

9.24 Screen potential from the high voltage d-c bus is applied to the screen of first detector tube V-103 through r-f inductor L-102, by-passed to ground by capacitor C-129, and thence through decoupling filter resistor R-144, by-passed to ground by capacitor C-107B. The suppressor is internally connected to the shell of the tube. Initial bias is obtained by means of cathode resistor R-105, by-passed to ground by capacitor C-107A.

9.3 High Frequency Oscillator Circuits

9.31 The H. F. oscillator circuit is of the so called "electron coupled" type. The tuned circuit consists of tapped inductor element T-109, shunted with variable, air dielectric trimmer capacitor C-147 and tuned with variable, air dielectric tuning capacitor C-144B, series connected capacitor C-136 and padder capacitor C-143. Capacitor C-136 is shorted out by the switch S-102B for the BROADCAST BAND. The inductor element is also provided with adjustable iron core E-129 for inductance trimming. Padder capacitor C-143 is used to modify the tuning of the H. F. oscillator so that it will maintain a fixed frequency difference of 455 kilocycles with respect to the signal frequency when tuning capacitors C-156, C-144A and C-144B are simultaneously varied from minimum to maximum capacity. The high potential end

of the oscillator tuned circuit is connected, by switch S-102B, through coupling capacitor C-132 to the control grid of the H. F. oscillator tube V-102. This grid is returned to ground through grid resistor R-122 for d-c bias return. The low potential end of the tuned circuit is also returned to ground. The cathode of H. F. oscillator tube V-102 is connected, by switch S-102B, to the tap on inductor element T-109, and through coupling capacitor C-131 to the oscillator injector grid of first detector tube V-103. This grid has a d-c return to ground through grid resistor R-118.

9.32 The plate of H. F. oscillator tube V-102 is connected to the high voltage d-c bus through decoupling filter resistor R-143, by-passed to ground by capacitor C-106B, and r-f filter inductor L-103, by-passed to ground by capacitor C-130. One side of the heater circuit operates at ground potential while the other side is filtered by capacitors C-106A and C-128 and r-f filter inductor L-104.

9.4 I. F. Amplifier Circuits

9.41 The signal frequency arriving at the control grid of first detector tube V-103 and the H. F. oscillator frequency arriving at the injector grid of this tube are mixed (or hetrodyned) and the resultant difference frequency (455 kilocycles) is fed to the input of the intermediate frequency amplifier.

9.42 Transfer of intermediate frequency energy, from the first detector tube V-103 to second detector tube V-106 is accomplished by inductive coupling through I. F. transformer T-110, T-111, and T-112 and amplified through I. F. amplifier tubes V-104 and V-105. First I. F. transformer T-110 consists of two tuned circuits, primary and secondary, with the secondary tuned circuit operating in conjunction with switch S-101B, resistors R-103 and R-104 and a tertiary winding to provide three degrees of selectivity by changing the electrical constants of the secondary tuned circuit and its coefficient of coupling with the primary tuned circuit. The primary and secondary windings are each tuned to the intermediate frequency by fixed, mica dielectric capacitors C-137 and C-138, augmented by adjustable iron cores E-130 and E-131, provided for inductance trimming, and accessible through the top and bottom of the transformer shield can. The high potential end of the primary tuned circuit connects to the plate of first detector V-103 through a shielded conductor, while the low potential end connects to the high voltage d-c bus through decoupling filter resistor R-113, by-passed to ground by capacitor C-112A. The high potential end of the secondary tuned circuit is connected to the grid of first I. F. amplifier tube V-104 while the low potential end is connected to the A.V.C. bus through A.V.C. filter R-134 and C-112B.

9.43 Screen potential from the high voltage d-c bus is applied to the screen of first I. F. amplifier tube V-104 through decoupling filter resistor R-127, by-passed to ground by capacitor C-113B. Initial cathode bias is applied through bias resistor R-110, by-passed by capacitor C-113A.

9.44 Second I. F. transformer T-111 is identical to first I. F. transformer T-110, with respect to its design, construction, and operating characteristics. Accordingly, except for differences in circuit symbol designations, which becomes obvious upon examination of Fig. 9, the circuit description of paragraph 9.42 is applicable to this transformer, in all details, except that the low potential end of the secondary tuned circuit is returned to ground instead of to the A.V.C. bus.

9.45 The circuit arrangement of second amplifier tube V-105 is the same, except for symbol designations, as described for the first I. F. amplifier tube V-104, in paragraph 9.43 above. No automatic control of control grid bias is provided for this tube, however.

9.46 Third I. F. transformer T-112 contains a tuned primary circuit and an untuned secondary circuit. The primary tuned circuit consists of the primary winding shunted by fixed, mica dielectric capacitor C-133, and permeability tuned by adjustable iron core E-134 which is accessible, for adjustment, through the top of the transformer shield can. Plate potential to the plate of third I. F. amplifier tube V-105 is applied from the high voltage d-c bus through the primary winding and decoupling filter resistor R-115, by-passed to ground by capacitor C-116B. The high potential end of the secondary winding feeds the second detector diode while its low potential end connects to the A.V.C. bus.

9.5 Second Detector Circuits

9.51 Tube V-106 is a dual diode tube, one section is used as a second detector the plate of which is connected to the high potential end of the secondary winding of third I. F. transformer T-112. The cathode is grounded thus the tube acts as a half-wave rectifier. The voltage appearing across diode load resistor R-130, R-131 is filtered by resistor R-139 and condenser C-114A and the resulting direct current A.V.C. voltage is used to control the gain of amplifier tubes V-101, V-103, V-104, the degree of control being de-

pendent on the strength of the incoming signal. The other half of dual diode V-106 is used in a very efficient noise limiter circuit which reduces peak noise levels so that weak signals may be received in locations where the noise level is high.

9.6 A. F. Amplifier Circuits

9.61 The a-f voltage developed across the diode load resistor R-130, R-131 as the result of the demodulating action of the second detector tube V-106, is applied to the control grid of first A. F. amplifier tube V-107, through coupling capacitor C-117, by switch S-101A and VOLUME control potentiometer R-146.

9.62 Switch S-101A is ganged with switch S-101B and S-101C. It operates to transfer the input to VOLUME control potentiometer R-146, and hence, the input circuits of first A. F. amplifier tube V-107 from the second detector circuit to PHONO terminals E-102 to permit the operation of the audio amplifier system of the Receiver with a high impedance phonograph pick-up. Low impedance pick-ups may also be employed provided that their connection to E-102 are made through suitable matching transformers.

9.63 Amplification of the a-f signals from the second detector is accomplished by resistance-capacity coupling between first and second A.F. amplifier tubes V-107 and V-108, respectively, and the output amplifier tube V-109. Transfer of audio frequency energy, from the plate of output amplifier tube V-109 to head telephone PHONE(S) jack J-101 and loud speaker terminals E-103, E-104, and E-105, is accomplished through output transformer T-113, E-104 and E-105, which matches the plate impedance of the tube with the separate loads with which the Receiver is designed to operate. A resistance net work, consisting of resistors R-106, R-107, and R-108 is connected between head telephone jack J-101 and the secondary winding of output transformer T-113 to reduce the maximum audio power below that available at speaker terminal E-105.

9.64 Inverse feed back is provided for the second A. F. and output amplifier stages to maintain approximately constant voltage across the primary winding of output transformer T-113 for relatively wide changes in output load, as specified elsewhere in these instructions.

9.65 A separate high voltage d-c bus supplies d-c voltage to the plates and screens of A. F. amplifier tubes V-107, V-108 and V-109. Direct current potential is applied to the plate of first A. F. amplifier tube V-107 through load resistor R-123 and decoupling filter R-124 and C-155; to the screen of second amplifier tube V-108 through decoupling filter R-138 and C-108B, to the plate of this tube through load resistor R-132, and decoupling filter R-125 and C-108A; and finally, to the screen and plate of output amplifier tube V-109, directly, with respect to the screen, and through the primary of output transformer T-113.

9.66 Variable potentiometer R-147 and series connected capacitor C-118 constitutes the control for regulating the fidelity of the audio amplifier system of the Receiver. The series combination is connected between the plate of first A. F. amplifier tube V-107 and ground.

9.7 Rectifier Power Circuits

9.71 The proper a-c heater potential for all vacuum tubes except the rectifiers is obtained from a common secondary winding of power transformer T-114. One side of the secondary is operated at ground potential. High voltage a-c plate potential from a second secondary winding of the transformer is applied to the parallel connected plates of rectifier tubes V-111 and V-112. The rectified pulsating potentials are derived from each cathode and fed through separate filters to two separate high voltage d-c feeder circuits to the Receiver vacuum tubes. The cathode of rectifier tube V-111 supplies d-c power to one feeder line through filter L-105, C-103, C-104 and C-110, while the cathode of rectifier tube V-112 supplies d-c power to the second feeder line through filter L-106, C-101, C-102 and C-120.

9.72 The a-c power input line to the primary winding of power transformer T-114 is filtered by capacitors C-111A and C-111B to prevent stray r-f potentials from being applied across the primary winding. Power is applied through switch S-103 in one side of the line circuit, which also is fused by F-101.

10. OPERATING INSTRUCTIONS

10.1 All switches and controls (with the exception of the main tuning control) of the Model SLR-12-A Radio Receiver are identified by panel engraving.

10.2 The main tuning control knob E-118 is centrally located near the bottom of the front panel and is secured to a shaft which drives the ganged, main tuning capaci-

tors through a friction operated mechanical drive. The mechanical drive, also controls the movement of dial pointer N-106, through a system of pulleys and a flexible bronze cable, across the face of main tuning dial, N-107. Dial disc N-104, which carries a linear dial scale and operates in conjunction with fixed index plate N-105, is rotated by the tuning drive mechanism in such a manner that one rotation is completed with a complete traverse of dial pointer N-106 across the face of main tuning dial N-107. Main tuning dial N-107 is of Lucite with white scale markings and characters on a black background. This dial carries a frequency scale for each band. The Lucite dial is framed with escutcheon plate H-110, fitted with a transparent shatter-proof lens. Indirect dial illumination is afforded by edge lighting of the Lucite dial plate, from suitably placed dial lamps mounted behind the panel and at the two sides of the dial plate.

10.3 The VOLUME control is located at the left of the main tuning control and is operated by control knob E-117. The control is a potentiometer which operates to adjust the signal input level that is applied to the grid of the first A.F. amplifier tube, and hence, the signal level at the output terminals of the receiver, since the A.F. amplifier is operated at constant gain. Clockwise rotation of control knob E-117 increases the audio output signal level.

10.4 The FIDELITY control, located at the left of the VOLUME control, is operated by control knob E-116. It is a rheostat which operates, in conjunction with a series connected fixed capacitor, in the plate circuit of the first A.F. amplifier tube to limit the high frequency response of the receiver. Full clockwise to full counter-clockwise rotation of this control affords a continuous reduction of the high frequency audio response. The control should be adjusted to an extreme clockwise setting for high fidelity reception. For such reception, the SELECTIVITY control, described in Paragraph 10.8 should be set at BROAD.

10.5 Immediately above the FIDELITY control is mounted PHONE(S) jack J-101 which is provided to permit monitoring of the received signals by head telephone methods, as described in previous portions of these instructions.

10.6 The power on-off toggle switch, located at the upper left-hand corner of the operating panel of the receiver, is connected in the power line input circuit and is provided to apply or remove line power to or from the complete equipment.

10.7 A BAND SELECTOR switch, operating by control knob E-119, is located at the right of the main tuning control knob E-118. This control operates to select the R.F. and high frequency oscillator circuits for the three frequency ranges covered by the Model SLR-12-A Radio Receiver. The settings of this switch for the three frequency bands covered by the Receiver are marked SW2, SW1 and BC, in left to right sequence.

10.8 The SELECTIVITY control is located adjacent to the BAND SELECTOR control. It operates the ganged, rotary type, four-position switches, operating in conjunction with the second I. F. transformers, to vary the selective characteristics of the I. F. amplifier. Selectivity control is afforded by three positions of the ganged selector switches to provide for three degrees of selectivity, namely SHARP, MEDIUM and BROAD; while the fourth position of the ganged switches connects the "PHONO" input terminals, at the rear of the Receiver chassis, to the input of the audio amplifier through the VOLUME control. The panel markings for the four-positions of the SELECTIVITY control are marked in left to right sequence, SHARP, MED, BRD and PHONO.

10.9 There is located at the upper right hand corner of the Receiver panel an electron ray indicator which indicates when the Receiver is tuned to resonance with the frequency of the received signals. Resonance is indicated by the shadow angle of the electron ray indicator, which should be adjusted, by manipulation of the main tuning control, until the two halves of the shadow approximately meet. The shadow of the electron ray indicator can be adjusted on a strong signal, so that the two halves of the shadow just meet, by turning the eye-adjusting control R-148 with a screwdriver. CAUTION: WHEN TUNING THE RECEIVER ALWAYS TURN THE SELECTIVITY CONTROL TO THE *SHARP* POSITION AND TUNE FOR MAXIMUM SIGNAL AS INDICATED BY THE ELECTRON RAY INDICATOR. Should the receiver be tuned while the SELECTIVITY control is at MEDIUM or BROAD, the electron ray indicator may indicate maximum signal on either side of resonance owing to the fact that the selectivity characteristic of the I. F. amplifier has somewhat of a flat-top characteristic in each of these two positions of the selectivity control. After the Receiver has been properly tuned to resonance, as described above, the SELECTIVITY control may then be adjusted to the BROAD and MEDIUM positions as desired. Hand grips H-111 and H-112, are mounted on either side of the panel for convenience in the removal of the chassis from its cabinet without subjecting any of the operating controls to undue strain.

11. PERFORMANCE DATA

11.1 The SENSITIVITY vs. FREQUENCY curves are plotted in Plate 1 and are representative of the overall sensitivity of the Model SLR-12-A Radio Receiving Equipment over the three frequency bands covered by the Radio Receiver. These curves, together with the OVERALL SELECTIVITY curves shown in Plate 2, provide data for definitely checking the Radio Receiver to determine if repairs or re-alignment are necessary since the majority of circuit element failures or any misalignment will reduce the sensitivity of the equipment. The data referred to above will, therefore, also serve to show the efficacy of repairs or realignment.

11.2 The selectivity of a radio receiving equipment is that characteristic which determines the extent to which it is capable of differentiating between the desired signal and disturbances of other frequencies. The OVERALL SELECTIVITY curves of Plate 2, are representative of the overall selectivity characteristics of the equipment for the three degrees of selectivity, that is made possible by suitable adjustment of the SELECTIVITY control of the Radio Receiver. Over the frequency ranges covered by the Model SLR-12-A Radio Receiving Equipment, the OVERALL SELECTIVITY, for any adjustment of the SELECTIVITY control, will be essentially the SELECTIVITY characteristics of the intermediate frequency amplifier. For signal frequencies below 1000 kilocycles, the OVERALL SELECTIVITY characteristics for the BROAD and MEDIUM adjustments of the SELECTIVITY control will be somewhat sharper than shown by the corresponding curves in Plate 2, due to "side band cutting" by the tuned circuits of the r-f amplifier preceding the first detector.

11.3 The image attenuation is the degree to which a superheterodyne type of radio receiving equipment is capable of rejecting signals off resonance which, in combination with the fundamental or any harmonic of the conversion oscillator, produce intermediate frequencies which are amplified by the intermediate frequency amplifier and result in spurious responses. The IMAGE ATTENUATION vs. DESIRED SIGNAL FREQUENCY curves of Plate 3, show the extent to which the Model SLR-12-A Radio Receiving Equipment is capable of rejecting image responses. The curves of Plate 3, are representative of the extent to which primary image frequencies are attenuated by the preselector tuned circuits of the Radio Receiver. The primary image frequency is equal to the desired signal frequency plus two times the intermediate frequency. The attenuation of the primary image, corresponding to any desired signal frequency, as derived from the curves of Plate 3, is predicated on the ratio between the r-f inputs, at the desired signal and primary image frequencies, to produce a constant output as measured with the receiver tuned for resonance with the desired signal frequency.

11.4 The intermediate frequency rejection offered by the Model SLR-12-A Radio Receiver is better than 75.0 decibels. This expression is the ability of the Model SLR-12-A Radio Receiving Equipment to reject signals at the frequency to which the intermediate frequency amplifier is resonated.

11.5 The A.V.C., OVERALL FIDELITY, and A.F. AMPLIFIER FIDELITY characteristics shown on Plates 4, 5, and 6 are necessary when particular performance checks are desired, but are of secondary importance in most cases in the determination of the necessity for repairs or realignment.

11.6 The maximum undistorted power output, as measured at 400 cycles across a load impedance of 60 ohms connected to terminals E-105, is approximately 2 watts. Due to the inverse feed-back feature associated with the audio amplifier system of the Radio Receiver, the voltage appearing across terminals E-105 remains constant, within a total tolerance of 2 decibels, as the load impedance is varied from 60 to 600 ohms. A maximum undistorted power output of approximately 2 watts may also be obtained across terminals E-104 and E-103 when connected to load impedances of 600 and 5000 ohms, respectively, providing that at no time more than one set of output terminals E-103, E-104, or E-105 are used.

11.7 The high frequency oscillator radiation, as measured at the r-f input terminals of the Radio Receiver, is less than 400 micro-microwatts at any frequency covered by the Model SLR-12-A Radio Receiving Equipment. This characteristic will permit "safe" operation of the equipment on Marine vessels.

12. MAINTENANCE-FAILURES AND REMEDIES

12.1 General

12.11 Adequate test equipment for maintenance of Model SLR-12-A Radio Receiving Equipment should include the following items:

(1) A Radio Frequency Standard Signal Generator.

(2) An audio output meter, General Radio Company Type 583A, or equivalent.

(3) A Model OE Analyzer, or equivalent, for resistance measurements, testing vacuum tubes and measuring a-c and d-c potentials and currents in the circuits with which the tube under test is associated. The Performance and Test Data of Sections 11 and 13 may be determined with equipment as listed above.

12.12 In making any tests or adjustments, it is essential that the operator consider the influence that any one circuit element may have upon other associated circuits. The Test Data of Section 13 will be particularly helpful in determining extent of such influences and the necessity for making further replacement after a fault in one particular circuit element has been located and repaired.

12.13 Any repairs in the Model SLR-12-A Radio Receiving Equipment which necessitate resoldering of joints should be made with care. The new joint should be such that the pieces to be soldered are firmly connected mechanically before solder is applied.

12.2 Tube Replacement

12.21 ALL TUBES SUPPLIED WITH THE EQUIPMENT OR AS SPARES ON THE EQUIPMENT CONTRACT SHALL BE USED IN THE EQUIPMENT PRIOR TO EMPLOYMENT OF TUBES FROM GENERAL STOCK.

12.22 Failure of a vacuum tube in the Receiver may reduce the sensitivity of the equipment to radio signals, produce intermittent operation or cause the equipment to be completely inoperative. In such cases all tubes should be checked either in an analyzer, or similar tube testing equipment, or by replacement with tubes of proven quality. When any tube is tested it should be tapped or jarred to make sure it has no internal loose connections or intermittent short-circuits.

12.23 When tube replacements become necessary, substitution of new tubes may alter alignment of r-f or i-f amplifier circuits inasmuch as the replacement tubes may not be identical with those originally employed. The necessity for realignment as well as alignment procedure are discussed in Section 14.

12.3 Failure of the Radio Receiver

12.31 In case of breakdown or failure of the Model SLR-12-A Radio Receiver, the fault must first be localized in one portion of the circuit. This can be accomplished by observation of some peculiar action of one of the controls or by checking the Receiver against Test Data tabulated in Section 13. Reference to Figures 1 to 9, inclusive, will show the location of any component part of the Receiver. Functions and ratings of component parts are given in Parts List, Section 15.

12.32 It must be remembered that the Test Data of Section 13 will not positively locate certain faults. For instance, an open-circuited by-pass capacitor will not appear in point to point resistance tests and may introduce regeneration or oscillation in certain circuits which effect the stage gain of other circuits. Similarly, a short circuit occurring in a low resistance inductor will not appear in point to point resistance tests and if the short appears in an R.F. coil, a false indication of the necessity for realignment may result.

12.33 By-pass or filter capacitors, which develop poor internal connections or which become open-circuited, will cause decreased sensitivity and/or poor stability. The defective unit can generally be located by temporarily connecting a good capacitor in parallel with each capacitor that is under suspicion.

12.34 Failures of any by-pass or filter capacitor may seriously overload resistors of associated circuits. Overloads of sufficient magnitude to permanently damage a resistor will cause the painted surface of the resistor to be scorched, making the defective unit easy to locate by visual inspection.

12.35 Open, — or short-circuited resistors can be definitely located by testing the resistance of each individual resistor. The Schematic diagram, Figure 9, should be consulted to make sure that any particular resistor under test is not connected in parallel with some other circuit element which might produce misleading measurements.

12.36 Loose connections, causing intermittent or noisy operation, and which cannot be found by point to point resistance

tests, can usually be located by individually testing each circuit element, or by tapping or shaking the component, under suspicion, when the Receiver is adjusted for normal operation.

12.37 The primary fuse F-101 will "blow" when the primary circuit, of transformer T-114, is subjected to a sustained primary current in excess of approximately two amperes.

13. TEST DATA

13.1 The TUBE SOCKET VOLTAGES AND CATHODE CURRENTS, Table 1 must not be considered as a list of the actual operational voltages and currents in the circuits of the Model SLR-12-A Radio Receiver. The resistance of the measuring instruments, together with capacitive and resistive loading effects, will disturb many of the circuits to such an extent that they become inoperative, thus altering normal voltage and current distribution.

13.2 The only currents listed in Table 1 are those in the various cathode circuits. This listing is a desirable simplification, inasmuch as measurements of cathode current constitutes a definite check on all circuits directly associated with the vacuum tube in question.

13.3 The POINT TO POINT RESISTANCE Table 2 shows average resistance values in the Model SLR-12-A Radio Receiver with speakers disconnected from terminal panels E-103, E-104, E-105 and headphones removed from PHONES(S) jack J-101. The vacuum tubes need not be removed from their sockets. In using Table 2, the statements of Par. 12.32 must be given consideration.

13.4 All measurements in Table 1 are made with the Receiver connected for normal operation a 115 volt, 60 cycle, single phase a-c power source. The *VOLUME* control should be adjusted for full clockwise rotation and the FIDELITY control for approximately mid rotation.

13.5 Stage Gain Measurements

13.51 The sensitivity measurements, listed below, are made under the following conditions:

(1) The Model SLR-12-A Radio Receiving Equipment is set up in accordance with Par. 14.13. The Standard Signal Generator is connected in accordance with Par. 14.23, except that the high potential output lead is connected to the control grid of the tubes specified in Table 3.

(2) Adjust the standard Signal Generator for a test signal frequency of 455 kilocycles, modulated 30% at 400 cycles.

(3) The VOLUME control of the Receiver is fully advanced, the FIDELITY control set approximately mid position and the SELECTIVITY control on SHARP position.

(4) Table 3 as a tabulation of the minimum allowable I.F. sensitivity (maximum signal input) for 10 milliwatts as measured at the PHONE(S) jack with the General Radio Type 583A output meter.

Table 3

V-105 Grid	60000 uv ± 5000 uv

14. ALIGNMENT DATA

14.1 General

14.11 Should realignment of the Model SLR-12-A Radio Receiver become necessary, the following alignment data should be carefully studied before making any circuit adjustments. It is important that the operator understand the functions of each circuit element so that correct alignment may be obtained quickly and accurately. The alignment data of this section is, therefore, supplemented by Section 8, Construction, and Section 9, Circuit Description.

14.12 Performance Data and Test Data, presented in Sections 11 and 13, will be particularly helpful in determining the necessity for making any specific adjustments. The operator is cautioned against making any adjustments indiscriminately and he should not realign any circuit unless tests definitely indicate realignment is necessary.

14.13 All alignment and calibration tests, measurements, etc., may be made with the Standard Signal Generator, or similar equipment, and an output meter, General

Radio Type 583A, or equivalent. All tests are made with the Standard Signal Generator adjusted to provide a test signal having 400 cycle 30% modulation, unless otherwise specified.

14.14 Before proceeding with the alignment of any circuit of the Model SLR-12-A Radio Receiver, other than adjustment of trimmer capacitors associated with the secondary windings of the antenna coupling transformers, then the Receiver chassis must be taken out of its cabinet; the bottom cover plate of the chassis; top cover plate of the shielded compartment (Fig. 8), containing the antenna coupling transformers; and the bottom cover plate of the shielded compartment containing the H.F. oscillator and R.F. transformers, (Fig. 7) must be removed. Removal of the latter cover plates provide access to the capacitive and inductive trimming components.

14.15 The Model SLR-12-A Radio Receiver must be connected to 115 volt, 60 cycle, single phase, A.C. power source; the power switch S-103 to ON; SELECTIVITY control knob, E-120, to SHARP; FIDELITY control knob E-116 to approximate mid position, and, VOLUME control knob E-117 to full clockwise rotation. An output meter, General Radio Type 583A, or equivalent, should be connected either to the PHONE(S) output jack J-101, or to speaker terminals E-105, and adjusted for 600 ohm impedance.

14.16 The complete alignment of the Radio Receiver may be divided into four steps:

(1) Intermediate frequency amplifier alignment.
(2) High frequency oscillator alignment.
(3) Radio frequency amplifier alignment.
(4) Trimming of antenna input circuit.

NOTE: THE CIRCUITS MUST BE CHECKED IN THE ABOVE ORDER WHEN COMPLETE ALIGNMENT IS NECESSARY.

14.2 I. F. Amplifier Alignment

14.21 The intermediate frequency of the Radio Receiver is 455 kilocycles, plus or minus one kilocycle.

14.22 Tuning adjustments are provided in each I.F. transformer. These adjustments consist of adjustable iron cores and are designated by symbol numbers E-130 to E-134, inclusive, as indicated on schematic diagram, Figure 9.

14.23 The high potential lead of the Standard Signal Generator should be connected to the control grid (terminal No. 5) of the first detector tube V-103 and the ground potential lead to any metal part making direct connection to the chassis.

14.24 The frequency of the Standard Signal Generator should be carefully adjusted to 455 kilocycles and the signal input to first detector tube V-103 adjusted to provide a reading on the output meter. The I.F. tuning adjustments, listed in Paragraph 14.22, should be carefully adjusted to give a maximum reading on the output meter. The order in which the adjustments are made is unimportant.

NOTE: IT IS ESSENTIAL THAT THE INPUT SIGNAL, FROM THE STANDARD SIGNAL GENERATOR, BE KEPT BELOW THE THRESHOLD OF OPERATION OF THE AUTOMATIC VOLUME CONTROL. EXCESSIVE SIGNAL INPUTS WHICH WILL CAUSE OVERLOAD OF EITHER THE SECOND DETECTOR OR AUDIO CIRCUITS SHOULD ALSO BE AVOIDED.

14.25 The performance of the Model SLR-12-A Radio Receiver, from the control grid of the first detector to the output load, can be checked against the stage gain data in Table 3, Section 13, after alignment has been completed. Similarly, the selectivity may be checked against the curves of Plate 2, Section 11.

14.3 High Frequency Oscillator Alignment

14.31 Realignment of the H.F. oscillator circuits for any frequency band is usually necessary if the resonant frequency of the Receiver, as indicated by the tuning dial reading, is in error with respect to the actual resonant frequency by more than ± 1.0 percent.

WARNING: READJUSTMENT OF THE H.F. OSCILLATOR CIRCUIT TRIMMERS SHOULD NOT BE ATTEMPTED UNTIL AFTER THE NEED FOR SUCH READJUSTMENTS HAS BEEN POSITIVELY ESTABLISHED BY TESTS COVERED IN SECTION 13.

14.32 To check the operation of the R.F. amplifier and H.F. oscillator circuits, the Standard Signal Generator, or equivalent, should be connected to the antenna input jack J-103, using a 400 ohm non-inductive resistor as a dummy antenna. The VOLUME control may be retarded somewhat if desired, as background noise may be excessive when the control is fully advanced.

14.33 If error in calibration is found, check the dial pointer to make certain that it has not been pushed out of position. This may be checked by turning the main tuning control knob E-118 until pointer N-106 is at the extreme left position of its travel. At this point the pointer should line up with the vertical lines on the end of the dial scales.

14.34 The following general procedure should be employed in the alignment of H.F. oscillator circuits of any frequency band.

(1) General.
If, when the Receiver is resonated, at the high frequency end of the band, with a test signal frequency, the dial pointer appears above the dial scale marking for this test frequency, then adjustment is made by tuning the oscillator trimmer capacitor, associated with that band, in a clockwise direction to increase its capacity; conversely, if the Receiver resonants at a lower frequency, as indicated by the markings on the dial, correction is made by turning trimmer counterclockwise.

(2) Broadcast-B.C. position of BAND SELECTOR switch.
- (A) Set Signal Generator to 1500 kilocycles.
- (B) Set Receiver dial pointer to 1500.
- (C) Adjust trimmer C-145 until maximum output is obtained.
- (D) Set Signal Generator to 600 kilocycles.
- (E) Set Receiver dial pointer to 600.
- (F) Adjust padder C-148 for maximum output.
- (G) Set Signal Generator to 900 kilocycles.
- (H) Set Receiver dial pointer to 900.
- (I) Adjust iron core E-127 for maximum output.
- (J) Repeat operations A to I, inclusive, until the pointer lines up with the dial markings at all three points on this band.

(3) Shortwave Band I-SW 1 position of BAND SELECTOR switch.
- (A) Set Signal Generator to 9.0 megacycles.
- (B) Set Receiver dial pointer to 9.0.
- (C) Adjust trimmer capacitor C-146 for maximum output.
- (D) Set Signal Generator to 5.8 megacycles.
- (E) Set Receiver Dial pointer to 5.8.
- (F) Adjust iron core E-128 for maximum output.
- (G) Repeat A to F, inclusive, until the dial markings correspond to these two frequencies without further adjustment.

(4) Shortwave Band II-SW 2 position on BAND SELECTOR switch.
- (A) Set Signal Generator to 15 megacycles.
- (B) Set Receiver Dial pointer to 15.
- (C) Adjust C-147 until maximum output is obtained.
- (D) Set Signal Generator to 9.3 megacycles.
- (E) Set Receiver dial pointer to 9.3.
- (F) Adjust E-129 for maximum output.
- (G) Repeat A to F, inclusive, until these two frequencies are resonated at the dial markings for these frequencies.

14.4 R. F. Amplifier Alignment

14.41 The following general procedure should be employed in the Alignment of R.F. and antenna stages.

(1) General.
Standard Signal Generator is adjusted to provide a 30%, 400 cycle modulated carrier, specified in (2), (3) and (4); connection made to the Receiver through J-103 using a 400 ohm, non-inductive resistance as a dummy antenna.

(2) Broadcast Band (BC).
- (A) Set Signal Generator to 1500 kilocycles.
- (B) Set Receiver dial pointer to 1500.
- (C) Adjust C-149 and C-152 for maximum output.
- (D) Set Signal Generator to 600 kilocycles.
- (E) Set Receiver dial pointer to 600.
- (F) Adjust E-121 and E-124 for maximum output.

(G) Repeat A to C, inclusive, for final adjustment.

(3) Shortwave Band 1 (SW1).

(A) Set Signal Generator to 9.0 megacycles.

(B) Set Receiver dial pointer to 9.0.

(C) Adjust C-150 and C-153 for maximum output.

(D) Set Signal Generator to 5.8 megacycles.

(E) Set Receiver dial pointer to 5.8.

(F) Adjust E-122 and E-125 for maximum output.

(G) Repeat A to C, inclusive, for final adjustment.

(4) Shortwave Band II (SW2).

(A) Set Signal Generator to 15 megacycles.

(B) Set Receiver dial pointer to 15.

(C) Adjust C-151 and C-154 for maximum output.

(D) Set Signal Generator to 9.3 megacycles.

(E) Set Receiver dial pointer to 9.3.

(F) Adjust E-123 and E-126 for maximum output.

(G) Repeat A to C, inclusive, for final adjustment.

14.5 Antenna Alignment

Final antenna alignment should be made after installation, by adjusting trimmers C-149, C-150 and C-151, for the B.C., SW-1 and SW-2 bands respectively, for optimum performance with the specific antenna employed.

PARTS LIST BY SYMBOL DESIGNATIONS
FOR MODEL SLR-12-A RADIO RECEIVING EQUIPMENT
SECTION 1 — MODEL SLR-12-A RECEIVER

Symbol Desig.	Function	Description	Drawing and Part Number
		CAPACITORS	
C-101	Input Filter	Capacitor, paper, 4 mfd, 600 volts DC working.	5070
C-102	Output Filter	Same as C-101	
C-103	Input Filter	Same as C-101	
C-104	Output Filter	Same as C-101	
C-105	V-107 Cathode Bypass	Capacitor, electrolytic, 25 Mfd. +50%, —10%,	5088
C-106		25 Volts DC working.	
C-106A	V-102 Heater Bypass	Capacitor, paper, 0.1/0.1 Mfd. each section 600	5069
C-106B	V-102 Plate Bypass	Volts DC working. Hermetically sealed.	
C-107		Same as C-106	
C-107A	V-103 Cathode Bypass		
C-107B	V-103 Screen Bypass		
C-108		Capacitor, paper, 0.1/0.1 Mfd. each section 600	5089
C-108A	V-108 Plate Bypass	Volts DC working. Hermetically sealed.	
C-108B	V-108 Screen Bypass		
C-109		Capacitor, paper, 0.1/0.1/0.1 Mfd. each section	5065
C-109A	V-101 Cathode Bypass	600 Volts DC working. Hermetically sealed.	
C-109B	V-101 Plate Bypass		
C-109C	V-101 Screen Bypass		
C-110	Filter Tuning	Capacitor, paper, 0.05 Mfd. 600 Volts DC work-	7002
		ing. Hermetically sealed.	
C-111		Capacitor, paper, 0.05/0.05 Mfd. each section	5067
C-111A	Line Bypass	600 Volts DC working. Hermetically sealed.	
C-111B	Line Bypass		
C-112		Same as C-111	
C-112A	V-103 Plate Filter		
C-112B	V-104 Grid Filter		
C-113		Same as C-111	
C-113A	V-104 Cathode Bypass		
C-113B	V-104 Screen Bypass		
C-114		Same as C-111	
C-114A	A.V.C. Line Bypass		
C-114B	V-104 Plate Filter		
C-115		Same as C-109	
C-115A	V-105 Plate Bypass		
C-115B	V-105 Cathode Bypass		
C-115C	V-105 Screen Bypass		
C-116		Same as C-111	
C-116A	V-110 Grid bypass		
C-116B	Limiter bypass		
C-117	V-106 to V-107 Coupling	Capacitor, paper, 0.02 Mfd. 600 Volts DC work-	5066
		ing. Hermetically sealed.	
C-118	Fidelity Control Condenser	Same as C-117	
C-119	V-107 to V-108 Coupling	Capacitor, mica, 5000 MMF, ±10% 300 Volts	5079
		DC working.	
C-120	+ B bypass	Same as C-119	
C-121	Diode filter bypass	Capacitor, mica, 50 MMF, ±10%, 500 Volts DC	5076
C-122	Not used	working. Low loss case.	
C-123	Ant to V-101 Coupling	Capacitor, mica, 250 MMF, ±10% 500 Volts DC	5077
		working. Low loss case.	
C-124	V-101 Plate coupling	Same as C-123	
C-125	V-103 Grid coupling	Same as C-123	
C-126	Not used		
C-127	V-108 to V-109 Coupling	Same as C-119	
C-128	V-102 Heater bypass	Same as C-119

FOR MODEL SLR-12-A RADIO RECEIVING EQUIPMENT
SECTION 1 — MODEL SLR-12-A RECEIVER

Symbol Desig.	Function	Description	Drawing and Part Number
		CAPACITORS (*Continued*)	
C-129	V-103 B + bypass	Same as C-119	
C-130	V-102 B + bypass	Same as C-119	
C-131	Oscillator coupling	Capacitor, Silver mica, 50 MMF ±2.5%, 500 Volts DC working.	5080
C-132	Oscillator grid Coupling	Same as C-131	
C-133	T-112 Primary tuning	Capacitor, Silver mica, 100 MMF ±2.5%, 500 Volts DC working.	5081
C-134	Antenna tuning padder	Capacitor, Silver mica, 175 MMF ±2.5%, 500 Volts DC working.	5082
C-135	R.F. tuning padder	Same as C-134	
C-136	Oscillator tuning padder	Same as C-134	
C-137	T-110 Primary tuning	Capacitor, Silver mica, 225 MMF ±2.5%, 500 Volts DC working.	5083
C-138	T-110 Secondary tuning	Capacitor, Silver mica, 250 MMF ±2.5%, 500 Volts DC working.	5084
C-139	T-111 Primary tuning	Same as C-138	
C-140	T-111 Secondary tuning	Same as C-138	
C-141	T-107 Padder fixed	Capacitor, Silver mica, 350 MMF ±2.5%, 500 Volts DC working.	5085
C-142	T-108 Padder	Capacitor, Silver mica, 3000 MMF ±2.5%, 500 Volts DC working.	5086
C-143	T-109 Padder	Capacitor, Silver mica, 4000 MMF ±2.5%, 300 Volts DC working.	5087
C-144 C-144A C-144B	R.F. tuning Oscillator tuning	Capacitor, variable air, 2 gang. Minimum capacity 14 MMF, Max. capacity 390 MMF. 25 plates each section curve "C", 0.015 inches min. spacing.	5101
C-145	T-107 trimmer	Capacitor, variable air. Minimum capacity 3 MMF, Max. capacity 25 MMF.	5072
C-146	T-108 trimmer	Capacitor, variable air. Minimum capacity 4 MMF, Max. capacity 50 MMF.	5073
C-147	T-109 trimmer	Same as C-146	
C-148	T-107 variable padder	Capacitor, variable air. Minimum capacity 6 MMF, Max. capacity 75 MMF.	5074
C-149	T-101 trimmer	Capacitor, Var. mica, Min. capacity 1 MMF, Max. capacity 12 MMF. Compression type.	6093
C-150	T-102 trimmer	Capacitor, variable mica, Minimum capacity 4 MMF, Max. capacity 60 MMF. Compression type.	5071
C-151	T-103 trimmer	Same as C-150	
C-152	T-104 trimmer	Same as C-149	
C-153	T-105 trimmer	Same as C-150	
C-154	T-106 trimmer	Same as C-150	
C-155	V-107 Plate filter	Same as C-109	
C-156	Antenna tuning	Capacitor, variable air. Min. capacity 14 MMF, Max. capacity 390 MMF 25 plates, curve "C", 0.015 min. spacing.	5100
		MISCELLANEOUS ELECTRICAL PARTS	
E-101	V-101 Grid cap	¼" Grid cap for octal tubes	5045
E-102	Phono input terminals	Phono input two terminal strip marked PHONO and GND, Terminals have captive screws.	6001
E-103	Speaker output term. 5000 ohm	Speaker output two terminal strip marked 5000 ohm SPKR. Terminals have captive screws.	6003

Symbol Desig.	Function	Description	Drawing and Part Number
		MISCELLANEOUS ELECTRICAL PARTS (*Continued*)	
E-104	Speaker output term. 600 ohm	Speaker output two terminal strip marked 600 ohm SPKR. Terminals have captive screws.	6004
E-105	Line term. 60 ohm	Output two terminal strip marked 60 ohm LINE. Terminals have captive screws.	6005
E-106	AC power receptacle	Two pole plug set in drawn steel shell for below surface mounting.	7006
E-107	SW II lamp socket	Bayonet type socket	5174
E-108	SW I lamp socket	Bayonet type socket	5173
E-109	BC lamp socket	Bayonet type socket	5172
E-110	Phono lamp socket	Bayonet type socket	5171
E-111	Dial lamp socket	Bayonet type socket	5041
E-112	Dial lamp socket	Same as E-111	
E-113	V-101 grid lead insul.	Porcelain lead through bushing	5036
E-114	L-101 support insul.	Same as E-113	
E-115	L-101 support insul.	Same as E-113	
E-116	Treble control knob	1½" Black bakelite knob.	5119
E-117	Volume control knob	Same as E-116	
E-118	Main tuning knob	2⅛" Black bakelite knob.	5120
E-119	Wave Change knob	Same as E-116	
E-120	Selectivity knob	Same as E-116	
E-121	T-101 Sec. Inductance Trimmer	Compressed powdered-iron core coil inductance trimmer.	5103
E-122	T-102 Sec. Inductance Trimmer	Compressed powdered-iron core coil inductance trimmer.	5102
E-123	T-103 Sec. Inductance Trimmer	Same as E-122	
E-124	T-104 Sec. Inductance Trimmer	Same as E-121	
E-125	T-105 Sec. Inductance Trimmer	Same as E-122	
E-126	T-106 Sec. Inductance Trimmer	Same as E-122	
E-127	T-107 Sec. Inductance Trimmer	Same as E-121	
E-128	T-108 Sec. Inductance Trimmer	Same as E-122	
E-129	T-109 Sec. Inductance Trimmer	Same as E-122	
E-130	T-110 Pri. Inductance Trimmer	Same as E-121	
E-131	T-110 Sec. Inductance Trimmer	Same as E-121	
E-132	T-111 Pri. Inductance Trimmer	Same as E-121	
E-133	T-111 Sec. Inductance Trimmer	Same as E-121	
E-134	T-112 Pri. Inductance Trimmer	Same as E-121	
		FUSES	
F-101	AC line fuse	Fuse, 2 Amps, up to 250 V., cartridge type, 1¼" long, ferrules ¼" diameter.	5111
		HARDWARE	
H-101	Plug button for T-101 Trimmer	½" Plug button	5038
H-102	Plug button for T-102 Trimmer	Same as H-101	
H-103	Plug button for T-103 Trimmer	Same as H-101	
H-104	Not used		
H-105	Plug button for T-110 Shield	½" Plug button	5037
H-106	Plug button for T-111 Shield	Same as H-105	
H-107	N-106 to C-144 coupling	Insulated coupling for ⅜" shaft	7157
H-108	C-144 to C-156 coupling	Insulated coupling for ⅜" shaft	6081A
H-109	O-101 to O-102 coupling	Insulated coupling for ¼" shaft	5106
H-110	Dial escutcheon	Transparent Escutcheon	5109
H-111	Pull Handle	Right Pull Handle	5115
H-112	Pull Handle	Left Pull Handle	5115

I-105	Dial lighting lamp	Same as I-101	
I-106	Dial lighting lamp	Same as I-101	
		JACK AND RECEPTACLES	
J-101	Phone Jack	Jack, single, open circuit, short, for 2 conductor plugs, with tip and sleeve only.	5118
J-102	Fuse Holder	Extractor type fuse holder	5112
J-103	Concentric Antenna	Concentric line jack for RF connections	7010
		INDUCTORS R.F. & A.F.	
L-101	V-101 Plate choke	Radio Frequency choke, 2.5 M H., 125 MA.DC, distributed capacity 1MMF 50 ohms DC resistance. Pigtail terminals.	5047
L-102	V-103 + B choke	Same as L-101	
L-103	V-102 + B choke	Same as L-101	
L-104	V-102 heater filter	RF choke, 32 turns of #20 wire	5046
L-105	Audio + B filter choke	32 H, 40MA choke ±10% Test voltage 1500 RMS 3900 T #34E, 450 OHMS.	5048
L-106	RF + B filter choke	Same as L-105	
		NAMEPLATES, DIALS, CHARTS	
N-101	Model nameplate	Etched model plate	8001
N-104	Linear dial	Etched linear scale	5107A
N-105	Dial Index plate	Etched indicator index plate	5107B
N-106	Dial main tuning	Friction Drive dial pointer	7100
N-107	Frequency dial	Dial plate with lucite calibration	5108
		PLUGS	
P-101	Antenna and ground plug	Concentric plug single circuit for RF connection	7009
P-102	Power input receptacle & plug	Receptacle, 2 pole	7006
		MECHANICAL PARTS, SHAFTS	
O-101	Band switch shaft	Switch shaft & detent plate	5195-A
O-102	Band switch shaft extension	Shaft extension	7018
O-103	Selectivity switch shaft	Switch shaft & detent plate	5196-A
		RESISTORS	
R-101	T-111 secondary series	Resistor, wire wound, 10 ohms, ±10%, ½ watt, phenolic insulated. Pigtail type terminals.	5131
R-102	T-111 secondary series	Resistor, wire wound, 47 ohms, ±10%, ½ watt, phenolic insulated. Pigtail type terminals.	5132

POWER SUPPLY

Models 4486, 4586, 4586-A..105-135 volts, 50-60 cycle, 100 watts
Model 4586-B.....105-135 volts, 25 cycle, 100 watts

Occasionally you may receive a complaint of microphonism or howl on the short wave band, in the models 4486, 4586, 4586-A or 4586-B receivers, having factory identification number 100156. In such cases, first make a careful test of all tubes, eliminating those which are microphonic, and other parts which might cause howl if defective. A good ground must be used. It is also advisable to see that the control knobs are not jammed too tightly against the cabinet front. If microphonics or howl is not caused by defective parts or any of the above items, it can usually be eliminated or greatly reduced by making the following circuit changes:

1. Disconnect and remove the 110,000 ohm, 1/4 watt carbon resistor which is connected from the junction of the two 510,000 ohm grid resistors in the grid circuits of the output stage, to the center tap of the power transformer. This resistor will be found only in receivers carrying changes shown in supplement No. 1 of bulletin 57 RL 26. In receivers where this resistor is not present the lead between the junction of the two grid resistors and the center tap should be removed. The junction point referred to should then be connected to ground.

2. Short out the R-18A section of the candohm bias resistor strip.

3. (a) Open the cathode connections to ground on both of the 6F6 output tubes.

   (b) Connect the two cathode terminals, of the 6F6 output tubes, together.

   (c) From the cathode terminal, of either of the 6F6 output tubes, connect a 270 ohm 2 watt resistor to ground. The value given for this resistor is quite critical.

INTERMEDIATE FREQUENCY.....456 KC.

FREQUENCY RANGES	ALIGNMENT FREQUENCIES
Band A.....526 to 1750 KC.	1500 KC.; 600 KC.

IMPORTANT ALIGNMENT NOTES

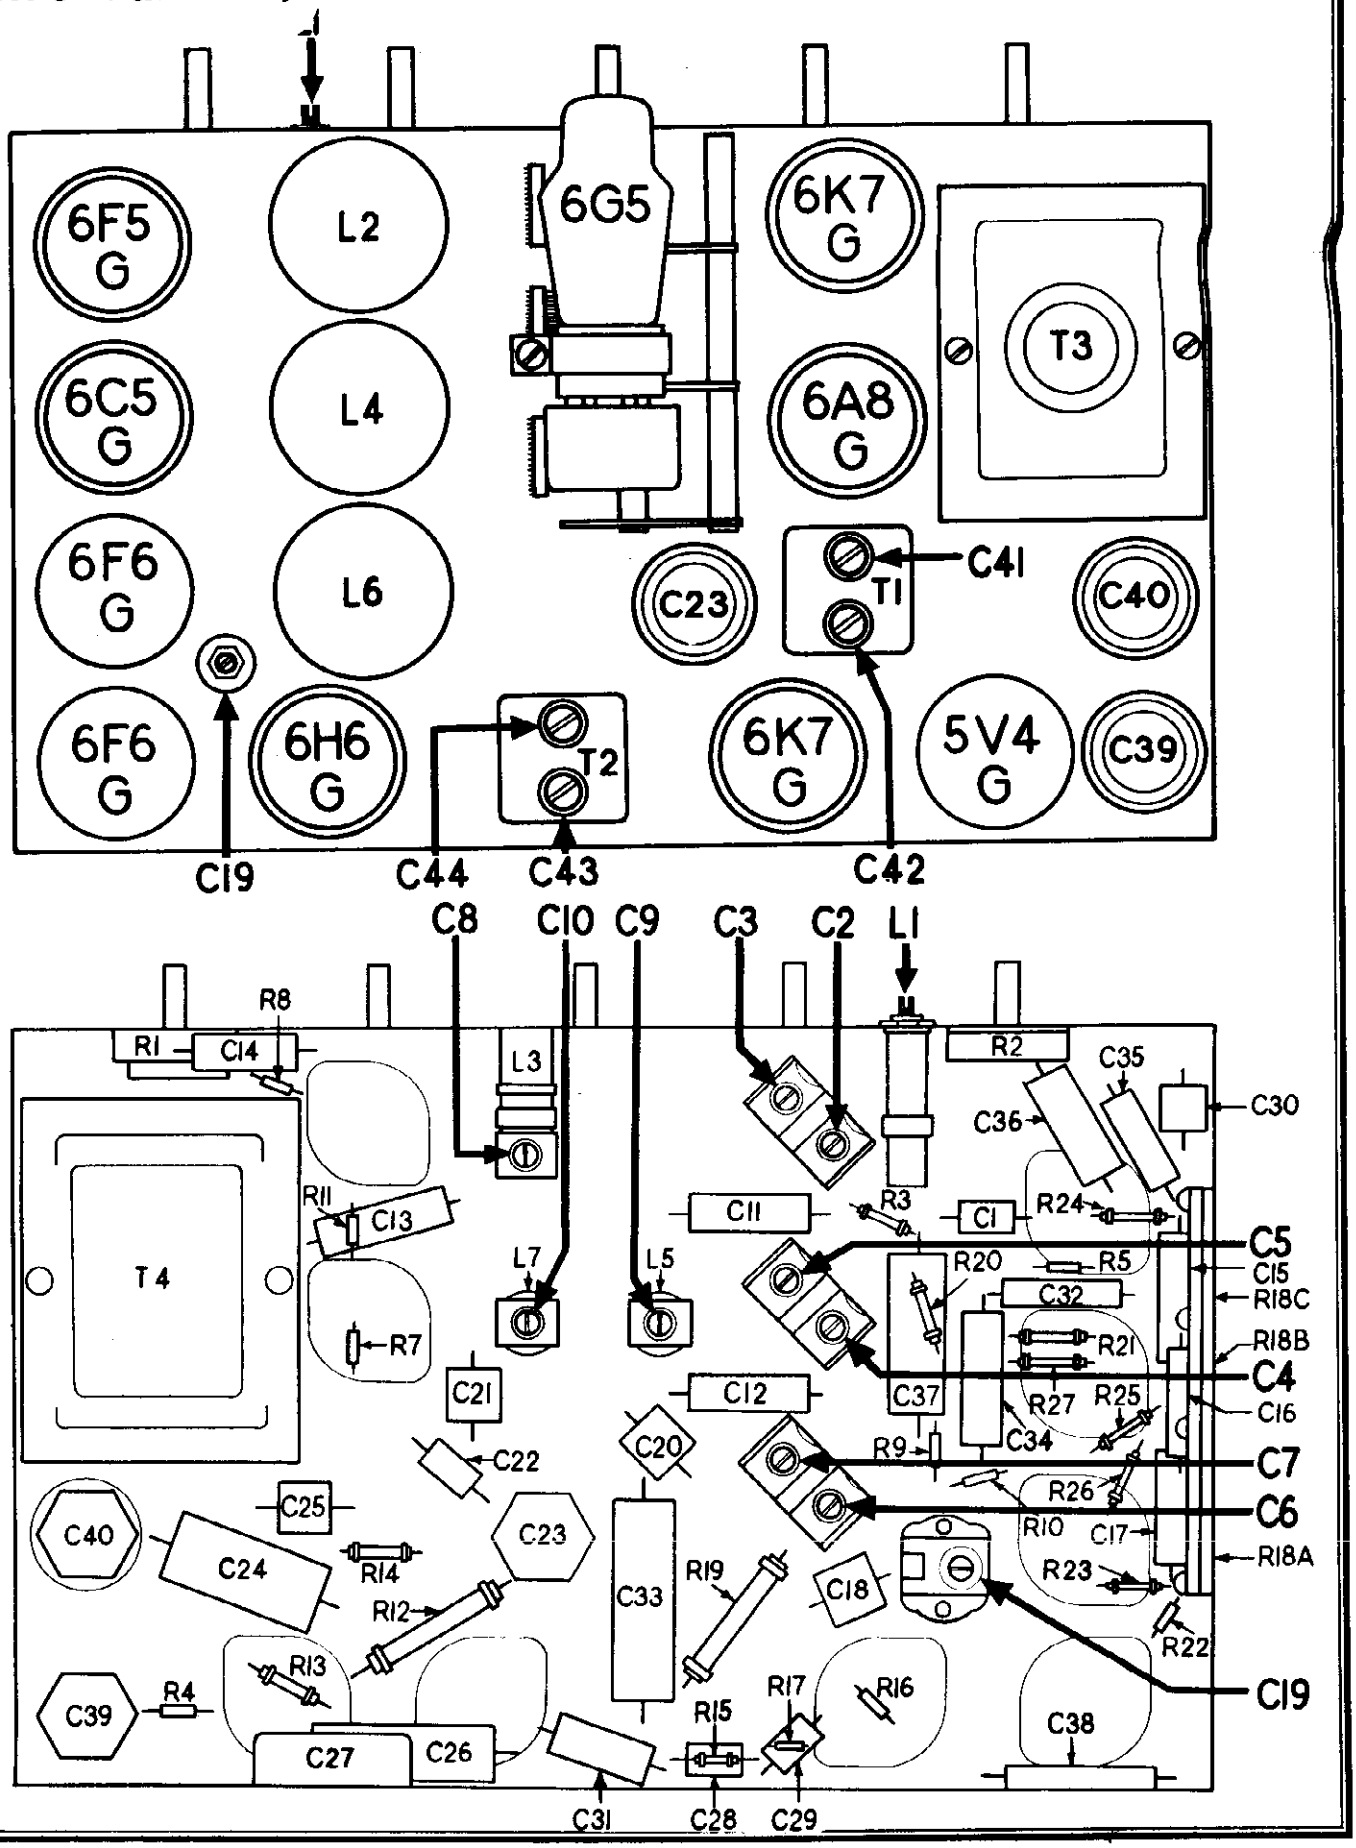
* Before attempting to align the receiver check to see that the dial pointer coincides with the last scale division at the low frequency end of the dial scale when the gang condenser is in full mesh.

After adjusting the I.F. trimmers C41, C42, C43 and C44, go back and repeat the adjustment, since the setting of each trimmer will have some effect on others. When adjusting L1, antenna trap trimmer, increase generator output to obtain clearly defined trimmer setting for a minimum.

** When aligning the broadcast band padder C19 at 600 KC. and the short wave detector trimmers, it is necessary to adjust the trimmers while slowly rocking the gang condenser through a small distance. Rocking the gang is essential if maximum sensitivity is to be obtained.

*** When aligning the short wave bands, care should be taken in adjusting trimmers C7 and C10, since two possible adjustments of these trimmers will result in signal peaks. The proper peak is that which occurs with the trimmer screw farthest out.

MODELS 4486,4586,4586-A, 4586-B CHASSIS 100,156 SEARS, ROEBUCK & CO.



GENERAL INFORMATION

The R-100156 three band radio receiver has a frequency range extending from 526 KC. to 18,000 KC. The intermediate frequency is 456 KC. A three deck band selector switch is used for selecting the proper combination of coils to be used for each wave band. Special contacts on one deck of the switch are used for shorting out unused oscillator coils to prevent dead spots due to absorption.

The coils for the antenna, R.F., and oscillator circuits covering the broadcast and short wave bands, are shielded and located on top of the chassis. They are designated by L2, L4 and L6 respectively in the circuit diagram. The antenna, R.F. and oscillator coils covering the police band are located on the underside of the chassis and are designated by L3, L5 and L7 respectively in the circuit diagram.

The receiver is designed for use with a conventional or doublet antenna. A 456 KC. wave trap is connected across the antenna input to prevent code interference from stations operating on frequencies in the vicinity of 456 KC.

The control grid circuit of the 6K7-G, radio frequency amplifier, is tuned by the secondary of the antenna coil and one section of the variable condenser. Similarly, the control grid circuit of the 6A8-G first detector and oscillator, is tuned by the secondary of the R.F. coil and one section of the variable condenser. After amplification in the 6K7-G R.F. amplifier, the signal is impressed on the control grid of the 6A8-G, 1st detector and oscillator, where frequency conversion to 456 KC. takes place. The 456 KC. output voltage of the 6A8-G tube is amplified by the 6K7-G intermediate frequency amplifier and impressed on the diode plates of the 6H6-G second detector and A.V.C. tube.

By means of the selectivity control, two degrees of selectivity are obtainable in the intermediate frequency amplifier. This is accomplished by altering the resonance characteristics of the 1st I.F. transformer. When the selectivity control is in the sharp position (clockwise) the 1st I.F. transformer functions as a typical transformer with tuned primary and secondary circuits. When it is in the broad position (counter-clockwise) the resonant frequency of the primary circuit is decreased and that of the secondary circuit increased. At the same time the selectivity curve of the secondary is broadened.

One section of the 6H6-G twin diode tube is used as a linear detector. The 260,000 ohm resistor R15 serves as a load resistor for the detector section of the twin diode. The potentiometer type of volume control R1, is capacity coupled to the diode load resistor R15, and acts as a continuous voltage divider of the audio frequency voltage developed. Hence any portion of the audio frequency voltage developed may be applied to the control grid of the 6F5-G resistance coupled audio frequency amplifier. The second section of the twin diode, fed through the condenser C29 is used for delayed A.V.C. With sufficient signal intensity, A.V.C. voltage is developed across resistance R17 and applied to the control grids of the 6K7-G and 6A8-G tubes through a resistance capacity filter.

The output of the 6F5-G audio amplifier is fed into a resistance coupled push-pull output stage. In this circuit, the 6C5-G tube operating as a phase inverter, takes the place of a push-pull input transformer.

The control grid bias of the 6F5-G is obtained from the negative end of resistance R18-C. Similarly, the control grid bias of the 6K7-G tubes, the 6A8-G tube, and the delay voltage for the A.V.C. section of the 6H6-G is obtained from the negative end of resistances R18-B and R18-C. Also the bias for the 6F6-G output tubes is obtained from the negative end of resistors R18-A, R18-B and R18-C. Resistances R18-A, R18-B and R18-C are located in the negative lead of the high voltage D.C. supply.

WEAK OR INOPERATIVE SETS DUE TO SHORT-CIRCUITED POLICE BAND R.F. COILS

Occasionally you may find a set which is weak or completely inoperative on all three bands due to a short between the coupling turn and the secondary of the police band R.F. coil (L5). The short circuit may first cause crackling and sputtering and then later the set will stop playing. To test for this short, disconnect the red and yellow wires from the coil (L5) and test for continuity from either end of the trimmer condenser on the coil to the lug to which the coil coupling turn is connected. This should show an open circuit. Even the slightest leakage between these two points with the red and yellow wires disconnected, calls for the replacement of the coil which is part number 1002888604. Such shorted coils do not occur very often, therefore, we recommend that tubes and voltages be checked first to make sure that no other trouble exists.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS. ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE TRIMMER CONDENSERS. VOLTAGES MUST BE MEASURED WITH NO SIGNAL. WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT INDICATES ZERO VOLTAGE OR A VERY LOW READING. FIGURES AT CATHODES ARE CATHODE CURRENT IN MILLIAMPERES.

"F"	15 mc (rock)	15 mc	400 ohms	Ant. Term.	C4	Translator	30
"F"	6 mc	6 mc	400 ohms	Ant. Term.	-	-	110

IMPORTANT ALIGNMENT NOTES

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

It it advisable to repeat the entire alignment procedure band by band and in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

After the alignment procedure has been completed, tune in a broadcast signal at about 1000 kc. If necessary, shift the dial pointer so that it indicates this frequency.

Values shown under, "Microvolts", are only approximate.

GENERAL INFORMATION

THE AVC CIRCUIT:

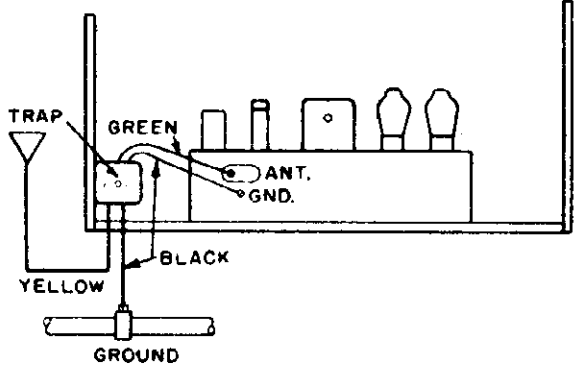
The diode current of the 6B6G tube, flowing through the 500M ohm resistor, R10, creates a voltage drop across it. This voltage is applied to the control grids of the 6A8G and 6K7G tube to provide AVC.

WAVE-TRAP TO ELIMINATE INTERFERENCE FROM SHIP OR AIRPORT TRANSMITTERS:

In locations near ship transmitters or airports or air beacon stations, code interference may be experienced. Part #1013114256 wave-trap is designed to eliminate such interference. It may be ordered directly from the Colonial Radio Corporation, 254 Rano Street, Buffalo, N. Y., using Purchase Order blank, form F5284.

Mount the trap, by means of two wood screws, at any convenient place on the chassis shelf or cabinet where it will be near the antenna terminal of the receiver. Connect the yellow lead of the wave-trap to the antenna downlead. Connect the green lead of the wave-trap to the antenna terminal of the receiver. Cut off any excess length of green wire from the trap so that the green lead from the wave-trap to the chassis is as short as possible. The yellow lead from the wave-trap should be run so that it is as far as possible from the green lead. Connect one of the black leads from the wave-trap to the ground terminal of the receiver. Connect the other wave-trap black lead to the ground used for the installation.

The trap is pre-tuned to the IF frequency so that normally no further adjustment is necessary. However, should interference still be experienced, tune the receiver between approximately 550 and 600 kc. Then adjust the wave-trap, by means of the trimmer screw at the bottom of the container, until the interference is eliminated. Addition of the trap will reduce the sensitivity of the receiver around 600 kc by approximately 50%. The customer should be forewarned of this to avoid complaints of reduced sensitivity.



INSTALLATION OF A PHONOGRAPH PICK-UP JACK OR AN EARPHONE JACK:

A kit, part #1016117189, can be ordered from Colonial Radio Corporation, 254 Rano Street, Buffalo, N. Y. This kit contains the necessary parts for installing either a phonograph pick-up jack or an earphone jack. If the customer desires both a phonograph pick-up jack and an earphone jack, it will be necessary to use two kits and to drill an additional hole in the back of the chassis for the additional jack.

PHONOGRAPH PICK-UP JACK: A hole, covered with a brass insert, is provided in the back of the chassis. Remove the brass insert and mount the jack in this hole. Insulate the jack from the chassis by means of the two insulating washers supplied in the kit. The Schematic Section shows the connections to the jack. In addition, changes must be made in the wiring to the speaker socket and the electrolytic condenser. As the Schematic Section shows, these wiring changes and the connections to the jack are as follows:

SEARS, ROEBUCK & CO.

MODELS 4663, 4763
CHASSIS 101-471

Disconnect the jumper between prongs 1 and 5 of the speaker socket.

Disconnect the jumper between prong #2 of the speaker socket and the anode (center terminal) of the wet electrolytic.

There is a lead running from the 40 ohm resistor, mounted on the terminal board near the power transformer, to the cathode (can terminal) of the wet electrolytic. Disconnect this lead from the electrolytic and connect it to terminal #2 of the speaker socket.

Run a lead from terminal #1 of the speaker socket to the cathode (can terminal) of the electrolytic.

Run a lead from terminal #1 of the jack to the cathode prong of 6B6G tube.

Connect the .05 condenser from terminal #2 of the jack to the junction of R10 and C19. This junction is at the end lug of the terminal board mounted under the IF output transformer.

Connect the 500M ohm resistor from terminal #3 of the jack to the end of R14 that is connected to the blank prong of the 6B6G socket.

Connect prong #4 of the jack to prong #1 of the speaker socket.

The radio Volume Control and Tone Control will operate for the phonograph pick-up.

EARPHONE JACK: Mount the jack in the hole in the back of the chassis. The jack frame must be grounded to the chassis. Therefore, do not use the insulating washers.

Connect the .05 condenser from terminal #2 of the jack to the grid prong of the 6V6G output tube.

Connect terminal #3 of the jack to terminal #3 of the speaker socket.

Connect terminal #4 of the jack to terminal #5 of the speaker socket.

This is the only wiring necessary. The wiring changes mentioned above for connection of the phonograph pick-up jack are not to be done if only an earphone jack is used.

With the connections as described, the loud speaker will not operate when the earphones are plugged in. If it is desired to have the loud speaker operate at the same time the earphones are plugged in, the connections to terminals 3 and 4 of the jack should be omitted.

CIRCUIT CHANGE IN 109.371 RADIO RECEIVER

The 109.371-1 receiver is identical with 109.371 with the following changes:

The value of C-13 is changed to .02 Mfd. 400V.
The value of C-9 is changed to .001 Mfd. 600V.

The connection from condenser C-13 is changed from the volume control side of condenser C-9 to the 12SQ7GT grid side of C-9.

Type ..... Push Pull Beam Tubes
Undistorted ..... 2 Watts
Maximum ..... 3.5 Watts

SPEAKER

Type ..... Dynamic
Size ..... 6½ Inch
Field Resistance ..... 500 Ohms

THE MASTER CONTROL SWITCH

This switch has six positions. The recording positions are described in detail on the next page.

Position No. 1 ..... Radio
Position No. 2 ..... Phono
Position No. 3 ..... Record Radio Programs
Position No. 4 ..... Record Radio Program & with Microphone at the same time
Position No. 5 ..... Record with Microphone Only
Position No. 6 ..... Public Address

THE TUNING EYE

When the Master Control Switch is in the "Radio" position the eye acts in the normal manner as a tuning indicator.

When the Master Control Switch is in any position except No. 1 the eye is connected to the output of the receiver so that it indicates volume. For recording, the volume control should be adjusted so that the eye just closes. In recording a radio program it is very hard to predict just how loud the loudest part of the program will be, therefore, it is best to set the volume control so that the eye is slightly open.

THE LOOP ANTENNA

The loop antenna is somewhat directional in its reception characteristics, therefore turning the receiver to a particular position will often improve reception or reduce interference.

ANTENNA AND GROUND CONNECTIONS

If the receiver is used in a building which has metal lath or a large amount of steel in its construction, or in a location where reception conditions are poor, an outdoor antenna and a ground connection may be necessary.

Two terminals are provided on the back of the cabinet for connection of antenna and ground.

DIAL LAMPS

The two dial lamps are connected in series, therefore if one burns out the other will not light. Mazda #47 dial lamps are used.

PHONO OPERATION

Turning the Master Control Switch to the No. 2 or Phono position connects the phono pickup to the audio amplifier of the receiver and disconnects the radio. The Volume control acts for phono the same as for radio.

RECORDING

The recording mechanism will cut records up to 10 inches in diameter. Recordings of excellent quality can be made if the instructions in the following paragraphs are very carefully followed.

INSERTING THE RECORDING NEEDLE IN THE HEAD OF THE RECORDER ARM

Notice that the shank of the recording needle is ground flat on one side. Loosen the screw in the end of the Recorder Arm. Insert the needle into the hole in the under side so that the flat side is towards the front of the cabinet. Tighten the retaining screw so that the needle is held firmly. Check to make sure that the recording needle is tight each time a recording is made.

TO RECORD A RADIO PROGRAM

Place a blank record on the turntable making sure that the small pin on the turntable projects through the hole provided for it in the record. This is necessary to prevent the record from slipping and ruining the recording.

Turn the Master Control Switch to the No. 1 (Radio) position. Tune in the program you desire to record. Observe the tuning eye carefully and be sure that the station is tuned in perfectly.

Turn the Master Control Switch to the "Record Radio" (No. 3) position. Notice that the shadow on the tuning eye screen now varies in width with the volume of sound.

Adjust the Volume Control so that the eye just closes.

Turn the phono motor ON.

Raise the Recorder Arm and move it so that the needle is just inside the edge of the record. Lower the arm carefully on the record.

When the recording arm is lowered on the record an arm on the under side of the recorder unit engages the lead screw which moves the arm across the record. The arm must be raised about three inches to disengage the lead screw so that the arm can be moved.

As the recording is being made, a small shaving is cut out of the record by the recording needle. This piles up in the center of the record.

After the record has been cut, raise the recorder arm, swing it outwardly and place it on the rest. Stop the turntable and remove the shaving which has been cut out of the record.

The record may now be played in the normal manner.

TO RECORD WITH THE MICROPHONE

Plug the Microphone into the socket provided on the rear of the cabinet.

Turn the Master Control Switch to the No. 5 position.

Speak into the microphone and adjust the volume control until the eye just closes. Whatever sound is picked up by the microphone will be recorded on the record. Keep the microphone some distance away from the receiver, preferably to one side so that it does not pick up the sound from the speaker. Keep the microphone at least six inches from your mouth and try to keep the same voice level as used initially in setting the volume.

Place the recording arm on the record as described above.

TO RECORD WITH MICROPHONE AND RADIO AT THE SAME TIME

Tune in the program you desire to record exactly as described under "Recording Radio Programs".

Turn the Master Control Switch to the No. 4 position.

Speak into the microphone and adjust the volume control so that the combined volume of the radio and the microphone just closes the eye as described previously. To make the voice predominate, retard the volume setting slightly to reduce the radio volume, and speak a little closer to the microphone.

Place the recorder arm on the record and proceed with the recording.

PUBLIC ADDRESS

The No. 6 position of the Master Control Switch connects the circuits so that the microphone, and the audio amplifier and speaker of the receiver may be used as a small public address system. Keep the microphone as far as possible from the speaker so that the sound from the speaker will not reach the microphone, causing a "Howl" or whistle.

GENERAL INFORMATION

In the recording positions (Positions 3, 4 and 5 of the Master Control Switch) the volume from the speaker is reduced. This is done automatically by the switch for three reasons, some of the power from the output tune is needed for operating the recording head, the volume level necessary for recording is too high for the average size room, and to prevent the sound from the speaker from reaching the microphone.

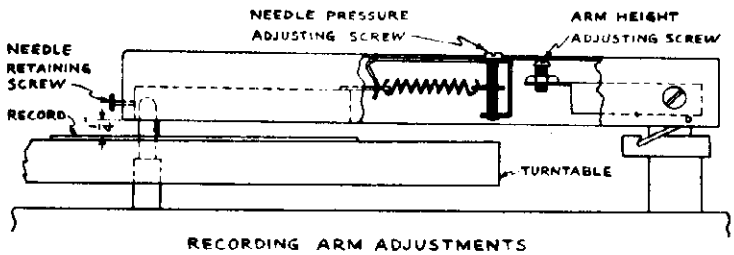
If the recording needle is not very sharp, the quality of the recording will be poor. A needle which has become dull through use or which has been otherwise damaged should be replaced.

The Master Control Switch should always be turned to the No. 1 (Radio) position when listening to radio programs.

RECORDING ARM ADJUSTMENTS

The bottom of the recording arm should be exactly 1/4 inch from the surface of the record. This should be measured beside the needle retaining screw on the end of the arm. The screw for making this adjustment can be found when the arm is raised, on a small platform near the hinge. Turning the adjusting screw to the left raises the arm, turning to the right lowers it. In making an adjustment turn the screw only a small fraction of a turn at a time.

Make a cut of at least ten or fifteen turns to see whether or not the needle is exerting the correct pressure on the record. This is correct when the groove cut by the needle is of approximately the same width as the space between grooves. On top of the cutting arms is a flat head screw. Turning this screw to the right increases the depth of cut, to the left decreases it. This adjustment is quite critical and the screw should be turned not more than 1/4 turn at a time.



RECORDING ARM ADJUSTMENTS

MODELS 5372, 5372-B
CHASSIS 109,371, 109.371-1

SEARS, ROEBUCK & CO.

ALIGNMENT PROCEDURE

Output Meter connection ..... Across speaker voice coil
Connection of generator lead ..... See chart below
Connection of generator ground lead ..... Tomchassis
Dummy antenna value ..... See chart below
Position of volume control ..... Fully clockwise
Position of Master Control Switch ..... "Radio" (Position No.1)

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS ADJUSTED (In order shown)
Open (Minimum capacity	455 Kc.	.1 mfd.	Antenna section of variable	T2, T1.
Minimum capacity	1720 Kc.	50 mmf.	Antenna terminal	Oscillator trimmer
Tune in Sig. from generator	1400 Kc.	50 mmf.	Antenna terminal	Antenna trimmer.

The alignment procedure should be repeated stage by stage in the original order for greatest accuracy. Always keep the output from the generator at the lowest possible level so that the AVC action of the receiver is ineffective.

109448928	Plate, Instruction
109448477	Plate, Motor-on-off
109548287	Plug, 1 Prong (for cutter leads)
109548288	Plug, 1 Prong (for phono pickup leads)
109548493	Plug, 2 Prong (for Motor leads)
109388454	Switch, Motor
109542997	Washer, Rubber (for recorder MTG)

CABINET ASSEMBLY PARTS

RECORDER UNIT PARTS

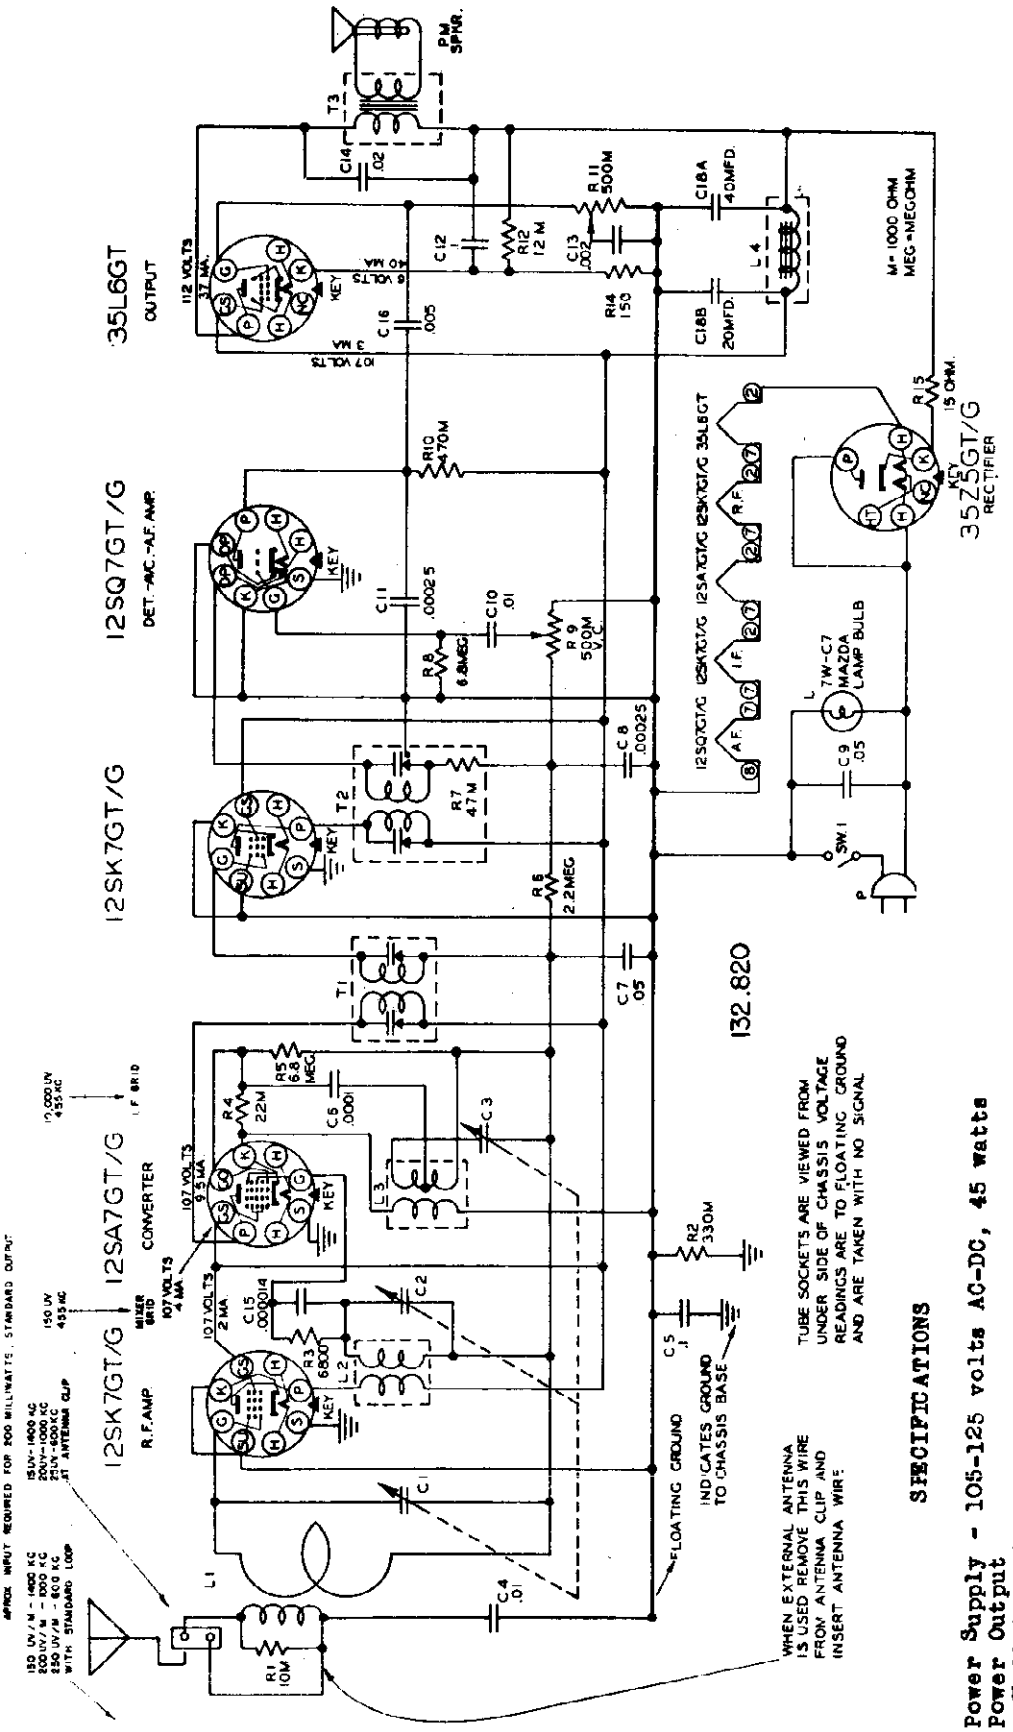
1095486943	Hex nut for pivot post
1095486947	Motor mounting screw
1095486948	Adjusting screw (Follower Arm)
10954869413	Turntable shaft locking screw
10954869417	Recorder Arm Rest
10954869418	Follower arm complete
10963869424	Pickup Cartridge
10963869426	Pickup Arm complete
10954869428	Cutter head tension spring
10964869484	Magnetic Cutter Head with leads
10963869434	Recorder arm complete
10954869438	Pivot post return spring
10964869450	10" one piece turn table
10964869456	Turntable drive disc stud clip
10964869458	Lead screw and pinion assembly
10964869463	Turntable drive disc tension spring
10964869464	Turntable shaft
10964869466	Turntable drive disc
10964869467	Turntable drive disc mounting bracket assembly
109547799	Connector - Microphone
109541297	Plug - Microphone
109548658	Bracket - Mic. Connector
109546909	Spring - Mic. Connector
109546908	Washer - Mic. Connector

The following parts are for models with ONE PIECE TURNTABLE ONLY

10964869469	Retractable pin spring
10964869470	Retractable pin
10964869472	Rotor shaft pulley
10964869474	Rotor shaft pulley set screw
10964869481	Motor 60 cycle
10964869482	Motor 50 cycle

MODELS 6015, 6016
CHASSIS 132.820

SEARS, ROEBUCK & CO.



SPECIFICATIONS

Power Supply - 105-125 volts AC-DC, 45 watts
Power Output
Undistorted .8 watts, maximum - 2.5 watts

Tuning Range Broadcast Band 540-1600 Kc
Speaker
Voice Coil Impedance 3.2 Ohms

Difference between 6015 and 6016:

Model 6015 has a walnut cabinet. Model 6016 has an ivory cabinet.

SEARS. ROEBUCK & CO.

MODELS 6015, 6016
CHASSIS 132.820

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across Speaker Voice Coil
Output meter reading to indicate 200 mw (Standard Output)..... .8 Volts
Dummy antenna value used in series with generator output ..... See Chart Below
Connection of generator output lead ..... See Chart Below
Connection of generator ground lead ..... Floating Ground
Generator modulation ..... 30% 400 Cycles
Position of volume control ..... Fully Clockwise
Position of tone control ..... Treble
Position of dial pointer with variable fully closed ..... Horizontal

POSITION OF VARIABLE	FREQUENCY OF GENERATOR	DUMMY ANTENNA	GENERATOR OUTPUT CONNECTION	TRIMMERS ADJUSTED IN ORDER SHOWN FOR MAX. OUTPUT	FUNCTION OF TRIMMER
Open	455	.05 mfd.	12SA7 Grid (or Stator of C-2)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.0002 mfd.	Antenna Clip (with black wire removed)	C-3; C-2; C-1 Trimmers located on Variable Condenser	Oscillator Mixer RF

IMPORTANT ALIGNMENT NOTES:

1. Place set loop in the same position and at the same distance with respect to the back of the chassis as it would be when the set is mounted in the cabinet, during alignment of the RF stage.
2. If a standard test loop is used with the Signal Generator for alignment of the receiver, the black wire will be left in the antenna clip.
3. The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

LOCATION OF PARTS UNDER CHASSIS

SERVICE NOTE:

The AC hum can often be greatly reduced on this chassis by replacing C12 with an .03 mfd. 400V condenser. Sometimes the hum can be further reduced by replacing R12 with a 15,000 ohm 1 watt resistor.

PARTS LIST

Schematic Location	Part No.	Description
R1		Resistor, 10,000 ohm, 1/4 watt

5Y3G	Rectifier

ALIGNMENT FREQUENCIES:

Oscillator	Antenna-Transl.	
Trimmer	Trimmer	Padder
1610 kc	1400 kc	600 kc
18.2 mc	15 mc	6 mc

POWER SUPPLY:

All models available	105-125 volts, 50-60 cycles; 70 watts
All models available	105-125 volts, 25-60 cycles; 75 watts

INTERMEDIATE FREQUENCY . . . . . 455 kc

POWER OUTPUT:

Type	Single Pentode
Undistorted	2.5 watts
Maximum	4.0 watts

FREQUENCY RANGES:

Band "A"	540-1600 kc
Band "B"	6.0-18.0 mc

LOUD SPEAKER:

Type	Dynamic
Size	7.5 inch
Approx.field coil res.	750 ohms
Approx.field coil voltage drop	40 V.

MODEL 7046
CHASSIS 141.416

SEARS, ROEBUCK & CO.

GENERAL INFORMATION & SERVICE HINTS

The RADIONET Antenna System equipped with the receiver is in use for Broadcast band operation only. An external antenna must be used for short-wave operation.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection . . . . . Across loudspeaker voice coil
Output meter reading to indicate 500 milliwatts . . . . . 1.1 volts
Generator ground lead connection . . . . . To chassis
Dummy antenna value to be in series with generator output . . . . . See chart below
Connection of generator output lead . . . . . See chart below
Generator modulation . . . . . 30%, 400 cycles
Position of Volume Control . . . . . Fully clockwise
Position of Tone Control . . . . . "I"
Position of Dial Pointer with variable fully closed . . . . . At mark to left of 550 kc calibration mark.

WAVE BAND SWITCH POSITION	POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS ADJUSTED (IN ORDER SHOWN)	TRIMMER FUNCTION	ANT. COUPLED APPROXIMATE MICROVOLTS
"BC"	Closed	455 kc	.1 mfd.	7H7 Grid	T2, T1	IF	100

"SW"	Open	18.2 mc	400 ohms	Ant. Term.	C7*	Oscillator	--
"SW"	15 mc(rock)	15 mc	400 ohms	Ant. Term.	C4	Translator	70
"SW"	6 mc(rock)	6 mc	400 ohms	Ant. Term.	C11	Padder	100

IMPORTANT ALIGNMENT NOTES

* If two peaks can be had, the correct one is with the trimmer screw further out. The other peak is the image.

** 160 microvolts per meter using standard Hazeltine alignment loop 24 inches from receiver loop.

*** 140 microvolts per meter using standard Hazeltine alignment loop 24 inches from receiver loop.

Where indicated by the work, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

MODELS 7085, 7102, 8085
CHASSIS 101.814,
101.814-1A, 101.814-4C

CHASSIS 101.814-4C

is Similar to chassis 101.814 except 14A7 I. F. Tube is used in place of 7B7. Elliptical Speaker is used in place of 5 1/4" Speaker. The styling of this model with respect to Escutcheon, Knobs, Dial Background and Pointer are similar to the 101.814-2B.

SPECIFICATIONS

CHASSIS 101.814 AND 101.814-1A

Model Differences:
Both models are similar, however, 101.814-1A is a console with a larger speaker. The 101.814 is a table model.

Power Supply:
All models available.....117 Volts AC 60 Cycles 90 Watts

PRELIMINARY:

ALIGNMENT PROCEDURE

Output Meter Connection.....Across loud speaker voice coil
Output Meter Reading to Indicate 50 Milliwatts (Standard Output)..... 0.4 Volt
Generator Ground Lead Connection.....Receiver chassis
Dummy Antenna Value to be in Series with Generator Output.....See chart below
Connection of Generator Output Lead.....See chart below
Generator Modulation.....30%, 400 cycles
Position of Volume Control.....Fully on
Position of Tone Control.....Treble (clockwise)
Position of Pointer with Tuner Fully Closed.....Last line below 540 calibration mark

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMER ADJUSTMENTS (IN ORDER) SHOWN	TRIMMER FUNCTION
Closed	455 KC	.1 mfd.	Trans. Grid	T2,T1	IF
1500 KC	1500 KC	.0002 mfd.	Antenna	C9	Oscillator
1500 KC	1500 KC	.0002 mfd.	Antenna	C5	Transl.

IMPORTANT ALIGNMENT NOTES

The Alignment must be done in the order given.
The entire Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

The Erase Oscillator Coil has been set at 39.5 Kc. at the factory. If necessary, it can be adjusted with the use of a Beat Frequency Oscillator.

The Erase voltage on the Recording Head should be approximately 3.3 volts as measured with a Vacuum Tube Voltmeter.

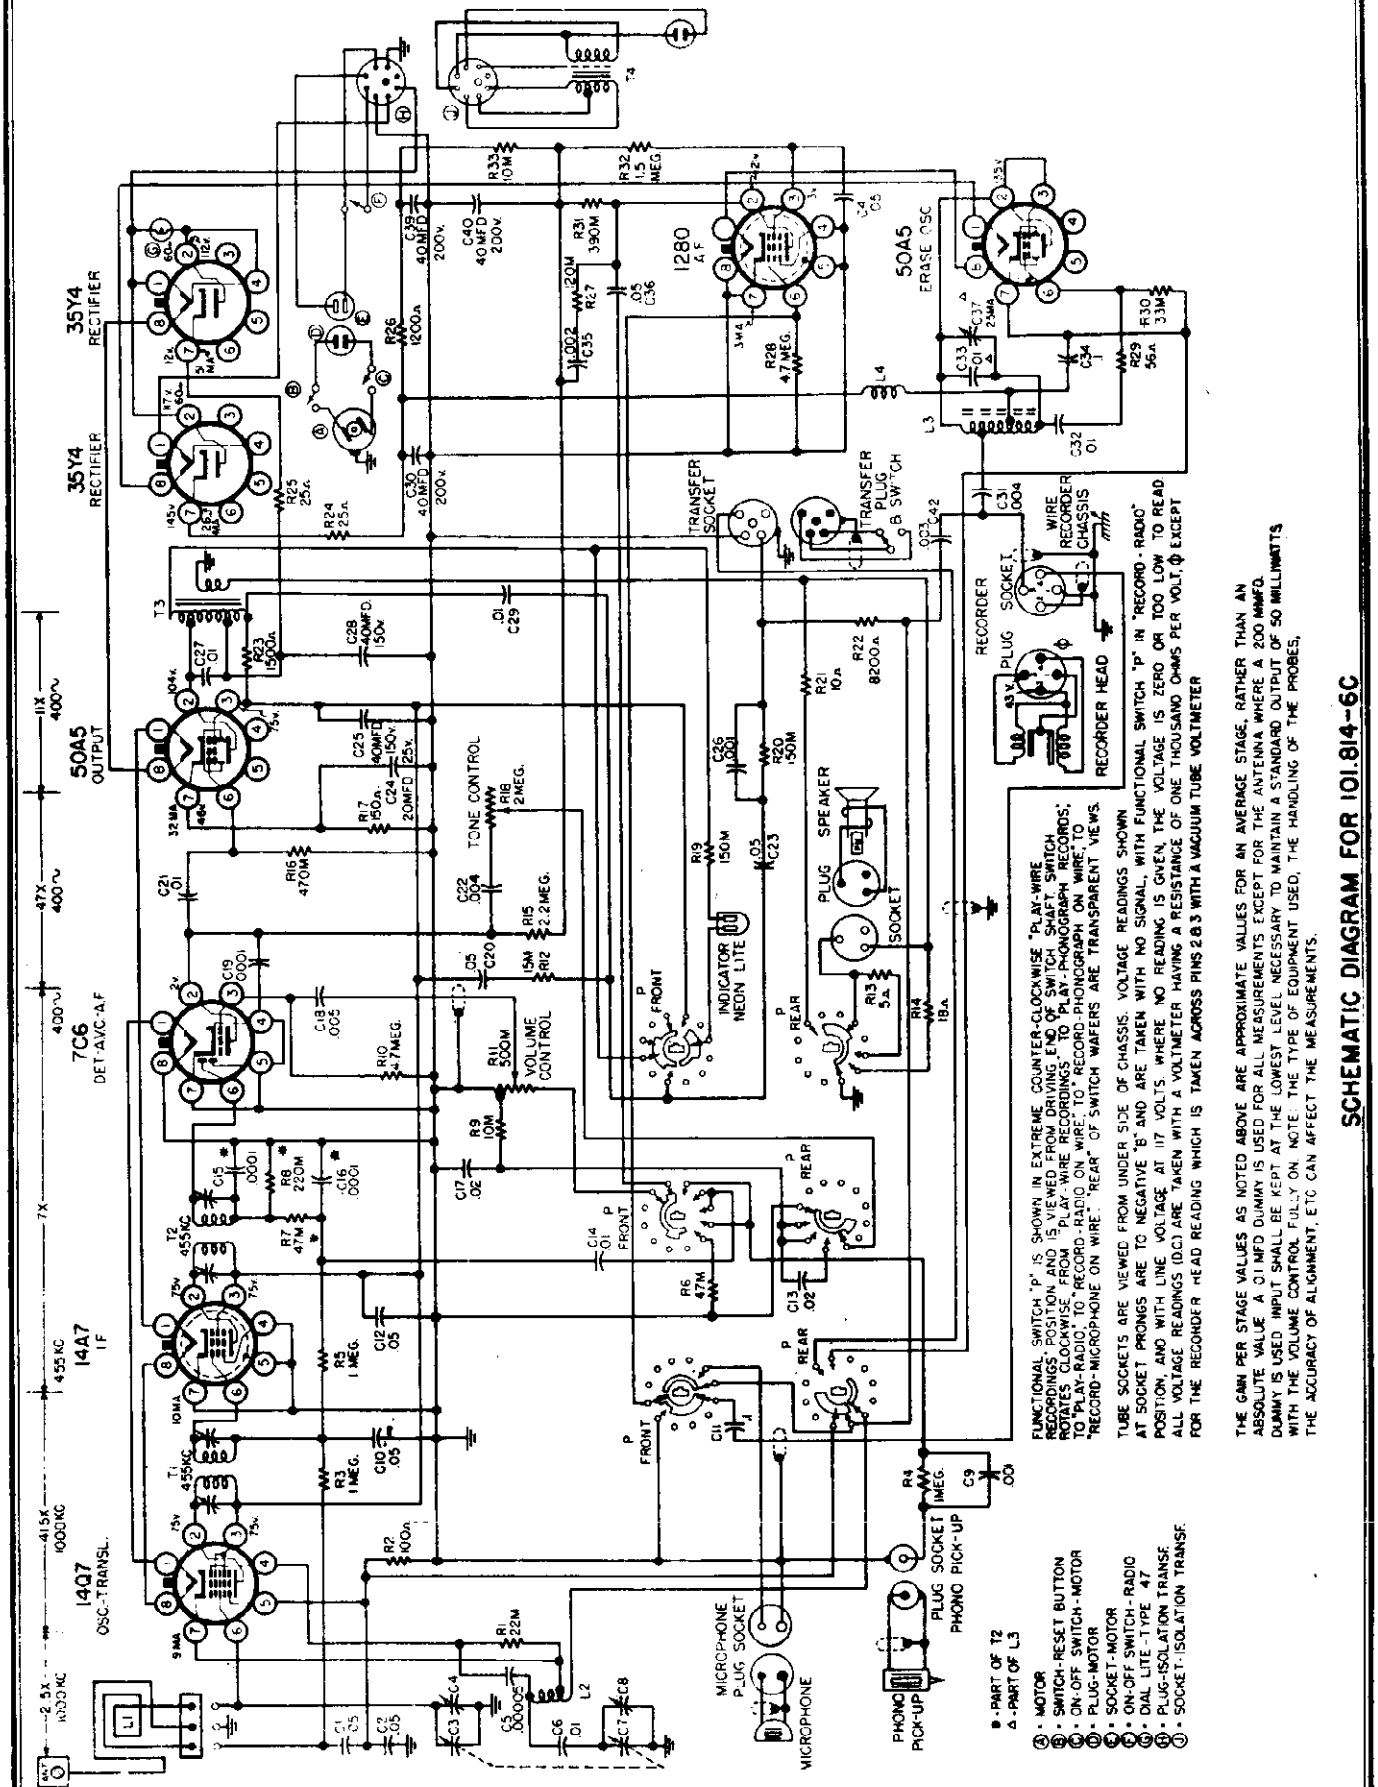
CHASSIS 101.814-6C

SEARS, ROEBUCK & CO.



FUNCTIONAL SWITCH "P" IS SHOWN IN EXTREME COUNTER-CLOCKWISE "PLAY-WIRE RECORDINGS" POSITION AND IS VIEWED FROM DRIVING END OF SWITCH SHAFT. SWITCH ROTATES CLOCKWISE FROM "PLAY-WIRE RECORDINGS" TO "PLAY-PHONOGRAPH RECORDS," TO "PLAY-RADIO," TO "RECORD-RADIO ON WIRE," TO "RECORD-PHONOGRAPH ON WIRE," TO "RECORD-MICROPHONE ON WIRE." "REAR" OF SWITCH WAFERS ARE TRANSPARENT VIEWS.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEGATIVE "B" AND ARE TAKEN WITH NO SIGNAL, WITH FUNCTIONAL SWITCH "P" IN "RECORD-RADIO" POSITION AND WITH LINE VOLTAGE AT 117 VOLTS WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ. ALL VOLTAGE READINGS (D.C.) ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT, EXCEPT FOR THE RECORDER HEAD READING WHICH IS TAKEN ACROSS PINS 2 & 3 WITH A VACUUM TUBE VOLTMETER.

THE GAIN PER STAGE VALUES AS NOTED ABOVE ARE APPROXIMATE VALUES FOR AN AVERAGE STAGE, RATHER THAN AN ABSOLUTE VALUE. A .01 MFD. DUMMY IS USED FOR ALL MEASUREMENTS EXCEPT FOR THE ANTENNA WHERE A 200 MMFD. DUMMY IS USED. INPUT SHALL BE KEPT AT THE LOWEST LEVEL NECESSARY TO MAINTAIN A STANDARD OUTPUT OF 50 MILLIWATTS WITH THE VOLUME CONTROL FULLY ON. NOTE THE TYPE OF EQUIPMENT USED, THE HANDLING OF THE PROBES, THE ACCURACY OF ALIGNMENT, ETC. CAN AFFECT THE MEASUREMENTS.

ALIGNMENT PROCEDURE FOR 101.814-3B,5C,6C ONLY

PRELIMINARY:

Output meter reading to indicate 0.05 watt across voice coil.....0.4 volt
Generator ground lead connection.....Receiver chassis
Generator modulation.....30%, 400 cycles
Position of volume control.....Fully on
Position of tone control.....H1
Position of pointer with tuner fully closed.....Last line below 540 Kc. calibration mark on the Dial or at the "Start" of calibration point on the dial background plate.

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMER ADJUSTMENTS (IN ORDER SHOWN)	TRIMMER FUNCTION
Closed	455 Kc.	0.1 mfd.	Transl.-Grid	T2 & T1	I.F.
See note below	1400 Kc.	200 mmfd.	Ant.	C8	Osc.
See note below	1400 Kc.	200 mmfd.	Ant.	C4	Transl.

IMPORTANT ALIGNMENT NOTES:

NOTE: With the dial background removed, the tuner should be positioned at the 1400 Kc. mark on the dial background plate.

The alignment must be done in the order given.

The alignment procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output voltage from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurage alignment.

The erase oscillator coil has been set at 33.7 Kc. at the factory. If necessary it can be adjusted with the use of a beat frequency oscillator.

***Run a wire from the output terminal of generator near the receiver. No connection is made between the signal generator and the receiver.

IMPORTANT ALIGNMENT NOTES

The alignment procedure should be repeated stage by stage, in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the Receiver ineffective.

POWER OUTPUT . . UNDISTORTED . . . . .95 WATTS MAXIMUM. . . . . 2.0 WATTS

SPECIAL SERVICE NOTES

To check the erasing voltage of the Recorder Head, turn set on. Set Master Selector Switch to Position #3 *(Record Radio)*. Set the Recorder Control Lever to "Record Wire" and measure the voltage between Pin #2 and 3 of the Recorder Head. This should be done with Recorder Head attached to the plug of the Recorder Cable. The voltage at this point should be 2.7 Volts, minimum, as measured with the Vacuum Tube Voltmeter.

The erasing voltage may also be checked using a #57 Pilot Light. This is done by setting the Master Selector Switch to Position #3 *(Record Radio)* and the Recorder Control Lever to "Record Wire". The voltage appearing across Pin #2 and 3 of the "J" Connector *(see schematic)* will light the lamp to a pale orange color which outlines the filament. *(without recorder head attached).*

IMPORTANT ALIGNMENT NOTES

The Alignment must be done in the order given.
The Alignment Procedure should be repeated step by step in the original order for greatest accuracy.
Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.
During alignment of the BC Band Padder and the SW Band Translator and Antenna Trimmers, the Tuner should be rocked through resonance to assure alignment.

Power Output — Undistorted 1.1 Watts — Maximum 2 Watts

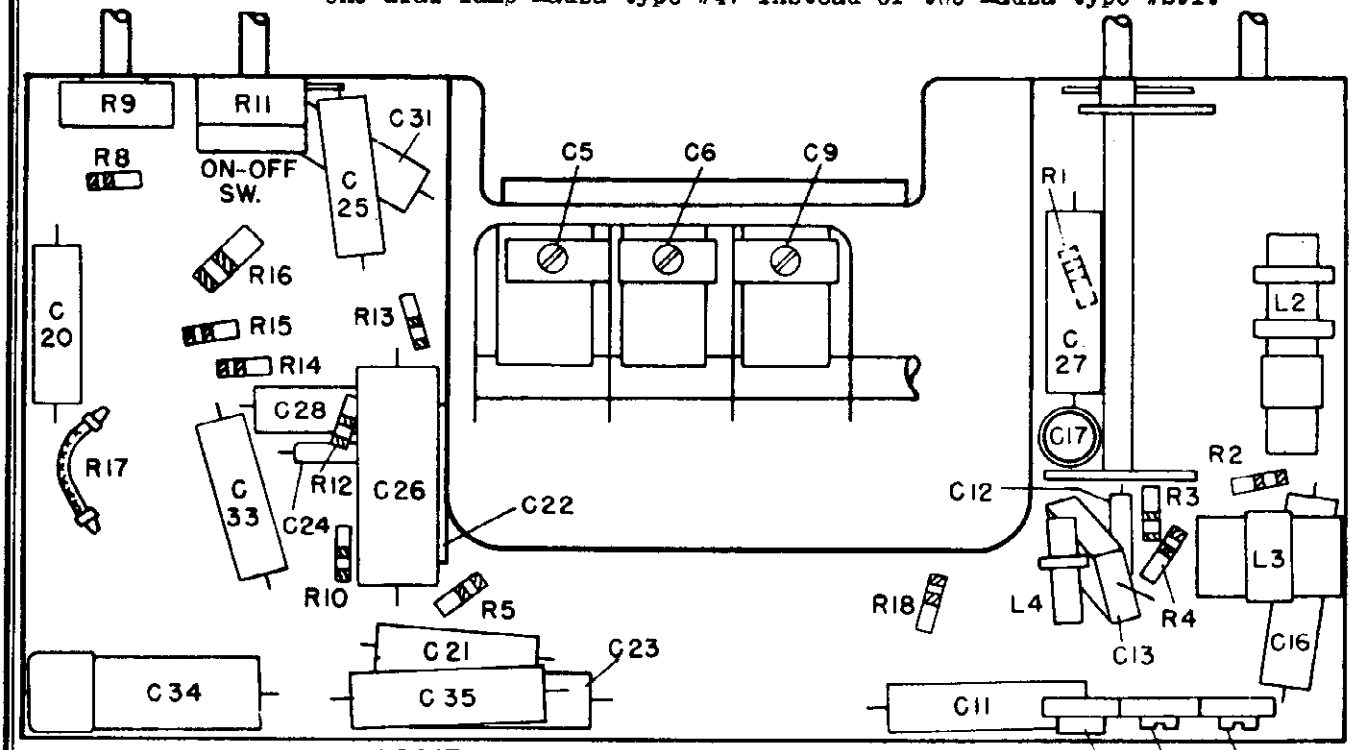
MODELS 7090,8092
CHASSIS 101.810-2,
101.810-1A

SEARS, ROEBUCK & CO.

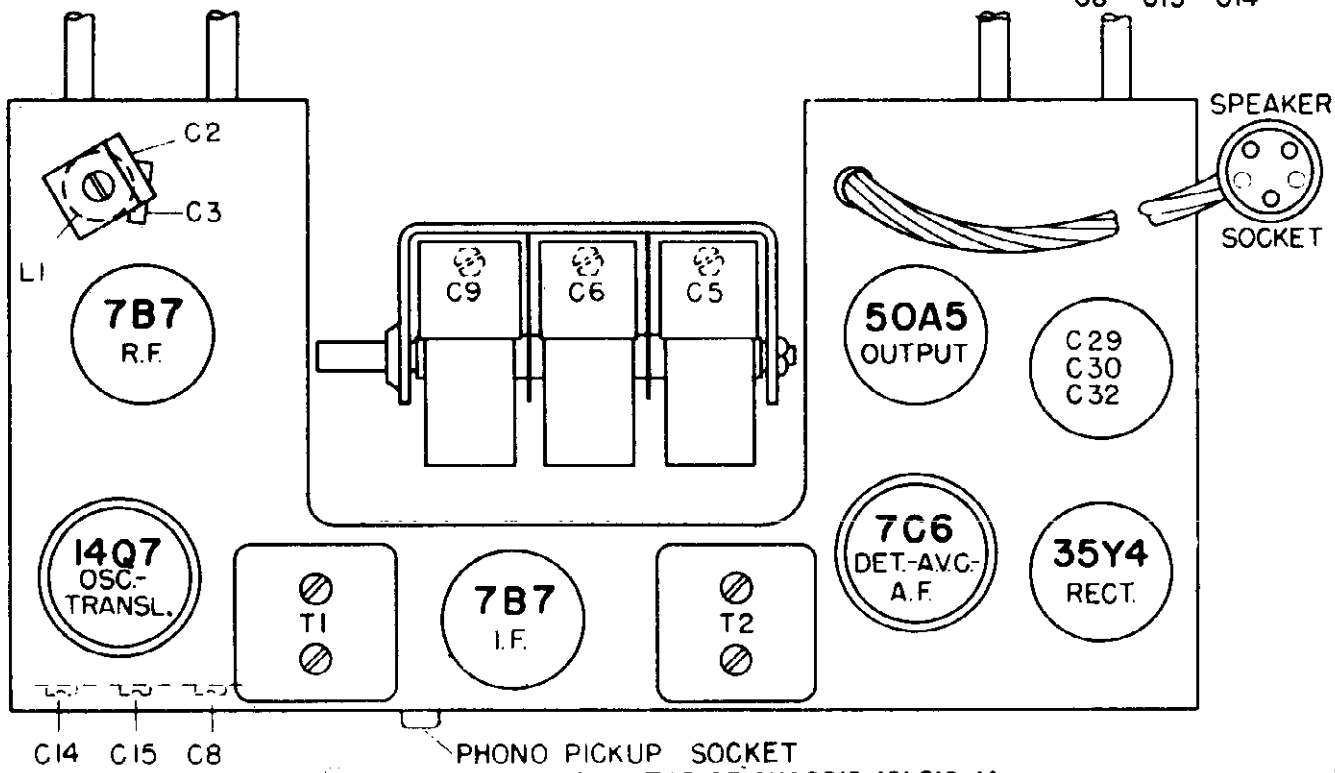
Chassis Differences:

101.810-1A - Chassis similar to 101.810-3 except linear dial.

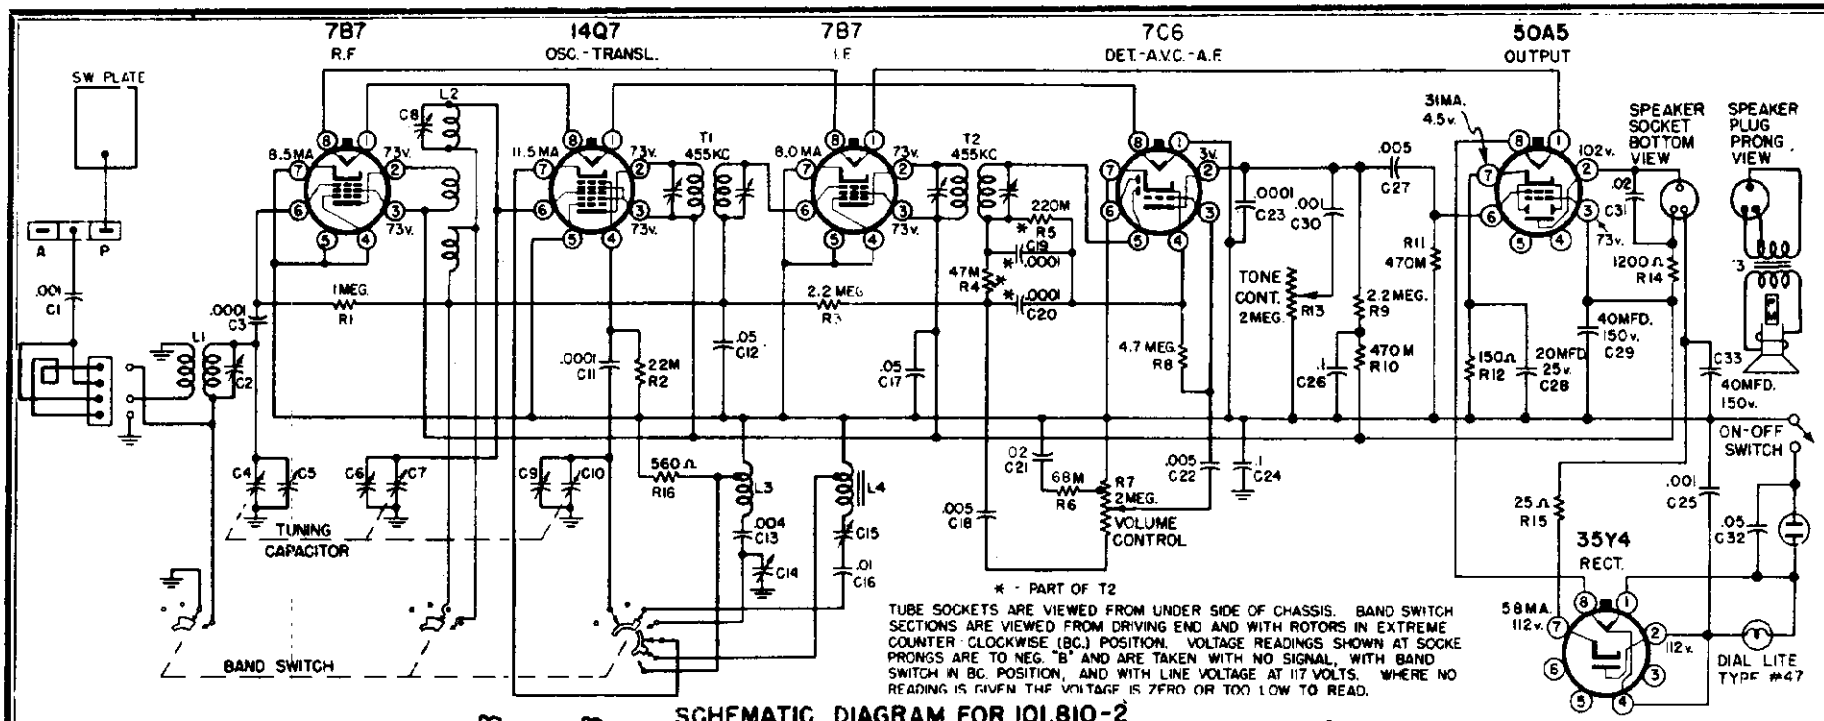
101.810-2 - Chassis same as 101.810 except new type tone control and uses one dial lamp Madza type #47 instead of two Madza type #291.



LOCATION OF PARTS UNDER CHASSIS 101.810-1A

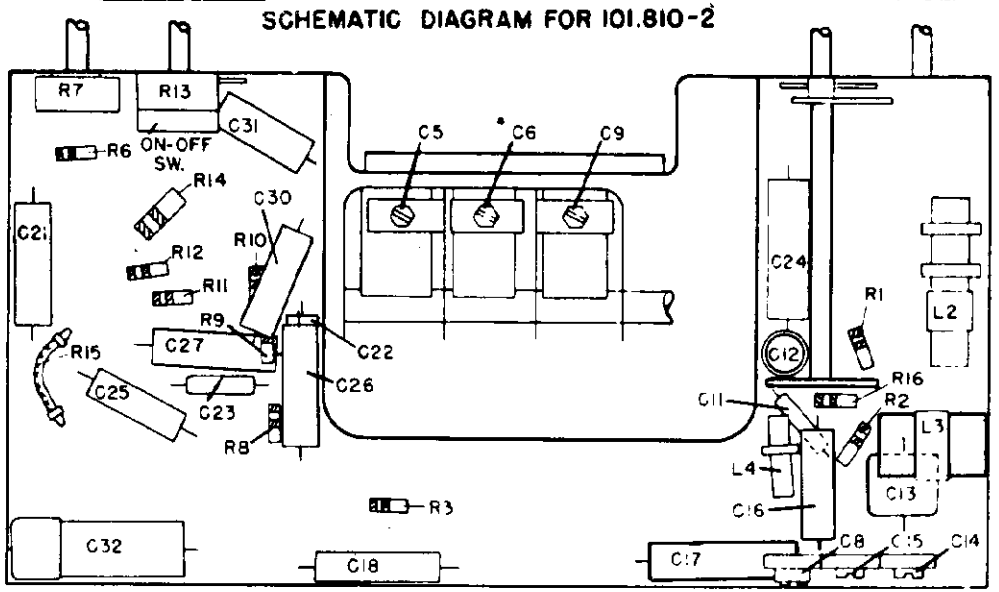


LOCATION OF PARTS ON TOP OF CHASSIS 101.810-1A



TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. BAND SWITCH SECTIONS ARE VIEWED FROM DRIVING END AND WITH ROTORS IN EXTREME COUNTER CLOCKWISE (BC.) POSITION. VOLTAGE READINGS SHOWN AT SOCKE PRONGS ARE TO NEG. "B" AND ARE TAKEN WITH NO SIGNAL, WITH BAND SWITCH IN BC. POSITION, AND WITH LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

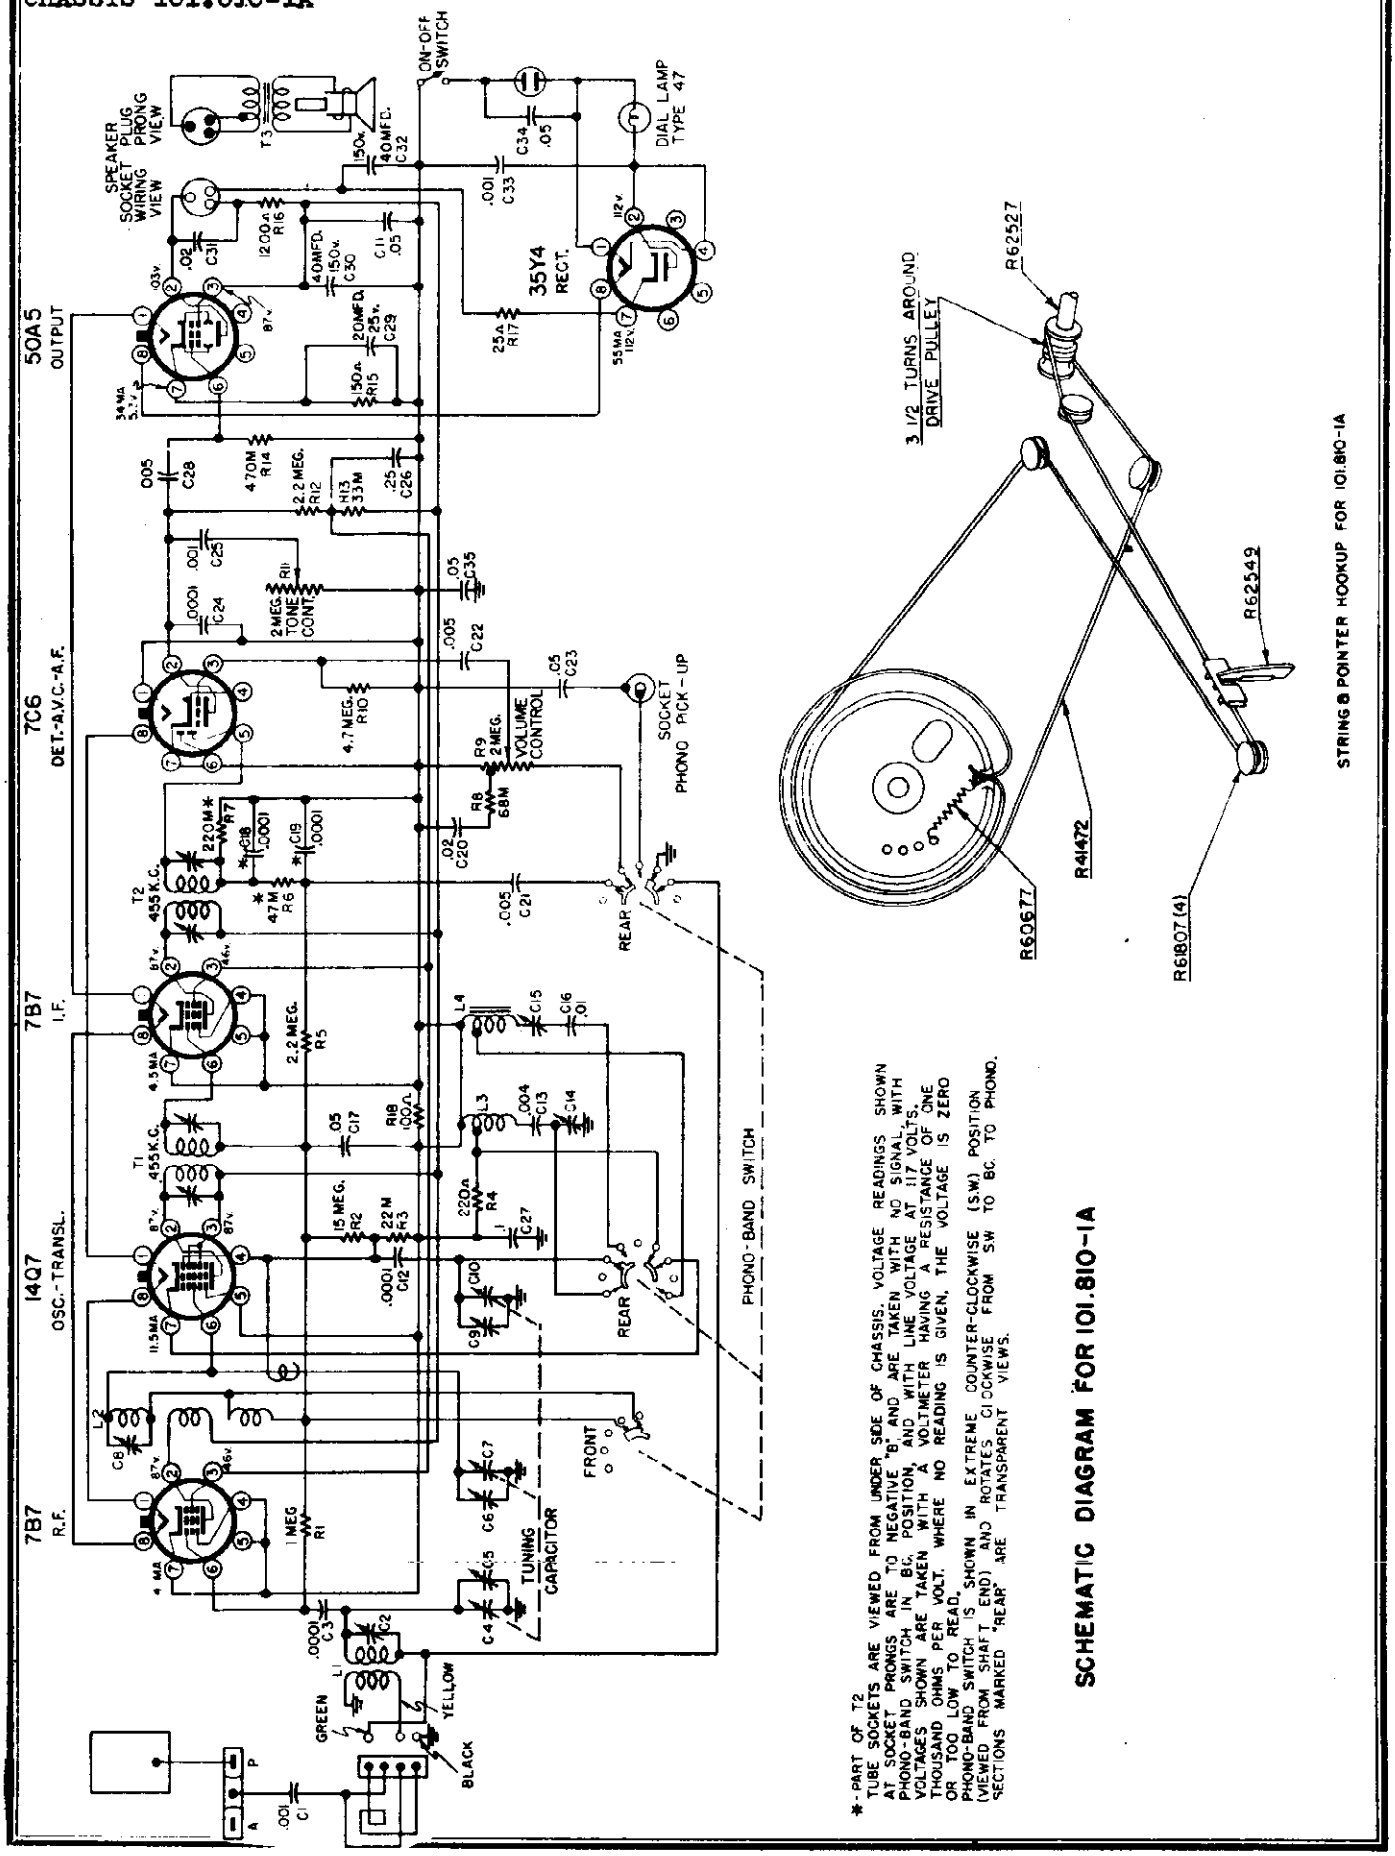
SCHEMATIC DIAGRAM FOR 101.810-2



LOCATION OF PARTS UNDER CHASSIS 101.810-2

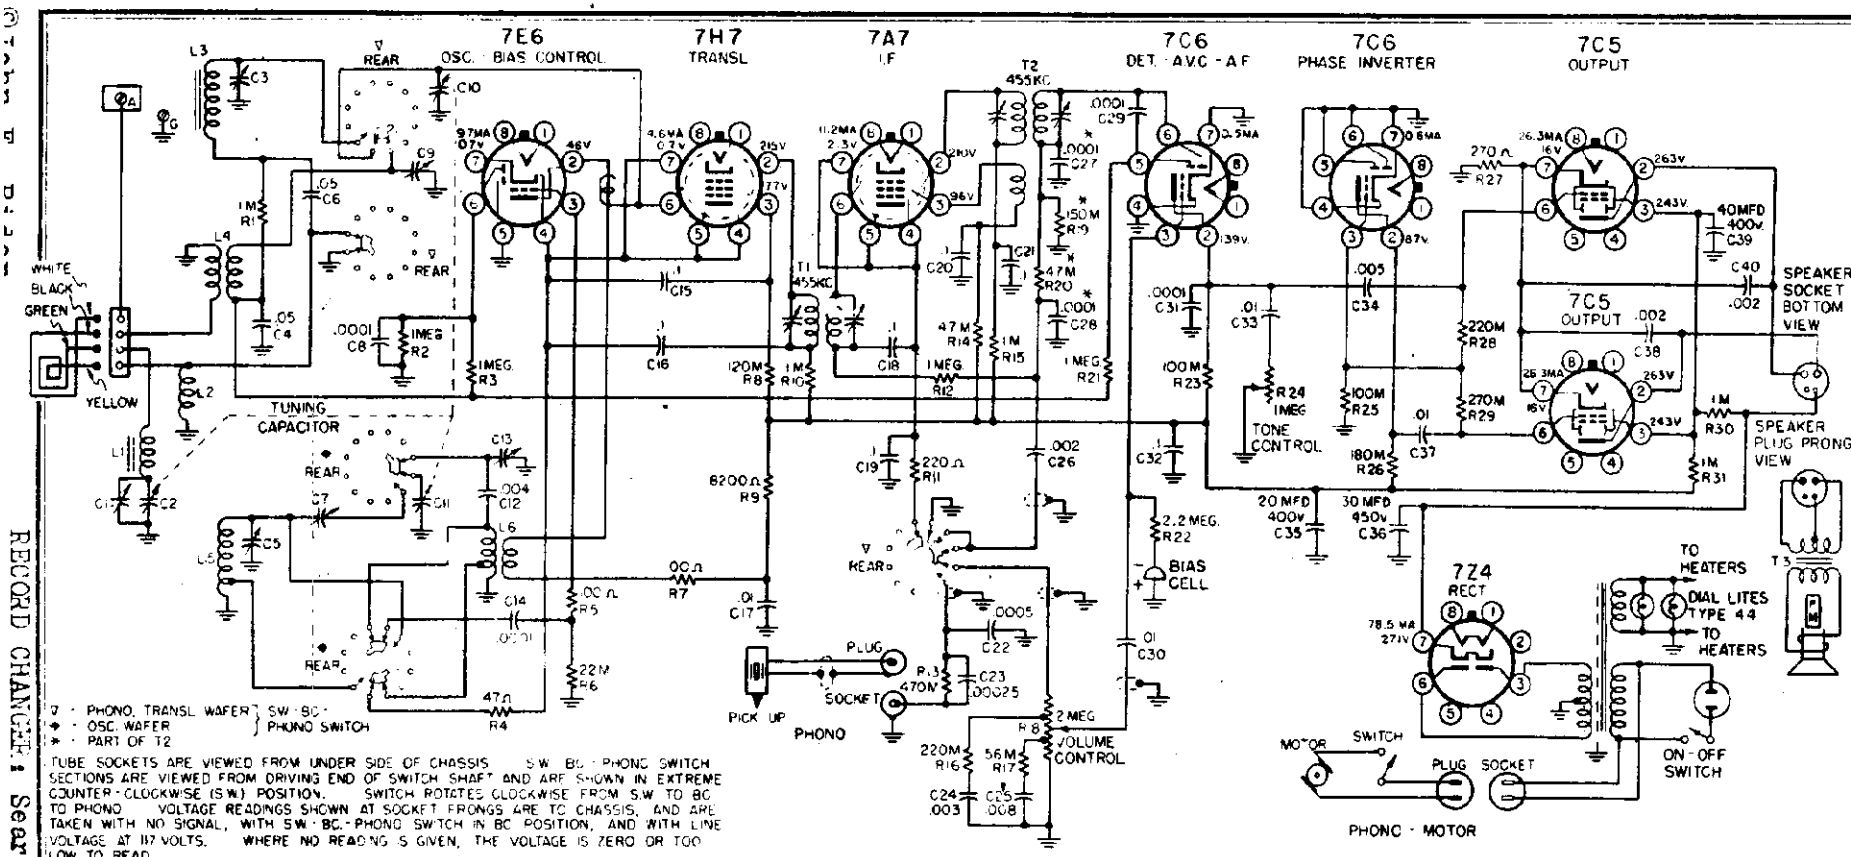
MODEL 8092
CHASSIS 101.810-1A

SEARS, ROEBUCK & CO.



SCHEMATIC DIAGRAM FOR 101.810-1A

*-PART OF T2
TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEGATIVE "B" AND ARE TAKEN WITH NO SIGNAL, WITH PHONO-BAND SWITCH IN BC. POSITION, AND WITH LINE VOLTAGE AT 117 VOLTS. VOLTAGES SHOWN ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT. WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ.
PHONO-BAND SWITCH IS SHOWN IN EXTREME COUNTER-CLOCKWISE (S.W.) POSITION (VIEWED FROM SHAFT END) AND ROTATES CLOCKWISE FROM SW TO BC. TO PHONO. SECTIONS MARKED "REAR" ARE TRANSPARENT VIEWS.



TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. S.W. BC - PHONO SWITCH SECTIONS ARE VIEWED FROM DRIVING END OF SWITCH SHAFT AND ARE SHOWN IN EXTREME COUNTER-CLOCKWISE (S.W.) POSITION. SWITCH ROTATES CLOCKWISE FROM S.W. TO BC TO PHONO. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO CHASSIS, AND ARE TAKEN WITH NO SIGNAL, WITH S.W. - BC. - PHONO SWITCH IN BC POSITION, AND WITH LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ.

Power Supply:
All models available

117 Volts 60 Cycle AC 100 Watts

Frequency Range:

Standard Broadcast.....540-1600 KC
Shortwave.....6-16 MC

Model Differences:

101.828 Cabinet is a Vertical Console
101.828-1A Cabinet is a Walnut Loboy

SEARS, ROEBUCK & CO. MODELS 7105,7106
CHASSIS 101.828,101.828-1A

IMPORTANT ALIGNMENT NOTES

The Alignment must be done in the order given.

The Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

During alignment of the BC Band Padder and the SW Band Translator Trimmers, the Tuner should be rocked through resonance to assure alignment.

Power Output — Undistorted 3.6 Watts — Maximum 6.5 Watts

ALIGNMENT PROCEDURE

Preliminary:

Output Meter Reading to Indicate.5 Watts Across Voice Coil.....1.2 Volts
Generator Ground Lead Connection.....Receiver Chassis
Generator Modulation.....30%, 400 Cycles
Position of Volume Control.....Fully on
Position of Tone Control.....Treble
Position of Pointer with Tuner Fully Closed.....Last Line Below 540 Calibration Mark

WAVE BAND SWITCH POSITION	POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	TRIMMER FUNCTION
BC	Closed	455 KC	0.1 Mfd.	7H7 Transl. Grid	T2, T1	I. F.

SCHEMATIC DIAGRAM FOR 101.819A

V - PART OF T1 M - PART OF T2
TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEGATIVE "B" AND ARE TAKEN WITH NO SIGNAL AND WITH LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

MODEL 7226
CHASSIS 101.819A

SEARS, ROEBUCK & CO.

PRELIMINARY:

Output meter connections.....Across loud speaker voice coil
Output meter reading to indicate 50 milliwatts (Standard output).....0.4 Volt
Generator ground lead connection.....Receiver chassis
Dummy antenna value to be in series with generator output.....See chart below
Connection of generator output lead.....See chart below
Generator modulation.....30%, 400 cycles
Position of Volume Control.....Fully on
Position of Tone Control..... HI
Position of pointer with tuner fully closed....To the left of 540 Kc calibration mark

MODEL 8003
CHASSIS 132.818-1
MODEL 8090
CHASSIS 101.821

MODEL 8003 CHASSIS 132.818-1
ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across speaker voice coil
Output meter reading to indicate 200 milliwatts ..... .8 volt
Connection of generator ground lead ..... Floating ground
Generator modulation ..... 30%, 400 cycles
Position of volume control ..... Fully clockwise
Position of dial pointer with variable fully closed ..... 54 on dial

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION (high)	TRIMMERS ADJUSTED (in order shown)	TRIMMER FUNCTION
Open	455 kc	.05 mfd.	12SA7GT grid	Top of T3	I. F.
1400 kc	1400 kc	.00005 mfd.	**Antenna	*C2	Oscillator
600 kc	600 kc	.00005 mfd.	**Antenna	Check point	- - - - -

IMPORTANT ALIGNMENT NOTES

*Since the antenna stator section of the variable has no trimmer, the rotor is rocked back and forth while adjusting oscillator trimmer, to obtain maximum output.

Check the sensitivity at 600 kc; if weak, adjust antenna section plates for maximum output at 600 kc; tracking is accomplished by adjusting plates of rotor.

**Unsolder 20' antenna lead from lug on antenna coil, and connect signal generator lead to lug through .00005 mfd. Dummy Antenna.

Approximate stage by stage sensitivities are: Mixer - 455 kc - 2600 uv; Mixer 1000 kc - 2600 uv; Antenna - 1000 kc - 180 uv.

ALIGNMENT PROCEDURE
MODEL 8090 CHASSIS 101.821

PRELIMINARY:

Output meter reading to indicate 0.05 Watt across voice coil.....0.4 Volt

Generator ground lead connection.....I.F. alignment-negative "B" lead
.....Ant. alignment-Receiver chassis

Generator modulation.....30%, 400 cycles

Position of volume control.....Fully on

Position of pointer with tuner fully closed..Last line to left of 540 calibration mark on escutcheon or the second light brown mark from the left-hand end on the upper edge of the dial background.

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	TRIMMER FUNCTION
Closed	455 Kc.	0.1 mfd.	Transl.-Grid	T2 & T1	I. F.
Fully open	1650 Kc.	.0002 mfd.	Antenna	C7	Oscillator
See note below	1410 Kc.	.0002 mfd.	Antenna	C3	Antenna

IMPORTANT ALIGNMENT NOTES:

NOTE: The 1410 Kc. calibration point is the first light brown mark from the right-hand edge of the dial background.

The alignment must be done in the order given.

The entire Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

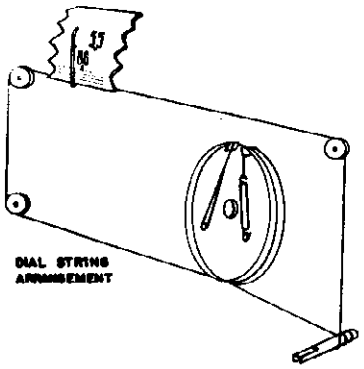
CIRCUIT CHANGES

Before start of Production on this model, certain circuit improvements were made, which do not appear on the printed stickers and instruction sheets which accompany each receiver. These differences are as follows:

1. A pickup coil was added to the AM loop antenna.
2. C44 added to FM antenna circuit and C12 relocated in FM antenna circuit.
3. R27 added from plate of 50L6 to plate of 6AQ6.
4. C34 -- .005 Mfd. was .05 Mfd.
5. C38 -- .005 Mfd. was .002 Mfd.
6. C47 -- .002 Mfd. was .005 Mfd.
7. L4 -- is relocated on the Schematic Diagram.
8. R5 -- deleted from FM antenna circuit.



The following changes were made after some sets had been produced, to improve the sensitivity and tone.

1. C45 Condenser added from 50L6 screen grid to chassis .001 uf.
2. C12 Condenser changed from .001 uf. to .00001 uf.
3. C44 Condenser changed from .001 uf. to .00001 uf.
4. C34 Condenser changed from 400 Volt to 600 Volt.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across speaker voice coil
Output meter reading to indicate 50 MW (Standard Output) ..... .4 volt
Generator modulation ..... 30 % 400 cycles
Position of volume control ..... Fully clockwise
Set dial pointer ..... To last mark on left end of dial with variable condenser closed
Set band switch ..... To left for AM alignment and to right for FM alignment

AM ALIGNMENT

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN FOR MAX. OUTPUT	TRIMMER FUNCTION
Open	455 Kc	.05 Mfd.	Mixer grid	Chassis	1-2-3-4	IF
1400 Kc	1400 Kc		*Test loop	Test loop	11	Oscillator
1400 Kc	1400 Kc		*Test loop	Test loop	12	Antenna
**600 Kc	600 Kc		*Test loop	Test loop	Check point	Antenna

*Connect generator lead to a Standard Hazeltine Test Loop, Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop. Or the generator can be connected with the high side lead to the green lead on the set loop and the ground lead to the chassis.

**With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section plates of variable for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy.

Always keep the output from the signal generator at its lowest possible value to make the A.V.C. action of the receiver ineffective.

FM ALIGNMENT

Discriminator

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	10.7 Mc	.05 Mfd.	2d IF grid	Chassis	*5, 6	Discriminator

*5 is adjusted for maximum A.V.C. voltage.
*6 is adjusted for zero reading of a vacuum tube voltmeter connected across the volume control. Rock this adjustment through the zero point to see that the voltage is positive on one side of the zero point and negative on the other.

IF

Open	10.7 Mc	.05 Mfd.	Mixer grid	Chassis	7, 8, 9, 10	IF

Adjust trimmers for maximum A. V. C. voltage.

Repeat "Discriminator" and "IF Alignment" with generator connected to mixer grid, being careful not to shift the generator frequency during this operation.

NOTE: If a 10.7 Mc FM generator is not available for alignment of discriminator and IF, an unmodulated signal of 10.7 Mc from an accurately calibrated conventional AM type generator can be used.

RF

108 Mc	108 Mc	200 Ohm Resistor	Ant. Terminal on Rear Cover	Ant. Terminal on Rear Cover	14	Oscillator
88 Mc	88 Mc	200 Ohm Resistor	Ant. Terminal on Rear Cover	Ant. Terminal on Rear Cover	13	Oscillator

Repeat the above oscillator adjustments until proper coverage is obtained.

105 Mc	105 Mc	200 Ohm Resistor	Ant. Terminal on Rear Cover	Ant. Terminal on Rear Cover	17, 18	Mixer & Antenna
91 Mc	91 Mc	200 Ohm Resistor	Ant. Terminal on Rear Cover	Ant. Terminal on Rear Cover	15, 16	Mixer & Antenna

All RF trimmers are adjusted for maximum output.

Repeat "Mixer & Antenna" adjustments until proper tracking is obtained.

Subject: General Service Suggestions and Circuit Changes.

This supplement is issued for the purpose of distributing information which should be helpful in servicing this radio. The following points are covered.

1. REDUCTION OF HUM LEVEL:

On some earlier production sets, excessive hum may be reduced to an acceptable level by reversing the intermediate and output sections of the electrolytic condenser, part no. M21402. The intermediate section, indicated as C28C on the Schematic Diagram printed herewith, should be 80 Mfd., and the output section 40 Mfd. Should these be connected oppositely, reversing them as indicated in the diagram below, will result in a lower hum level.

2. MICROPHONISM:

Examination of the metal chassis will disclose that the R. F. unit (variable condenser, three miniature tubes and related parts underneath) is rubber mounted on a separate panel. Any direct contact between this panel and the main chassis base may result in a tendency toward microphonics, particularly at high volume level. Slightly loosening the three mounting screws which protrude through the rubber grommets,so as to free the "floating" action of the panel, will, in some cases, eliminate the microphonic tendency. It may be necessary also to pry up the front edge of the panel in order to clear contact with the head of the rivet in the front of the panel. On later production sets, the location of this rivet was changed, so as to avoid any contact with the main chassis base.

3. DISTORTION AT LOW VOLUME LEVEL:

A complaint of low volume distortion or "hum modulation" may be satisfied by the addition of a .001 mfd. condenser from the 50L6GT screen grid to chassis ground. This addition was incorporated in early production; however, some sets were shipped without it

4. NEW CIRCUITS:

(4) additional circuit changes have been made in current production. These are indicated on the revised schematic diagram printed here, and are as follows:

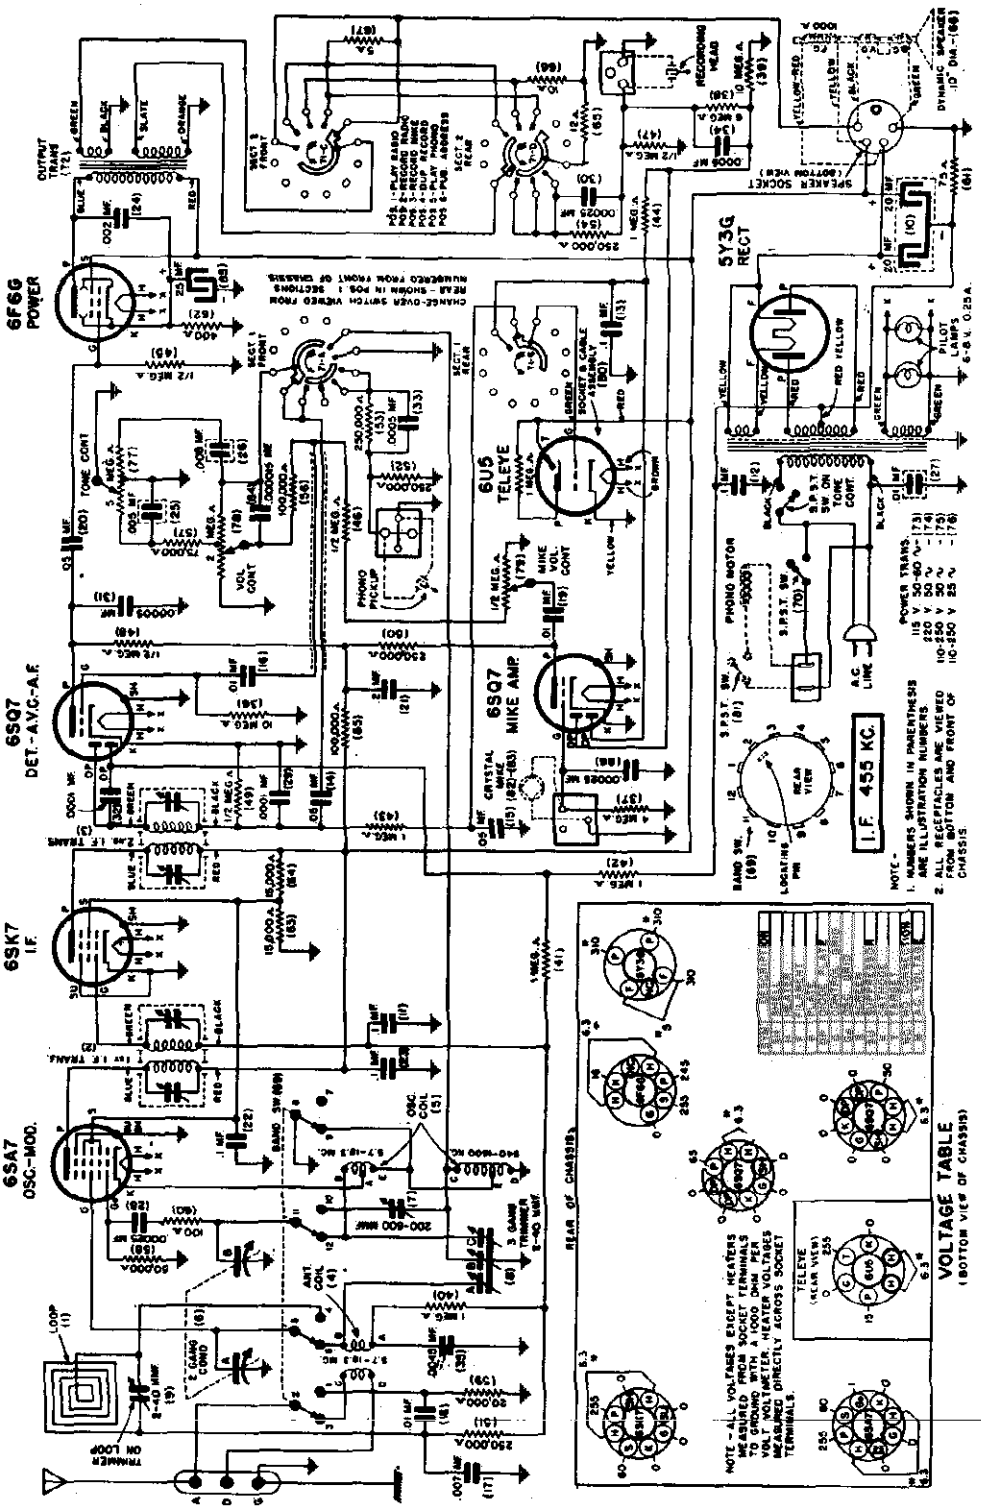
1. Condenser C6 - .00005 mfd., deleted.
2. Condenser C46 - .005 mfd., added across antenna loop sections and connection to antenna screw terminals removed.
3. Condenser C41 - changed from .002 mfd. to .005 mfd.
4. Condenser C38 - changed from .005 mfd. to .002 mfd.

Any set not wired in accordance with the above #2 change should be changed over, only if it is to be used in conjunction with an external antenna. Otherwise, these changes are not necessary.

Changes #3 and #4 make the tone control more effective.

SENTINEL RADIO CORP.

MODEL 216J

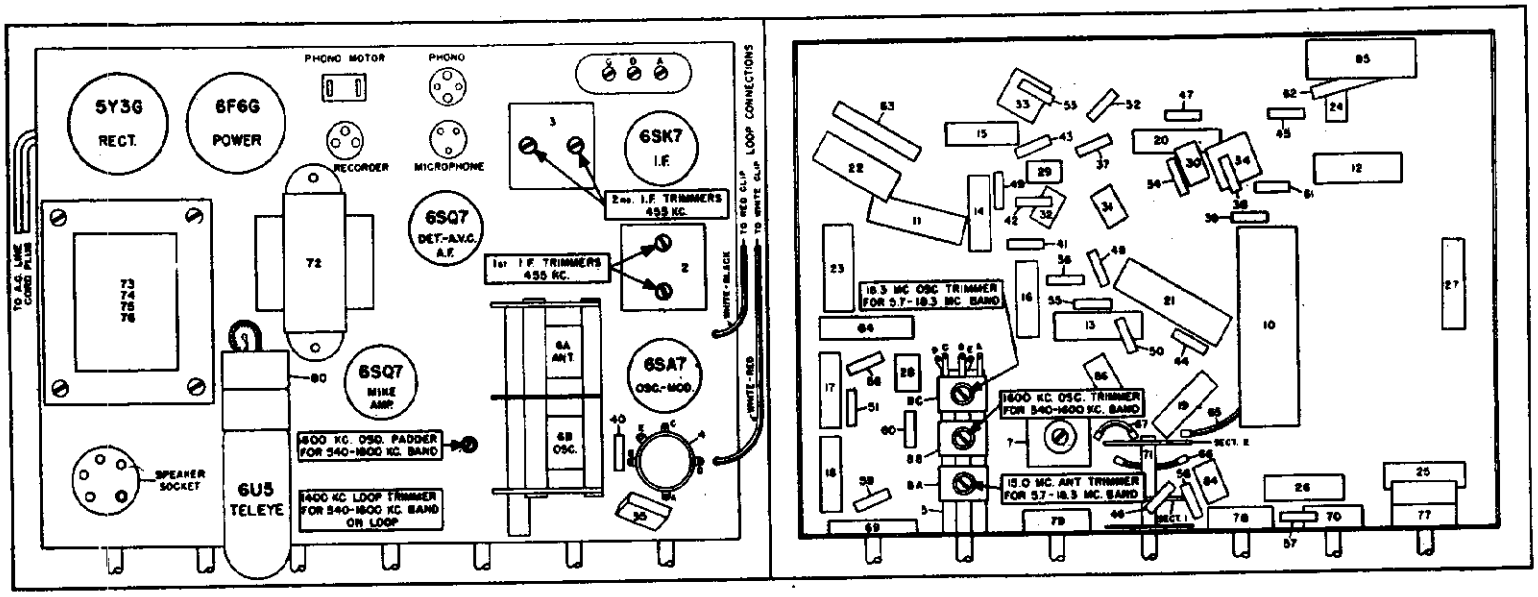


ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET, AND HAVE CHANGE OVER SWITCH KNOB IN "PLAY RADIO" POSITION.

When adjusting 1600 kilocycle oscillator trimmer and 1400 kilocycle antenna trimmer, do not connect oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

Place band switch for operation on:	Set Receiver dial to:		TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received		Exactly 455 K. C.	0.2 Mfd. condenser	High side to grid of 6SA7 tube.	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
1600 to 540 K.C. Band	1	Exactly 1600 K.C.	Exactly 1600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.	Adjust 1600 K. C. oscillator trimmer for maximum output.
	2	Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.	While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.
	3	Approx. 600 K.C.	Approx. 600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.	While rocking gang condenser adjust 600 K. C. oscillator padder for maximum output.
5.7 to 18.3 M.C. Band	1	Exactly 18.3 M.C.	Exactly 18.3 M.C.	400 Ohm carbon resistor	High side to "A" Post. Low side to chassis.	Adjust 18.3 M.C. oscillator trimmer for maximum output—be sure to use proper peak. If more than one peak is noticed, back off trimmer to minimum capacity, then screw down trimmer (add capacity) until the second peak—which is the proper one to use is tuned in.
	2	Approx. 15 M.C.	Approx. 15 M.C.	400 Ohm	High side to "A" Post, Low side to chassis.	While rocking gang condenser adjust 15 M. C. antenna trimmer for maximum output.



VOLTAGE RATING

WHILE THE RADIO MAY BE OPERATED ON EITHER 50 OR 60 CYCLE 100-120 VOLT ALTERNATING CURRENT (A.C.), THE PHONOGRAPH MOTOR MUST BE USED ON THE FREQUENCY DESIGNATED ON THE PAPER LICENSE TAG, which will be found attached to the cabinet.

Check receiver and recorder motor voltage and frequency rating before attempting to operate this unit. Be sure that the voltage and frequency rating given on the license tag is the same as the house current supply.

IF THE LICENSE NOTICE IS MARKED 115 VOLTS 60 CYCLE, THE PHONOGRAPH MOTOR IS DESIGNED FOR OPERATION ON 110-120 VOLTS 60 CYCLE CURRENT ONLY.

IF LICENSE NOTICE IS MARKED 115 VOLTS 50 CYCLE, THE PHONOGRAPH MOTOR IS DESIGNED FOR OPERATION ON 110-120 VOLT 50 CYCLE CURRENT ONLY

AERIAL

THE LOOP AERIAL SUPPLIED with the radio should provide ample 540-1600 kilocycle band reception in average locations.

OUTSIDE AERIAL

LOOP AERIALS ARE NOT SATISFACTORY FOR SHORT WAVE RECEPTION, AND BECAUSE OF THIS AN EXTERNAL AERIAL MUST BE ATTACHED TO THE RADIO WHEN TUNING FOR SHORT WAVE STATIONS. Also, if the radio is used in shielded areas or when located a great distance from broadcast stations, the volume of the stations operating in the 560-1600 kilocycle band may not be ample, in which case it would be necessary to attach a 35 to 50 foot outdoor aerial to the receiver to obtain satisfactory results.

A DOUBLET TYPE ANTENNA can be used and will be of aid in eliminating man made static noises in locations where this interference is excessive, if the flat top of the aerial can be located outside of the field of disturbance. Satisfactory doublet type aerials containing necessary material and complete installation instructions are available in kit form from most radio dealers.

THERE ARE THREE POSTS marked "A," "D," and "G" on the rear of the chassis. When the receiver is shipped from the factory a flexible wire is connected to post "D" and "G." When a straight aerial is used this wire should be left in this position and the aerial lead-in connected to the post marked "A."

When a doublet type antenna is used, remove the small piece of wire connecting "G" and "D" posts together and attach one of the doublet antenna lead-ins to "A" post and the other to "D" post.

GROUND

A GOOD GROUND such as a cold water pipe, steam radiator, or an iron rod driven into the ground three or four feet in a place where it is moist should be attached to the post marked "G" regardless of the type of antenna used.

PARTS LIST

Illus. No.	Part No.	Part Name	Description

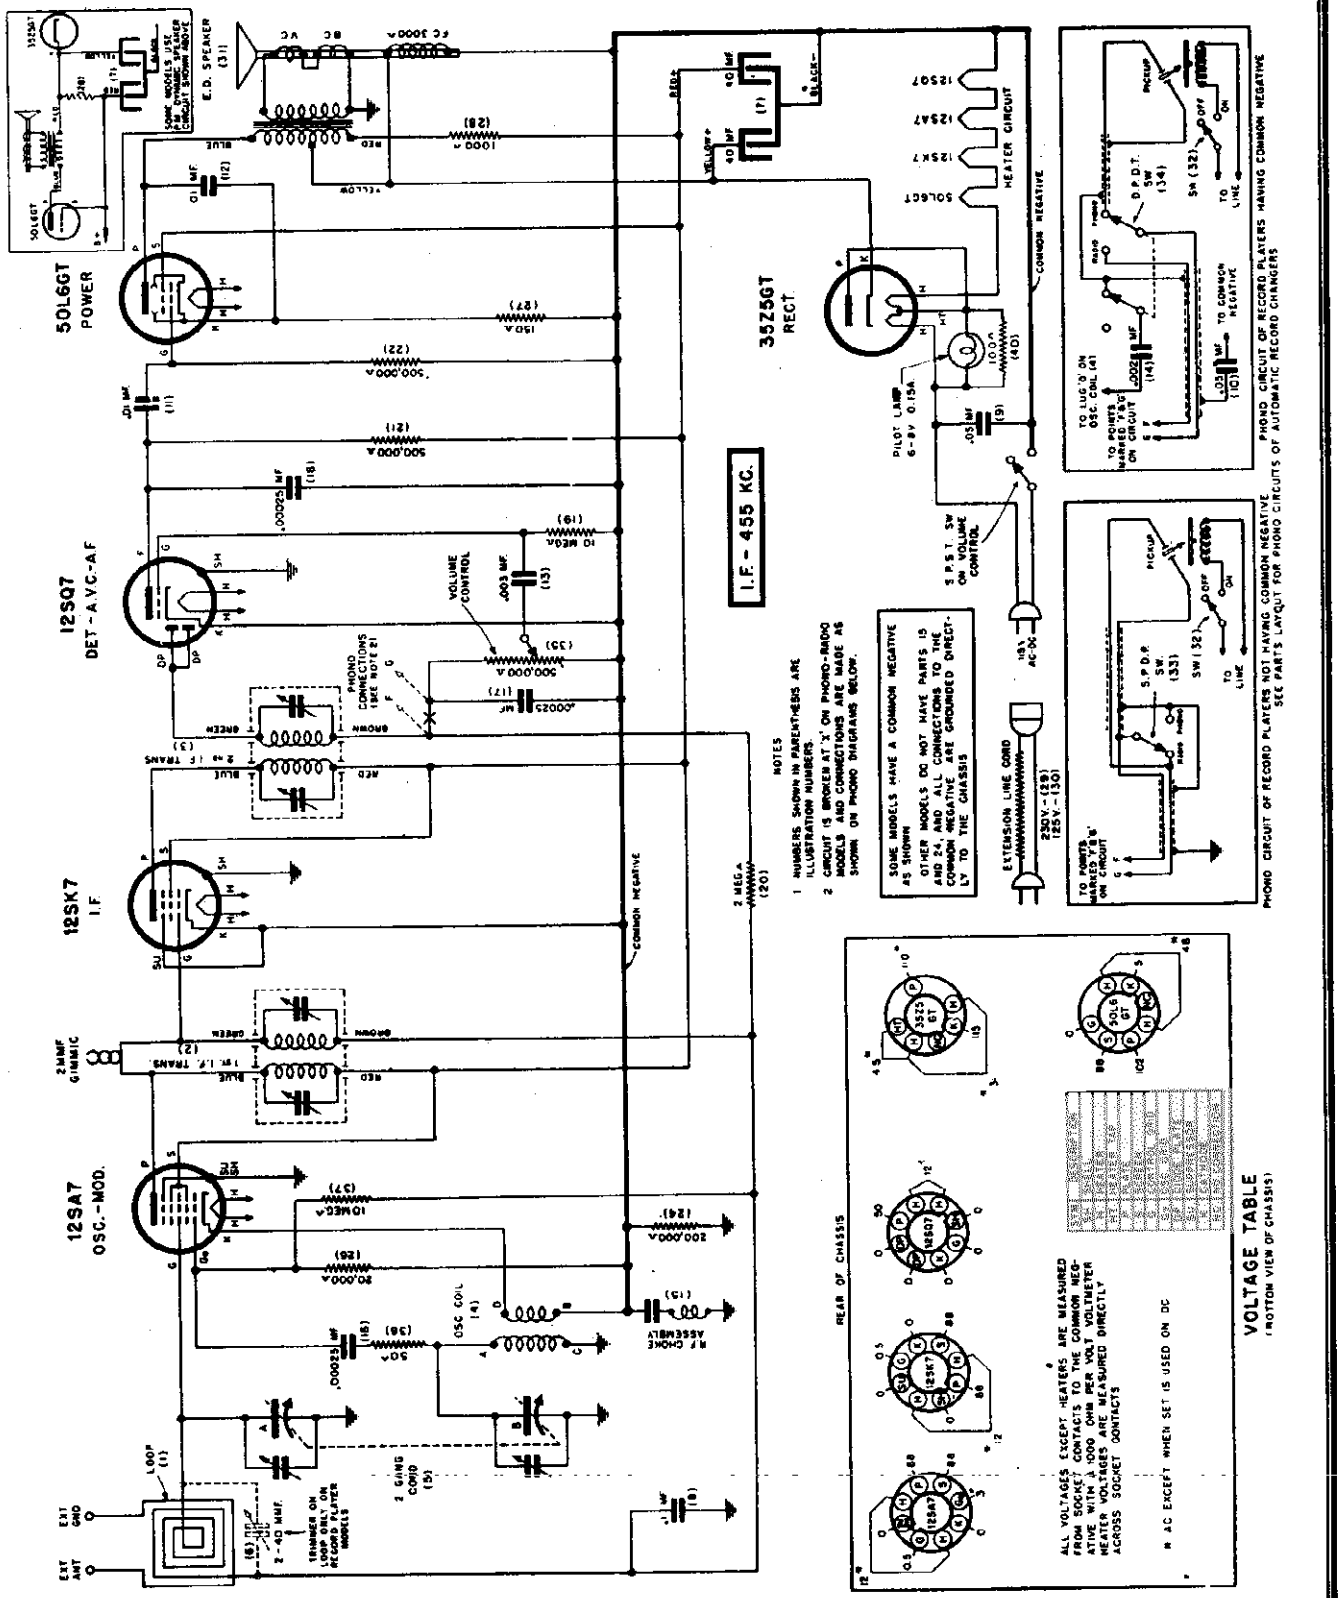
MODELS 248, 10-248 SENTINEL RADIO CORP.



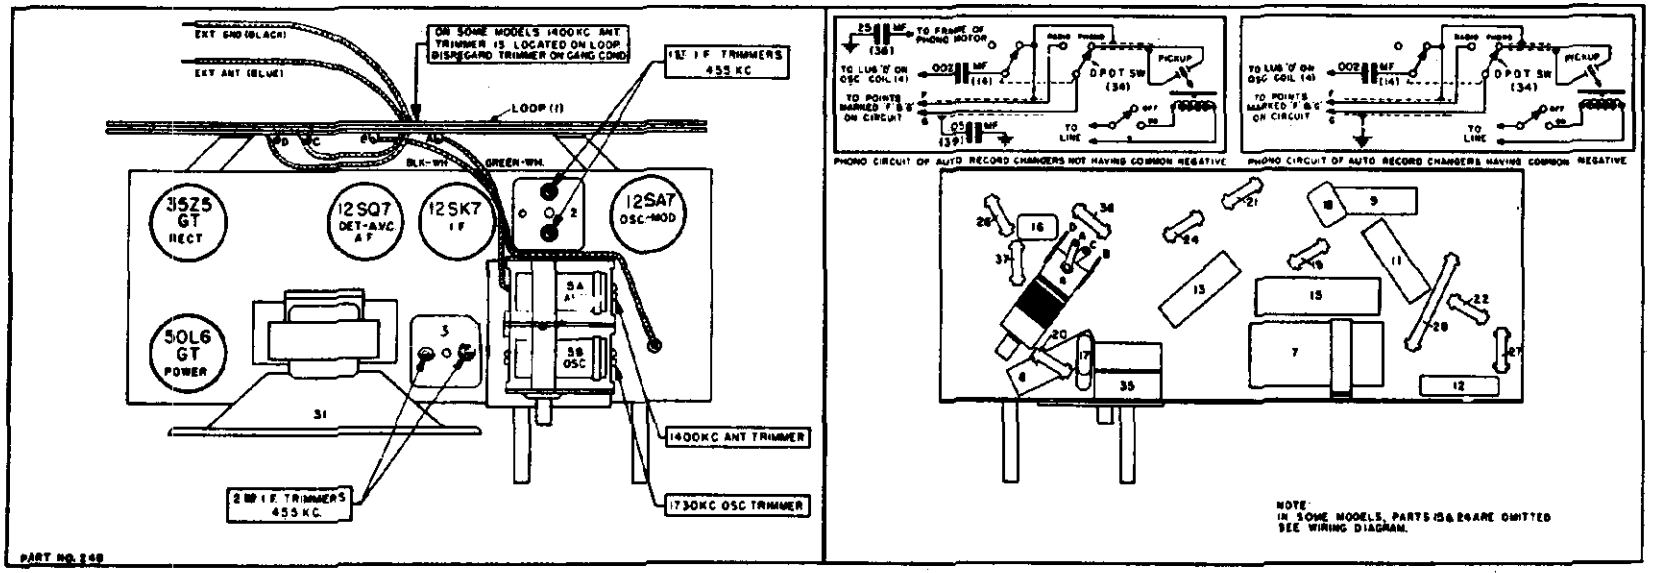
New Products Model 300, ARCR-312; R.C.A. Model 9865, ARCR-963;

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

When adjusting 1730 kilocycle oscillator trimmer and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

	Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
Any point where no interfering signal is received		Exactly 455 K.C.	0.1 Mfd. condenser	High side to grid of 12SA7 tube. Low side to frame of gang condenser through .01 Mfd. condenser.	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
1	Exactly 1730 K.C.	Exactly 1730 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of gang condenser through .01 Mfd. condenser.	Adjust 1730 K. C. oscillator trimmer for maximum output.
2	Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of gang condenser through .01 Mfd. condenser.	While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.



VOLTAGE RATING

BE SURE THAT THE VOLTAGE RATING MARKED ON THE WHITE PAPER LICENSE NOTICE ATTACHED EITHER TO THE BOTTOM OR THE INSIDE OF THE CABINET IS EXACTLY THE SAME AS YOUR HOUSE LIGHT CURRENT SUPPLY—IF IN DOUBT CONSULT YOUR LOCAL ELECTRIC LIGHT COMPANY OR RADIO DEALER.

VOLTAGE RATING OF ALL MODELS NOT EQUIPPED WITH PHONO PLAYER OR AUTOMATIC RECORD-CHANGER

IF THE RECEIVER IS NOT EQUIPPED WITH PHONO PLAYER OR AUTOMATIC RECORD-CHANGER it may be used on either 110-120 volt 50/60 cycle alternating current (AC) or 110-120 volt direct current (DC).

If the radio does not operate on DC current after approximately one minute remove the plug on the end of radio line cord from the house current receptacle turn it half way around (180°) and re-insert it into power receptacle.

VOLTAGE RATING OF PHONO PLAYER AND AUTOMATIC RECORD-CHANGER MODELS

MODELS EQUIPPED WITH PHONO PLAYER OR AN AUTOMATIC RECORD-CHANGER ARE DESIGNED FOR USE ON ALTERNATING CURRENT ONLY. While the radio may be operated on either 50 or 60 cycle 110-120 volt alternating current (AC) the phonograph motor must only be used on the correct frequency.

If license notice is marked 115 volt 60 cycle the phonograph motor is designed for operation on 110-120 volt 60 cycle current only.

If license notice is marked 115 volt 50 cycle the phonograph motor is designed for operation on 110-120 volt 50 cycle current only.

DO NOT ATTEMPT TO OPERATE PHONO PLAYER OR RECORD CHANGER MODELS ON DIRECT CURRENT. TO DO SO WILL DAMAGE THE MOTOR.

THE LOOP AERIAL SUPPLIED with the radio should provide ample reception in average locations.

Loop aerials are directional — for maximum volume and range when using the loop carefully tune in the desired station, next lift the complete radio and slowly turn it until the station is heard with greatest volume, then set the radio down in this position.

OUTSIDE AERIAL

When the radio is used in shielded areas or when located a great distance from broadcast stations, the volume of some or all stations may not be ample in which case it would be necessary to ATTACH A 25-50 ft. OUTDOOR AERIAL TO THE BLUE LEAD COMING OUT THE REAR OF THIS CHASSIS to obtain satisfactory results.

GROUND

When a regular aerial is used, best result will be obtained with a ground attached to the black lead.

WARNING—Do not attach a ground direct to the radio chassis—ANY EXTERNAL GROUND CONNECTION TO ANY METAL PART OF THE CHASSIS WILL CAUSE A SHORT AND POSSIBLE DAMAGE.

PARTS LIST

Illus. No.	Part No.	Part Name	Description
1	13222	Coil	Loop Antenna (A & B)
1	13259	Coil	Loop Antenna (C & D)

39	1147	Condenser	Tubular .05 Mfd. 200 Volt (F)
40	13540	Resistor	Carbon 100 Ohm ½ Watt

(A)—Used only in models having common ground and not equipped with phone player or automatic record changer.

(B)—Used only in models not having common ground and not equipped with phone player or automatic record-changer.

(C)—Used only in phone player model and having common ground.

(D)—Used only in phone player model not having common ground.

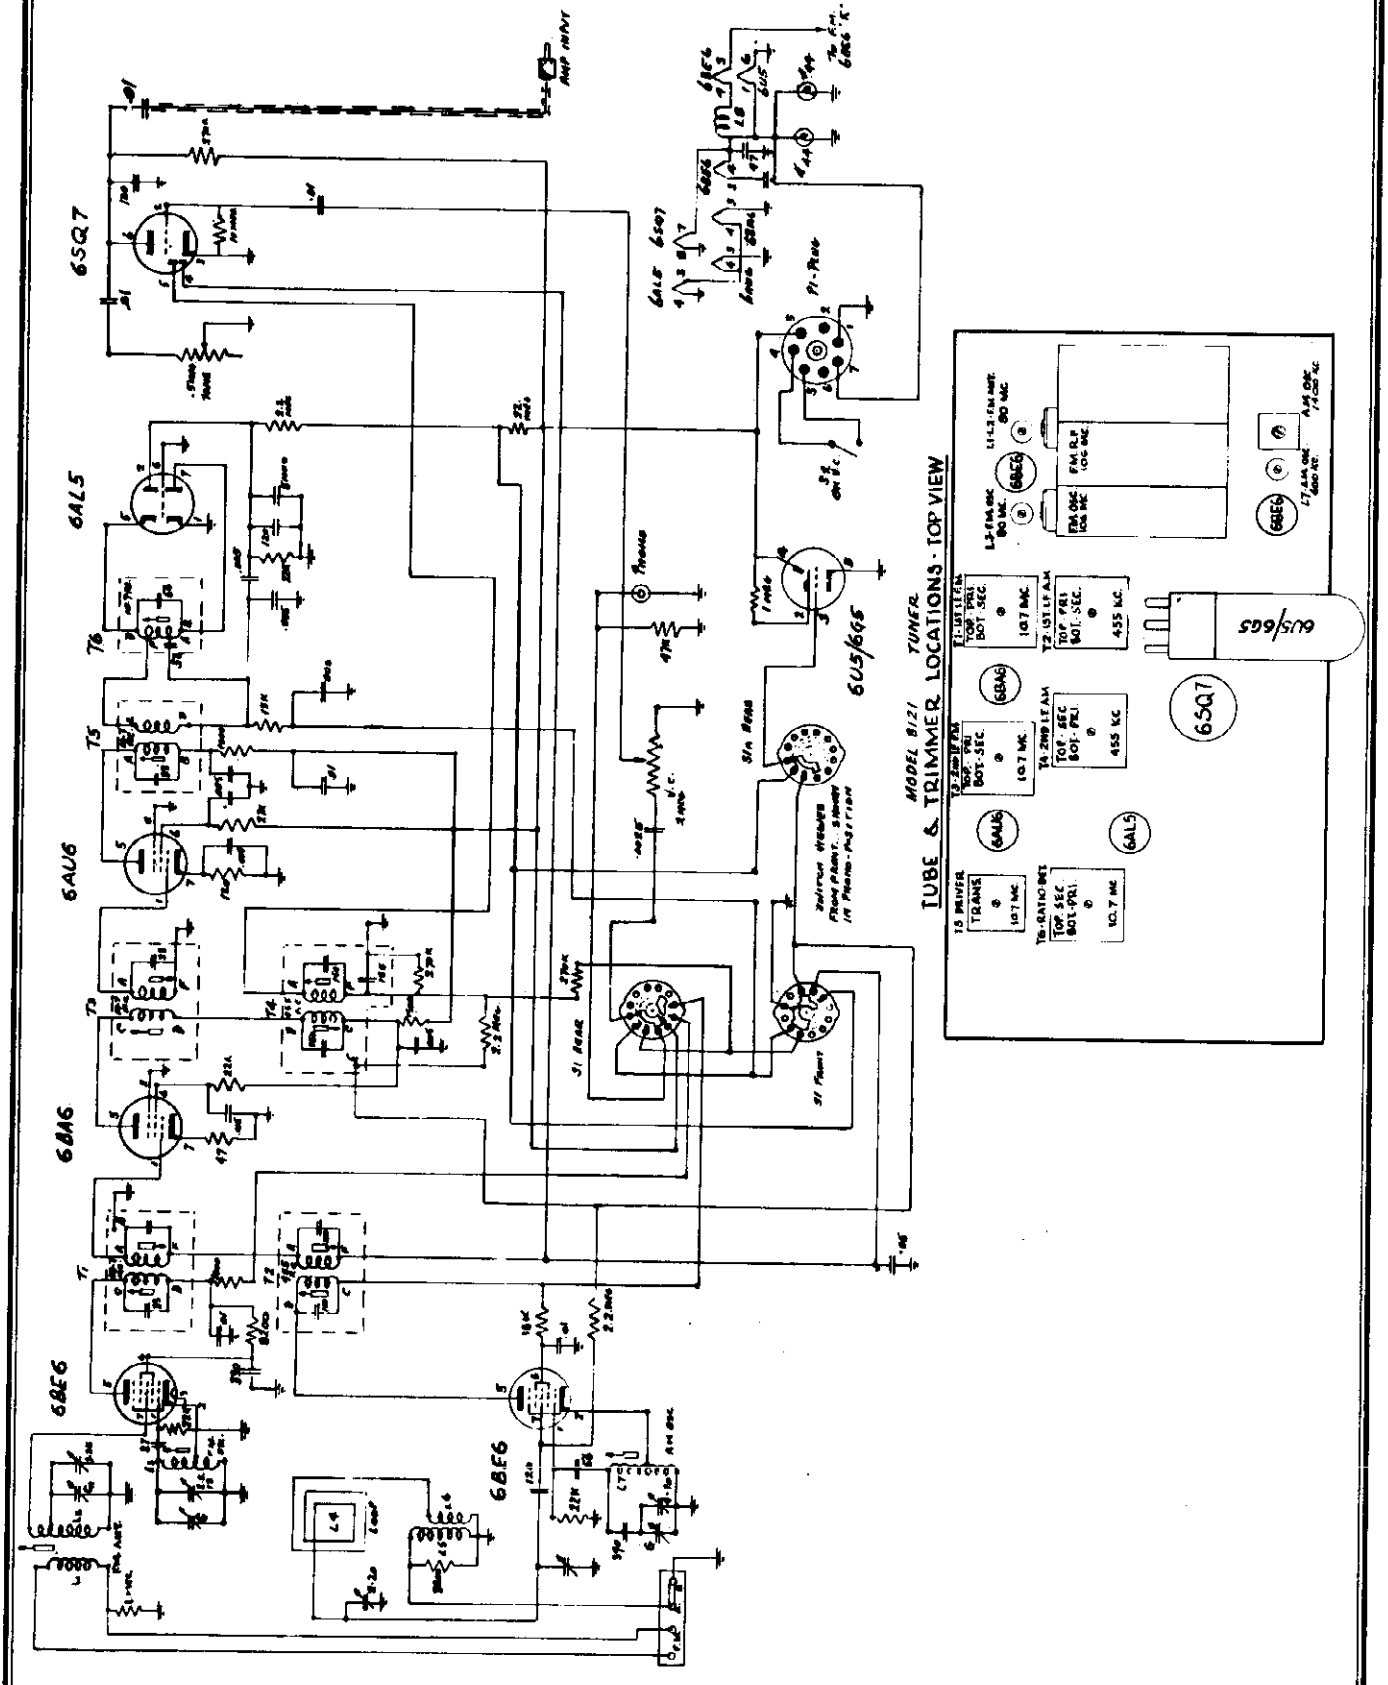
(E)—Used only in models having record-changer and having common ground.

(F)—Used only in models having record-changer and not having common ground.

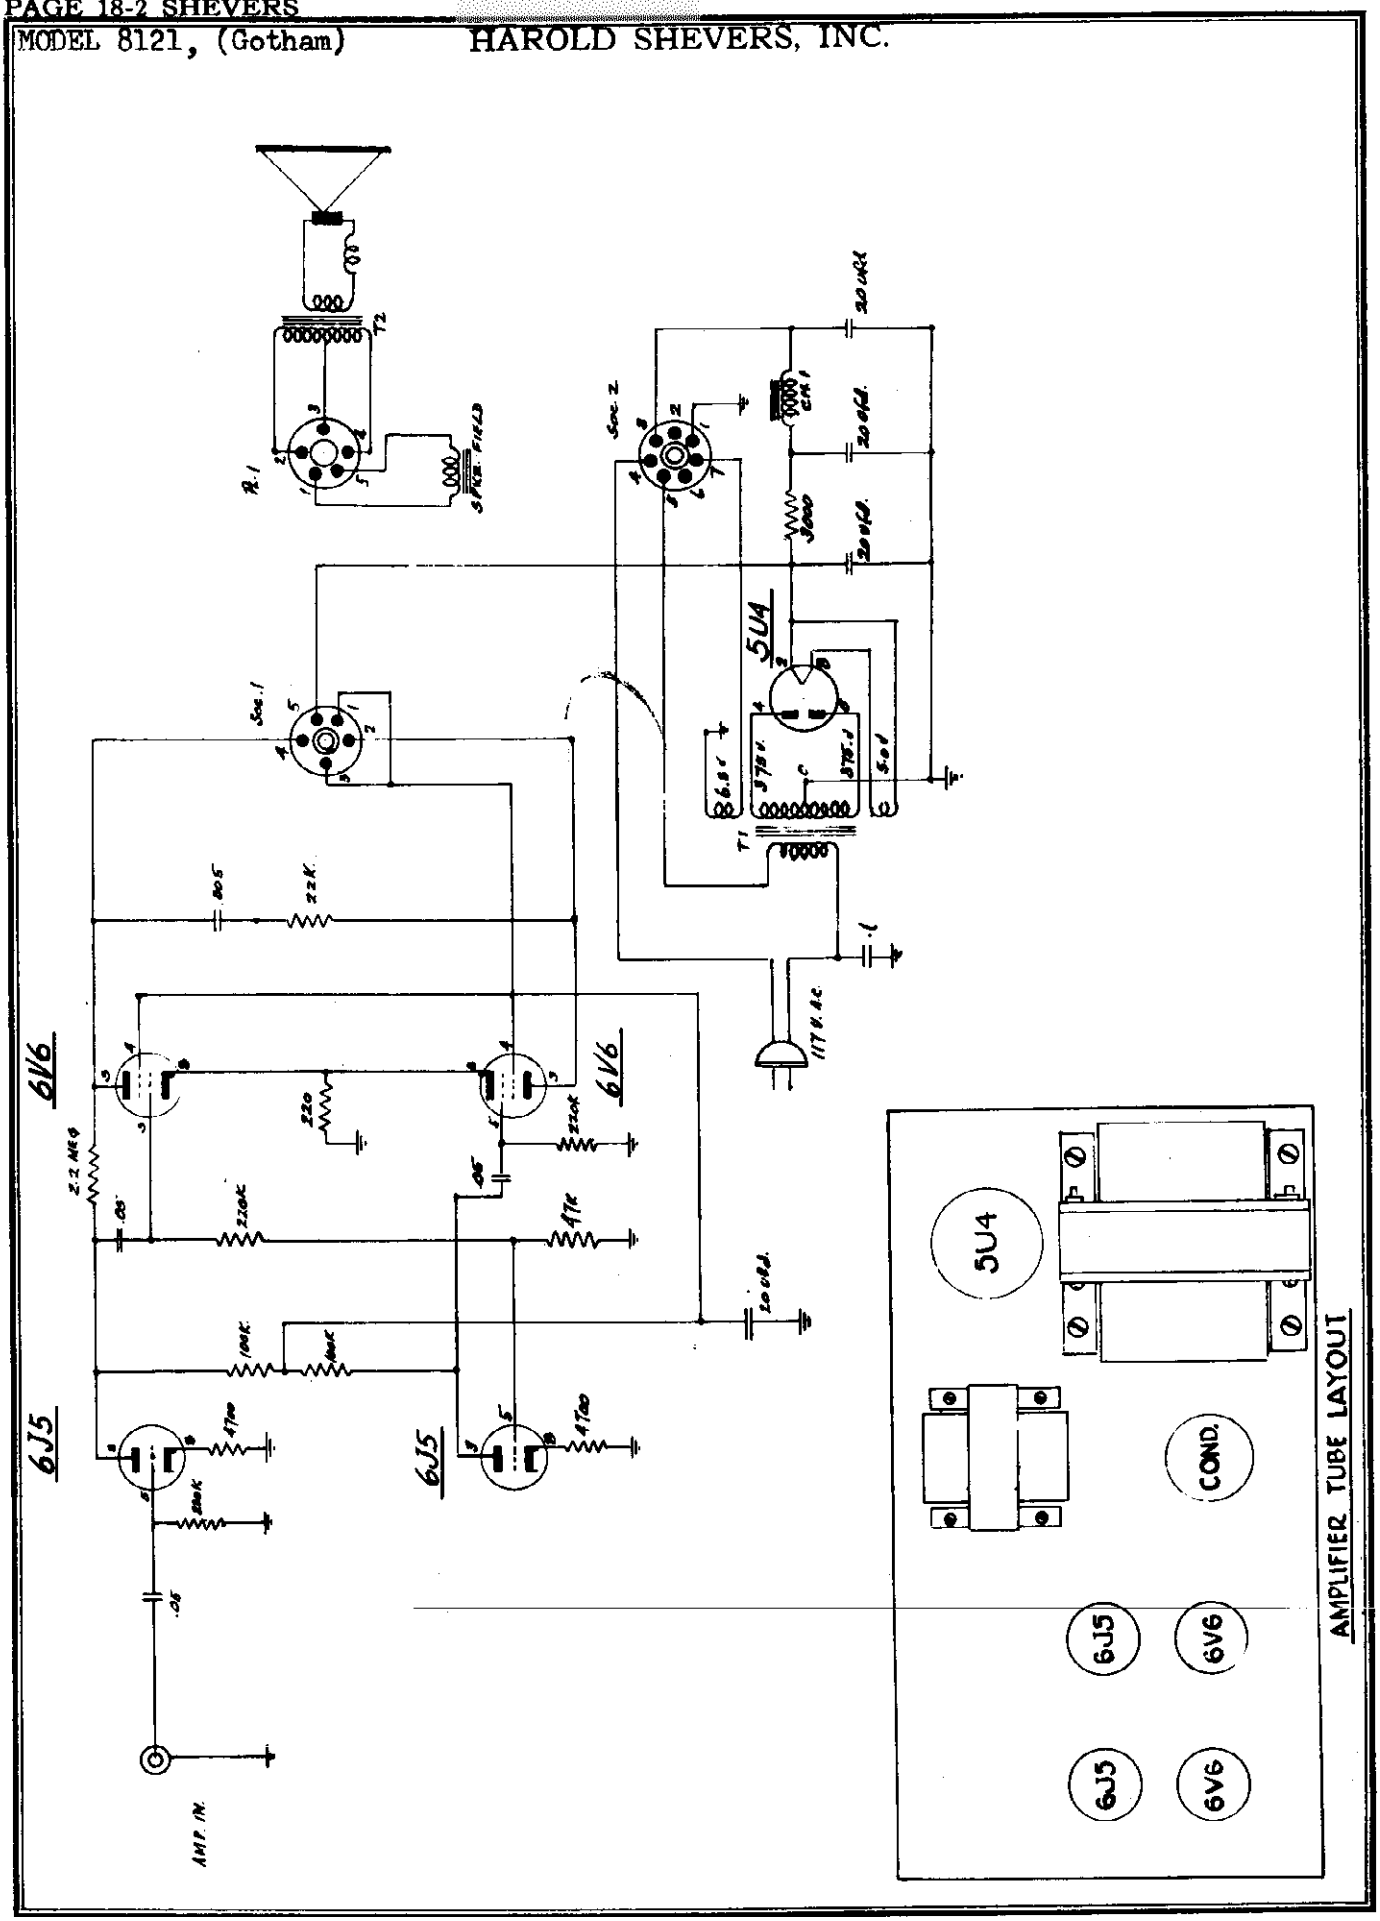
MISCELLANEOUS PARTS

Part No.	Part Name	Description
12022	Back	For Plastic Cabinets
12280	Back	For Phone Player Cabinet
11364	Bulb	6-8 Volt .150 Amp. No. 47 Bayonet Base Dial Light
276	Cabinet	Ivory Plastic
278	Cabinet	Walnut Plastic
13217	Dial Scale	Calibrated Scale
11992	Dial Shaft	Drive Shaft
6184	Dial Cord	17" of 18 Lb. Drive Cord
11357	Dial Crystal	Acetate Crystal for Dial
13245	Dial Pointer	Dial Indicator
12105	Knob	Used with Walnut Plastic Cabinet
12106	Knob	Used with Ivory Plastic Cabinet
12096	Knob	Used with Phone Player and Automatic Record-Changer Model only
12816	Pickup	Crystal Pickup and Arm Used Only with Phone-Player

HAROLD SHEVERS, INC. MODEL 8121, (Gotham)



MODEL 8121, (Gotham) HAROLD SHEVERS, INC.



ALIGNMENT PROCEDURE

Alignment Indicators:

A high resistance volt meter is necessary for measuring D.C. voltage during F.M. alignment. An output meter is also necessary to indicate minimum audio output during F.M. ratio detector alignment. The output meter may be connected across the speaker voice coil.

For A.M. alignment, the high resistance volt meter can be used as an indicator by measuring developed A.V.C. voltage.

F.M. RATIO DETECTOR ALIGNMENT

1. Connect a 680 ohm resistor between pins 5 and 7 of the ratio detector tube 6AL5. Connect the D.C. probe of the indicating meter to the negative lead of the 5 mfd. electrolytic condenser. The common lead is connected to ground.

2. Set the generator at 10.7 m.c., modulated 30% at 400 cycles (AM). Turn the volume control to maximum volume and connect the generator to the driver grid, pin 1, of the 6AU6 in series with a .01 mfd. condenser.

3. Adjust driver transformer, T5, for maximum D.C. across the 5 mfd. electrolytic condenser.

4. Remove the meter leads and disconnect the 680 ohm resistor. Connect two 100,000 ohms (±1%) resistors in series, across the 22,000 ohms ratio detector load resistor. Connect the common lead of the indicating meter to the center point of the 100,000 ohm resistors and the D.C. probe to terminal "A" of the ratio detector transformer, T6,

5. Repeat connections as in step 2 above and adjust T6, bottom core for zero D.C. balance. This point is approached rapidly and continued adjustment causes the indicated polarity to reverse. A slow approach to zero is an indication of severe detuning.

Adjust T6 top core for minimum audio output. Alternate the adjustments of the top and bottom core of T6 until minimum audio output and zero D.C. balance occur at the same point.

6. Disconnect the two 100,000 ohm resistors and repeat steps two and three, eliminating the 680 ohm resistor.

7. Repeat steps 5 and 6 until further adjustment does not improve the calibration.

A.M. ALIGNMENT

1. Connect the signal generator to pin 1, converter grid, 6BE6 in series with .01 condenser. Tune the generator to 455 kc.
2. Turn the radio dial to a quiet point at the low frequency end of the variable condenser.
3. Adjust the A.M. I.F. transformers for peak output.
4. Connect the signal generator to the antenna lead in series with 200 mmf. Tune the generator to 1400 kc.
5. Turn the radio dial to 1400 kc, and adjust the oscillator trimmer and the loop trimmer for peak output.
6. Set the generator and set at 600 kc. and "rock in" L7, oscillator coil.

NOTE:
Correct alignment of 455 kc. I.F. requires that the 10.7 mc. F.M. I.F. be aligned previously.

F.M. I.F.-R.F. ALIGNMENT

1. Connect the D.C. probe of the high resistance meter to the negative lead of the 5 mfd. electrolytic condenser and the common lead of the meter to ground.
2. Set the generator at 10.7 m.c., modulated 30% at 400 cycles (AM). Set the radio dial at the low frequency end of the variable condenser and connect the signal generator in series with a .01 condenser to pin 7 of the 6BE6.
3. Adjust the I.F. transformers for peak output on the meter.
4. Set the generator at 106 m.c. and connect the high side in series with 120 ohm resistor and the low side in series with 120 ohm resistor to the F.M. antenna terminals. Set the radio dial at 106 mc.
5. Adjust the F.M. osc. ceramic trimmer and the F.M. antenna trimmer maximum output.
6. Set the generator and radio dial for 90 mc. and adjust L3 and L2 oscillator and antenna coil for peak output.

MODEL 8121 TUNER MEASUREMENTS, VOLTAGE AND RESISTANCE

105-125 volts-60 cycles.....105 watts

PILOT LAMPS.....(2) No. 44, 6-8 volts, 0.25 amp.

LOUDSPEAKER

Type.....Rola G12, Auditorium Model
Size.....12" Electrodynamic
Voice coil impedance.....6.8 ohms at 400 cycles

POWER OUTPUT

Undistorted.....10 watts
Maximum.....14 watts

CIRCUIT DESCRIPTION

This receiver is a twelve tube combination FM-AM superheterodyne radio with provision for phono operation. Three separate sections are employed for the entire receiver; a tuner, amplifier-power supply and a metal encased auditorium speaker.

The tuner incorporates two separate convertors, one for FM and the other for the broadcast band. A range switch is provided with a third position allowing phonograph operation through the sound channel. A 6U5/6G5 tuning eye tube facilitates visual indication of proper tuning for both AM and FM operation.

The set utilizes a ratio detector eliminating the necessity of a limiting stage preceeding the detector and having an inherent insensitivity to amplitude modulated signals.

A loop antenna is included for the broadcast band.

The amplifier section employs two 6J5 tubes as phase inverter and amplifier driving a pair of 6V6 in push-pull operation which deliver ten watts of undistorted output from a Rola G12 auditorium speaker.

A 5U4 rectifier is used in the power supply with separately filtered sections for both the tuner and amplifier.

TUNING RANGE

The receiver is designed to operate over the standard broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters).

DIAL CALIBRATION. The scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

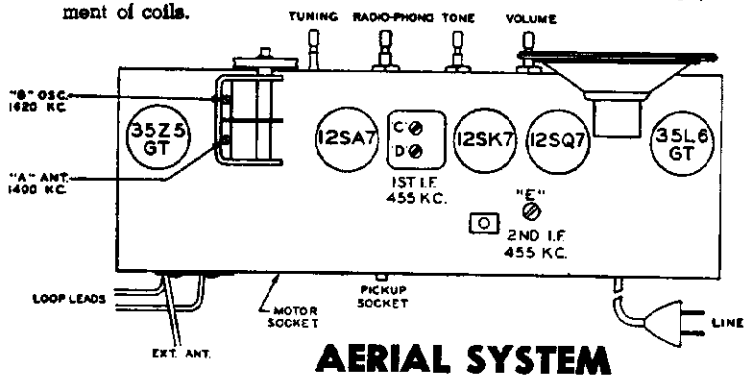
ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove chassis from the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.



AERIAL SYSTEM

The receiver has a built-in "loop" aerial. Its excellent design is such as to increase pick-up from stations having wide variations in signal strength. The efficiency and selectivity of the loop provide outstanding reception without the use of an external aerial. The "loop" aerial used on this receiver is somewhat directional so reception from weak stations can be improved by turning the set in the proper direction. In or near metal buildings, iron ore deposits or steel structures or in localities remote from broadcasting stations, reception can be improved by using an outside aerial 50 feet to 100 feet in length including lead-in. Connect the outside aerial to the aerial lead. When using the outside aerial it may be necessary to reverse the power cord plug in wall socket to eliminate hum or distortion.

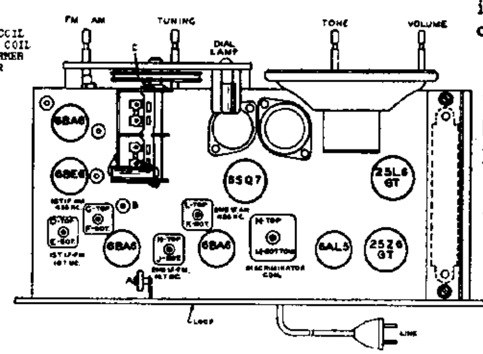
CHASSIS LAYOUT AND TUBE POSITIONS



This receiver is designed to operate over two tuning ranges; the broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters), and the Frequency Modulation (FM) Band which extends from 87 to 109 Megacycles (MC).

DIAL CALIBRATION. **(Standard Broadcast Band.)** The upper scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba, and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

DIAL CALIBRATION. **(Frequency Modulation Band.)** The entire lower scale is calibrated from 88 to 108 Megacycles (201 to 300 FM channels) which covers the entire popular Frequency Modulation (FM) Band.

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes, such as weak or defective tubes or speaker, open or grounded resistors, or bypass condensers. Never attempt to realign the set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause. It will be necessary to follow the procedure outlined below and to use recommended equipment for satisfactory results.

BROADCAST ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: Modulated Test Oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC, also an Output Meter to connect across the primary or secondary of the output transformer.

I. F. ALIGNMENT: Put switch in the broadcast position and connect the test oscillator to the converter grid through a .05 condenser. The ground lead of the test oscillator should be connected to the buss of the receiver. Adjust the four I. F. trimmers (F,G,L and K) for maximum reading on the output meter. Always use the peak on the slug which is obtained when screw is out of the can the greatest distance.

R. F. ALIGNMENT: Connect the test oscillator to the antenna lead on the loop through a 100 mmf. condenser. Set the gang condenser to the maximum high frequency position and the test oscillator to 1620 KC. Adjust Trimmer "C" to the maximum output. Set test oscillator to 1400 KC and tune in signal with the gang condenser and adjust Trimmer "A" to maximum response. Set test oscillator to 600 KC and tune in signal with gang condenser. Check for damage to gang condenser or coils.

F. M. ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: F. M. Generator with frequencies of 90, 98, 106, and 109 megacycles, and generator without any modulation which covers 10.7 megacycles, also a zero center microammeter, and a DC Vacuum Tube Voltmeter (An oscilloscope and variable frequency audio oscillator can be used for better results. This method of alignment is described in the last paragraph).

DISCRIMINATOR ALIGNMENT: Connect DC Vacuum Tube Voltmeter between the buss and point "XX" on circuit diagram. Point "XX" is negative potential on the vacuum tube voltmeter. Isolate point "XX" and buss connections to vacuum tube voltmeter with chokes made by wrapping approximately 20 turns of hookup wire around a pencil. This is illustrated in Figure 1. Connect two 100,000 ohm resistors in series. (These resistors must match to 5%.) Connect them from point "XX" to buss. Between junction of 100,000 ohm resistors and the point "YY" connect Zero Center Meter, which is also isolated by the choke described above. These connections are illustrated in Figure 1. Connect test oscillator which is adjusted to 10.7 megacycles to grid of IF Driver through a 250 mmf condenser. Adjust slug "M" to maximum on the vacuum tube voltmeter. Reduce test oscillator to keep vacuum tube voltmeter to around 5 volts. Adjust slug "N" to bring zero center meter to zero point. Slug "N" should never be touched after this alignment.

PRELIMINARY IF ALIGNMENT: Connect test oscillator to the converter grid through a 250 mmf. mica condenser. Adjust slugs D, E, H and J to maximum output on the vacuum tube voltmeter. In making these adjustments reduce the generator input to keep the vacuum tube voltmeter at approximately 5 volts when making this adjustment. Always use the peak on the slug which is obtained when the screw is out of the can the greatest distance.

FINAL I. F. ALIGNMENT: Set the test oscillator to 109 MC without frequency moldulation and connect it to converter grid. Adjust trimmer "B" for approximate maximum output on the vacuum tube voltmeter and zero center for exact centering. Adjust test oscillator to approximately 25 KC deviation, carefully adjust trimmers D, E, H, J and M for maximum on vacuum tube voltmeter. It may be necessary to shift the frequency of the oscillator slightly to hold the zero center meter on center. In making this adjustment turn up volume control slightly to obtain an audio signal out of the speaker. If this signal is free of distortion, increase the deviation to approximately 75 KC and repeat the above alignment. If this is done carefully there will be no distortion in the speaker with this deviation. If distortion is obtained in the speaker with this deviation, it will be necessary to carefully repeat the I.F. alignment.

R. F. ALIGNMENT: Move the signal generator to the FM antenna terminals, using 150 ohm resistors between the generator terminals and each of the FM antenna terminals. Set the test oscillator to 106 megacycles and tune in signal with gang condenser to obtain approximate maximum on the vacuum tube voltmeter and zero center on the meter. Slightly bend the RF section in the gang condenser for maximum output with vacuum tube voltmeter. Set the signal generator to 98 megacycles, tune in signal with the gang condenser. Repeat the above procedure at this frequency and also at 90 megacycles. Recheck alignment at 106 megacycles.

FINAL ALIGNMENT OF FM IF WITH OSCILLOSCOPE AND VARIABLE AUDIO OSCILLATOR: The oscilloscope and variable audio oscillator should be connected as shown in Figure 2. Adjust the deviation to approximately 25 KC and align trimmers D, E, H, J and M to maximum on the vacuum tube voltmeter while watching the oscilloscope for a straight line. It may be necessary to vary the frequency of the variable audio oscillator in order to make the line straight on the scope. Next increase deviation to approximately 75 KC and repeat procedure, adjusting for maximum or as close to maximum as it is possible to obtain without losing the straight line on the oscilloscope. After all the trimmers have been properly adjusted to a maximum and a straight line on the scope, increase the deviation from approximately 125 to 150 KC. The curves illustrated in Figure 3 should be obtained. In making the above adjustments it may be necessary to make slight variations in the RF frequency in order to hold the zero center meter at the zero point.

TUNING RANGE

This receiver is designed to operate over two tuning ranges; the broadcast band which extends from 535 to 1720 Kilocycles (KC) (174 to 560 Meters), and the International Short Wave Band which extends from 5.65 to 18.3 Megacycles (MC) (16.4 to 53 Meters.)

DIAL CALIBRATION. (STANDARD BROADCAST BAND.) The outside scale is calibrated from 55 to 170 (Standard Broadcast.) This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba, and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

DIAL CALIBRATION. (SHORT WAVE BAND.) The entire inside scale is devoted to short wave American and foreign broadcasts. This scale is calibrated from 6 to 18 megacycles (MC). Consult the Sonora Short-Wave Station list for the proper frequency and time for best short wave reception.

BAND-SWITCH SHOWN
AT 1ST POSITION.
BROADCAST BAND
535 - 1720 KC

ALIGNMENT PROCEDURE

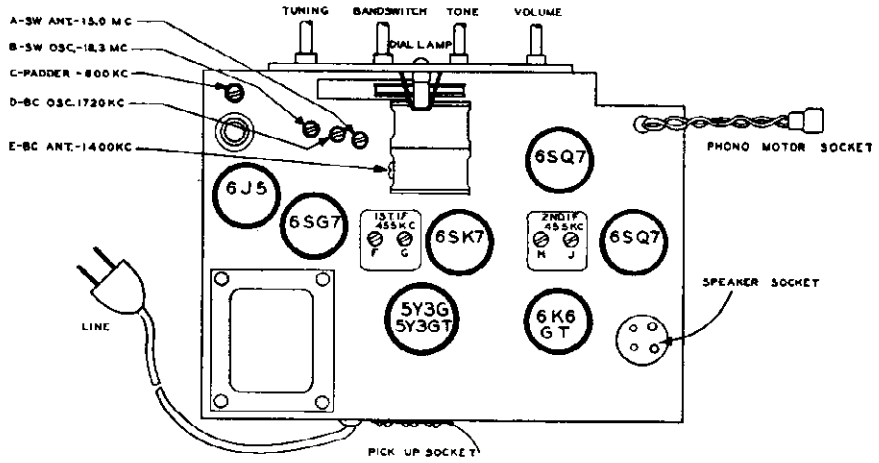
GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400, 1720, 6000, 15000, and 18300 KC, and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast and Short Wave bands should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the Band Switch set to the Broadcast Band and with the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube 6SG7 through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the receiver ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

SHORT WAVE BAND ALIGNMENT. With the band switch turned to the S.W. position, connect the test oscillator to the antenna with a 400 ohm dummy and the ground on the test oscillator to the ground connection on the receiver. Adjust the S.W. oscillator to give a maximum output with the dial at 18300 KC (extreme end.) Set the test oscillator at 15000 KC and tune in the signal with the dial. Adjust the antenna trimmer for maximum output. With a strong signal input turn the dial to approximately 1 M.C. lower in frequency and pick up the image frequency. If the image is not received, it will be necessary to return the dial to 18300 KC to reduce the capacity in the oscillator trimmer until a second signal is received. Proceed as before with the alignment of the antenna and recheck for image frequency. Check the sensitivity at 6000 KC to determine if the coils and mica pad are not defective.

BROADCAST BAND ALIGNMENT. With the Band Switch turned to the Broadcast Position, connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser, and the ground on the test oscillator to the receiver ground. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer). For the antenna adjustment set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in the signal on the condenser. Adjust the 600 KC Pad while rocking the gang to obtain maximum output.



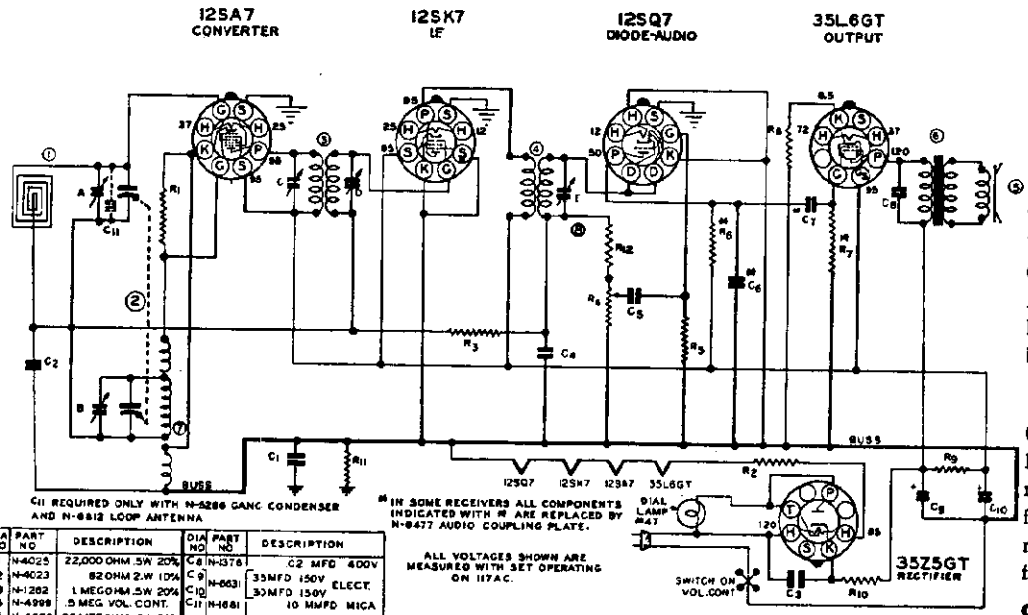
SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

AERIAL SYSTEM

The receiver has a built-in "loop" aerial. Its excellent design is such as to increase pick-up from stations having wide variations in signal strength. The efficiency and selectivity of the loop provide outstanding reception without the use of an external aerial. The "loop" aerial used on this receiver is somewhat directional so reception from weak stations can be improved by turning the set in the proper direction. In or near metal buildings, iron ore deposits or steel structures or in localities remote from broadcasting stations, reception can be improved by using an outside aerial 50 feet to 100 feet in length including lead-in. Connect the outside aerial to the aerial lead. When using an outside aerial, use a good ground connection. Water pipes and steam or hot water radiators make a desirable ground connection. The ground wire should be connected to the black wire on the receiver. Although broadcast reception is satisfactory, the short wave band may require an additional aerial.



C11 REQUIRED ONLY WITH N-5286 GANG CONDENSER AND N-6812 LOOP ANTENNA

IN SOME RECEIVERS ALL COMPONENTS INDICATED WITH # ARE REPLACED BY N-8477 AUDIO COUPLING PLATE.

ALL VOLTAGES SHOWN ARE MEASURED WITH SET OPERATING ON 117 A.C.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters).

DIAL CALIBRATION. The scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

POWER SUPPLY. This receiver is designed to operate on any alternating current supply (AC) ranging from 110 to 120 volts, 50 to 60 cycles; or on any direct current supply (DC) ranging from 110 to 120 volts.

5 TUBE AC-DC

SUPERHETERODYNE SINGLE BAND

NOVEMBER, 1947

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformer has been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective position on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to a dummy loop which can be made by coiling 2 turns of hookup wire about 6" in diameter. Place this dummy loop about a foot from the loop on the receiver and in the same plane as the receiver loop. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

I.F. 455 KC.

BATTERY
SUPERHETERODYNE
RANGE 535 KC.-1620 KC

BATTERY: To install new batteries or replace an old one, the following sequence should be followed. Attach the connector with the snap-on fasteners to the "B" battery (67½ V.) and insert battery into left side of battery compartment as viewed from rear of cabinet so that the connector faces the rear of cabinet. Secondly, insert the prongs of the other battery connector into the socket of the "A" battery (4½ V.) and insert battery into cabinet so that the socket of the "A" battery faces the "B" battery.

This receiver will accommodate any of the batteries listed below:

Manufacturer	Manufacturer's "A" Battery	Type Number "B" Battery
National Carbon	746	467
General Dry Battery	3H3	W45A
Ray-O-Vac	P83A	4387
Burgess Battery	G3	XX45

CAUTION: *Do not place receiver on hot objects such as stoves, radiators, etc. Heat will damage the internal components of the receiver and reduce the battery life.*

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters).

DIAL CALIBRATION. The scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformer has been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT: Remove the chassis and batteries from the cabinet and remove the bottom enclosure plate from the chassis. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (1R5) through a .05 or .1 MFD condenser. The ground of the test oscillator should be connected to the chassis. Align all four I.F. slugs to peak or maximum reading on the output meter. Each I.F. has an adjustment at the top and bottom of the can. The peaks on the slugs must be the ones farthest out of the coils.

R.F. ALIGNMENT: Place the cabinet on its face and open cabinet back to a 90° angle. Lay a board across the body of cabinet ahead of the loop. Replace the bottom chassis enclosure and set the chassis and batteries on the board so that they occupy the same relative position to the loop as they do in the cabinet. Care should be taken to have no iron or other metal near the loop.

Connect the test oscillator to a dummy loop which can be made by coiling 2 turns of hookup wire about 6" in diameter. Place this dummy loop about a foot from the loop on the receiver and in the same plane as the receiver loop. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

BATTERY. To operate this receiver on battery, it will first be necessary to insert one prong of power cord plug into the switch through the slot located at the lower left hand corner of the top of the Chassis Base.

Before installing new batteries or replacing old ones, turn the volume control to the extreme left or "OFF" position, then the following sequence should be followed. Attach the connector with the snap-on fasteners to the "B" battery (67½ V.) and insert battery into left side of battery compartment as viewed from rear of cabinet so that the connector faces the rear of cabinet. Insert the prongs of the other battery connector into the socket of the "A" battery (4½ V.) and place battery into cabinet so that the socket of the "A" battery faces the "B" battery.

This receiver will accommodate any of the batteries listed below:

Manufacturer	Manufacturer's Type Number "A" Battery	"B" Battery
National Carbon	**746**	**487**
General Dry Battery	**3H3**	**W45A**
Ray-O-Vac	**P83A**	**4367**
Burgess Battery	**G3**	**XX45**

CAUTION: *Do not place receiver on hot objects such as stoves, radiators, etc., or store in closed car during summer months, as the excessive heat will damage the internal components of the receiver and cabinet, and reduce the battery life.*

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

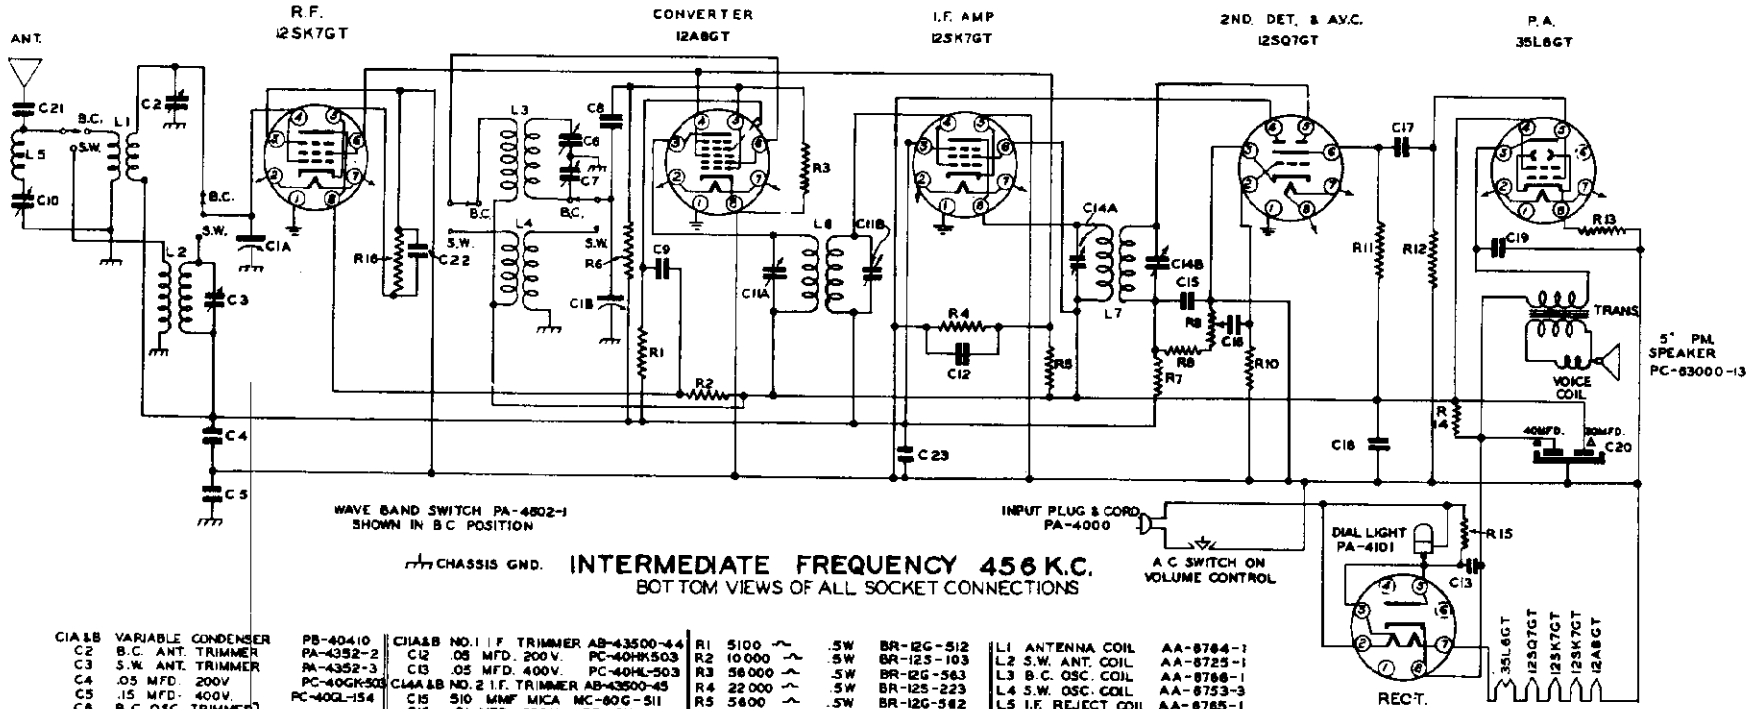
CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT: Remove the chassis and batteries from the cabinet and remove the bottom enclosure plate from the chassis. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (1R5) through a .05 or .1 MFD condenser. The ground of the test oscillator should be connected to the buss. Align all four I.F. slugs to peak or maximum reading on the output meter. Each I.F. has an adjustment at the top and bottom of the can. The peaks on the slugs must be the ones farthest out of the coils.

R.F. ALIGNMENT: Place the cabinet on its face and open cabinet back to a 90° angle. Lay a board across the body of cabinet ahead of the loop. Replace the bottom chassis enclosure and set the chassis and batteries on the board so that they occupy the same relative position to the loop as they do in the cabinet. Care should be taken to have no iron or other metal near the loop.

Connect the test oscillator to a dummy loop which can be made by coiling 2 turns of hookup wire about 6" in diameter. Place this dummy loop about a foot from the loop on the receiver and in the same plane as the receiver loop. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

POWER SUPPLY. This receiver is designed to operate on self-contained batteries or on either an AC or DC power supply when such a supply is available. (For battery information, see section on batteries.) The receiver will operate on either AC (50 to 60 cycles) with a voltage of 110 to 120 or DC with a voltage from 110 to 120.



CHASSIS GND.

VISUAL I. F.-F. M. ALIGNMENT DATA

1. Description of circuit used:

The I. F. channel in this model consists of 1 stage of amplification at 456 Kc. plus a diode detector used for AM reception on the BC band and a 10.7 Mc. amplifier consisting of two stages of amplification, one ratio detector and 1 ratio detector driver.

The tube complement is as follows, two 7A7 IF amplifiers only one of which is used for AM reception, one 7C7 ratio detector driver used on FM only and one 6S8GT detector and 1st audio amplifier. The 6S8GT tube contains three diodes and a triode and is there used as the diode detector and 1st audio amplifier on AM and as a ratio detector and 1st audio amplifier on FM. The various circuits are connected to the wave band switch where necessary to switch from AM to FM.

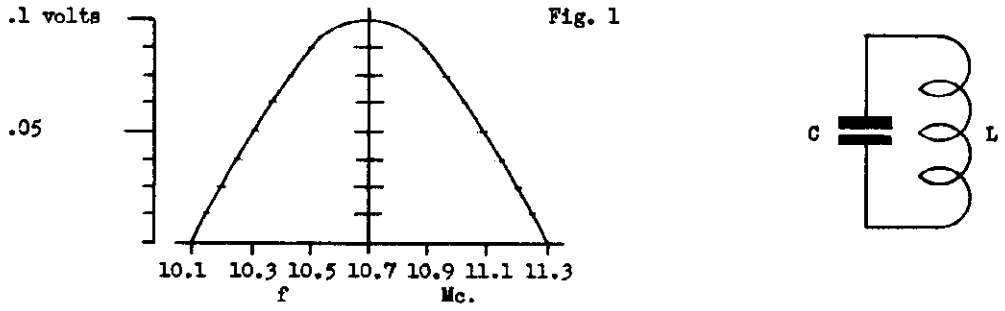
The IF transformers used are of the composite type wherein the 456 KC. circuits and the 10.7 circuits are constructed in the same shield can and is generally wired in series to obviate the need for switching. Only the converter plate connection on the model is switched when changing from FM to AM or vice versa. The ratio detector driver is tuned by an iron core, peaking coil tuned to 10.7 Mc. in the grid circuit of the 7C7 tube.

The ratio detector transformer is a special design made for this purpose and generally peculiar to the receiver in which it is used. Most of the noise rejecting characteristics and to a large extent the audio fidelity of the receiver hinges on the proper design and adjustment of this circuit. This adjustment together with the proper alignment of the other IF transformers determines the gain of the IF system and thus the overall sensitivity of the complete receiver. Thus the importance of properly making these adjustments is of the utmost importance.

2. Theory of Visual Alignment:

One of the characteristics of a tuned circuit is the fact that when it is excited or driven by a generator such as a vacuum tube or another tuned circuit, the voltage developed across it will vary with slight changes in frequency. This voltage will be greatest when the frequency is equal to the resonant frequency of the circuit and will be less if the frequency is higher or lower than the resonant frequency. Thus if we were to shift the frequency from high to low or low to high across the resonant frequency and make a record of the voltage across the tuned circuit, we could plot the voltage against frequency and obtain a curve which might look like Fig. 1.

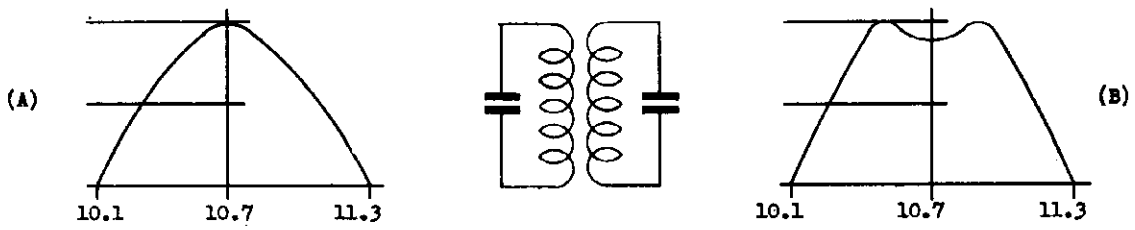
Fig. 1



This is the selectivity curve or response curve for the circuit under discussion.

This type of circuit may be aligned or adjusted to resonance by simply changing either L or C until maximum voltage is obtained at the resonant frequency. Now if another circuit tuned to the same resonant frequency is coupled to the simple case above, a number of things can happen. First, current flowing in one circuit will induce current in the second circuit, the magnitude of this current depending on the degree or amount of coupling between the two circuits. This coupling may be in the form of mutual inductance, mutual capacitance or any impedance common to the two circuits and its magnitude may be either controlable or uncontrolable or as is often the case only partly controlable in a production item. Most IF transformers in present day use are circuits of this type where the coupling is in the form of mutual inductance which may be controled in fabrication. However with the advent of 10.7 Mc. IF channels the effect of the stray capacity coupling always present becomes important and is usually difficult to control. Now if we repeat the procedure outlined for obtaining the response curve of a single tuned circuit using the voltage developed across the secondary of the coupled circuit while driving the primary, we may get either of two types of curves depending on the magnitude of the coupling, (a) in Fig. 2 is a typical curve for two circuits coupled below critical coupling and (b) is a representation of the curve for an overcoupled circuit.

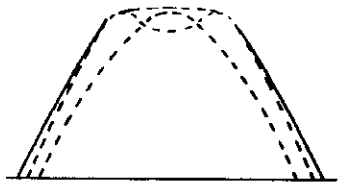
Fig. 2



VISUAL I. F.-F. M. ALIGNMENT DATA

Overcoupled circuits producing a response curve like (b) Fig. 2 are often employed where it is important that the response curve remain approximately flat over a narrow band of frequencies near the resonant frequency. They are also frequently combined with single peaked circuits to produce a response curve like Fig. 3.

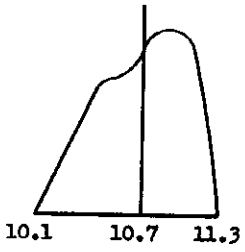
Fig. 3

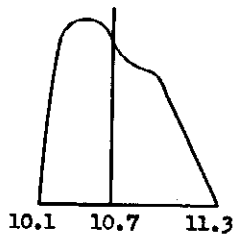


The dotted lines indicate the curves of the individual circuits and the solid curve shows the overall response of two or more pairs of coupled circuits. Circuits like the above or approaching them in form are desirable in a FM receiver where the pass band should be of the order of 200 Kc. Now from the above it is evident that simply peaking both sides of a circuit coupled below critical for maximum voltage will provide optimum alignment but if this procedure is followed with an overcoupled circuit it is almost a certainty that the two circuits will not be tuned to the resonant frequency but will instead be aligned so that either one or the other peak is accentuated. The response curve will then look like Fig. 4 (a) or (b).

Fig. 4

(A)

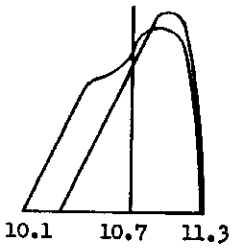




(B)

Now if this overcoupled circuit is combined with a single peaked circuit (where the coupling is below critical) the misalignment becomes worse, something like Fig. 5.

Fig. 5



From the above it appears that to properly align a receiver using overcoupled IF transformers it will be necessary to take a response curve of each stage and align the circuit so that the two peaks are symmetrical, that is, approximately equal in amplitude and displaced equally from the center frequency. To do this with a CW or AM signal would be laborious and time consuming whereas the use of visual equipment makes it nearly as simple as adjusting a simple single peaked amplifier.

Visual alignment test equipment performs the operation of plotting the response curve almost exactly as described above except that instead of manually changing the generator frequency, recording the voltage and then plotting the results, these operations are performed automatically and simultaneously by a combination of electronic circuits. The operation is briefly as follows.

In the signal generator a low AC voltage is applied to a reactance tube modulator which shifts the oscillator frequency from low to high or from high to low at a rate determined by the frequency of the AC voltage and by an amount determined by the AC voltage. The frequency at any instant is then dependant on the AC voltage present at that instant of time. An oscilloscope is provided which may be considered a voltmeter used to read the voltage across the tuned circuit, provided a detector is used to convert the RF to a low audio frequency. This voltage is then applied to the vertical plates and results in a vertical displacement of the spot on the screen. Some of the voltage used to shift the oscillator frequency is also applied to the horizontal plates of the oscilloscope providing a means of displacing the spot horizontally. It is now evident that since that for any given

VISUAL I. F.-F. M. ALIGNMENT DATA

AC voltage only one frequency may be obtained and since that AC voltage will result in an exact amount of spot deflection on the scope we can read the voltage across the circuit under examination by noticing the position of the spot at this exact instant.

Now if we consider the frequency as shifting from low to high 60 times per second and remember that the spot is moving across the screen of the scope 60 times per second at exact synchronization with the change in frequency it is only necessary to apply the voltage from our circuit to the vertical plates to obtain a replica of the response curve on the face of the cathode ray tube. This curve will be repeated 60 times per second if our sweep frequency is 60 cycles. Adjustments to the circuit may now be made and the effect on the response curve noted instantaneously.

EQUIPMENT REQUIRED

To align the IF stages in this receiver the following equipment will be necessary.

(a) A sweep signal generator with a center frequency of 10.7 Mc. and a total sweep width of at least 400 Kc. This generator should be equipped with filters to remove all spurious oscillator frequencies and limiters should be provided to remove all amplitude modulation. There should also be a crystal oscillator to provide a marker frequency at 10.7 Mc. for accurate determination of the center frequency.

(b) An amplitude modulated signal generator tuned to 456 Kc. This generator should be either crystal controlled or means should be provided for accurate frequency calibration.

(c) An oscilloscope with either a 3" or 5" tube equipped with both vertical and horizontal amplifiers.

(d) A power output meter with an internal impedance to match 3.2 ohms for use in 456 Kc. alignment.

(e) A diode detector for use in connection with the oscilloscope while aligning the FM IF channel. This diode detector may be either a IN34 crystal or a two element vacuum tube such as the 6H6. A diode load resistor, coupling condenser, etc. will also be necessary. A connection for this detector is supplied on the speaker socket.

(f) Connecting cables, from the generator to receiver, receiver to scope, etc.

Alignment of the 456 Kc. IF.

This alignment adjustment should be made before attempting to align the 10.7 IF circuit because of possible effects on the operation of the FM IF.

Connect the output meter, scope and speaker to the receiver by pluging the detector into the speaker socket. All output connections will be made automatically when this is done. Connect the signal generator output lead to the converter (6BE6) grid. Turn the wave band switch to BC and the generator to 456 Kc. Using the output meter as an indicator peak the AM IF trimmers for maximum output.

Alignment of the 10.7 IF.

Turn the wave band switch to FM and the generator switch to 10.7 Mc. Move the signal generator lead to the plate of the second 7A7 tube and turn the function switch on the scope to Det. Now proceed to align the ratio detector transformer for maximum linearity and minimum noise. This operation can be facilitated by applying a small amount of amplitude modulation along with the FM and then adjusting the secondary trimmer for minimum noise. Please note that the adjustment of the secondary circuit, controls to a large extent, the linearity of the pattern and adjustment of the primary is responsible for the gain in the circuit. Fig. 6 will represent a linear detector curve and Fig. 7, a detector curve with noise or AM present.

Fig. 6

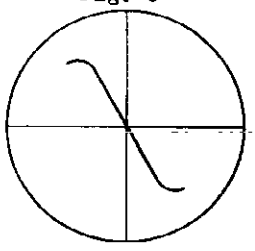


Fig. 7

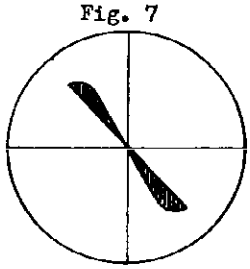
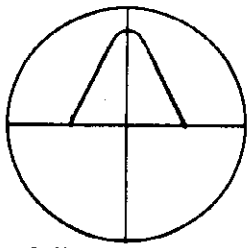


With the generator output lead still connected to the grid of the second 7A7 tube, turn the function switch to IF. Align the core adjustment in the tuned choke for maximum output. Note that since this is a single tuned circuit, the response curve is single peaked. See Fig. 8.

VISUAL I. F.-F. M. ALIGNMENT DATA

Fig. 8

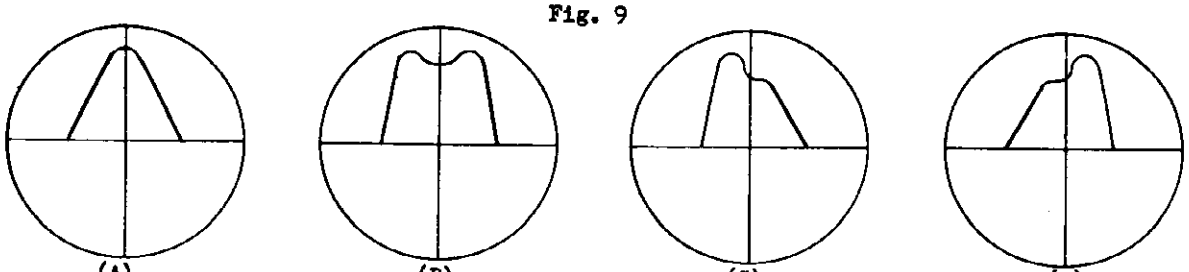


Move the generator lead to the grid of the first 7A7 tube and align the second IF transformer. Adjust both trimmer screws for maximum gain, meanwhile maintaining symmetry in the curve. Observe that by alternatly adjusting the primary and secondary trimmer, the vertical amplitude can be increased without allowing the response curve to become greatly distorted. This transformer is not supposed to be overcoupled and so should not present a double peaked curve, however, production variations in coupling may be large enough for the transformer to become overcoupled in which case final alignment should be so made that the two peaks are equally spaced about the center frequency and approximately equal in amplitude.

Move the generator lead to the grid of the 6BE6 tube and align No. 1 IF transformer following the same procedure as for #2 above.

Fig. 9, (a) (b) (c) (d) below represent response curves typical of those for #1 and #2 IF stages.

Fig. 9



(A) Not Overcoupled Properly Aligned (Right)

(B) Overcoupled Properly Aligned (Right)

(C) Overcoupled Improperly Aligned (Wrong)

(D) Overcoupled Improperly Aligned (Wrong)

With the generator lead still connected to the 6BE6 grid, turn the function switch on the scope to Det. and check the detector curve for linearity and noise. Should this appear unsatisfactory, a very slight readjustment of the detector secondary alignment may be made at this time. If however the adjustment required is very great the entire alignment procedure should be repeated in that the need for adjustment is indication of incorrect alignment in one of the other stages.

Use of Marker Frequencies.

A crystal controlled marker frequency is provided at 10.7 Mc. This frequency may be turned on or off by means of the marker control and should be used only when necessary to check the calibration of the sweep oscillator. This is accomplished by simply turning on the marker and observing the position of the pip. When the frequency of the sweep oscillator is correct the pip will appear in the exact center of the sweep and so in the center of the resonance curve. See Fig. 10.

TUBE & TRIMMER LOCATION

SPIEGEL

Model G-521 has 5 tubes plus an instant operating dry disc rectifier. It is a three way portable superheterodyne receiver using the latest types of low drain electronic tubes.

Operation: The set operates on 105 to 120 volts 50 or 60 cycles A.C., 105 to 120 volts D.C., or from self contained batteries. Power drain is approximately 13 watts on electric operation. Because Model G-521 uses an instant operating dry disc rectifier, no warm up period is necessary on either A.C., D.C., or battery operation. The set will play immediately after the power switch is turned on. When operated on direct current (D.C.) if no reception is obtained, reverse the line plug in the power outlet.

Ranges: Model G-521 has both a broadcast and a short wave range. It covers the broadcast band from 535 to 1620 kilocycles. Since the broadcast dial scale is calibrated from 55 to 160 the actual frequency of the station may be obtained by adding a zero to the dial calibration. The range of the short wave band covered in Model G-521 is from 5.6 to 18.5 megacycles. The short wave dial scale is calibrated directly in megacycles.

Antenna: For normal reception on the broadcast band, no outside aerial is required, as more than adequate pickup is obtained by the self contained loop antenna. At installations remote from stations desired to be heard, improved results may be obtained by rotating the receiver for maximum response, as the loop antenna has a marked directional effect on weak signals.

For short wave or weak broadcast reception the whip antenna should be extended to its full length. This will provide sufficient signal for satisfactory reception in most locations.

Reception can be improved especially in poor receiving locations by attaching an external antenna and ground to the antenna and ground connections provided in the rear of the cabinet. The blue wire is the external antenna connection, the black wire is the external ground connection.

Batteries: The batteries comprise: Two 4½ volt "A" units, Eveready type 746 or equivalent, and two 45 volt "B" units, Eveready type 482 or equivalent.

They should be mounted in the compartment provided in the bottom of the cabinet as shown in the sketch. Batteries should be removed when they are dead or if the set is not to be used on battery operation for several months.

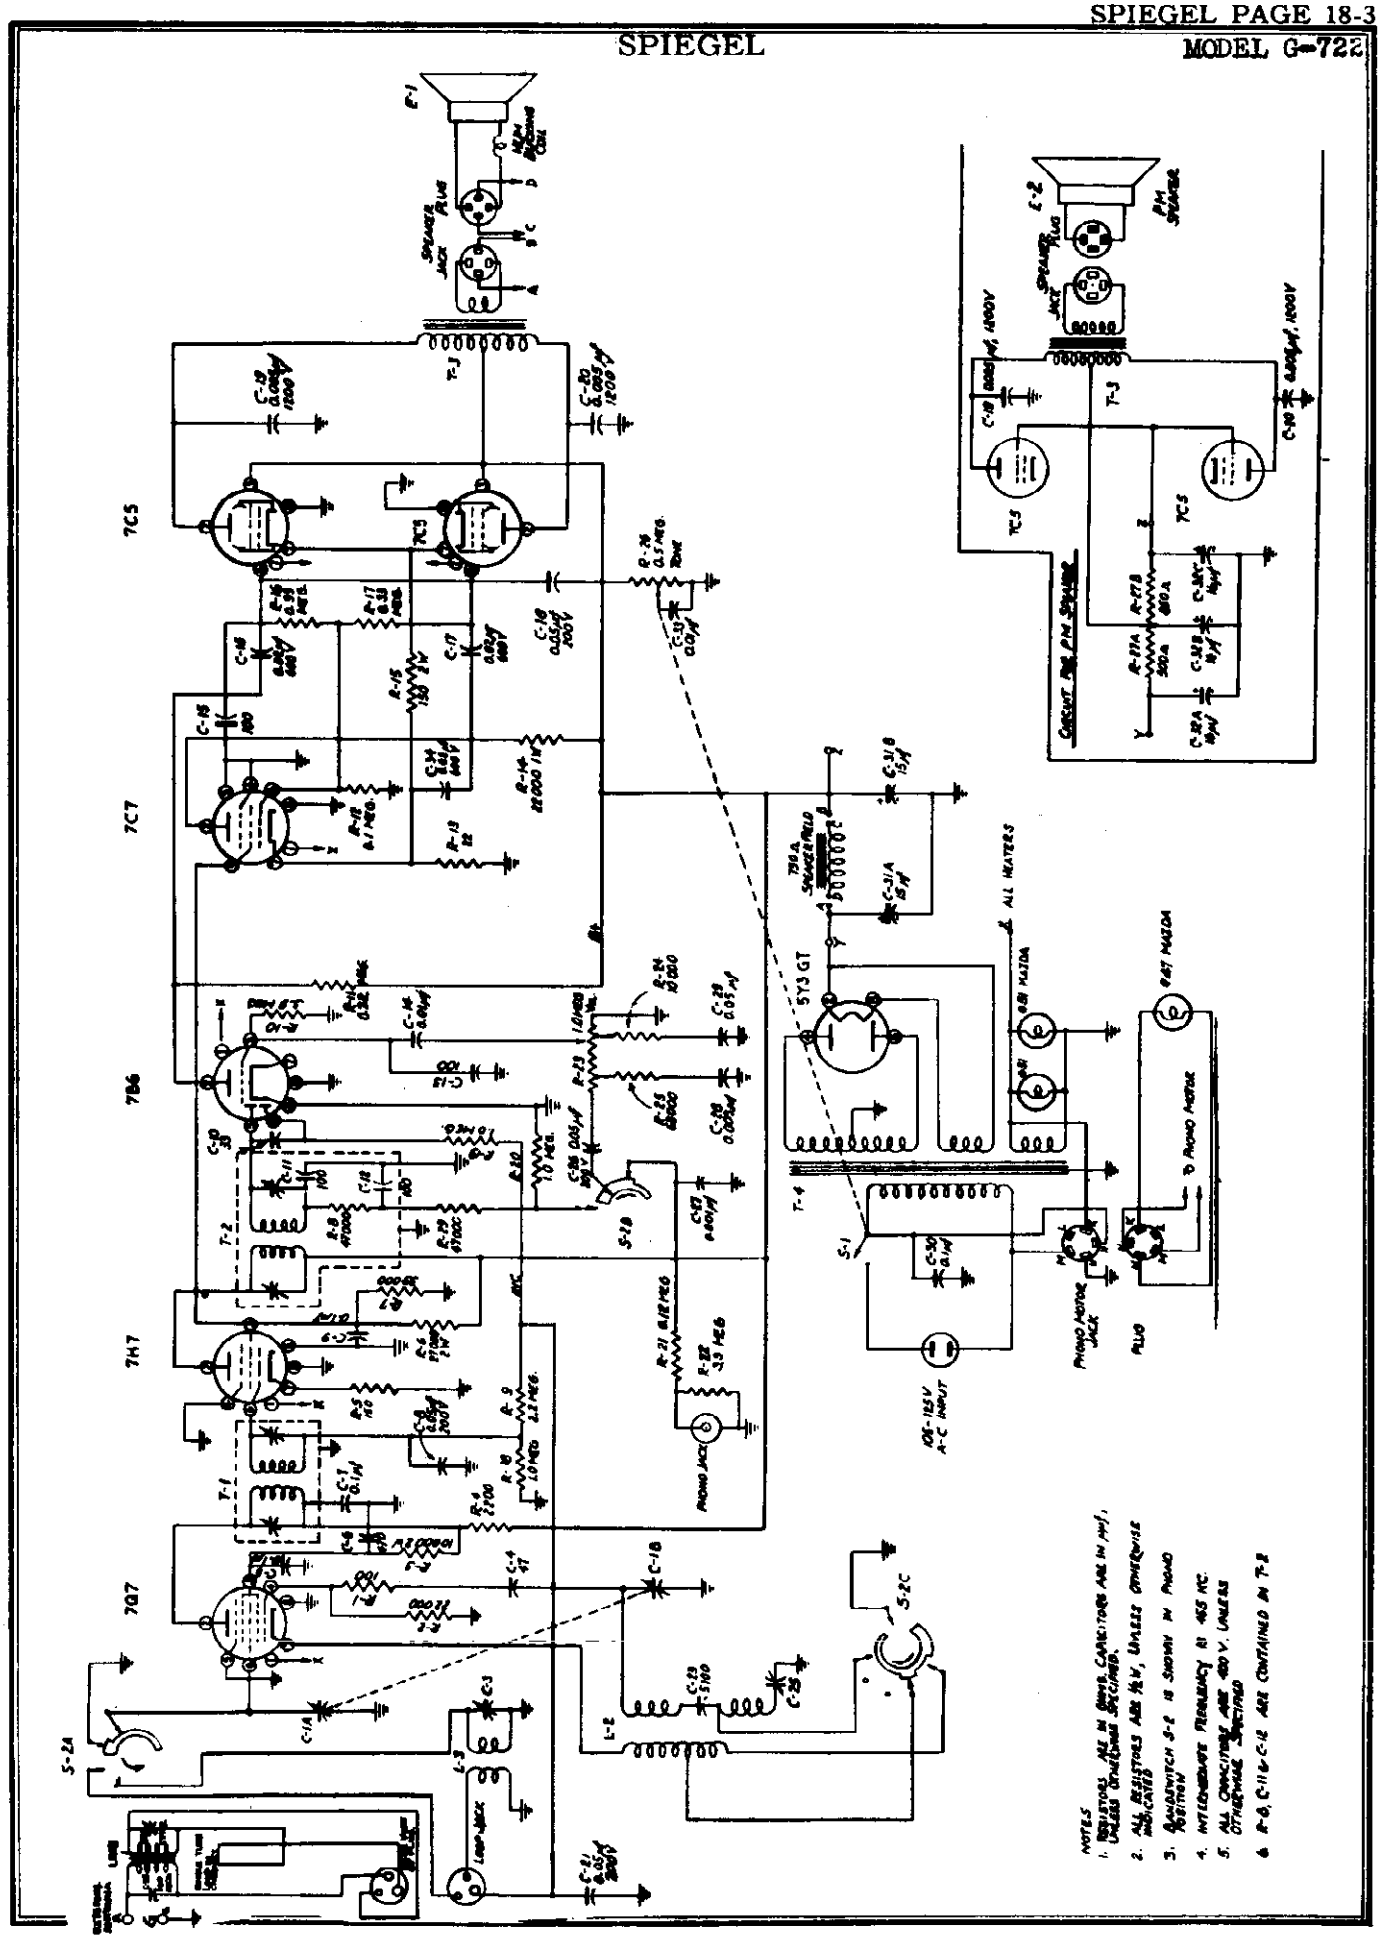
Alignment: No attempt should be made to realign this receiver until it has determined that a poor tube, or some local condition is not responsible for faulty reception. The Signal Generator may be connected through a 0.01 mf capacitor (used as a dummy antenna) to the lug on the R. F. section (B) of the tuning capacitor. Connect ground clip of generator to the common negative of the electrolytic capacitor. An output meter may be clipped across the voice coil lugs. Align the I. F. trimmers to 455 K.C. using the least possible input from the Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

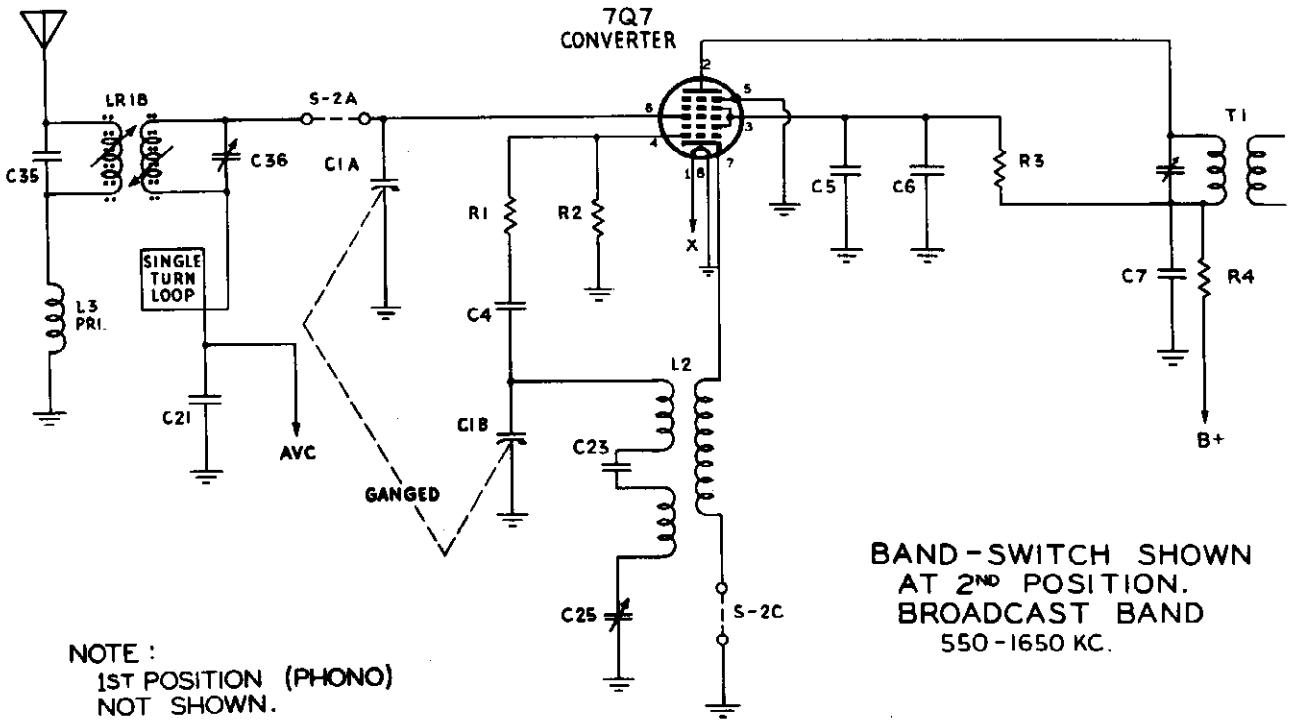
The short wave band trimmers must be aligned before attempting to align the broadcast band. To align the short wave band turn the bandswitch to the short wave position and connect the Signal Generator through a 0.01 mf capacitor and a 400 ohm resistor in series (used as a dummy antenna) to the antenna connection at the back of the cabinet. With the tuning capacitor plates completely out of mesh and the pointer at the extreme right end of travel, adjust the short wave oscillator trimmer (A) to 18.5 megacycles. With both tuning capacitor and Signal Generator adjusted to 6 megacycles, adjust the short wave antenna coil slug (C) for maximum response. Readjust both the Signal Generator and the tuning capacitor to 18 megacycles and tune the short wave R. F. trimmer (B) for maximum response.

With the short wave band aligned, the broadcast band trimmers may now be aligned. To align the broadcast band turn the bandswitch to the broadcast position. Remove the 0.01 mf capacitor and the 400 ohm resistor and connect the Signal Generator to two or three turns of heavy wire, forming a self supporting loop of about 7 or 8 inches diameter placed about a foot away from the receiver's loop antenna. Again use the least possible input from the Signal Generator. With the tuning capacitor completely out of mesh and the pointer at the extreme right end of travel, adjust the broadcast oscillator trimmer (E) to 1620 kilocycles. With the dial pointer set to 600 KC adjust the padder (F) while rocking the signal generator dial for maximum audio output. Readjust both Signal Generator and dial pointer to 1550 kilocycles and adjust the R. F. trimmer (D) for maximum response.

SPIEGEL

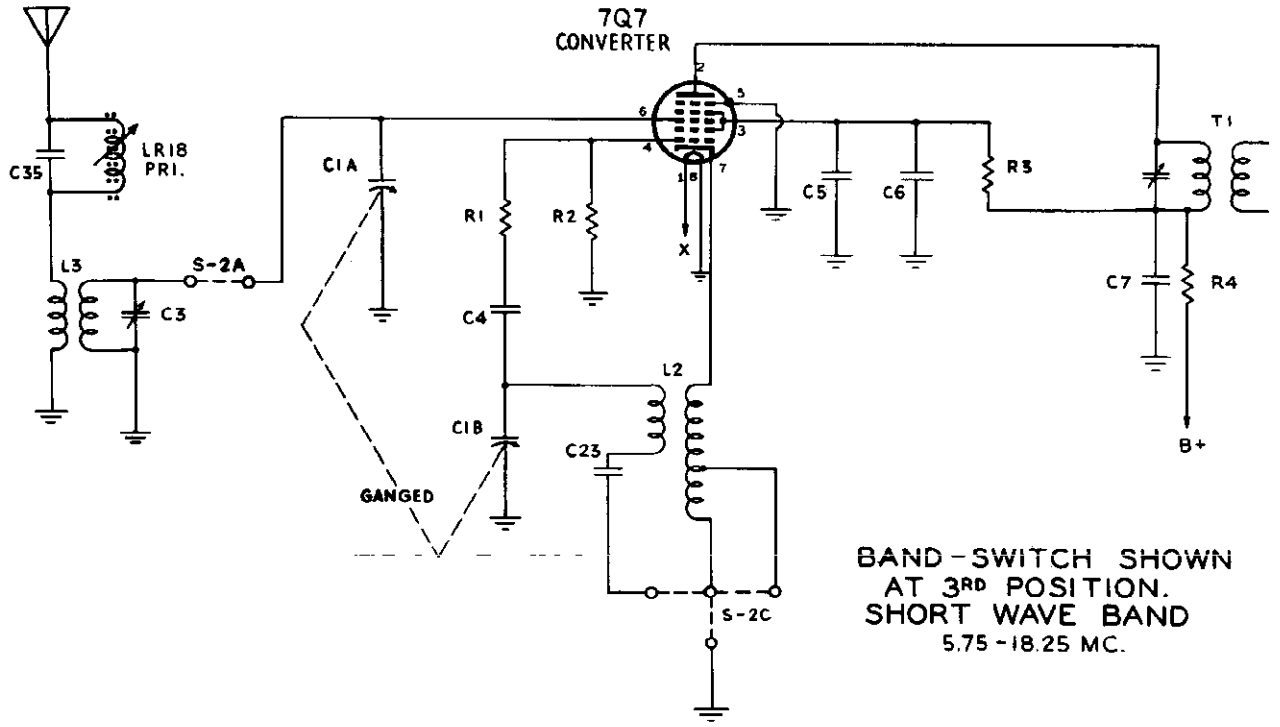
MODEL G-722





NOTE :
1ST POSITION (PHONO)
NOT SHOWN.

BAND-SWITCH SHOWN
AT 2ND POSITION.
BROADCAST BAND
550-1650 KC.



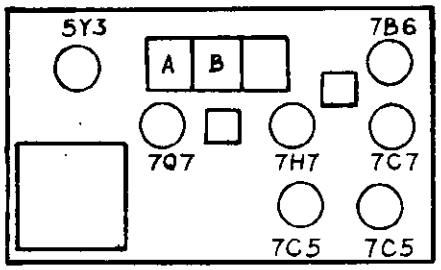
BAND-SWITCH SHOWN
AT 3RD POSITION.
SHORT WAVE BAND
5.75-18.25 MC.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. The Signal Generator may be connected through a 0.01 mf capacitor (used as a dummy antenna) to the lug on R. F. section (A) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 K.C., using least possible input from the Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad. An output meter may be clipped across the voice coil lugs.

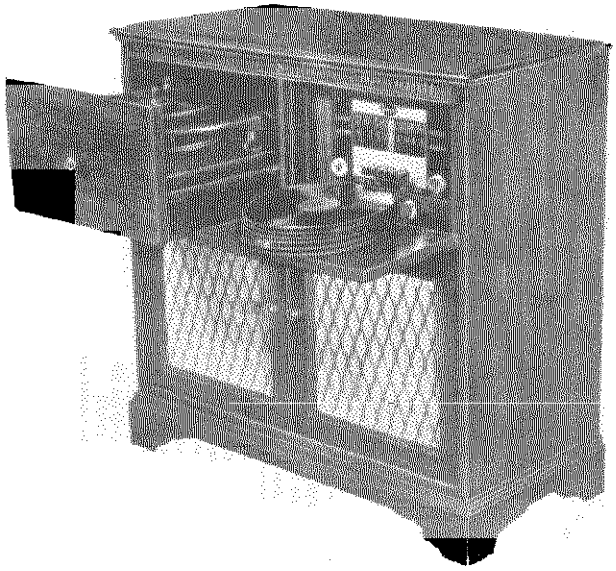
To align broadcast R. F. trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning plates completely out of mesh and the pointer at the extreme right end of travel, adjust the broadcast oscillator trimmer, on the under side of the chassis, to 1650 K.C. With tuning capacitor fully meshed adjust the padder on the chassis deck to 535 K.C. Readjust both Signal Generator and tuning capacitor to 1550 K.C. and adjust the R. F. trimmer on the loop for maximum response.

To align the short wave band connect the Signal Generator through a 0.01 mf capacitor and a 400 ohm resistor in series (used as a dummy antenna) to the antenna connection on the loop antenna. With the tuning capacitor plates completely out of mesh, and pointer at the extreme right end of travel, adjust the short wave oscillator trimmer (on the under side of the chassis) to 18.25 magacycles. Readjust both Signal Generator and tuning capacitor to 16 megacycles and adjust short wave antenna coil trimmer for maximum response. With tuning capacitor fully meshed, the receiver should tune to 5.75 megacycles, however, no adjustment is required at this point.

For checking purposes five marks are engraved on the front of the dial plate. These represent, in order, the pointer position with the capacitor plates fully meshed and the pointer settings for 600 kc, 8 mc, 16 mc, and 1550 kc.



TUBE LOCATION



REPLACEMENT PARTS LIST

Circuit Symbol	Part Number	Item	Description
C-1 A & B	CV-9	Capacitor	Variable 2-gang, Push-button
C-2	CT1-1	Capacitor	Trimmer 1.5—15 MMF

MODEL G-724 SPIEGEL

Model G-724 Radio is a 7-tube including rectifier superheterodyne Frequency Modulation and Amplitude Modulation receiver using the latest type of low drain tubes.

Operation: The set is designed for operation on 105 to 125 volts, 60 cycles A. C. It will also operate on 120 D. C. Power drain is approximately 36 watts for the radio.

Ranges: Model G-724 has both a broadcast and FM range. It covers the broadcast band from 535 to 1625 kilocycles. Since the broadcast dial scale is calibrated from 53.5 to 160, the actual frequency of the station may be obtained by multiplying the dial calibration by ten. The range of the FM band covered in Model G-724 is from 87.6 to 108.4 megacycles. The FM dial scale is calibrated directly in megacycles.

Antenna: This radio will operate without an external antenna. For normal reception more than adequate pickup is obtained by the self contained antenna. At installations remote from station desired to be heard on the broadcast band, improved results may be obtained by attaching twenty or thirty feet of insulated wire to the antenna connection provided in the rear of the cabinet. The wire may be concealed under the rug or laid on the floor along one side of the room.

For normal reception on FM, no outside aerial is required as sufficient signal pickup is secured from the built-in FM antenna. However, in poor receiving locations provision is made for improved results, which may be obtained by the addition of an outside antenna of correct design, properly installed. (Your dealer can supply and install a suitable FM antenna for your FM Radio).

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube or some local condition is not responsible for faulty reception. The following is a list of the minimum equipment necessary to realign this receiver.

1—AM signal generator covering 455 KC, 600 KC, 1550 KC and 10.7 MC

2—FM signal generator covering 10.7 MC, 92 MC and 106 MC

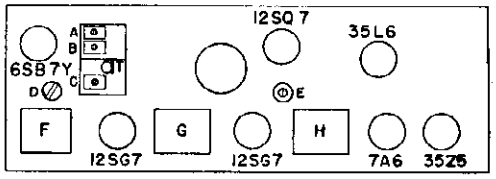
3—Output meter, rectifier type, approximately 0 to 2 volts RMS

4—Dummy antennas

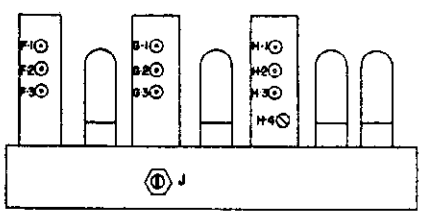
0.01 MFD Capacitor 100MMFD Mica Capacitor 300 Ohm Risistor

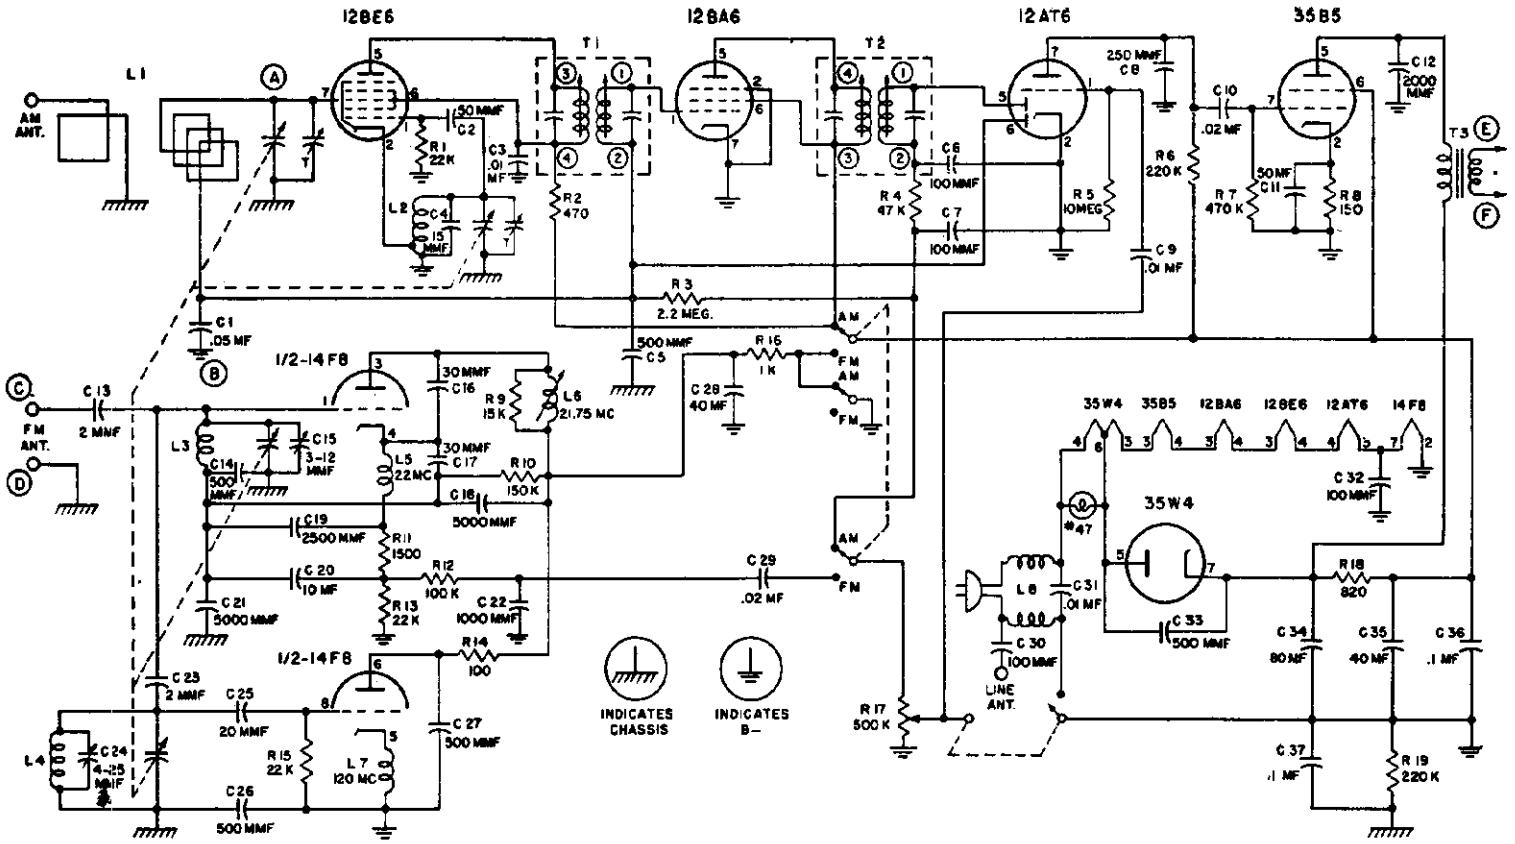
In the following alignment procedure the high side of the signal generator is connected to the terminal indicated in the "Signal Generator Coupling" column below. The ground side of the signal generator is connected directly to the chassis. The output meter should be connected across the voice coil of the speaker for all measurements.

In adjusting the radio frequency trimmers and padders it is advisable to "rock" the variable capacitor gang slightly across the signal being delivered by the signal generator until that particular signal has been accurately peaked.



TUBE AND TRIMMER LOCATION





POWER SOURCE:

This receiver may be operated from either an AC or DC line, between 105 and 125 volts. On AC lines the frequency must be 50 to 60 cycles.

TUBE COMPLEMENT:

1 12BE6 — AM converter.
1 12BA6 — AM intermediate frequency amplifier.
1 12AT6 — AM demodulator and AVC; AM-FM 1st audio amplifier.
1 14F8 — FM oscillator-mixer-Super Regenerative I.F. amp.
1 35B5 — Audio output amplifier.
1 35W4 — Power rectifier.

INSTALLATION:

1. Antenna Connection.

AM—A self contained loop antenna is provided, which will give satisfactory reception on the standard broadcast band without requiring any additional external antenna. However, if stronger signals are desired from weak or distant stations an external antenna may be connected to the wire extending from the loop.

FM—A self contained line antenna system is provided for reception of stations appearing in the FM band. To use this line antenna a short wire jumper should be connected between the two outside screw terminals of the FM antenna panel, which is mounted on the broadcast loop antenna form. Should poor reception conditions make it necessary, an FM dipole antenna may be connected to the left hand and center screw terminals of the FM antenna panel. In such a case, the line antenna link should be disconnected.

2. Ground.

This set has been designed to operate without an external ground, and the use of any ground connection is not recommended.

3. Power Connection.

After making certain that the power circuit is rated between 105 and 125 volts extend the line cord to its full length and insert the plug into the nearest convenient outlet. If the supply is DC, and the set fails to operate, it may be necessary to reverse the plug connection to secure operation of the set.

OPERATION:

The left hand knob controls the ON-OFF power switch and volume level. To turn receiver on, rotate this knob in a clockwise direction. Within a few degrees of rotation an audible click will be heard, and the dial will become luminous. After a half minute of warm up the receiver will be in an operating condition. Further advance of this control in a clockwise direction will provide an increase in volume level.

The center knob controls the selection of AM or FM stations. When rotated to the counterclockwise position, operation in the AM (standard broadcast) band is provided. When this control is rotated to the clockwise position, FM stations may be tuned in.

The right hand or tuning knob enables the selection of any desired station as indicated on the calibrated dial. The upper row of numbers is calibrated directly in megacycles and covers the FM band. The lower scale is used to tune in stations in the standard broadcast band. Add one zero to the numbers on this scale to obtain the station frequency in kilocycles.

SERVICE ADJUSTMENTS:

Alignment or adjustment of the various circuits of this receiver can only be made by a skilled radio technician with the proper equipment.

NOTE: Points A, B, C, D, E, and F are noted on the circuit diagram.

AM Equipment:

Equipment Required:

a) Broadcast Band Signal Generator.
b) Output Meter.

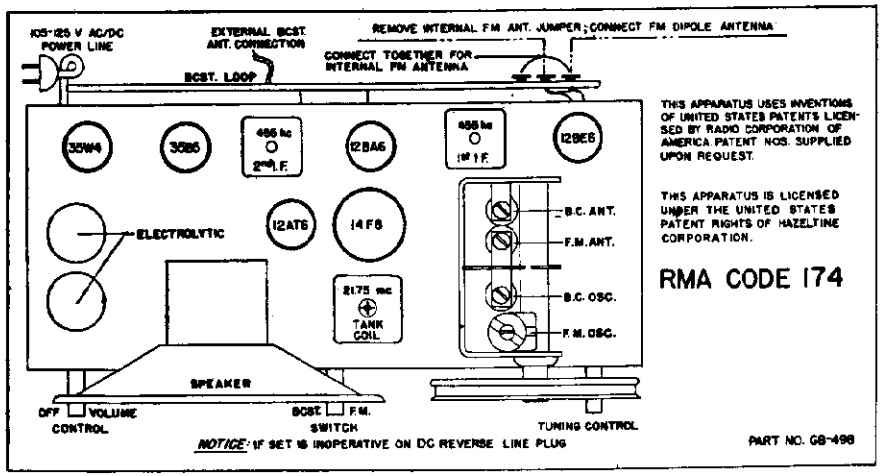
1. Set band switch at AM. Advance volume control to full volume setting.
2. Connect output meter across voice control at points "E" and "F".
3. Connect the "high" side of the Signal Generator to point "A" through a .01 mfd condenser. Connect the "ground" side to point "B". Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I.F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.
4. Connect the "high" side of the Generator to the antenna terminal with a 200 mmf condenser inserted in series. Connect the "ground" side of the Generator to point "B".
5. Tune receiver to 150 on the dial. Adjust Signal Generator to 1500 kc. Adjust BC oscillator and BC antenna trimmers for maximum output. Use a weak signal for final adjustment.

FM Equipment:

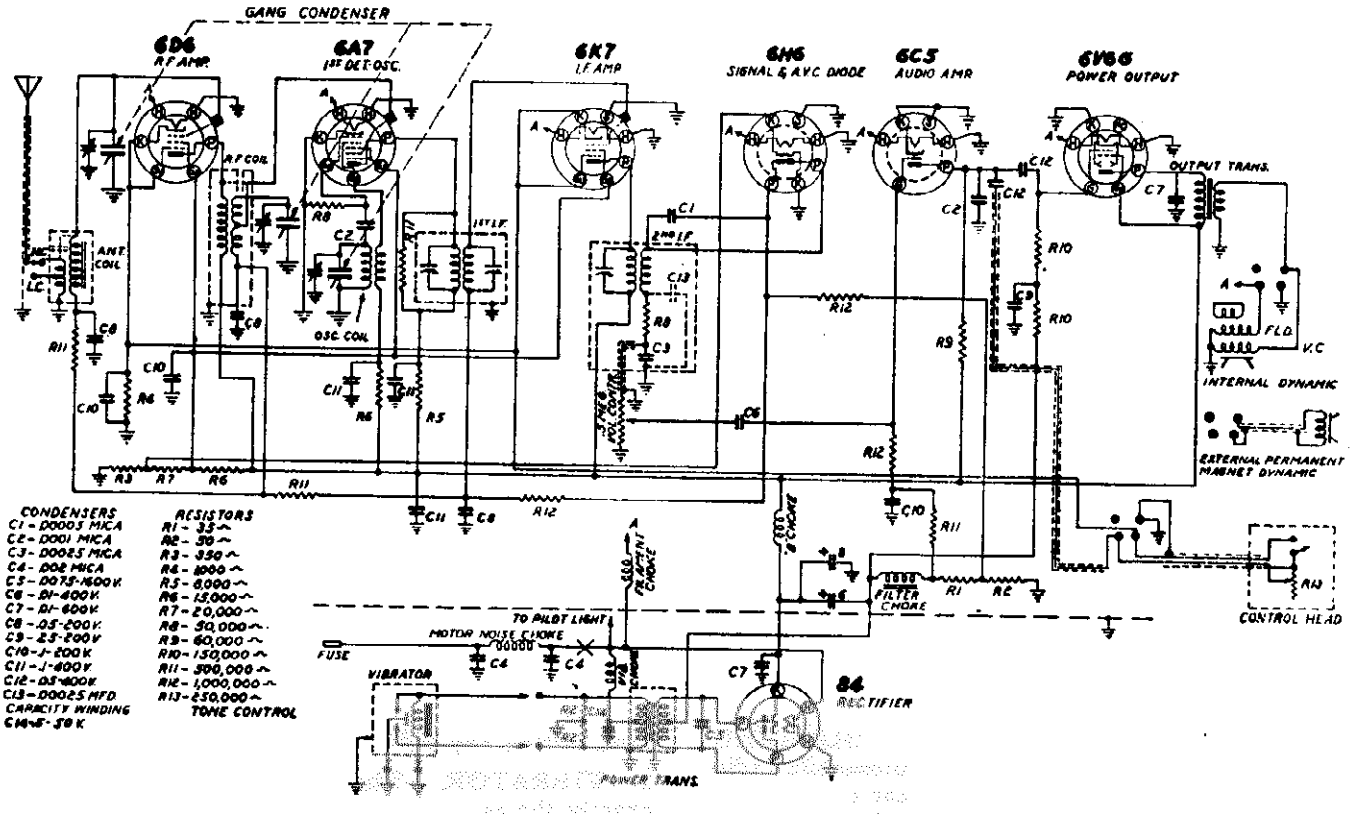
Equipment Required:

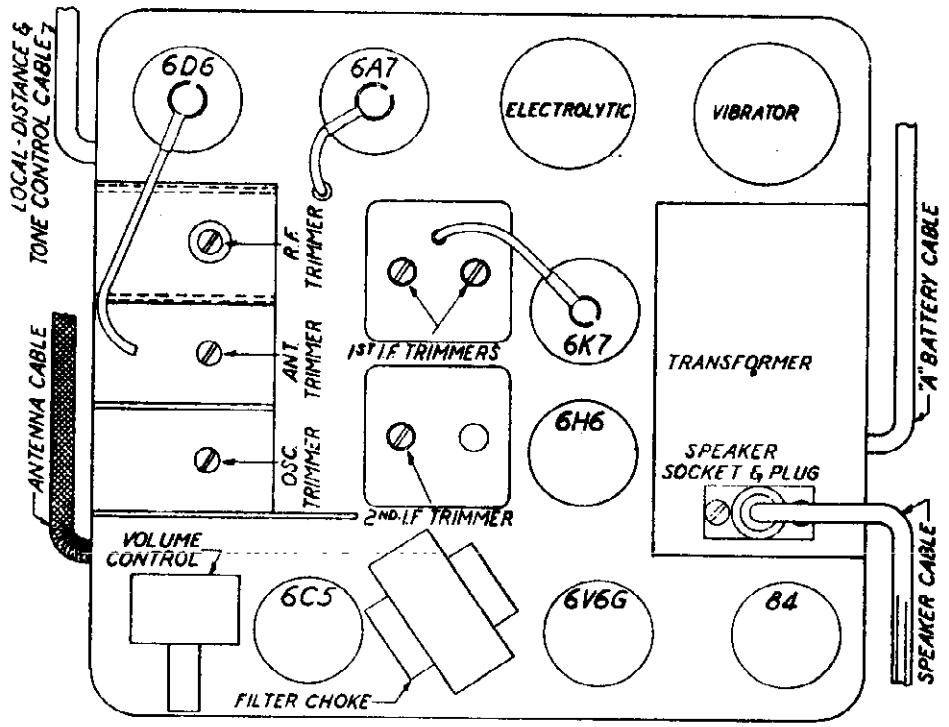
a) 21.75 kc oscillator.
b) FM Signal Generator for 88 to 108 megacycle range.
c) Output meter.

1. Connect output meter across points "E" and "F".
2. With set switched on and volume control at maximum, feed modulated 21.75 mc signal into terminals "C" and "D".
3. Adjust tank coil for maximum response on output meter.
4. Disconnect 21.75 kc oscillator and connect FM signal generator to points "C" and "D".
5. Set receiver dial to 88 megacycles and adjust Signal Generator for same frequency. Adjust spacing of FM oscillator coil for maximum signal response.
6. Tune receiver to 108 megacycles and adjust Signal Generator to same frequency. Adjust FM oscillator trimmer for maximum signal response.
7. Repeat operation 5 and 6.
8. Tune receiver to 90 megacycles and adjust Signal Generator for same frequency. Adjust spacing of the FM antenna coil for maximum signal response with minimum background noise. Slowly rock tuning control while performing this adjustment.
10. Repeat operations 8 and 9.



SPIEGEL MODELS 77, 770





1. CONTROLS. Two knobs appear on the control head. The one that moves the dial pointer is for tuning; the other controls volume and turns the receiver "On" and "Off".

2. TURNING THE RECEIVER "ON". Turn the volume control knob to the right. A click will be heard, and the pilot lamp will light. Wait thirty seconds for the tubes to heat up.

3. TUNING IN STATIONS. Put the volume on full by turning the volume control knob to the right as far as it will go. Next turn the station selector knob slowly until a station is heard. Reduce the volume by means of the volume control knob to below the desired intensity. Now turn the station selector knob very slowly back and forth until the signal is clearest and strongest. If the signal is not carefully tuned in, reception will be noisy and distorted. Then adjust the volume control until the desired intensity is obtained. Always reduce the volume by means of the volume control knob and never by turning the station selector knob. To get the kilocycle reading, multiply the scale reading by ten.

4. TONE CONTROL. The tone control is located on the control plate and is operated by means of a wing type knob directly behind volume control knob as shown in Figure 8. When the knob is turned to the right, a brilliant tone is obtained, and when it is turned to the left, a deep bass tone is produced.

5. LOCAL AND DISTANCE SWITCH. The local and distance switch is located directly behind the station selector and is operated by means of a wing knob. When tuning local stations, turn the wing knob to the extreme left to enjoy brilliant performance without the usual in-between station noises, and noise and static caused by high voltage lines. When tuning distant stations, turn wing knob to extreme right, and a click will be heard, and the set becomes very sensitive, bringing in far-away stations with surprising sharpness and clarity.

6. TURNING THE RECEIVER "OFF". Turn the volume control knob to the left as far as it will go. A click will be heard, and the pilot light will go out, indicating that the set is turned off.

CARE AND MAINTENANCE

1. ADVANCING GENERATOR CHARGING RATE. The installation of any automobile radio imposes an additional drain on the car storage battery. This can be compensated for by advancing the charging rate of the car generator. Check the state of charge of the storage battery about a week after the installation of the automobile radio is made and have the charging rate adjusted accordingly.

2. TUBES. The type of tubes used and location of these tubes in the chassis are shown in Fig. 8. These tubes are of a sturdy, rugged construction designed especially for an auto receiver. Most of them, under normal use, will last for many months and in some cases, years. Some of them, however, may become faulty after a few months of operation. For that reason it is advisable to secure a new set of tested tubes at intervals of three to six months and to have them inserted in the receiver one at a time, noting any difference in performance.

3. VIBRATOR. The vibrator unit is plugged in exactly the same as a tube. This unit may, in case of failure, be readily replaced in the same manner as replacing a tube.

4. PILOT LAMP. To replace the pilot lamp first turn the receiver off. Then pull out the pilot lamp assembly and replace the lamp. A 6-8 volt automobile type lamp is used (Bulb No. 51).

5. FUSE. A 20 ampere automobile fuse is used in the battery cable. This fuse is placed in an insulating shield and is in the receptacle provided for it at the chassis end of the battery cable.

CAUTION—Be sure the fuse insulator is on the fuse before the latter is inserted in the receptacle. If a fuse blows, do not replace it without first investigating the cause.

ALIGNMENT DATA AND SERVICING

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 175, 600 and 1400 K.C., and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignment should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) transformers should be alligned properly as the first step.

I.F. ALIGNMENT. Adjust the test oscillator to 175 K.C. and connect the output directly to the grid of the first detector tube (6A7), without the use of any series condenser or resistor; the omission of series condenser and resistor to block out the AVC action. The ground on the test oscillator can be connected to the chassis ground. Align the trimmers of the first and second I.F. transformers to peak or maximum reading on the output meter.

OSCILLATOR ALIGNMENT. Adjust the test oscillator to 1400 K.C. and connect the output to the antenna through a .0001 mfd. mica condenser to give the equivalent of a low capacity type average auto antenna. Set the dial pointer to 1400 K.C. and adjust the oscillator trimmer to peak. (Front section of gang condenser.)

R.F. ALIGNMENT. The next step is to adjust the center and rear trimmers of the gang condenser to peak. The center section of the gang condenser tunes the antenna amplifier stage (6D6 tube), and the rear condenser section tunes the detector grid coil of the 6A7 tube.

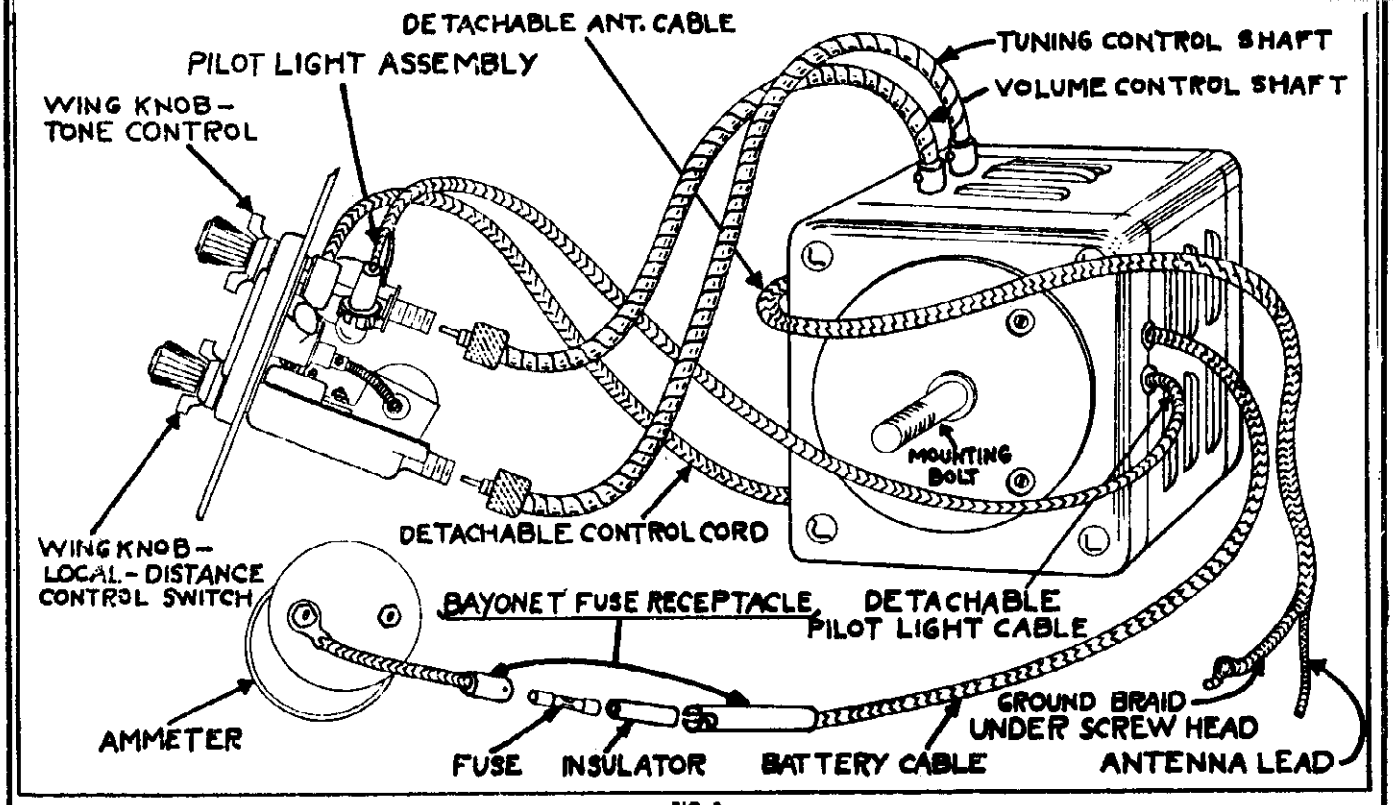


FIG. 8

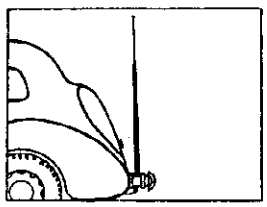

FIG. 9

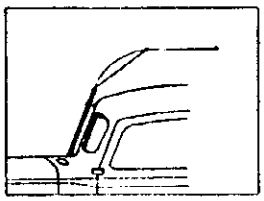

FIG. 10

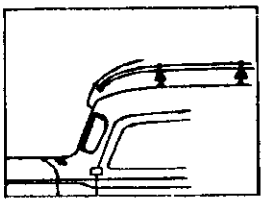

FIG. 11

FIG. 12

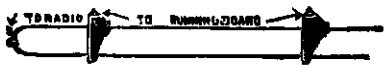

FIG. 14

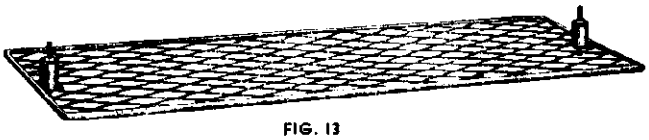

FIG. 13

Buick and Oldsmobile have what is known as insulated running board type antenna which is about 500 mmfd. These types of high capacity antennas can efficiently be coupled to the receiver by means of a special provision which provides proper matching.

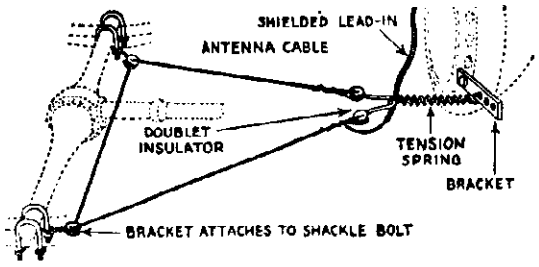

FIG. 15

COMPLETING THE WIRING CONNECTIONS

Now, with the receiver and control units mounted, and with flexible shafts attached, the next step is to complete the wiring connections. Supplied with the receiver: (1) a shielded antenna lead-in with two prong plug attached; (2) a shield pilot light lead with slip-on pilot light head at one end and tip jack connector at the other end; (3) a battery lead with built-in replaceable fuse (4) detachable control cord with a two prong plug at one end for chassis connection. (See Fig. 8).

1. ANTENNA CONNECTION. The shielded antenna lead should be soldered to the antenna lead-in as shown in Figure 16. The position in which the plug is inserted into the receiver depends upon the type of antenna used in the installation. The antenna lead plug has two tips, one soldered and one blank. If a low capacity antenna is used, the soldered tip of the plug is inserted in the hole specified in Figure 17. If a high capacity antenna is used, the soldered tip of the plug should be inserted in the hole indicated for high capacity antenna.

Keep the antenna cable as far away from car wiring as possible, and ground the pig tail of the antenna cable shield as close to the antenna end as possible. If a roof antenna is used the cable supplied will prove sufficiently long in practically all uses to reach the corner post or column at which the antenna lead comes down. The shielded cable should be pushed up into the column as far as possible to prevent ignition interference that may be picked up by any unshielded portion of the antenna cable.

Three connections are necessary. First, the antenna must be hooked up to the receiver unit; second the pilot light must be in the control head; third, the battery cable must be connected to the ammeter. (See Fig. 8).

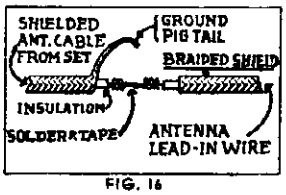

FIG. 16

If an under car or running board antenna is used. the shielding must be extended to the antenna in all cases. The pigtail on the end of the antenna cable shield must be well grounded at the extreme antenna end. If it is necessary to extend the antenna cable shielding as described below, be sure that a pigtail is put on the end of the shielded extension and that it is well grounded at the extreme antenna end. (See Fig. 16).

To extend the antenna cable shielding, the antenna lead wire should be covered with heavy insulation such as loom, to properly separate the shielding from the wire. Then connect the two wires together and connect the two shields together, care being taken that no strand of the shield touches the antenna wire.

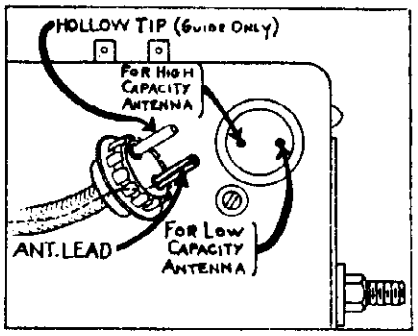

FIG. 17

2. PILOT LAMP CONNECTION. Connect the pilot lamp cable at the chassis by inserting the pin tip connector into the receptacle on the side of the chassis case indicated in Figure 8. Push the fitting all the way down. Then insert the pilot lamp assembly into the receptacle at the back of the control unit as indicated in Figure 8. In some cases the cable supplied will not be long enough and an extra length cable may be fitted.

3. BATTERY CABLE CONNECTION. The battery connection is made at the ammeter. The end of the battery cable should be soldered to a lug and secured to one of the posts at the back of the ammeter in the instrument panel. The other end of the battery cable has a fuse receptacle with bayonet fitting. Insert the fuse shield and fuse into the receptacle and connect it to the bayonet pin connector in the end of the battery lead coming from the chassis case as shown in Figure 8.

4. THE CONTROL CORD. Connect the control cord at the chassis by inserting the 3 prong plug into the receptacle on the side of the chassis case as indicated in figure 8. Push the fitting all the way down.

ADJUSTING THE DIAL POINTER FOR CORRECT CALIBRATION

After the control unit has been installed the dial pointer must be adjusted to provide a correct calibration of the receiver in operation. Tune in a station of known frequency around 700 K.C. Now reach back behind the control unit and loosen the knurled nut. This now makes it possible to rotate the flexible shaft by hand until the dial is set at the exact frequency of the station tuned in. Now tighten the knurled nut with fingers. (Do not use pliers or other tools). If this procedure is carefully followed the dial pointer will indicate 700 K.C. when a 700 K.C. station is being received. Once you adjust the dial pointer for correct calibration at any one frequency, all other points or calibrations on the dial scale will be found to be in agreement with frequencies tuned.

HOW TO SUPPRESS IGNITION AND GENERATOR NOISE

This radio incorporates all of the latest circuit developments for the elimination of motor noises.

Due to the use of special filter circuit, the set is inherently quiet, and only a few precautionary procedures are required. Cars of recent manufacture will not require the use of spark plug suppressors.

Even in older cars, suppressors should not be required providing the ignition system wiring has not developed high tension "leaks" due to aged, cracked or otherwise defective insulation.

There are a few units in every car that will require a little attention to provide absolute "noiseless motor" operation. The following automobile components are often not grounded or poorly grounded from a radio standpoint and should be investigated as suggested. It is advisable to pay particular attention to the first four causes listed below. In a majority of cases, if these are treated, no further noise suppression will be required. If the noise persists, the remaining seven points should be checked in the order recommended.

1. Distributor
2. Generator
3. Dome Light
4. Ammeter
5. Bonding of Cables
6. Coil Position
7. High and Low Tension Wires
8. Steering Columns, etc.
9. Grounding Engine and Other Parts
10. Loose Parts in Car
11. Weak Pick-up

HOW TO INSTALL THE RECEIVER AND CONNECT THE CONTROL UNIT

THE RECEIVER. After the receiver and control head positions have been selected, the installation of these two units should be completed. A single hole made by using a ½ inch or 9/16 inch drill is all that is necessary for mounting the receiver unit proper. The short threaded end of the stud bolt should be screwed into the rear mounting plate of the receiver, with the long threaded section of the bolt fitted through the hole in the car bulkhead. (See Fig. 7).

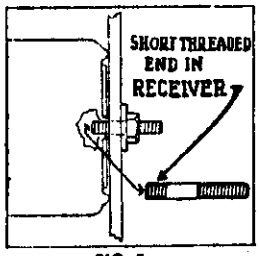

FIG. 7

IMPORTANT: Never screw the long threaded end of the stud bolt into the receiver as it is long enough to penetrate the interior of the chassis and cause serious damage to the wiring and components within. THE SHORT THREADED END ONLY should be screwed into the receiver mounting plate.

THE CONTROL UNIT. The control unit supplied with this receiver is custom built for your car, employing either aeroplane or porthole type dial assembly, as engineered by the car manufacturer. The mounting of the control head is easily accomplished. Remove the ash receiver or the ornamental plate designed to accommodate the radio control unit. In few 1937 cars it will be necessary to remove the ash receiver and the plate. There is no sawing, drilling or filing necessary in preparing for installation. Now assemble the control unit as per instruction sheet enclosed in each control unit package and proceed to clamp to the dash. Once the receiver unit and control unit have been mounted into position, the flexible shafts should be connected in the manner clearly indicated in figure 8. Figure No. 8 also shows the proper battery, control cord, pilot light and antenna connections.

1. DISTRIBUTOR ROTOR. Distributor rotors develop an unshielded spark and in practically all installations it will be necessary to install a distributor suppressor to squelch this interference. The intensity of this spark interference can be greatly reduced by "peening" the rotor blade. This operation reduces the gap between the rotor blade and the distributor head contact. Normally there is a gap of about twenty thousandths of an inch and the spark jumping this gap produces the most objectionable interference. Hammering the rotor blade which is made of copper will lengthen it and reduce the clearance to a few thousandths of an inch and consequently reduce proportionately the spark and interference. A more desirable and easier way of "peening" the rotor is to increase its length by building it up with solder. Sufficient solder, which is soft, can be added to completely close this space and a trial turn over the engine will scrape off any surplus so that the gap will be almost spaceless.

2. GENERATOR. Generators on new cars usually do not cause much interference, but as the car becomes older the brushes wear and spark, producing objectionable noise. The ½ microfarad condenser furnished with the receiver should be installed on the generator cut-out relay to prevent this source from causing interference. In some of the new cars, the generator relay is mounted on the front of the bulkhead or in some other location. It will be most convenient and advisable for best results to mount the generator condenser at the relay.

3. DOMELIGHT. To determine the amount of noise caused by the dome light, try a ¼ or ½ mfd. condenser from the end of the dome wire to ground.

The end of the dome light wire will usually be found at the ammeter or at a special connection terminal block. In cases where the condenser does not cure the noise it may be necessary to shield the dome light wire to the point where it enters the corner post running to the roof, and to ground the shield. If the noise still persists, disconnect this lead and remove it from the front cornerpost, at which point it is generally run down, and use one of the side posts in back of the door, connecting it directly to the storage battery. If done in this manner, this lead should be fused.

4. AMMETER. By-passing the ammeter with a ½ mfd. condenser should be tried in looking for the source of interference and permanently applied if a reduction in noise results.

5. BONDING OF CABLES. Try grounding to the dash all cables and tubing which pass through it, such as oil lines, gas lines, hand throttle, choke wire, etc. By means of a file, contact can be established between any of the lines and the dash, in order to determine whether such a ground will reduce the noise. To bond the cables to the dash, clean the point of contact, wrap a length of braided shielding around the cable and solder the connection.

Then solder the ends of the shielding to the dash or ground it under a screw head if one is convenient. Sufficient play should be left in the bonding shielding so that movement of the cables or tubing will not loosen this shielding from the dash.

6. COIL POSITION. If the receiver chassis and ignition coil are both in back of the dash (under the cowl) take off the coil and mount it on the front of the dash (in the engine compartment). Should the coil be moved, mount it as close to the distributor as possible. If the coil cannot be moved place a copper can over it and ground the can at the coil mounting. Shield the high tension lead from the coil to the dash, grounding this shield both to the metal can of the coil and to the dash. Considerable care must be exercised in shielding this lead to prevent short circuiting the high tension system. It should first be covered with loom or heavy insulation before the braided shielding is put on.

7. HIGH AND LOW TENSION LEADS. In some cases, the high and low tension leads between the coil and distributor are run close together. In some cars they are in the same conduit. If this is the case, remove the low tension lead from this conduit. In any event, keep the high and low tension leads as far apart from each other as possible. Shield and ground the shield of the low tension lead, if separating the two leads is not sufficient.

8. STEERING COLUMN, ETC. It is possible for the steering column, foot pedals and brake lever to carry interference to the back of the dash at which point it may affect the radio receiver. See if each of these are well grounded to the frame of the car. By means of a file or a braided shielding jumper, contact can be established between these points and the frame in order to determine whether such a ground will reduce the noise. A piece of one inch braided shielding should be used if a ground is necessary and this shielding may be grounded under a screw head, or nut, or may be soldered in position.

9. GROUNDING ENGINE AND OTHER PARTS. The engine must, in every case, be well grounded to the frame of the car. If it is not, use a very heavy braided lead for this purpose, similar to a storage battery ground lead. In like manner it may be necessary to check the grounding of the metal dash, instrument panel, radiator and hood to the frame of the automobile.

10. WEAK PICKUP. Noise, on occasion, may be caused by the automobile being in a shielded location or by a faulty antenna system. Automatic volume control, when counteracting weak pickup, causes the set to operate at its maximum sensitivity, thereby increasing the noise level. If the antenna instructions, previously outlined are carefully followed, weak pickup should not be experienced.

11. LOOSE PARTS IN CAR. Noisy operation is also caused in some instances by loose parts in the car body or frame. These loose parts rubbing together affect the grounding and cause noises. Tightening up the frame and body at all points and in some cases, using a copper jumper will eliminate noise of this nature.

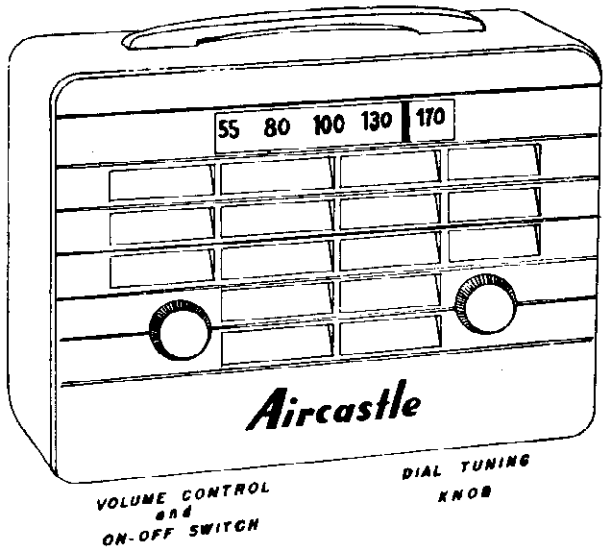
MODEL 179 SPIEGEL



ALIGNMENT PROCEDURE

- Output meter across 3.5 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				*SETTING TUNER*	*ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)*
Frequency	*Coupling Factor*	*Connection to Receiver*	*Ground Connection*		
455 kc	.1 mfd	1R5 Grid	B—	Rotor full open (Plates out of mesh)	Input and output trimmers on IF cans
1700 kc	.1 mfd	1R5 Grid	B—	Rotor full open (Plates out of mesh)	Oscillator trimmer T2
1500 kc		Radiating Loop		1500 kc*	Antenna trimmer T1

* Five markings on the dial bracket represent respectively 530 kc., 600 kc., 1000 kc., 1500 kc., and 1700 kc., reading from left to right. These points are to be used for the alignment of the receiver.

ELECTRICAL SPECIFICATIONS

Batteries..... A—1½ volts. 250 ma.
B—67½ volts. 8 ma. average.
Frequency Range..... 530 to 1700 kc.
Intermediate Freq...... 455 kc.
Tuning..... Two-gang capacitor
Antenna..... Built-in loop
Speaker..... 4 inch PM; voice coil impedance 3.5 ohms.
Power Output..... 80 milliwatts undistorted
140 milliwatts maximum
Sensitivity..... 800 microvolts per meter for 50 milliwatt output
Selectivity..... 55 kc broad at 1000 times signal at 1000 kc.

POWER SUPPLY

The battery supply to be used with this receiver is as follows:

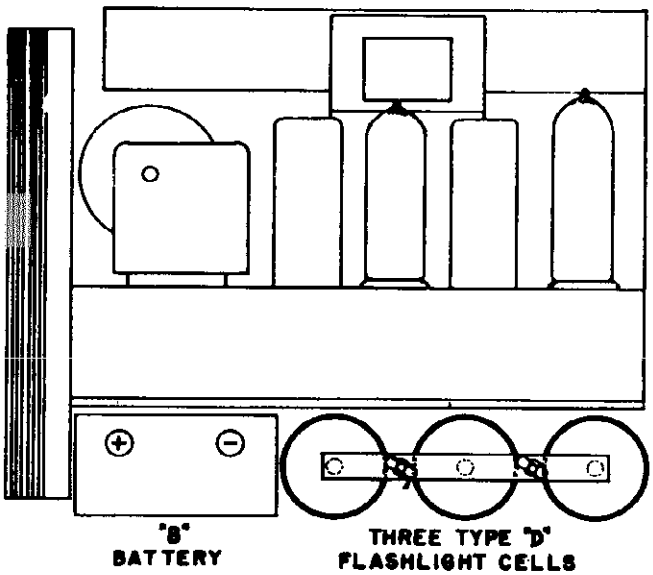
"A" supply ..... 1½ volts. Use three type "D" flashlight cells; Aircastle No. 1514, or Burgess No. 2, or RCA-VS-001, or Eveready No. 950 or equivalent.

Use Aircastle No. 1523 or Burgess No. XX45 or RCA-VS-016 or Eveready No. 467 or equivalent.

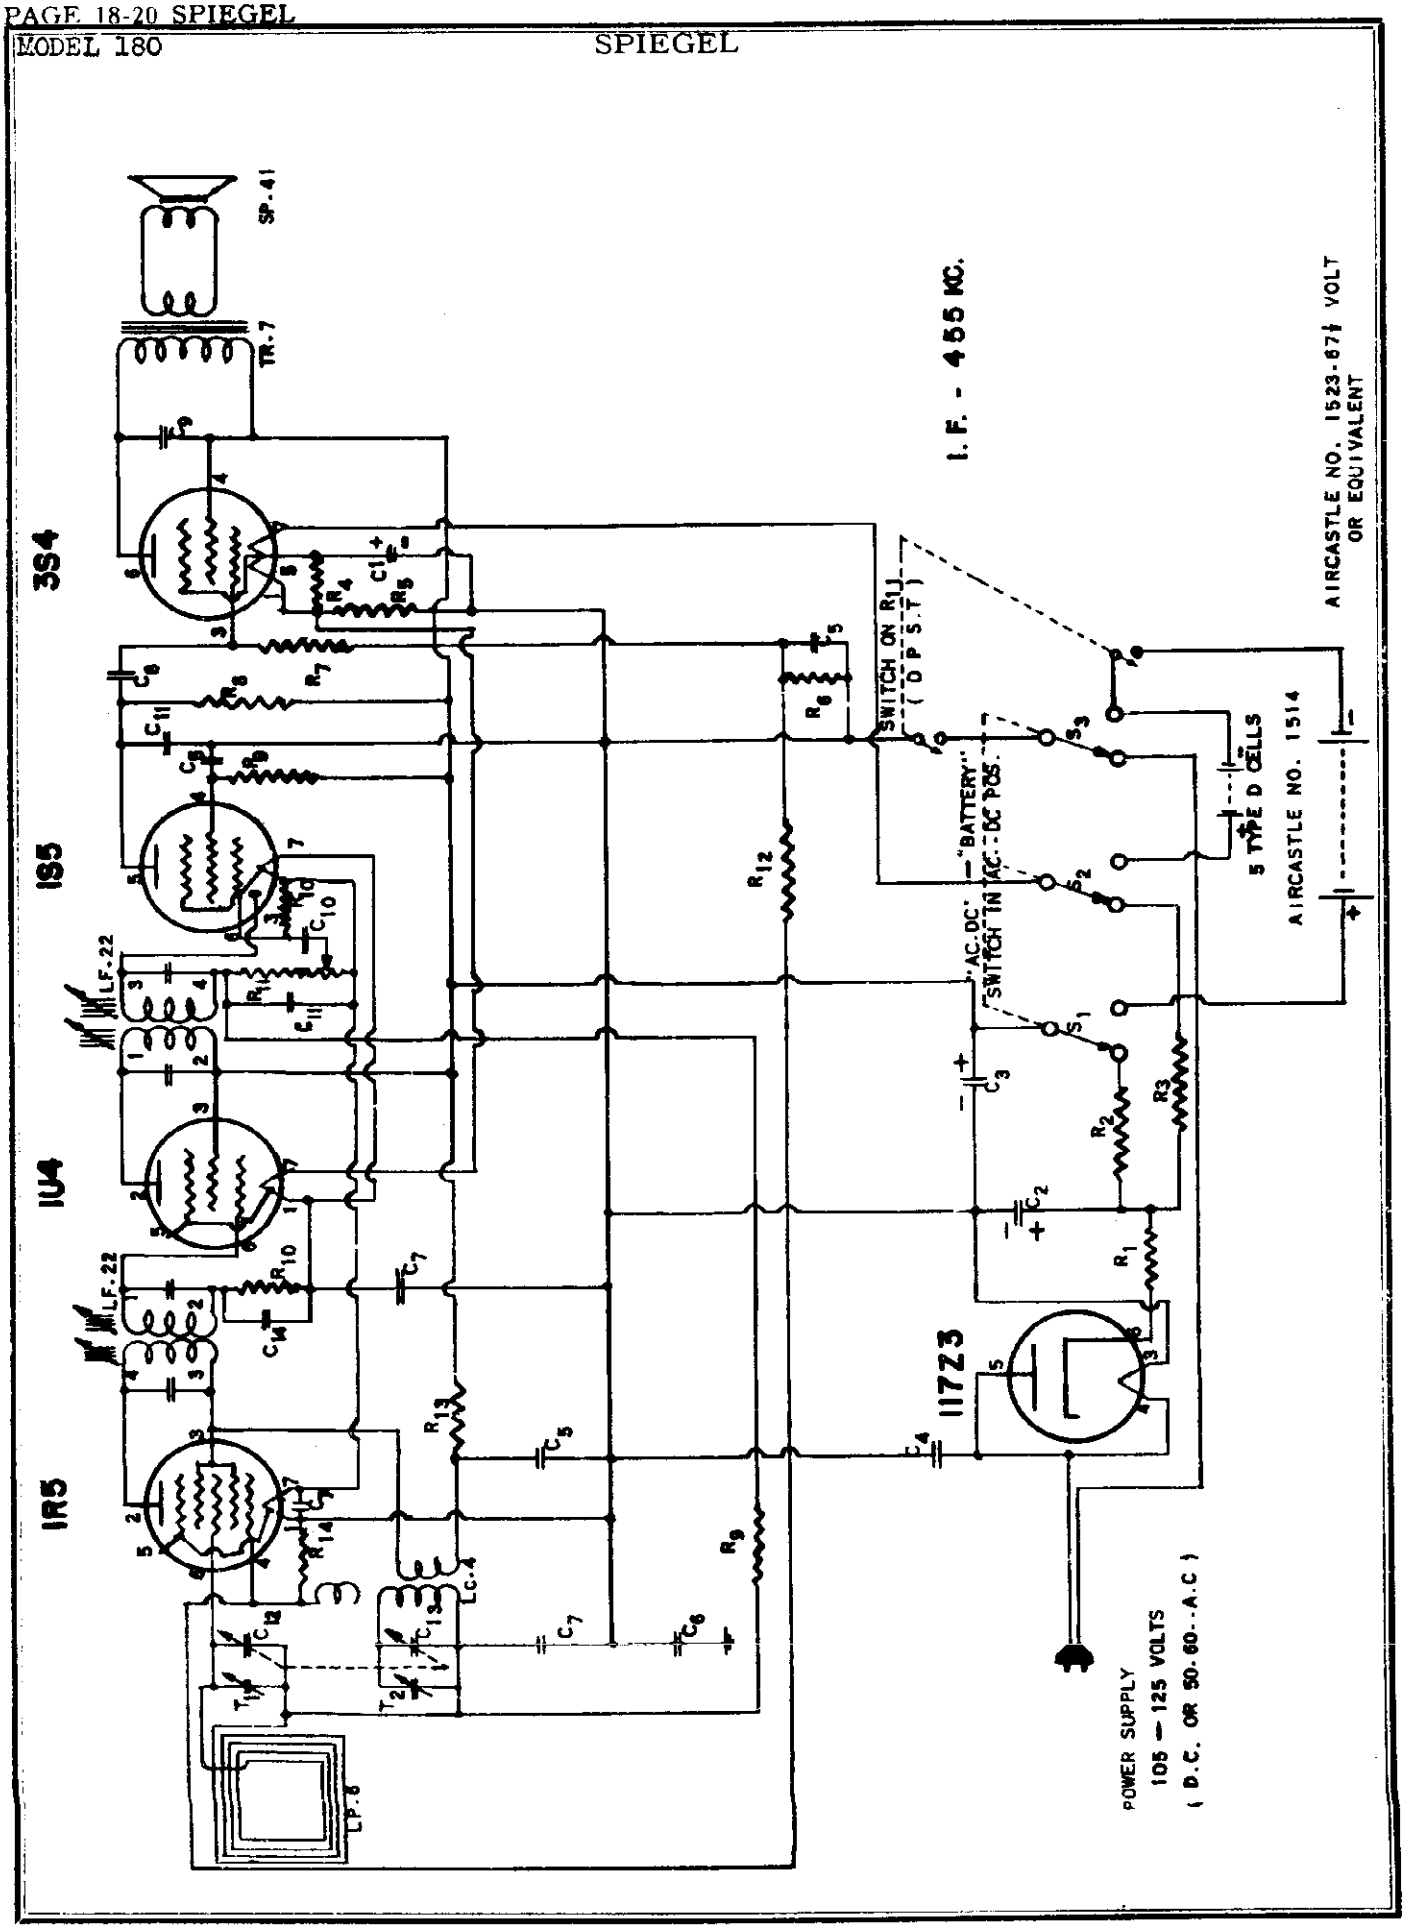
ANTENNA SYSTEM

This receiver is equipped with a built in Antenna System, which obviates the necessity of using an antenna connection for receiving most local and some distant stations.

When tuning Broadcast Stations, it may be found advisable to rotate the radio about its position of rest until the most distant station regularly enjoyed is heard the clearest. In some vicinities where there is a localized noise interference prevalent, it is best to rotate the radio cabinet to a position which gives a minimum of noise.



MODEL 180 SPIEGEL



ALIGNMENT PROCEDURE

- Output meter ac oss 3 5 ohm output load
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment. A signal generator is required having the following frequencies: 455 KC and 1400 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD. condenser. The ground lead from the generator may be connected to any spot on the metal chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the movable iron cores in the IF cans. These IF adjustments are made in the top and in the bottom of the can under the chassis. Adjust the cores until a maximum reading is noted on the output meter.

The volume control of the receiver should be turned to maximum during the IF and all subsequent alignment and the generator output as low as possible to prevent the AVC from working and giving false readings.

SECOND STEP: With the leads from the generator still connected as in IF alignment, adjust the generator to 1400 KC. Set the dial pointer to 1400 KC on the dial scale. Adjust the oscillator trimmer until the signal is tuned in.

THIRD STEP: Remove the generator leads from the gang condenser.

Replace the chassis in the cabinet. Loosely couple the generator to the receiver loop by making a complete turn over the outside of the cabinet. With the receiver and the generator still set at 1400 KC increase the generator output. Adjust the Antenna trimmer through the back of the chassis until a maximum signal is noted on the output meter.

No further adjustment should be necessary as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

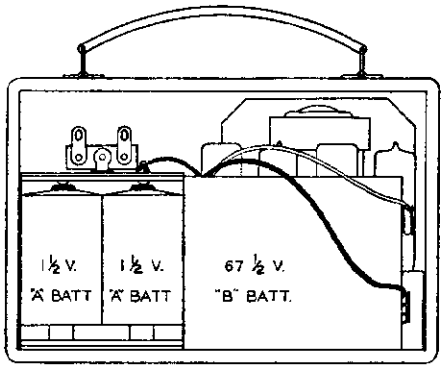
NOTE: When the antenna trimmer is adjusted at 1400 KC., the chassis as well as the "A" and "B" batteries must be in normal position in the cabinet to reflect the proper loop impedance.

For proper operation this receiver requires two "A" batteries and one "B" battery.

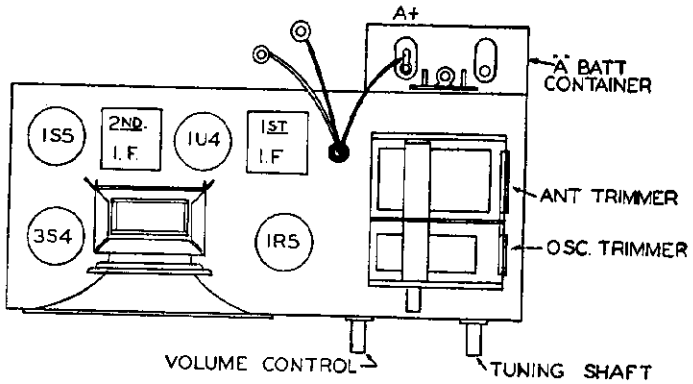
The "A" batteries are size "D" flashlight cells and are made by all battery manufacturers.

The "B" battery is a 67½ volt battery and is made by the following manufacturers:

Eveready	**67½ vlt.**	**#467**
Burgess	**67½ vlt.**	**#XX45**
General	**67½ vlt.**	**#W45A**
Ray-O-Vac	**67½ vlt.**	**#4367**



BATTERY LOCATION
FIGURE-1



MODEL 5029
TUBE AND TRIMMER LOCATION
TL-61

BATTERY SERVICING

(See Fig. No. 1)

To replace the batteries in this receiver:

Remove the back.

To the left, looking into the rear of the cabinet is the "A" or flashlight battery container. To the right is the "B" or 67½ volt battery.

To replace the "A" batteries, pull the old batteries out of the container. Replace with fresh batteries, making sure the batteries are inserted according to the diagram on the inside of the container.

To replace the "B" battery, disconnect the snap fastener connectors. Replace with a fresh battery and snap the connectors into place. Replace the battery in the cabinet as shown in Fig. No. 1, making sure that the connector end faces the right side of the cabinet.

After the batteries have been installed, replace the back, making sure that the two washers in the bottom of the back fit into the slot near the bottom edge of the cabinet.

STATION SELECTOR: The right hand knob is the station selector or tuning control. Rotate this knob to the right or left to select your desired station. By mentally adding a zero to the figures on the dial the result will be read directly in kilocycles i.e., 140 plus 0 equals 1400 KC or 60 plus 0 equals 600 KC.

Rotate the tuning knob until the proper station has been selected, then adjust the volume control to the desired level.

ANTENNA: This receiver is equipped with a sensitive loop antenna and requires no external antenna wire. However, due to the directional qualities of the loop some stations may appear to be weak in reception. This condition may be remedied by rotating or changing the position of the receiver.

CAUTION: If the batteries in the receiver wear out from use and the receiver refuses to operate make sure that the volume control is turned all the way to the left in "OFF" position, until the batteries can be replaced. If the switch is left in the "ON" position this will cause the battery cells to burst and they will leak into the receiver which may ruin the component parts.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through the .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the trimmers of the first and second I. F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator leads from the gang condenser. Loosely couple the generator to the receiver loop by using a complete turn of wire. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer until a maximum signal is noted on the output meter. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

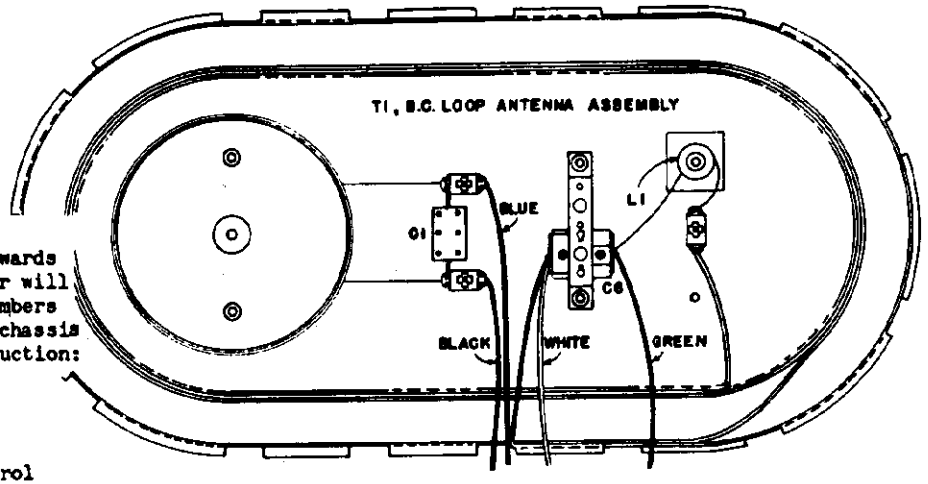
Voltage readings are for schematic diagram in this bulletin. Allow 10% ± on all measurements

All DC voltages made with 1000 ohms per volt voltmeter

Voltages are DC unless otherwise specified.

LOOP WIRING DIAGRAM



These changes are incorporated in chassis bearing serial numbers upwards of No. 24000. A limited number of chassis beyond this serial number will not have these changes, and similarly, a few chassis with serial numbers somewhat under 24000 will have had the changes. Inspection of the chassis will readily determine whether these changes have been made in production:
These changes are shown in dotted lines on the schematic

1. The volume control circuit has been altered to:

   a) Delete resistor R-11.
   b) Remove capacitor C-33 (.02 mfd. 200 volts) from volume control grid lead and substitute with .02 mfd. 400 volt or 600 volt capacitor to be connected in switch lead of volume control. Connect ground (outside foil) to switch as shown.
   c) Add resistor R-18 (470,000 ohms, 1/2 watt) as in diagram.

2. Substitute capacitor C-39 which couples the plate of 1st audio 6SJ7 tube to the grid of output 6V6GT tube with capacitor having 600 volt rating (no change in the capacity of .02 mfd.) and change polarity so that outside foil connects to plate, as shown in diagram.

NOTE:

These changes have been found to result in generally improved performance characteristics. In case of excessive hum or microphonism, it is recommended that: 1) the condition of all tubes be checked by substitution, 2) the correct polarity of by-pass capacitors be ascertained, 3) the filter capacitor be checked.

OPERATION

Insert the power cord plug into the power receptacle. To turn the receiver on, turn the lower knob to the right until a click is heard. In about 30 seconds the set will be in operating condition.

The tuning range of this receiver is 540 to 1600 kilocycles, the standard broadcast band. The dial has the last 0 omitted so that 54 is 540 Kc. and 160 is 1600 Kc.

Rotate the tuning knob (upper knob) until the desired station has the deepest tone, and the background noise is at a minimum. Adjust the volume control (lower knob) for the desired volume. Do not reduce the volume by tuning the receiver off the station.

To turn the receiver off, turn the lower knob to the left until a click is heard and the receiver is switched off.

ANTENNA

A 20 foot antenna hank is attached to the receiver. In metropolitan areas it may be necessary to uncoil only a portion of the antenna to obtain satisfactory reception. For maximum pickup uncoil the antenna hank the full length. Do not attach it to a water pipe, radiator, or other grounded object. If you are located some distance from a broadcasting station, or if local noise from electrical equipment is high, reception will be greatly improved by the addition of an outside antenna which may be connected to the end of the hank.

This receiver is designed to operate without a ground connection and no attempt should be made to use one.

ALIGNMENT PROCEDURE

I. F. Alignment

1. Set variable condenser to high frequency end of dial.
2. Connect suitable output meter to voice coil of speaker.
3. Connect signal generator to grid of BE6 through .05 condenser. Connect ground side of generator to B-.
4. Adjust trimmers A and B for maximum output at 455 Kc.
5. Repeat trimmer adjustment for peak sensitivity.

R. F. Alignment

1. Set variable condenser to extreme high frequency end of dial.
2. Connect signal generator to antenna input terminal on antenna coil through 50 mmf. condenser.
3. Set generator to 1720 Kc.
4. Set trimmer C to 1720 Kc.
5. Set generator to 1400 Kc. and tune receiver dial to maximum response.
6. Adjust trimmer D for maximum output at 1400 Kc.
7. Check tracking and make necessary compensations.

R10	RC-12202	" " 22,000 OHM 1/4 WATT
R11	RC-12203	" " 220,000 OHM 1/4 WATT

The tuning range of this receiver is 550 to 1600 kilocycles. The dial has the last 0 omitted so that 55 is 550 Kc. and 160 is 1600 Kc.

ALIGNMENT PROCEDURE

Connect a suitable signal generator to the R.F. section of the tuning condenser. Connect the ground side of the generator to the frame of the condenser. Use a .05 condenser to isolate the generator from the R.F. section.

Connect a suitable output meter to the voice coil leads of the speaker.

With the variable condenser open, apply a 455 Kc. signal. Use the lowest level consistent with good output indication.

Adjust trimmers A, B, C, and D for maximum response, reducing the input signal as required to keep the output meter on scale.

Connect the generator to terminals A & G through a 400 ohm dummy antenna. Apply a 1720 Kc. signal and adjust trimmer E to maximum.

Set the signal generator to 1400 Kc. Tune the receiver dial to maximum response, then adjust trimmer F to maximum response. This completes the alignment.

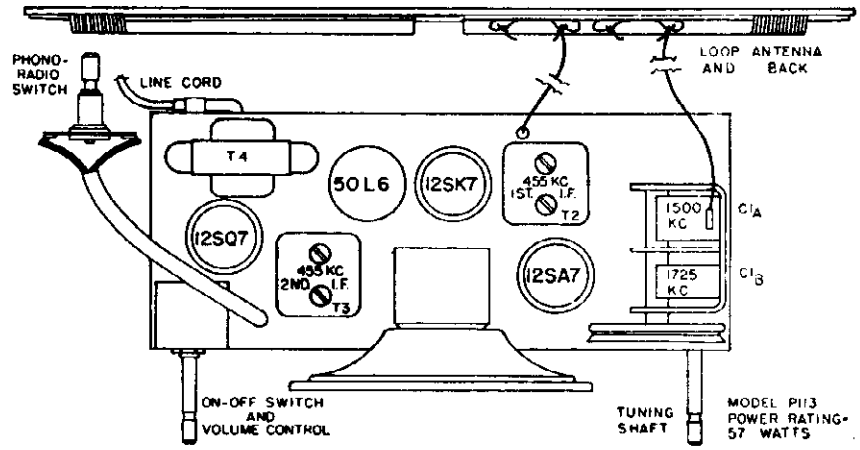
117 volt 60 cycle A.C. power supply.

The tubes used are:—

12SA7—Mixer, Oscillator
12SK7—I. F. Amplifier
12SQ7—Det., AVC, Audio
50L6—Power Output

No rectifier tube is required as a Selenium rectifier is used in its place.

This receiver covers the frequency range from 535 kilocycles to 1725 kilocycles (K.C.).



ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

117 volts 60 cycle AC or 117 volts DC power supply.

The tubes used are:—

1—12SA7	Oscillator Converter	1—12SQ7	AVC Detector and 1st Audio
1—12SK7	I.F. Amplifier		
1—35Z5GT	Power Rectifier	1—50L6GT	Power Output

This receiver covers the frequency range from 540 kilocycles to 1630 kilocycles (KC).

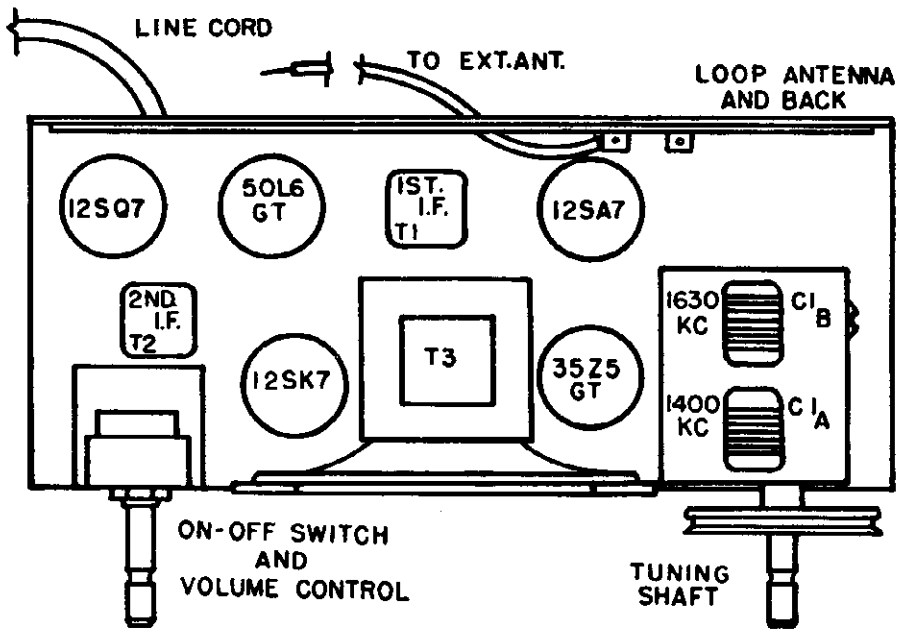
ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milli-watts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.



ALIGNMENT PROCEDURE

(Continued)

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

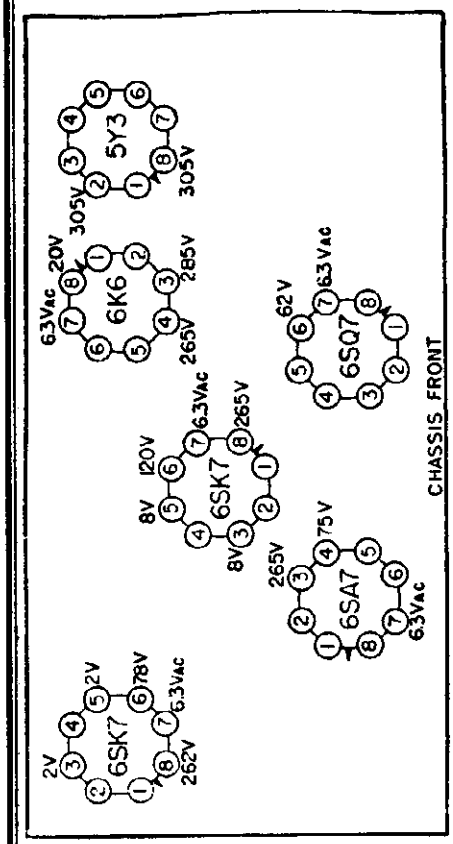
Tune in signal from generator	1400 KC	.00025	*Ant. lead from loop	C1A	Antenna

*Connect ground lead of signal generator to chassis.

SPIEGEL



SOCKET VOLTAGES

All voltages are measured with a 1000 ohm per volt meter on the 150 volt scale, with no signal. To obtain an accurate voltage check the A.C. line voltage must be 117 volts. Where no voltage is shown the voltage is O or cannot be read with this type of volt-meter.

Fig. 2 Chassis, Bottom View

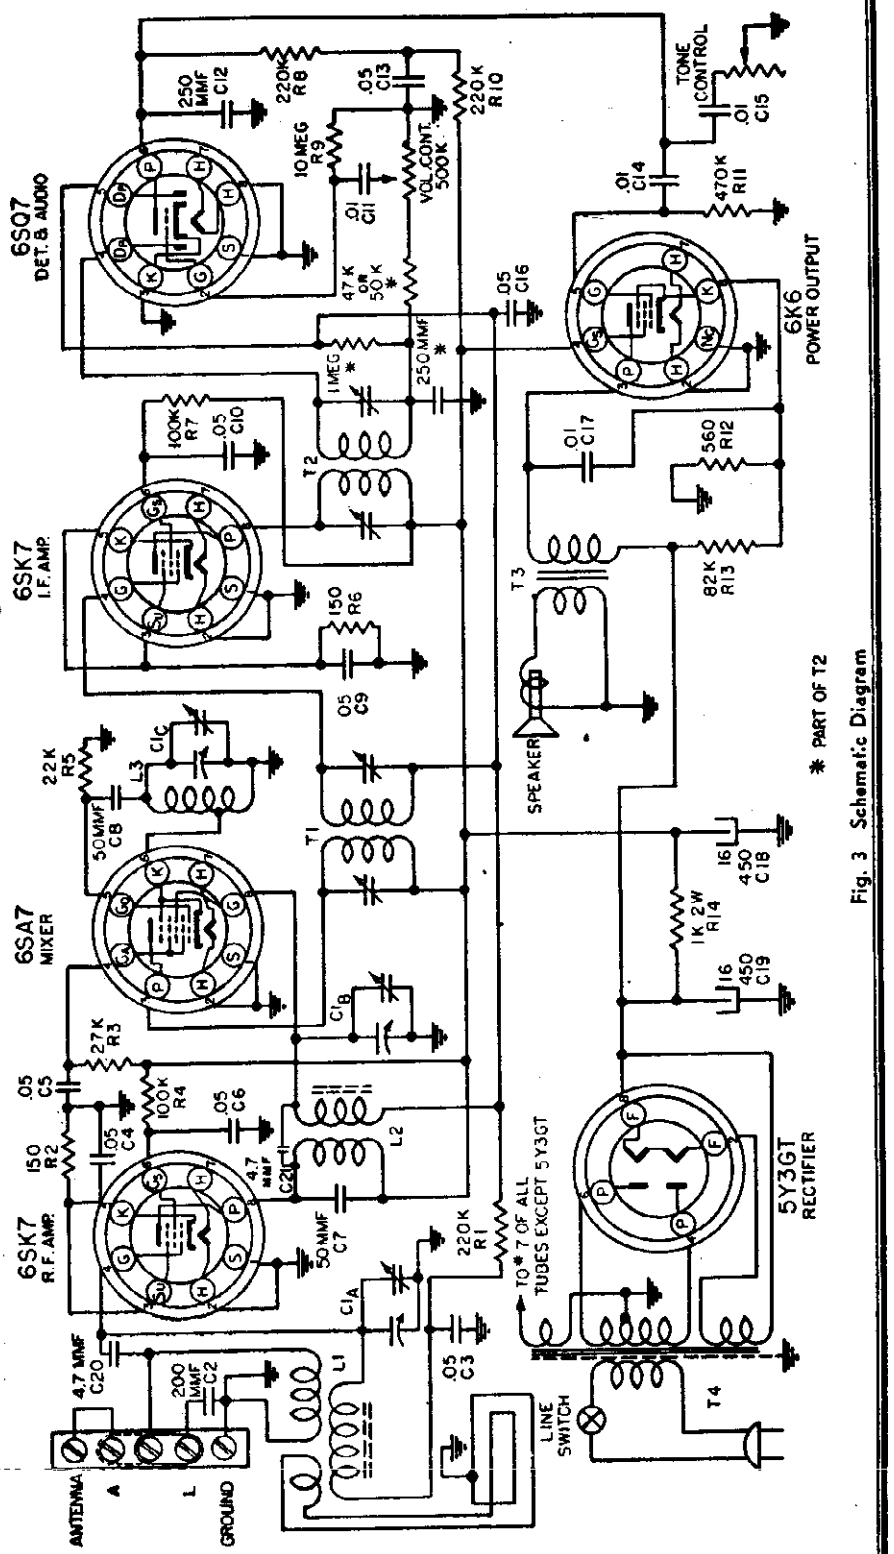


Fig. 3 Schematic Diagram

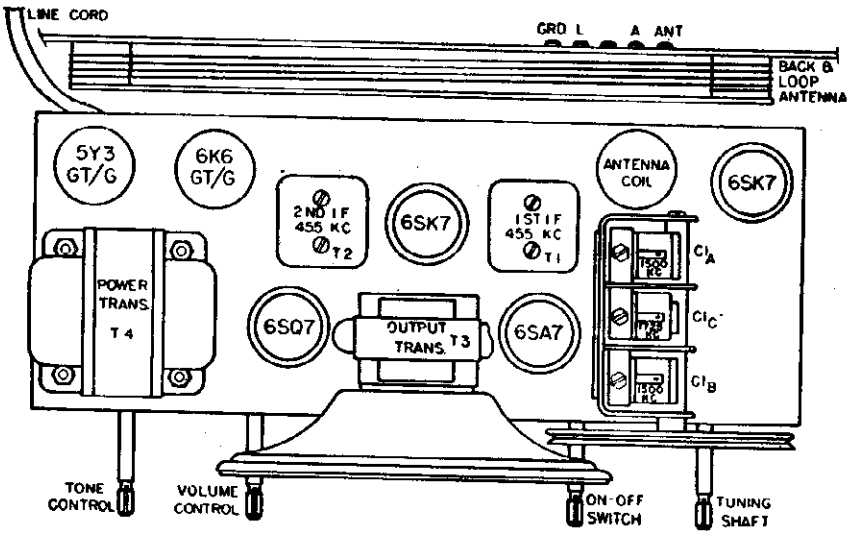

Fig. 1 Chassis, Top View

TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

1—6SK7—R.F. Amplifier
1—6SA7—Mixer—OSC.
1—6SK7—I.F. Amplifier
1—6SQ7—Det. AVC—Audio
1—6K6—Power Output
1—5Y3—Rectifier

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.

Tone Control—Treble: Full Clockwise Rotation.

Connect ground lead of signal generator to radio chassis.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.

Output meter.

Non-metallic screwdriver.

Dummy antennas—.1 mfd., 00025 mfd.

Position of Variable	Generator Frequency	Dummy Ant. mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Minimum Capacity (Fully Opened)	455 K.C.	.1	6SA7 Grid (Stator of C1B	T1 T2	I. F.
Minimum Capacity (Fully Opened)	1725 K.C.	.00025	*Ant. Terminal on Loop	C1C	Osc.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1B	R. F.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1A	Ant.

*Be sure coupling link is in correct position for external antenna operation. See illustration below (Fig. 4).

Repeat the above alignment procedure as a final check.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts using a signal which is modulated 400 c.p.s.

POWER SUPPLY

This receiver is designed to operate from a power source of 117 volts A.C. 60 cycle current. If in doubt about the power rating in your location consult your local power company for this information. Never attempt to operate this radio on any current other than that specified.

DESCRIPTION

Your New Aircastle Radio is a 4-Tube Superhetrodyne receiver designed to cover a frequency range of from 540 kilocycles to 1725 kilocycles (K.C.). The tubes used are—

1A7 GT—Osc. Converter
1N5 GT—I. F. Amplifier
1H5 GT—AVC Det. Audio Amplifier
3Q5 GT—Power Output

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.

Connect ground lead of signal generator to chassis.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:
Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.
Output meter.
Non-metallic screwdriver.
Dummy antennas— .1 mfd., .00025 mfd.

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	1A7 Grid (Stator of C1A)	T2	Output I.F.
Fully open	455 KC	.1	1A7 Grid (Stator of C1A)	T1	Input I.F.
Fully open	1725 KC	.00025	Antenna Lead	C1B	Oscillator
Tune in signal from generator	1400 KC	.00025	Antenna Lead	C1A	Antenna

INSTALLATION

This receiver has been designed to operate on a self-contained battery containing both the "B" battery (90 Volts) and the "A" battery (1½ Volts) Aircastle No. 1491.

After inserting the battery plug of the receiver into the socket on the battery, the battery may be placed inside the cabinet in the space provided.

Anyone of the following batteries may also be used with this receiver: Eveready No. 748, General No. 60DL-11 L, Burgess No. 17G-D60, Ray-O-Vac No. AB 82.

For best results an outside antenna about 75-100 feet long, including the lead-in, should be used. It should be erected as high as possible and as far away from surrounding objects as practical. When the receiver is used close to powerful broadcasting stations it may be desirable to use a shorter antenna. (For most ordinary instalations use Aircastle House Mast Arial No. 1396.)

To obtain the best possible performance a good ground should be used. This can be a water pipe, or a galvanized pipe driven into the ground. It should be connected to the ground lead (black) of the receiver. Connect the antenna wire to the other lead coming from the receiver.

FREQUENCY MODULATION

INSTRUMENTS: Alignment of the FM circuits in this receiver may be accomplished with either a conventional AM type signal generator o FM signal generator. The output indicator should be an oscilloscope or a vacuum tube voltmeter.

Although it is preferable to use an FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventi AM generator and a vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer condenser.

IMPORTANT: If an AM signal generator is used, it should be capable of producing fundamental frequencies of 10.7 and 88 to 108 MC. A using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which dependent upon third, fourth or fifth harmonics for frequencies of 88 to 108 MC will generally produce undesireable spurious beat signals the local oscillator in the receiver and alignment will be exceedingly difficult.

The following procedure is adaptable for use with either an AM or FM generator and oscilloscope or vacuum tube voltmeter merely fo the instructions that are applicable to the instruments that are used.

SIGNAL GENERATOR CONNECTIONS			V-T VOLTMETER OR OSCILLOSCOPE CONNECTIONS

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

DESCRIPTION

Coil—FM oscillator	
Coil—BC oscillator	
Transformer—1st I.F.	
Transformer—2nd I.F.	
Transformer—discriminator	
Coil R.F. choke (FM)	
Transformer—output	

OTHER ELECTRICAL PARTS

Switch band	
Switch—radio, phono and tone	
Lamp dial, 115 volt 10 watt

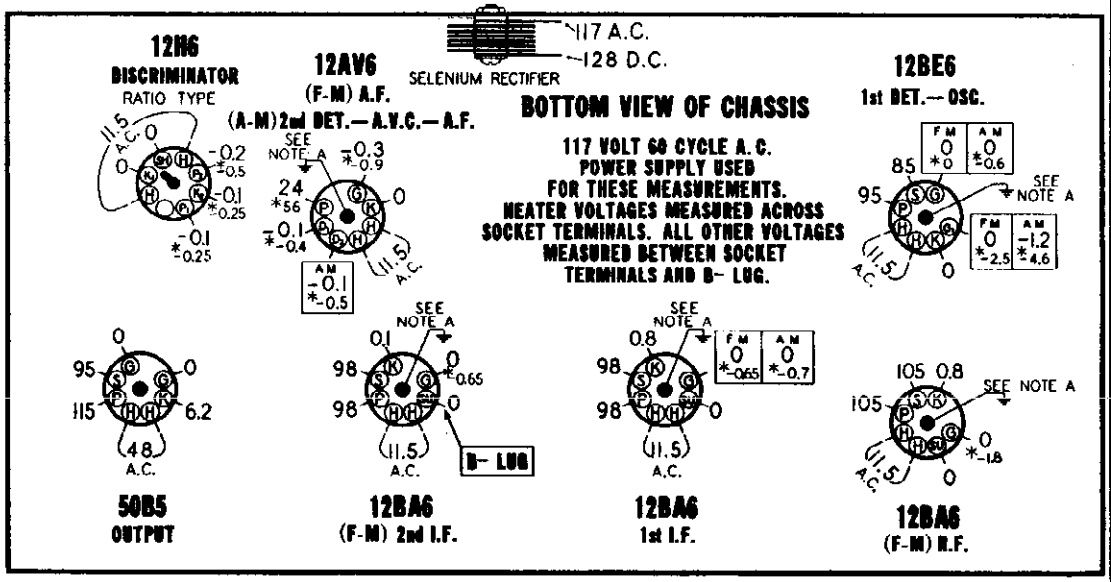
Drawer—record changer compartment (less hardware)	
Handle for drawer	
Knob—tuning	
Knob—"VOLUME"	
Knob—"RADIO-PHONO"	
Knob—"FM-AM"	
Light diffusing strip	
Pointer	
Rail for drawer (supplied in sets)	
Retaining ring for tuning shaft	
Ring for dial cord	
Rubber stop for drawer	
Screw—No. 2 x 3/8"; for mtg. dial scale	
Screw—No. 3 x 7/8"; chassis mtg.	
Screw—No. 4 x 1/2"; for mtg. back	
Shaft—tuning	
Shield—tube; has internal spring	
Shield—tube; has no internal spring	
Shield—light	
Socket—octal base	
Socket—phono motor cable	
Socket—miniature	
Socket—phono pickup cable	
Socket—dial light	
Spring—dial cord tension	
Trim strip for dial	

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

ALL MEASUREMENTS MADE WITH BAND SWITCH IN "FM" POSITION UNLESS OTHERWISE INDICATED
DIAL TUNED TO 108MC. FOR "FM" MEASUREMENTS
DIAL TUNED TO 540KC. FOR "AM" MEASUREMENTS
VOLUME CONTROL SET TO MINIMUM WITH NO SIGNAL
"PHONO-RADIO" AND TONE SWITCH SET "RADIO-BASS" POSITION



REAR OF CHASSIS

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

— "FM" — ALIGNMENT PROCEDURE

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in the following chart (AM alignment procedure is given on page 7).
2. During alignment of this receiver, it will be necessary to set the dial pointer to 98 MC. In order to avoid replacing the chassis in the cabinet, it will be found convenient to mark this frequency point on the dial background before starting the alignment.
3. Do not attempt to reposition pointer by releasing it from clip on dial cord as this is done only during AM alignment.
4. Disconnect leads from built-in FM antenna (do not disturb connections to built-in AM loop antenna); also disconnect phono-plugs and speaker.
5. Remove chassis and AM loop antenna from cabinet. Reconnect speaker.
6. Set "PHONO-RADIO" and Tone switch to "Radio-Bass" position (extreme counter-clockwise).
7. Set the receiver volume control to the maximum volume position.
8. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
9. Alignment of receiver circuits may now be accomplished by using the procedure in the chart below.

RECEIVER			TYPE OF ADJUSTMENT AND OUTPUT INDICATION	
DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	ADJUSTMENT AND OUTPUT INDICATION WHEN USING A V-T VOLTMETER	ADJUSTMENT AND OUTPUT INDICATION WHEN USING AN OSCILLOSCOPE
Any position where it does not affect the signal.	8	Discriminator Primary	Set meter to a low D.C. voltage range and adjust trimmer ⌭8 for maximum meter reading. (This voltage will be negative.)	Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope. Then adjust setting of trimmer ⌭9, before attempting to adjust trimmer ⌭8, until a pattern similar to the following appears on the screen. Should the pattern fail to appear on screen or be of insufficient amplitude, adjust trimmers ⌭10, 11, 12 and 13 for maximum sound output from speaker. Then readjust trimmer ⌭9 for approximately correct pattern and trimmer ⌭8 for maximum amplitude and steepness of that portion of the curve between "A" and "C". If pattern does not remain stationary operate sweep frequency control on scope and also "sync" control until desired result is obtained.  This double "S" curve pattern results when 'scope uses properly phased "Sawtooth" horizontal deflection voltage whose frequency is twice the modulation frequency of signal generator. This single "S" curve pattern results when 'scope uses properly phased "sine wave" horizontal deflection voltage.
Same as above	9	Discriminator Secondary Use an insulated phasing tool to adjust this trimmer.	Set meter for operation on its lowest D.C. voltage range. Note that as trimmer ⌭9 is rotated a point will be found where voltmeter will swing rather sharply from a positive to a negative reading or vice versa. Correct setting of trimmer ⌭9 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable care must be exercised to set the trimmer for a zero meter indication.	With the 'scope set up as described above, adjust trimmer ⌭9 until the cross-over point "B" is centrally located in both the horizontal and vertical directions; in addition, the portion of the curve between "A" and "C" should be as linear (straight) as possible.
uum tube voltmeter or oscilloscope. Then disconnect and remove the two 68,000 ohm resistors that were used for the vacuum tube voltmeter connection in the 2nd step.				
Same as above	10 and 11	2nd I.F.	Adjust trimmers ⌭10 and ⌭11 for maximum meter reading.	With 'scope set up as described above, adjust trimmers ⌭10 and ⌭11 for maximum amplitude and steepness of that portion of the pattern between "A" and "C".
Same as above	12 and 13	1st I.F.	Adjust trimmers ⌭12 and ⌭13 for maximum meter reading.	Adjust trimmers ⌭12 and ⌭13 for maximum amplitude and steepness of pattern as described above. If the enlarged pattern now indicates a lack of symmetry, readjust trimmer ⌭9 for correct cross-over point.
98 MC	14	Oscillator Trimmer	Set trimmer ⌭14 to receive 98 MC. signal as indicated by maximum meter reading.	Adjust trimmer ⌭14 to obtain the symmetrical pattern shown above. Correct setting of trimmer ⌭14 is obtained when cross-over point in pattern is centrally located.
98 MC	15	R.F. Trimmer	Adjust trimmer ⌭15 for maximum meter reading.	Adjust trimmer ⌭15 for maximum amplitude of pattern.
	12 and 13	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.	Recheck adjustment of these trimmers for maximum amplitude and symmetry of pattern.
98 MC	16	Antenna Trimmer	Adjust trimmer ⌭16 for maximum meter reading.	Adjust trimmer ⌭16 for maximum amplitude of pattern.

CIRCUIT DESCRIPTION

This receiver operates on 60 cycle Alternating Current (A.C.) at 105 to 125 volts. Rectified B+ voltage is obtained by using a miniature selenium type rectifier which is noted for reliability and long life.

The built-in antenna used for AM reception is a high impedance loop that is mounted at the rear of the chassis. Two 18" lengths of wire, arranged to form a dipole, serve as the built-in FM antenna.

Tuning of the radio frequency circuits of the receiver is accomplished by a 5 section gang condenser. Two sections are used to tune the AM antenna and oscillator circuits, and three sections are used to tune the FM antenna, R.F., and oscillator circuits.

An R.F. amplifier stage is utilized to give maximum sensitivity and selectivity as well as high image rejection on FM reception. Although this stage is switched out of the circuit on AM reception, overall receiver sensitivity is adequate for highly satisfactory reception where station signals are of moderate strength.

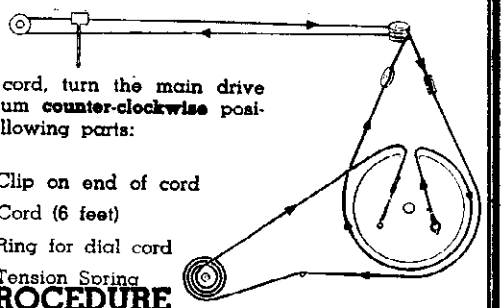
Both transformer coupled I.F. stages are used for FM and one stage is used for AM. The first and second I.F. transformers have two sets of windings; one set is tuned to 455 KC for AM operation and the other is tuned to 10.7 MC for FM operation. Switching of the windings, to alleviate undesired beat frequencies, is necessary only in the first I.F. transformer.

Detection of amplitude modulated 455 KC signals is accomplished by the 12AV6 diode rectification circuit.

Frequency modulation detection is accomplished by an entirely new circuit that is known as the "RATIO DISCRIMINATOR." This FM detector circuit has the unusual ability to reject noise or other brief variations in amplitude of the signal. The relative insensitivity of the Ratio Discriminator to signal amplitude variation makes it possible to eliminate the use of a "limiter" stage that usually precedes the discriminator in other types of FM detector systems. It will therefore be noted that this receiver utilizes a normal I.F. amplifier stage instead of a low gain limiter stage preceding the FM discriminator.

Audio frequency output from both AM and FM detectors is amplified through the triode section of the 12AV6. The audio power amplifier stage incorporates a 50B5 tube which is coupled to a permanent magnet dynamic speaker. A special inverse feedback arrangement is used which reduces distortion and contributes to exceptionally good tone quality.

DIAL AND POINTER DRIVE CORD ARRANGEMENT



To string dial cord, turn the main drive drum to maximum **counter-clockwise** position and use following parts:

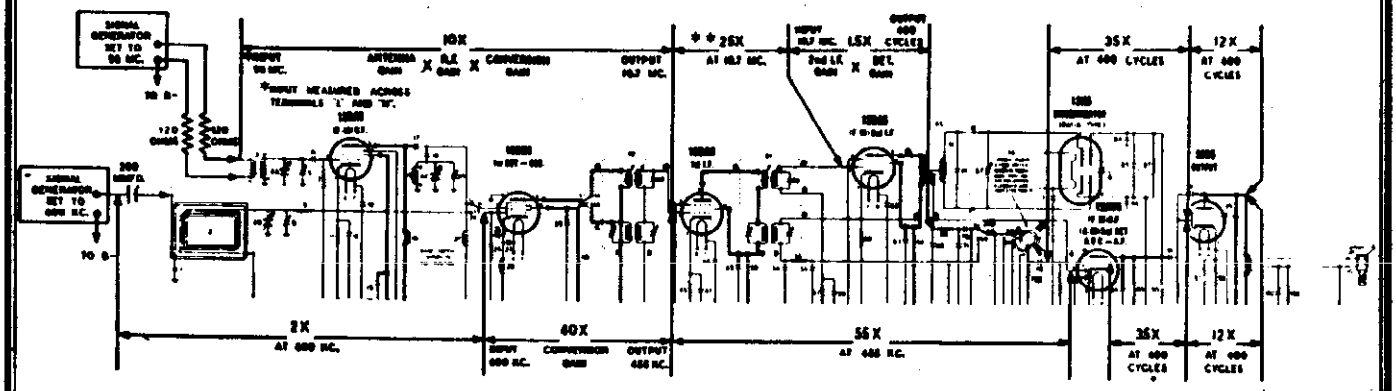
114955—Clip on end of cord
117057—Cord (6 feet)
119087—Ring for dial cord
161384—Tension Spring

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver should be measured with an A. C. Vacuum Tube Voltmeter of the high frequency type (uniform response up to 100 MC). A conventional "AM" type signal generator may be used but it must be capable of producing **fundamental** frequencies of 600 KC. and 98 MC—**avoid using a generator that produces the 98 MC. signal by means of harmonics.**

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. and then carefully tune radio receiver to this signal by using a D. C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin #3 of 12H6 tube and B—. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of 1.5 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 1.5 volt battery to A.V.C. at terminal 7 of the 1st I.F. transformer and connect the positive battery lead to B—.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.



** When measuring the gain of this stage with a vacuum tube voltmeter the input signal level for minimum meter indication may cause overloading. Under those conditions the measured gain will be found to be approximately 14X.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

MODELS B72CR1, 9038B STEWART-WARNER CORP.

BROADCAST BAND — "AM" — ALIGNMENT PROCEDURE

1. With the gang fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
2. During the alignment of this receiver, it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., and 600 Kc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the dial background before starting the alignment.
3. Disconnect leads from built-in FM antenna (do not disturb connections to built-in AM loop antenna); also disconnect phono plugs and speaker.
4. Remove chassis and AM loop antenna from cabinet. Place loop antenna in same position with respect to the chassis as is maintained when both units are mounted in the cabinet. Reconnect speaker.
5. Connect an output meter across speaker voice coil or from plate of the 50B5 tube to B through a 0.1 Mfd. condenser (see voltage chart for convenient B— connection).
6. Connect ground lead of signal generator to B— lug.
   CAUTION: If your signal generator is designed with an AC-DC type power supply, connect ground lead of signal generator to B— lug through a .25 Mfd. condenser.
7. Set "PHONO-RADIO" and Tone switch to "Radio-Bass" position (extreme counter-clockwise).
8. Set volume control to the maximum volume position and use a weak signal from the signal generator.
9. If alignment of both AM and FM channels is required, it is necessary to align the AM channel first; then align the FM channel as instructed in the preceding section.

65	117637	Coil—oscillator
66	117638	Transformer—2nd I. F.

MODELS R-3271,R-3271C STEWART-WARNER CORP.

ALIGNMENT PROCEDURE

1. Remove the top cover and connect output meter. If the meter has a 2 volt scale or less, connect from chassis to the lug with the white wire on the back of the speaker socket. If a less sensitive meter is used, it should be connected in series with a .1 mfd. condenser across the plates of the 6V6GT output tubes.

2. The volume control should be turned to maximum and the bottom of the receiver must be in place during alignment.

3. DIAL CALIBRATION: Before connecting the tuning cable, close the gang condenser (fully meshed). Turn the tuning knob on the control head clockwise until you reach appreciable resistance, then turn the knob counter-clockwise one whole turn. Now connect the tuning control cable as well as all other cables to the chassis and place the control head in a position where it will not be necessary to move it until the alignment procedure is completed. Turn the tuning knob clockwise as far as possible. At this time the last dial division below 55 should be in line with the center of the tuning shaft. If it is not, the dial may easily be moved to the correct position. IMPORTANT. Do not move the control head or radio again until the alignment is complete as this has a tendency to shift the dial position with respect to the tuning condenser position and the setting of the dial will no longer be correct.

4. The station selector push button should be pushed until a position is reached where the set can be tuned manually with the tuning knob.

5. Remove the small chrome button on side of receiver case and turn the antenna switch so that the slot points toward the WHITE dot on the receiver case. This is the position for the cowl type antenna.

Dummy Ant. in Series With Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. CONDENSER	Control Grid of 6A8 Tube (do not remove grid cap)	455 KC	Any Point Where It Does Not Affect Signal	1	2nd I.F.	Adjust for maximum output, then repeat.
				2-3	1st I.F.	
*60 MMFD. MICA CONDENSER	Clip to Lug on Back of Antenna Socket	1400 KC	Exactly 1400 KC	4	Oscillator Shunt	Adjust for maximum output.
				5	Antenna Shunt	

After the set has been installed, the antenna switch under the small chrome button should be turned so that the slot points toward the red dot if an under car antenna is used, or to the white dot for a cowl antenna. Then tune in a weak signal at about 1360 to 1450 KC. and adjust the antenna shunt condenser, No. 5 (under the large chrome button) until maximum volume is obtained.

*If you do not have a 60 mmfd. mica condenser available, use a 250 mmfd. and turn antenna switch described in No. 5 to the red dot.

PARTS LIST

Stewart-Warner Part Number — *Description*

IGNITION NOISE SUPPRESSION PARTS

117251—Distributor Suppressor (screw type) 5000 ohms
117301—Condenser—1 mfd. 200 volt (generator)
117302—Condenser—.5 mfd. 200 volt (ignition)

CONTROL HEAD PARTS

117462—"A" cable & socket (from control head to set; 16 inch)
117494—Ammeter cable with bayonet tip
117496—Ammeter cable with fuse housing
117493—Cable for tone control
111658—Clip—for dial drum retainer
114851—Clip—hairpin type; on control shafts
117451—Clutch spring—for tuning dial drum
116948—Cord—dial drive (supplied in 6 ft. lengths)
117486—Dial drive drum (less scale)
117499—Dial lamp 6 to 8 volt (Mazda 55)
117503—Dial scale & disc assembly (less drive drum)
117468—Flexible drive shaft & housing (tuning)
117473—Flexible drive shaft & housing (volume)
83319—Fuse insulator tube
117256—Gland nut
117257—Gland nut cover
117255—Knob—metal for tuning or volume
117453—Light shield- felt pad on push button shaft
117465—Pawl assembly for station indicator dial drum
117492—Pilot light socket assembly
117480—Push button control cable housing
117482—Push button control cable with tip

PARTS LIST (Continued)

Stewart-Warner Part Number — *Description*

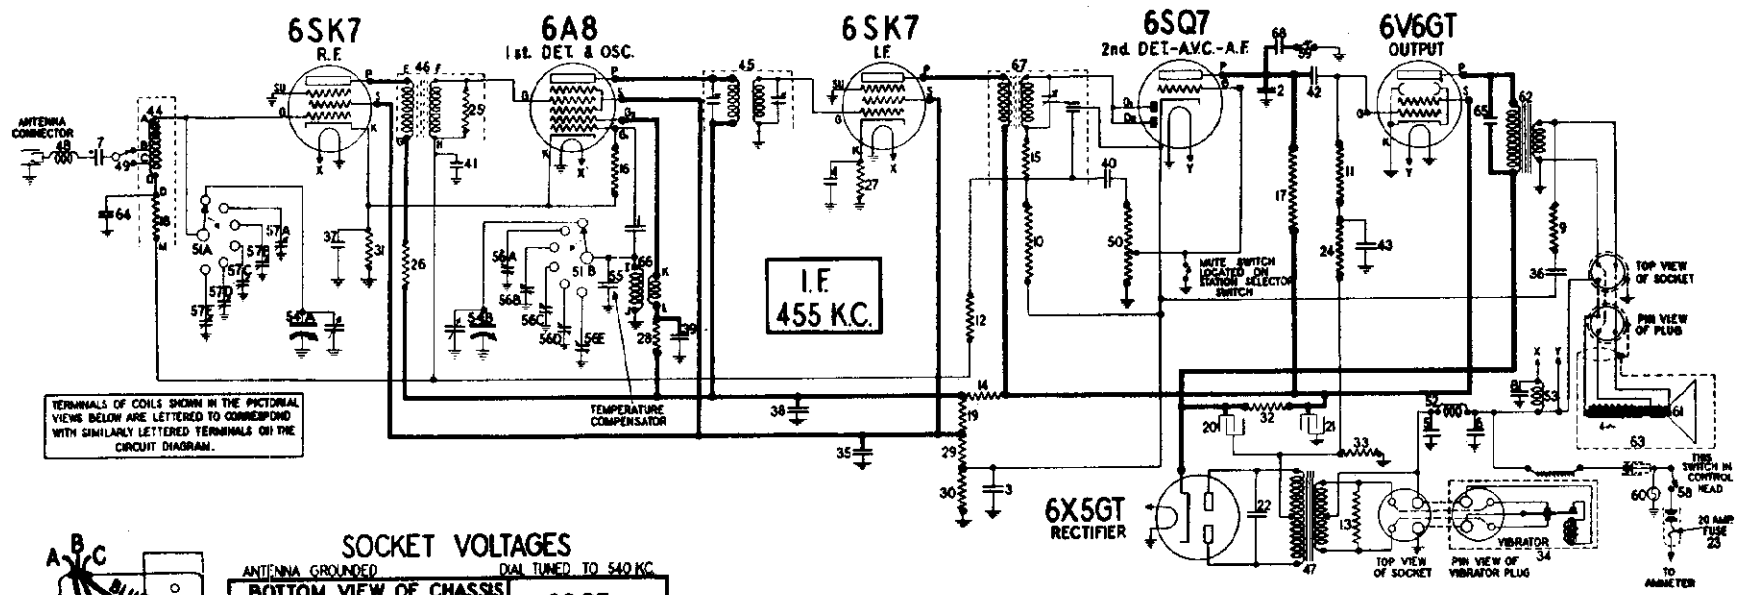
117397—Push button (station selector)
117416—Push button (tone)
85827—Set screw—8-32 square head
117258—Spacer—on control shaft
113177—Spring—dial cord tension
117497—Spring—tension
117498—Spring—tension
117464—Station indicator dial assembly
117402—Switch—"on"-"off"
117417—Trip—for "on"-"off" switch
111456—Washer—spring washer

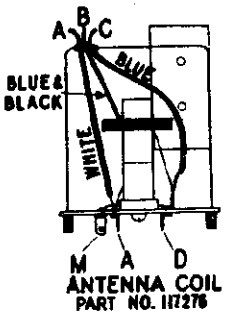
CASE SECTIONS AND SPEAKER SHELL

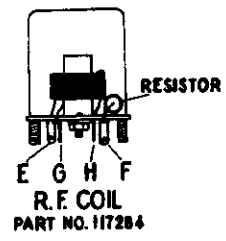
110236—Anti Rattle Clips for case
117320—Bottom cover for case
117330—Case for speaker (less back cover)
117342—Cover for back of speaker
117344—Grill cloth for speaker
117329—Grill screen for speaker shell
117435 Plug button (brown finish)
110413—Plug button—chrome plate
117436—Plug button (nickel plated)
117438—Receiver case—wrap around section only
117443—Top cover & monogram

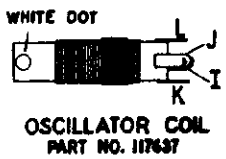
MISCELLANEOUS PARTS

117377—"A" cable (bayonet tip)
117434—Antenna lead & socket
117548—Brass & fibre gear assembly—condenser drive
117328—Cable for speaker
117254—Call letter tabs
114253—Clamp—for vibrator
112745—Clip—coil mounting
110189—Coupling for drive shaft
79106—Lockwasher for mounting set to bulkhead
79105—Lockwasher for mounting speaker
12387—Nut—5/16 Hex. for mtg. speaker
79107—Nut for mounting set to bulkhead
64459—Nut for retaining "A" cable to ammeter terminal
85040—Screw—No. 6 Hex. Hd.
117347—Socket—for speaker plug
116690—Socket (octal base) (small)
117253—Stud—for speaker mounting
117252—"T" bolt—for mounting case
110237 Tube shield cap (for metal tube)
88262—Vibrator socket (4 prong)
45233—Washer for mounting speaker
77477—Washer for mounting set to bulkhead
117549—Worm gear with set screw—condenser drive



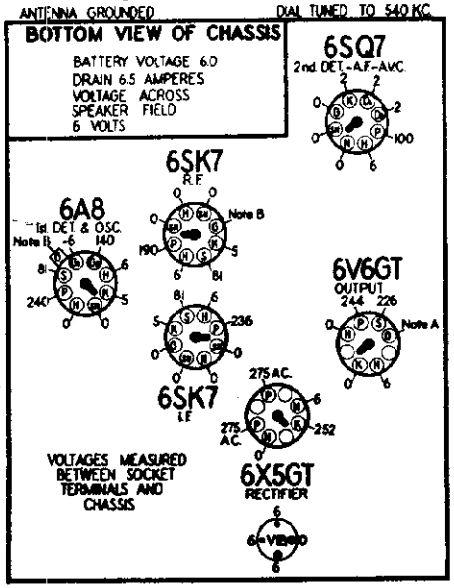






SOCKET VOLTAGES

ANTENNA GROUNDED — DIAL TUNED TO 540 KC.



Use a voltmeter of at least 1000 ohms per volt.

NOTE A—The voltage appearing at this point is measured across resistor number 33 and is -14.5 volts.

NOTE B—Due to the high resistance of the A.V.C. circuit, accurate voltage measurements cannot be made at these points.

ELECTRICAL PARTS LIST

Diagram No.	Stewart Warner Part No.	Description
1-2	83539	Condenser—mica 260 mmfd.

41	116819	Condenser—.05 mfd. 600 volt.
42-43	116893	Condenser—.02 mfd. 600 volt.
44	117276	Coil—antenna (in shield)
45	117281	Transformer—1st I.F.
46	117284	Transformer—R.F.
47	117297	Transformer—power
48	117308	Antenna motor noise choke coil.
49	117313	Switch—antenna
50	117321	Volume control—1 meg. without switch.
51A-51B	117331	Switch for station selector.
52-53	117332	Choke coil in "A" line.
54A-54B	117338	Condenser—variable gang
55	117341	Condenser—temperature compensating
56A to 56E	117345	Push button trimmer gang oscillator section
57A to 57E	117346	Push button trimmer gang antenna section.
58	117402	Switch—"ON-OFF"
59	117491	Tone switch & cover assembly.
60	117499	Dial lamp 6-8 volt (Mazda 55).
61	U-117509	Cone & voice coil assembly for U-115067 speaker
62	117565	Output transformer
63	U-115067	Speaker—dynamic 6 inch.
64-65	117571	Condenser—.008 mfd. 600 volt.
66	117637	Coil—oscillator
67	117723	Transformer—2nd I.F.
68	117725	Condenser—.015 mfd. 600 volt.

ALIGNMENT PROCEDURE

1. Remove the top cover and connect output meter. If the meter has a 2 volt scale or less, connect from chassis to the lug with the white wire on the back of the speaker socket. If a less sensitive meter is used, it should be connected in series with a .1 mfd. condenser from the 6V6GT plate to chassis.
2. The volume control should be turned to maximum and the bottom of the receiver must be in place during alignment.
3. DIAL CALIBRATION: Before connecting the tuning cable, close the gang condenser (fully meshed). Turn the tuning knob on the control head clockwise until you reach appreciable resistance, then turn the knob counter-clockwise one whole turn. Now connect the tuning control cable as well as all other cables to the chassis and place the control head in a position where it will not be necessary to move it until the alignment procedure is completed. Turn the tuning knob clockwise as far as possible. At this time the last dial division below 55 should be in line with the center of the tuning shaft. If it is not, the dial may easily be moved to the correct position. IMPORTANT. Do not move the control head or radio again until the alignment is complete as this has a tendency to shift the dial position with respect to the tuning condenser position and the setting of the dial will no longer be correct.
4. The station selector push button should be pushed until a position is reached where the set can be tuned manually with the tuning knob.
5. Remove the small chrome button on side of receiver case and turn the antenna switch so that the slot points toward the WHITE dot on the receiver case. This is the position for the cowl type antenna.

Dummy Ant. in Series With Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. CONDENSER	Control grid of 6A8 tube (do not remove grid cap)	455 KC	Any point where it does not affect signal	1	2nd I.F.	Adjust for maximum output, then repeat.
				2-3	1st I.F.	
*60 MMFD. MICA CONDENSER	Clip to lug on back of antenna socket	1400 KC	Exactly 1400 KC	4	Oscillator Shunt	Adjust for maximum output.
				5	Antenna Shunt *	

After the set has been installed, the antenna switch under the small chrome button should be turned so that the slot points toward the red dot if an under car antenna is used or to the white dot for a cowl antenna. Then tune in a weak signal at about 1360 to 1450 KC. and adjust the antenna shunt condenser, No. 5 (under the large chrome button) until maximum volume is obtained.

*If you do not have a 60 mmfd. mica condenser available, use a 250 mmfd. and turn antenna switch described in No. 5 to the red dot.

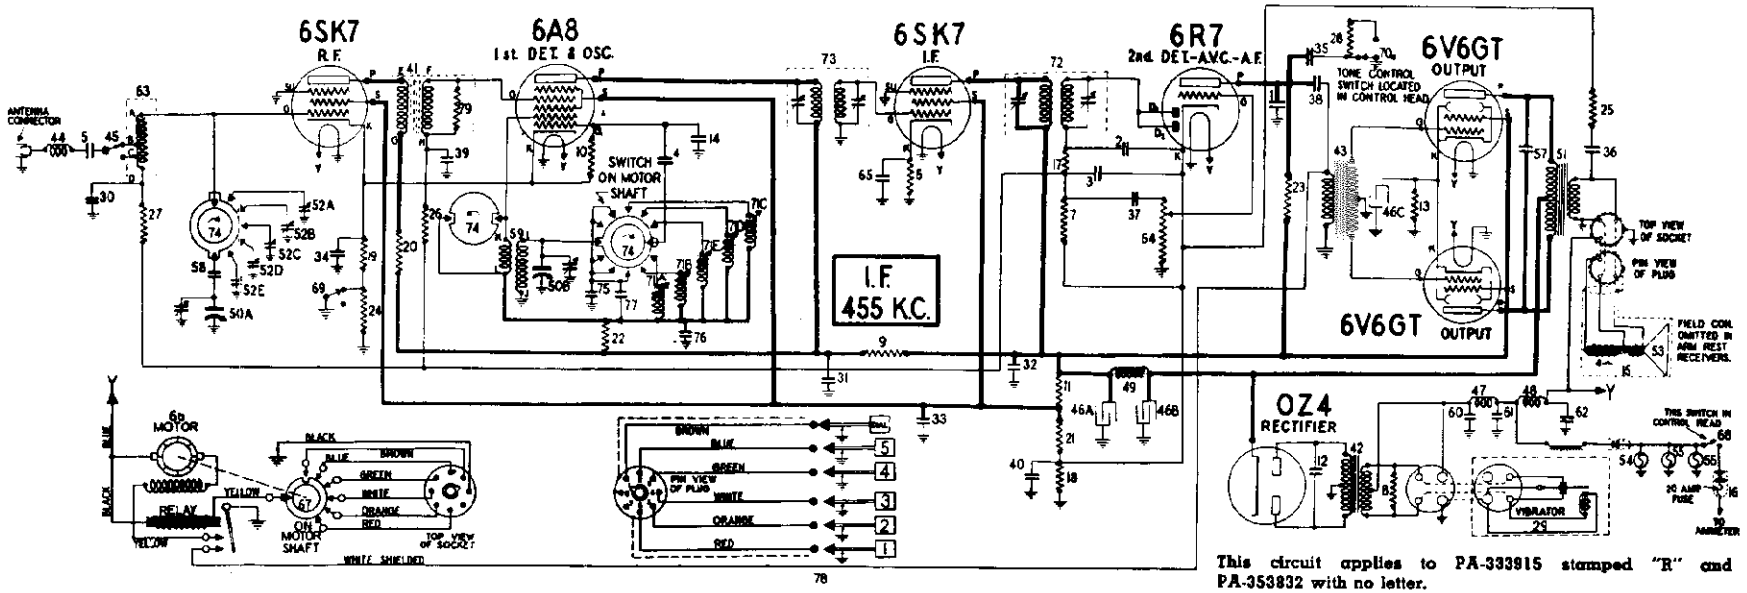
PARTS LIST

Stewart-Warner Part Number	Description
	IGNITION NOISE SUPPRESSION PARTS
117251	Distributor Suppressor (screw type) 5000 ohms
117301	Condenser—1 mfd. 200 volt (generator)
117302	Condenser—.5 mfd. 200 volt (ignition)
	CONTROL HEAD PARTS
117462	"A" cable & socket (from control head to set; 16 inch)
117494	Ammeter cable with bayonet tip
117496	Ammeter cable with fuse housing
111658	Clip—for dial drum retainer
114851	Clip—hairpin type; on control shafts
117451	Clutch spring—for tuning dial drum
116948	Cord—dial drive (supplied in 6 ft. lengths)
117465	Dial drive drum (less scale)
117499	Dial lamp 6 to 8 volt (Mazda 55)
117503	Dial scale & disc assembly (less drive drum)
117468	Flexible drive shaft & housing (tuning)
117473	Flexible drive shaft & housing (volume)
83319	Fuse insulator tube
117256	Gland nut
117257	Gland nut cover
117255	Knob—metal for tuning or volume
117512	Light shield felt pad on push button shaft
117465	Pawl assembly for station indicator dial drum
117492	Pilot light socket assembly
117490	Push button control cable housing
117482	Push button control cable with tip
117397	Push button (station selector)

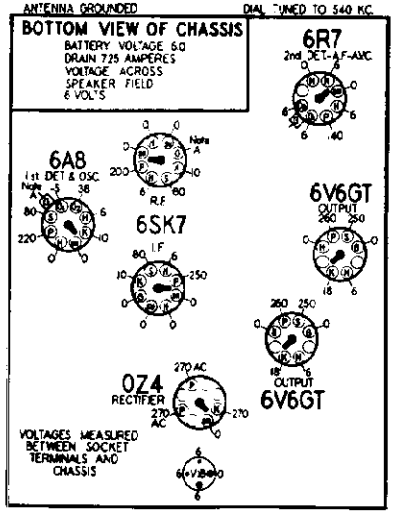
PARTS LIST (Continued)

Stewart-Warner Part Number	Description
85827	Set Screw—8-32 square head
117258	Spacer—on control shaft
113177	Spring—dial cord tension
117497	Spring—tension
117498	Spring—tension
117464	Station indicator dial assembly
117402	Switch "on"-"off"
117417	Trip—for "on"-"off" switch
111456	Washer—spring washer
	CASE SECTIONS AND SPEAKER SHELL
110236	Anti Rattle Clips for case
117542	Back cover for speaker (with dust seal)
117320	Bottom cover for case
117545	Case for speaker (less back cover)
117540	Grill cloth for speaker
117541	Grill screen for speaker shell
117435	Plug button (brown finish)
110413	Plug button—chrome plate
117436	Plug button (nickel plated)
117515	Receiver case—wrap around section only
117444	Top cover & monogram
	MISCELLANEOUS PARTS
117377	"A" cable (bayonet tip)
117434	Antenna lead & socket
117548	Brass & fibre gear assembly—condenser drive
117636	Cable for speaker
117254	Call letter tabs
114253	Clamp—for vibrator
112745	Clip—coil mounting
110189	Coupling for drive shaft
79106	Lockwasher for mounting set to bulkhead
79105	Lockwasher for mounting speaker
12387	Nut—5/16 Hex. for mtg. speaker
79107	Nut for mounting set to bulkhead
64459	Nut for retaining "A" cable to ammeter terminal
85040	Screw—No. 6 Hex. Hd.
117347	Socket—for speaker plug
116690	Socket (octal base) (small)
117538	Stud—for speaker mounting
117252	"T" bolt—for mounting case
110237	Tube shield cap (for metal tube)
88262	Vibrator socket (4 prong)
77477	Washer for mtg. set to bulkhead
117549	Worm Gear with set screw—condenser drive



This circuit applies to PA-333915 stamped "R" and PA-353832 with no letter.

SOCKET VOLTAGES



Use a voltmeter of at least 1000 ohms per volt. **NOTE A:** Due to the high resistance of the A.V.C. circuit, accurate voltage measurements cannot be made at these points. This chart applies to both circuit diagrams.

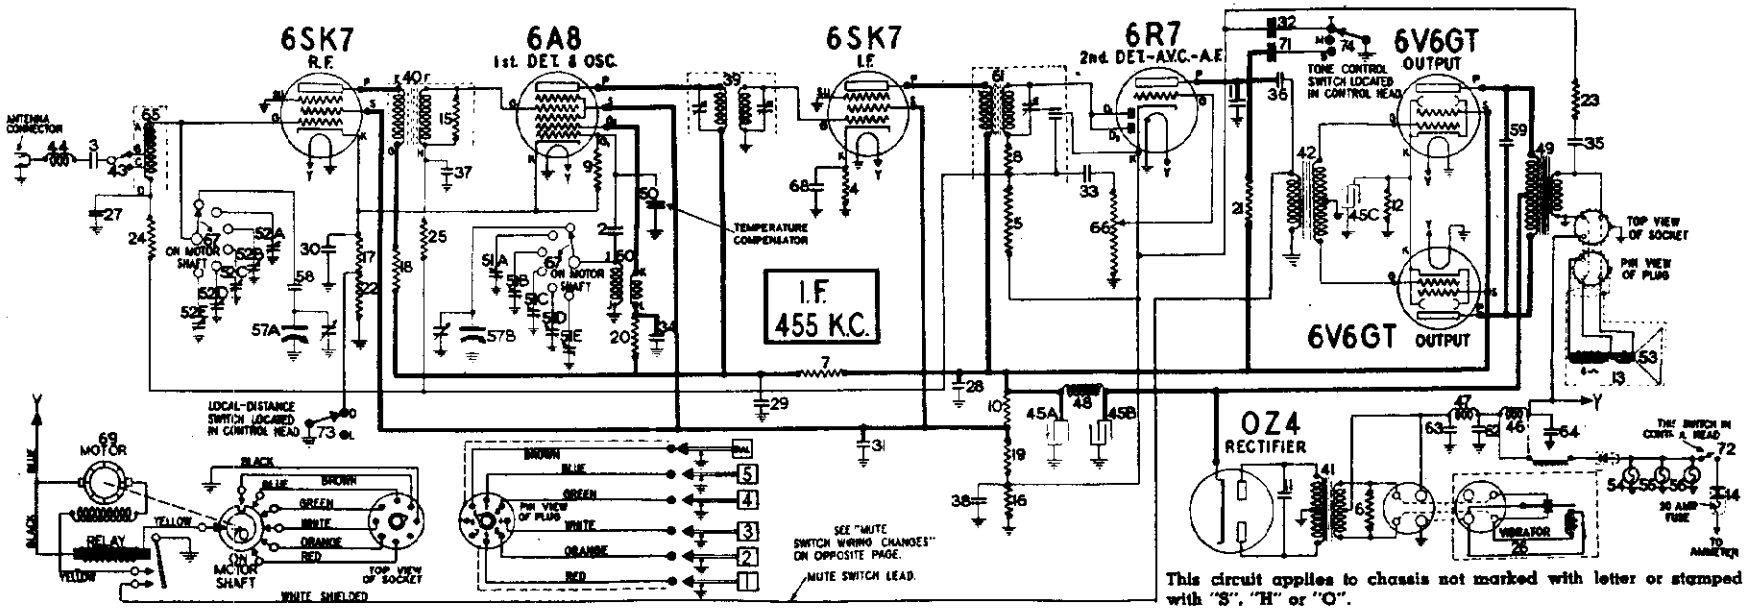
78	118793	Control Head Station Selector Switch (Arm Rest Models Only)
79	116052	Resistor—carbon—33,000 ohms 1/10 watt

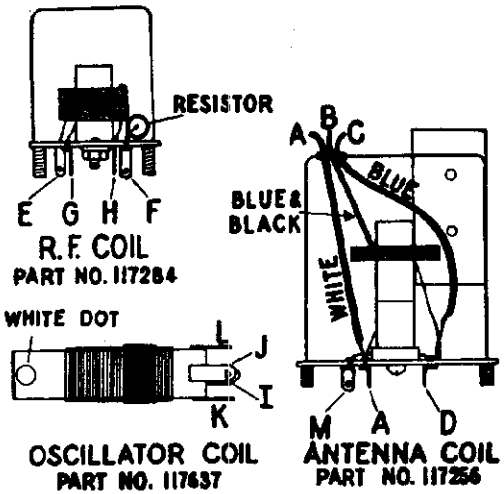
INTERACTION BETWEEN TUNING COILS

When setting up stations on either the inductance-tuned Custom or Arm Rest receivers, the adjustment of an adjacent coil plunger may affect the tuning of a station previously set up. Therefore, after all five stations have been set up, it is advisable to check the setting of all coils. Repeat this adjustment until no further change in tuning is experienced.



This circuit applies to chassis not marked with letter or stamped with "S", "H" or "O".

Terminal letters in illustrations correspond to letters on circuit diagrams.



ELECTRICAL PARTS LIST

Diagram Number	Stewart-Warner Part Number	Description
1	83539	Condenser—mica 260 mmfd.

MUTE SWITCH WIRING CHANGE

In chassis not marked with a change letter on the power transformer housing, the mute switch connects to the center terminal of the volume control and the red wire of the push-pull input transformer connects to B plus.

PACKARD MODELS PA-333915 Early, PA-333915 Late, PA-353832 — STEWART-WARNER CORP. MODELS 3341, 3341-R (Late), 3371

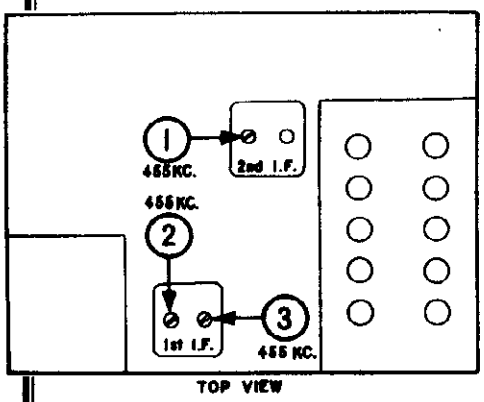
ALIGNMENT PROCEDURE

1. Remove the top cover and connect output meter. If the meter has a 2 volt scale or less, connect from chassis to the lug with the white wire on the back of the speaker socket. If a less sensitive meter is used, it should be connected in series with a .1 mfd. condenser across the plates of the 6V6GT output tubes.
2. The volume control should be turned to maximum and the bottom of the receiver must be in place during alignment.
3. DIAL CALIBRATION: In Custom Models with 6-button control head, hold down "DIAL" button until tuning motor stops running. Now tune in a station whose frequency in kilocycles is known. Hold the tuning control knob and with the eraser on the end of a lead pencil, move the dial until the correct frequency is indicated. In Arm Rest Models push the Automatic Station Selector Button until the word "DIAL" appears in the window of the control head escutcheon. Now tune in a station whose frequency is known. Pull off the tuning knob and loosen the set-screw underneath this knob. Now turn the tuning control until the dial indicates the frequency of the station you have tuned in, then retighten set-screw, and replace knob. IMPORTANT: Do not move the control head again until the alignment is complete as this has a tendency to shift the dial position with respect to the tuning condenser position and the setting of the dial will no longer be correct.
4. Remove the small chrome button on side of receiver case and turn the antenna switch so that the slot points toward the WHITE dot on the receiver case. This is the position for the cowl type antenna.

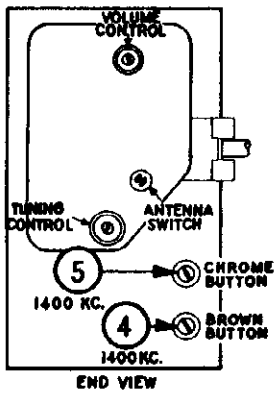
Dummy Ant. in Series With Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. CONDENSER	Control Grid of 6A8 Tube (do not remove grid cap)	455 KC	Any Point Where It Does Not Affect Signal	1-6	2nd I.F.	Adjust for maximum output, then repeat. **NOTE: Trimmer No. 6 is used on late radios only. It is adjacent to No. 1 on 2nd I.F. Transformer.**
				2-3	1st I.F.	
*60 MMFD. MICA CONDENSER	Clip to Lug on Back of Antenna Socket	1400 KC	Exactly 1400 KC	4	Oscillator Shunt	Adjust for maximum output.
				5	Antenna Shunt	

After the set has been installed, the antenna switch under the small chrome button should be turned so that the slot points toward the red dot if an under car antenna is used, or to the white dot for a cowl antenna. Then tune in a weak signal at about 1360 to 1450 KC. and adjust the antenna shunt condenser, No. 5 (under the large chrome button) until maximum volume is obtained.

*If you do not have a 60 mmfd. mica condenser available, use a 250 mmfd. and turn antenna switch described in No. 4 to the red dot.



TOP VIEW



END VIEW

MOTOR SHAFT BINDING

If the shafts of the tuning motor and the station selector switch are not in perfect alignment, binding of the shafts will result. Such binding may cause the motor to stall or else to run continuously, without changing stations.

If such binding occurs, it will be necessary to realign the motor and station selector switch shafts. Loosen the four screws holding the motor to the case. Then set the radio receiver on end so that the motor housing is on top. Remove the top cover and observe the shaft alignment between the end of the case and the R. F. housing while the motor is running. Now shift the position of the motor until the shafts line up and turn freely, then retighten the motor mounting screws.

If the shafts cannot be brought into alignment by shifting only the motor, it will be necessary to shift the position of the receiver chassis with respect to the case. Loosen the four screws mounting the chassis to the case and shift the chassis until the shafts can be brought into alignment.

CHIPS IN TUNING MOTOR

If metal chips or filings are present in the motor housing, they will eventually work their way into the drive gears, into the relay or into the air gap between the armature and field poles thus causing the motor to stall or operate erratically. These chips can best be removed by blowing them out with a blast of compressed air, although they can be removed using a small brush or similar device.

TONE CONTROL CIRCUIT CHANGES

The tone control circuit of the early and late Custom receiver differs. The latter circuit reduces high note response somewhat, thus reducing hiss and background noises. If a reduction in high note response is desired in the early sets, merely change condenser No. 35 to .05 mfd. This condenser is the one on the top of the output transformer.

MISCELLANEOUS PARTS LIST

IGNITION NOISE SUPPRESSION PARTS

Stewart-Warner Part Number	Description	List Price
117251	Distributor Suppressor (screw type) 5000 ohms	$0.30
117301	Condenser—1 mfd. 200 volt (generator)	.70
117302	Condenser—.5 mfd. 200 volt (ignition)	.56

CONTROL HEAD PARTS FOR CUSTOM MODELS

(6 button type)

118576	"A" lead with fuse housing
118572	Automatic tuning cable—with plug
118580	Bezel—chrome
118562	Bracket for mounting dial drum
118559	Bushing—dial drum shaft (brass eyelet)
118582	Casting for tuning mechanism
118575	Clamp—cable retaining
118433	Clamp—control mounting
118432	Clip—cable mounting
111658	Clip—for small gear
111160	Collar—drive cable retaining
118553	Control head assembly, complete with gland nuts and knobs
118581	Cover for tuning mechanism
118557	Dial drum
118558	Dial drum shaft—with gear
118571	Dial lamp socket—with lead
118404	Flexible drive shaft and housing (tuning)
118403	Flexible drive shaft and housing (volume)
118449	Gasket—push button ..... Per C
118563	Gear—on dial support brackets
118566	Gear—on tuning shaft
118451	Gland nut
117257	Gland nut cover
117430	Knob—metal—for tuning or volume
118588	Light shield—metal bracket
118589	Metal grounding clips
118554	Push button body
118555	Push button cap—(chrome)
118577	Push button retainer bar
118578	Push button switch (3 section)
118579	Push button switch housing
118561	Retaining clip—for dial drum
118583	Retaining clip (small) in front of gear on tuning shaft
118567	Retaining clip—on tuning and volume shafts (½" O.D.)
79138	Screw—for mounting control head (No. 8-32 x 5/16 R.H.M.S.) ..... Per C
85827	Set Screw—for trip; also control cable retaining
117258	Spacer washers
118560	Spring—on dial drum shaft
118584	Spring—(rectangular) in front of gear on tuning shaft
118568	Spring washer—on tuning shaft (½" O.D.)
118551	Switch—"Local Distance"
118550	Switch—"ON-OFF"
118552	Switch—tone control
118585	Toggle button for tone or local distance switch
118573	Tone control cable—with plug
118569	Trip—for on-off switch—with set screw
118565	Washer—on dial drum shaft (1 inch O.D.)
79146	Washer—under gland nut

CONTROL HEAD PARTS FOR ARM REST MODELS

118895	Cable—Station Selector
118796	Clamp—Cable
118856	Cover—Push Button Switch
118852	Dial Scale
118885	Escutcheon—for control head
118868	Flexible Shaft—tuning
118867	Flexible Shaft—volume
118786	Gear—(1" Diam.)—on station selector switch
118789	Idler gear and bracket assembly
118799	Knob—Push Button

CONTROL HEAD PARTS FOR ARM REST MODELS —(Continued)

Stewart-Warner Part Number	Description
118892	Knob—Tone Control
118798	Knob—Tuning or Volume
118797	Light Shield
118851	Rear Plate and Bushings for Control Head
118859	Screw—Chrome head—for mounting escutcheon
118861	Screw (No. 4-40 x 3/16) Retains 1" gear to station selector switch
118876	Screw No. 6 x ¼" Self-Tapping
88360	Set Screw—No. 8-32 x ⅛"
118853	Shaft and Trip Arm Assembly
118778	Shaft—Tuning

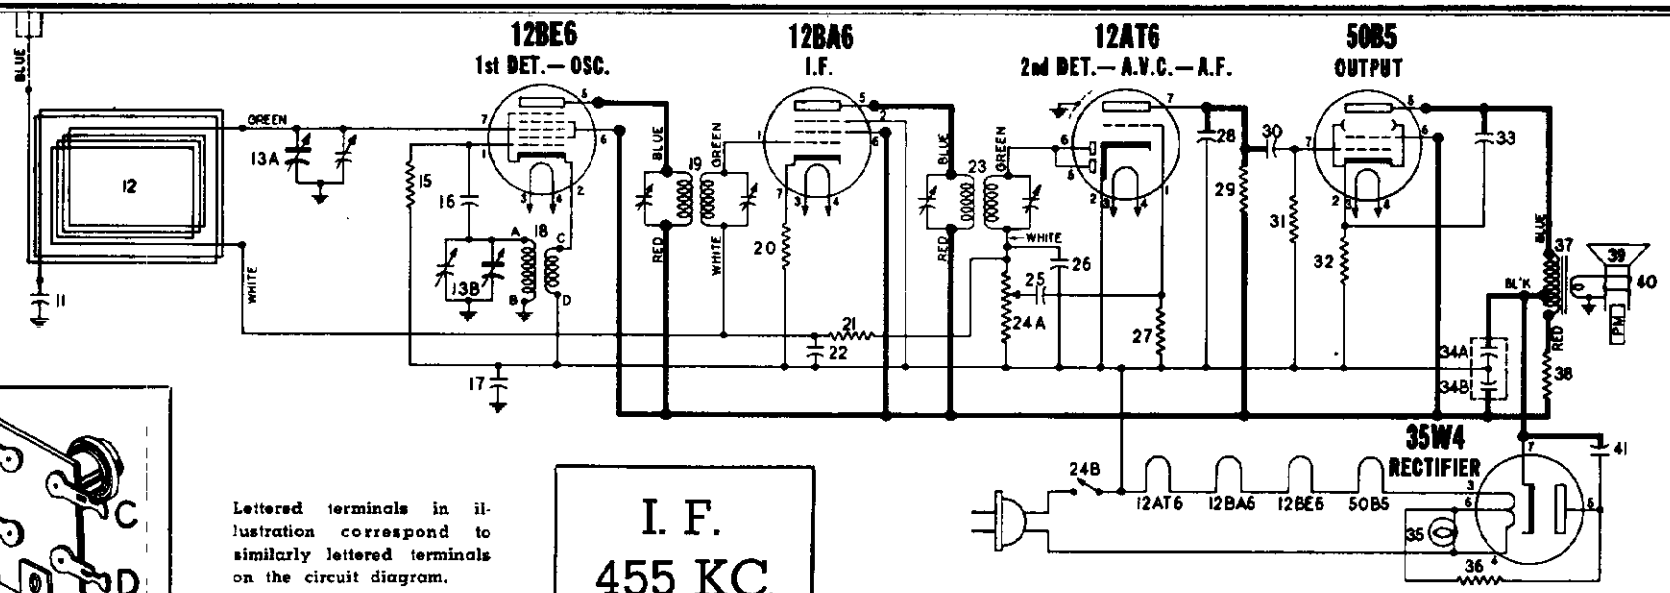
118790	Switch—"On"-"Off"
118894	Switch—Tone Control

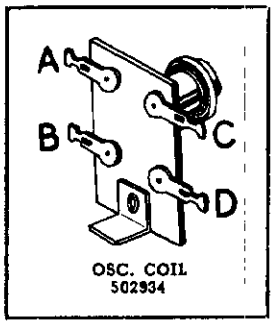
CASE SECTIONS AND SPEAKER PARTS

110236	Anti rattle clips for case
117320	Bottom cover for case
118276	Case cover for motor assembly
117330	Case for speaker (custom)
117342	Back cover for speaker case (custom)
117344	Grille Cloth for speaker (custom)
118884	Grille Ring—Speaker (arm rest)
119091	Grille Screen and Cloth (arm rest)
117329	Grille Screen for Speaker Shell (custom)
117435	Plug button (brown finish)
110413	Plug button—chrome plate
117436	Plug button—nickel plated
118265	Receiver case and motor case assembly less covers
118269	Top cover and monogram

MISCELLANEOUS PARTS

117377	"A" cable (bayonet tip) (custom)
118880	"A" Cable and Fuse Retainer (arm rest)
117434	Antenna lead and socket
118877	Antenna Lead Extension (arm rest)
117548	Brass and Fiber gear assembly—condenser drive
118590	Brush, carbon—for motor
117328	Cable for speaker (24") (custom)
118875	Cable—for speaker (arm rest)
118879	Cable—tone control (arm rest)
118441	Call letter tabs (custom)
118858	Tabs—station call letters (arm rest)
114253	Clamp—for vibrator
118432	Clip—Control Cable Mounting (arm rest)
112745	Clip—coil mounting
110189	Coupling for drive shaft
118470	"Dial" tab (custom)
83721	Grommet—for lead-in (arm rest)
79106	Lockwasher for mounting set to bulkhead
79105	Lockwasher for mounting speaker (custom)
12387	Nut—5/16 Hex. for mounting speaker (custom)
79107	Nut for mounting set to bulkhead
64459	Nut for retaining "A" cable to ammeter terminals
85040	Screw—No. 6 Hex. Hd. ..... Per C
118886	Screw—No. 8 x 1" Self Tapping (for mtg. speaker) (arm rest)
116690	Socket—octal (small)
117347	Socket—for speaker plug
118297	Socket—for tone control plug
118331	Spacer—for mounting motor switch
117253	Studs—for mounting speaker (custom)
117252	"T" bolt—for mounting case (custom)
118899	"T" bolt—for mounting receiver case (arm rest)
110237	Tube shield cap (for metal tube)
77477	Washer for mounting set
118469	Window—for push button (custom)
117549	Worm gear with set screw—condenser drive
88262	Vibrator socket (4 prong)





OSC. COIL
502934

Lettered terminals in illustration correspond to similarly lettered terminals on the circuit diagram.

I. F. 455 KC.

SOCKET VOLTAGES

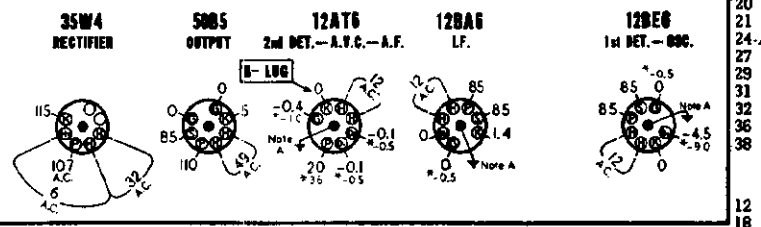
Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC.

BOTTOM VIEW OF CHASSIS

HEATER VOLTAGES MEASURED ACROSS SOCKET TERMINALS. ALL OTHER VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND B- LUG.

117 VOLT 60 CYCLE A.C. POWER SUPPLY USED FOR THESE MEASUREMENTS.



REAR OF CHASSIS

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

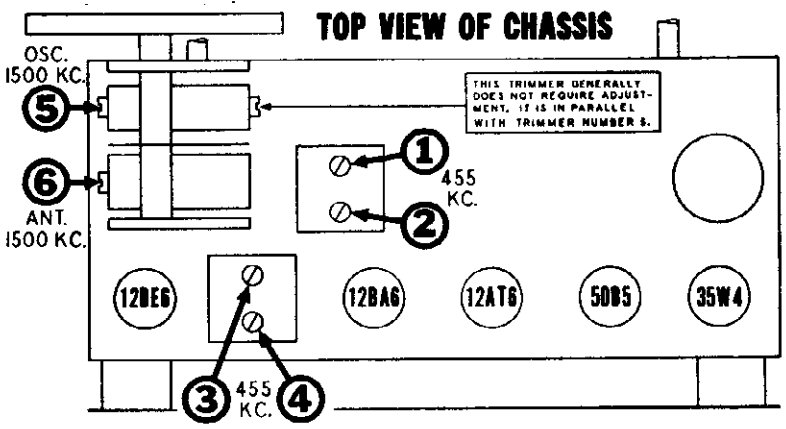
STEWART-WARNER CORP.

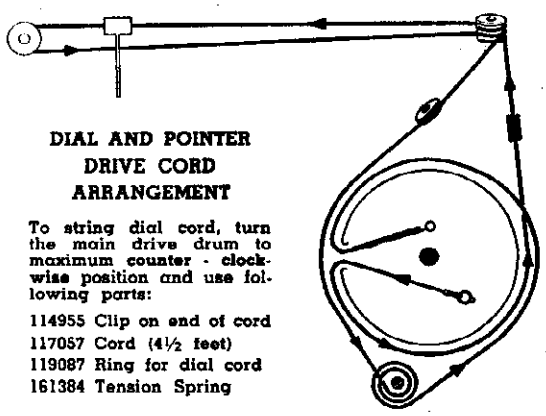
ALIGNMENT PROCEDURE

1. With the gang condenser fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
2. Remove chassis from cabinet by taking out two screws which hold chassis to bottom of cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location).
3. Connect ground lead to signal generator to B— through a 0.25 Mfd. condenser.
4. Connect output meter across speaker voice coil (terminals at back of speaker) or from plate of 50B5 tube to B— through a 0.1 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Trimmer on rear section of gang.	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
200 MMFD. Mica Condenser	External antenna lead on loop.	1500 KC	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
200 MMFD. Mica Condenser	External antenna lead on loop.	1500 KC	Tune to 1500 KC generator signal.	6	Broadcast Antenna	Adjust for maximum output.



TRIMMER LOCATIONS



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum counter - clockwise position and use following parts:

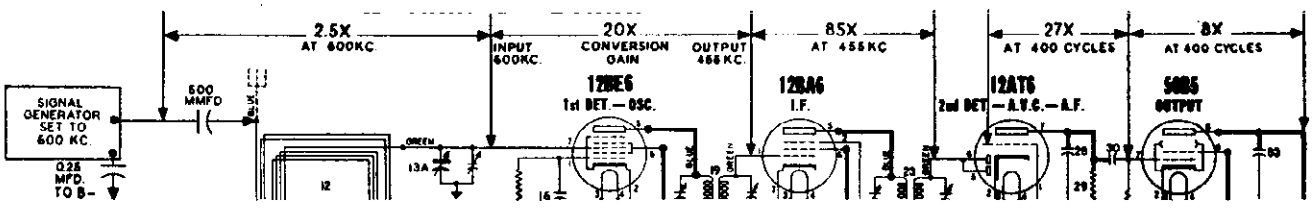
114955 Clip on end of cord
117057 Cord (4½ feet)
119087 Ring for dial cord
161384 Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. connection at loop antenna (white wire) and connect positive battery terminal to B —. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

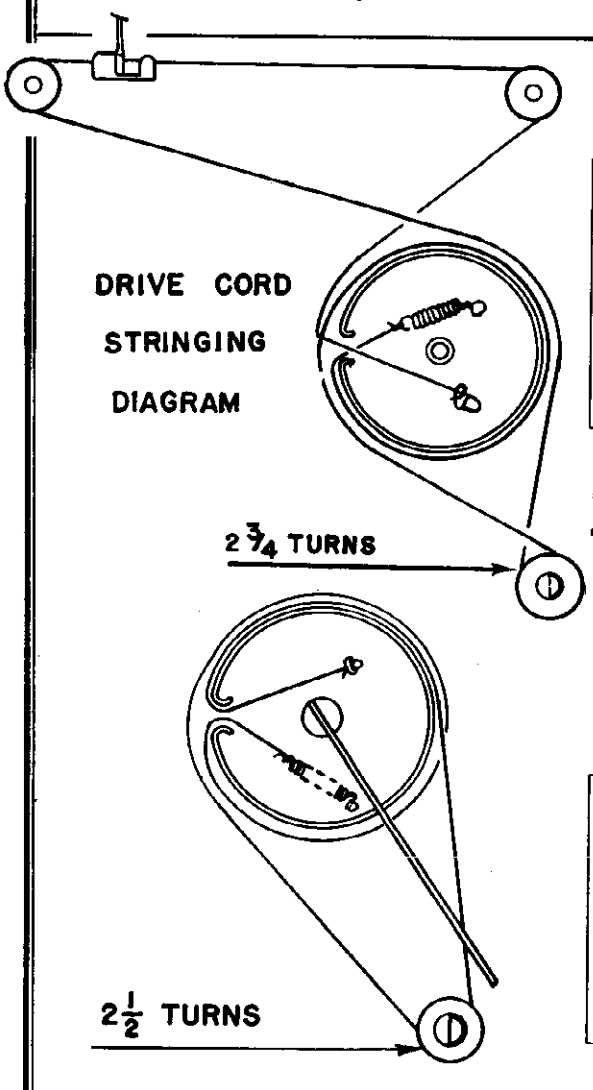
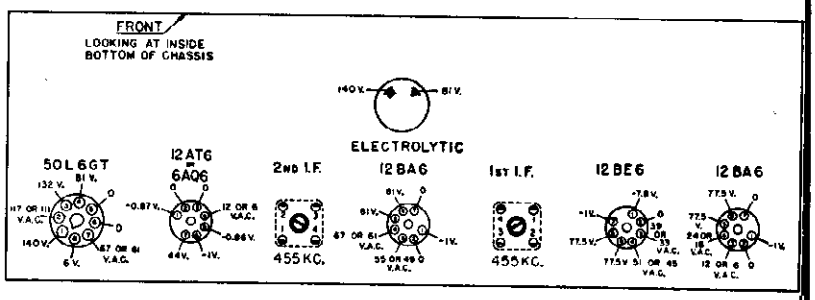
ALIGNMENT PROCEDURE

CAUTION: As this is a transformless Receiver, observe all usual precautions. The Black-White (B-) lead is common to one side of the 117 Volt Power Line Cord.

	Pointer Setting	Generator Setting	Input and Dummy	VTVM and Scope Connection and Scale	Adj. and Notes
			I. F. ADJUSTMENT		
(1)	Low frequency end of dial	455 kc. 400 cy. mod.	Pin #7, 12BE6 tube 0.01 mfd. dummy	-3V DC Scale Green-White (AVC) lead and Black-White (B-) lead.	Adj. top and bottom cores of each I. F. transformer with non-metallic screwdriver for maximum voltage.
(2)	"	455 kc. Swept 15 kc.	"	Scope to Junction C-6 and Volume Control	Adj. same cores as above for best over-lapping curve on scope.
			R. F. ADJUSTMENT		
(1)	1650 kc. Condenser plates all way out	1650 kc. 400 cy. mod.	Ant. terminal 0.01 mfd dummy	"	Adj. Osc. (front) trimmer on variable condenser for maximum voltage.
(2)	1400 kc.	1400 kc. 400 cy. mod.	"	"	Adj. R. F. and Loop trimmers on variable condenser for maximum voltage.



Voltage and Tube Location Chart



*Where two tube types or voltage values are shown, the first is for the 1200 chassis, the second is for the 1202 chassis.

Measurements are made at 117V line, using electronic Voltmeter. Except where otherwise indicated, voltages are D.C. and are positive with respect to the reference point which is the common Black-White lead.

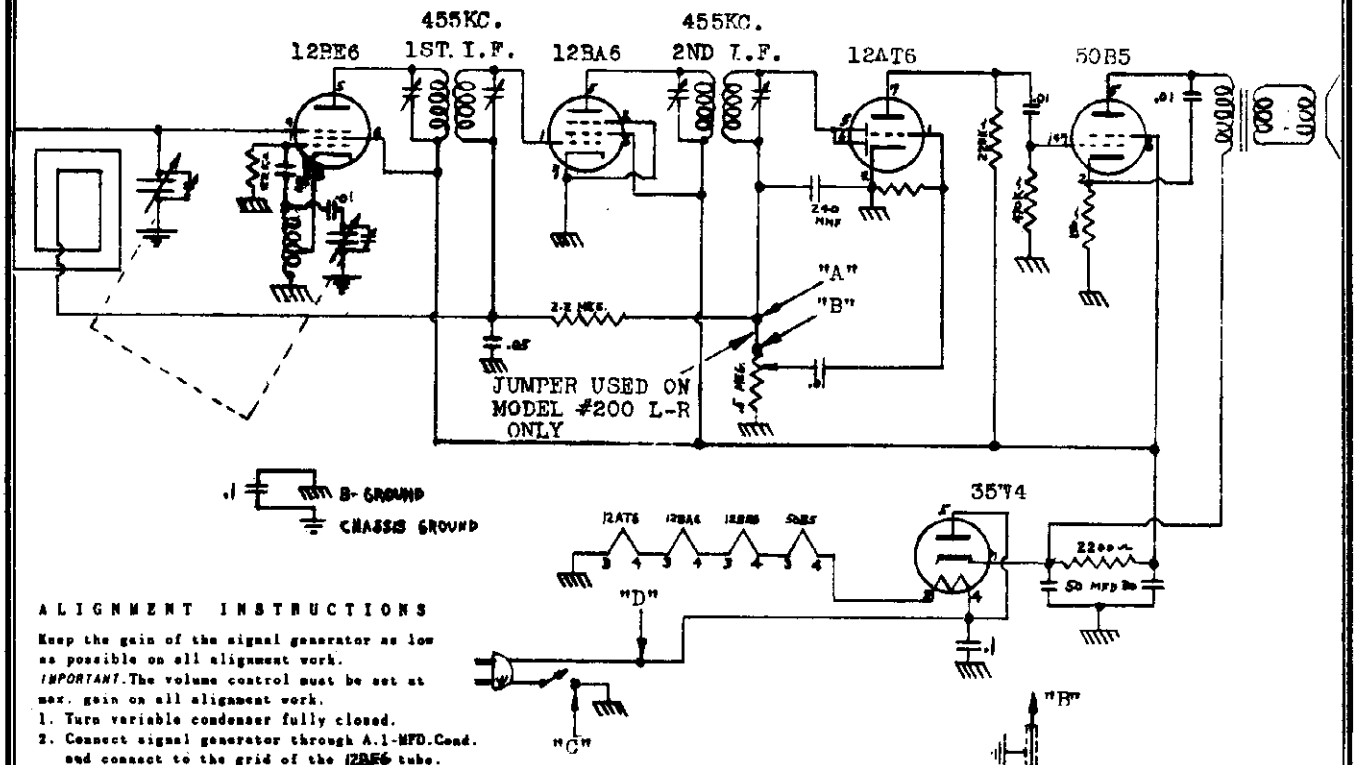
BOTTOM CHASSIS VIEW

SYMPHONY RADIO & TELEV. CORP. MODELS 200, 200L-R



ALIGNMENT INSTRUCTIONS

Keep the gain of the signal generator as low as possible on all alignment work.

IMPORTANT. The volume control must be set at max. gain on all alignment work.

1. Turn variable condenser fully closed.
2. Connect signal generator through A.1-MFD.Cond. and connect to the grid of the 12BE6 tube.
3. Align IF's to 455 K.C. max. reading. (A)

RF CALIBRATION

1. Turn variable condenser fully open.
2. Place signal generator leads near loop antenna.
3. Set signal generator to 1720 K.C.
4. Align osc. section (B) of variable condenser for max. reading.
5. Set signal generator to 1500 K.C.
6. Turn variable condenser to 150 on dial and align RF (C) section of var. cond. for max. reading.

ALIGNMENT INSTRUCTIONS

Keep the gain of the signal generator as low as possible on all alignment work.

IMPORTANT. The volume control must be set at max. gain on all alignment work.

1. Turn variable condenser fully closed.
2. Connect signal generator through A.1-MFD.Cond. and connect to the grid of the 1R5 tube.
3. Align IF's to 455 K.C. max. reading. (A)

RF CALIBRATION

1. Turn variable condenser fully open.
2. Place signal generator leads near loop antenna.
3. Set signal generator to 1600 K.C.
4. Align osc. section (B) of variable condenser for max. reading.
5. Set signal generator to 1400 K.C.
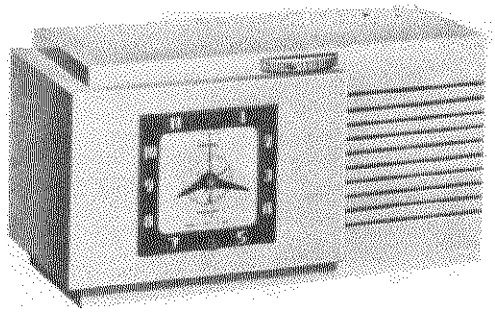
6. Turn variable condenser to 140 on dial and align RF (C) section of var. cond. for max. reading.
7. Set signal generator to 600 K.C. Turn var. cond. to 60 on dial and adjust the iron core loop loading coil screw for max. reading.

TELECHRON INC.

MODEL 8H67
MUSALARM



SPECIFICATIONS

CABINET:

Model	8H67
Color	Fawn
Height	6⅜ inches
Width	11¼ inches
Depth	6 inches

ELECTRICAL RATING (INPUT):

Voltage	105-125 volts, a-c
Frequency	60 cycles
Wattage	35 watts

OPERATING FREQUENCIES:

Intermediate Frequency	455 kc
Broadcast Band	540-1600 kc

POWER OUTPUT:

Undistorted	1.0 watt
Maximum	1.7 watts

LOUDSPEAKER:

Type	Alnico PM
Outside Cone Diameter	4-inch
Voice Coil Impedance (400 cycles)	3.5 ohms

TUBE COMPLEMENT:

Oscillator-Converter	Type 12SA7
I-F Amplifier	Type 12SK7
Detector and 1st Audio	Type 12SQ7
Power Output	Type 50L6GT
Rectifier	Type 35Z5GT

CAUTION — One side of the power line is connected to B–. Avoid any ground connections direct to B–. Use an isolating transformer when making service adjustments with the chassis removed from the cabinet, or be certain that the cord plug is connected to the power line so that B– is on the ground side of the power line.

RADIO CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES:

R-F	1620 kc and 1500 kc.
I-F	455 kc

EQUIPMENT REQUIRED:

1. Signal generator, 450 kc to 1620 kc, with 400 cycle tone modulation.
2. A-C voltmeter, 3 volts full scale at 1000. ohms/volt, or vacuum tube voltmeter.
3. 0.05 mfd. paper capacitor.
4. 200 mmfd. mica capacitor.
5. Insulated screwdriver.

ALIGNMENT PROCEDURE–GENERAL:

1. With the tuning scale control wheel turned so that the gang condenser plates are fully meshed, the index should read approximately ⅛-inch to the right of the 550 kc scale calibration mark. If it does not, remove the control wheel from the gang condenser shaft and replace it for correct position. CAUTION—Do not attempt to correct the position by rotating the wheel on the shaft as this will cause the knob to slip.
2. For i-f alignment, it is necessary to remove the chassis from the cabinet.
3. Connect the output voltmeter across the loudspeaker voice coil terminals.
4. Keep radio volume control at maximum and attenuate the signal generator output so that the output voltmeter reading never exceeds 1.0 volt.
5. Connect the capacitor as listed in column 2 between the output "High Side" of the test oscillator and the point of input specified.
6. Figure 3 shows the locations of all trimmers listed in the alignment chart.

ALIGNMENT CHART

Step	Connect Test Oscillator to—	Test Osc. Setting	Dial Drum Setting	Adjust Trimmers for Maximum Output
1	12SK7 grid (4) in series with 0.05 mfd. cap.	455 kc	1600 kc	2nd i-f trans. trimmers, C14 and C15
2	12SA7 grid (8) in series with 0.05 mfd. cap.	455 kc	1600 kc	1st i-f trans. trimmers, C8 and C9
3	Antenna Post in series with 200 mmfd. cap.	1620 kc	(Full Open)	C4 (oscillator)
4	Antenna Post in series with 200 mmfd. cap.	1500 kc	1500 kc	C3 (antenna)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings should be taken with low signal input so that AVC is not effective.

(1) R-F and I-F Stage Gains

Antenna Post to 12SA7 Grid	2 at 1000 kc
12SA7 Grid to 12SK7 Grid	50 at 455 kc
12SK7 Grid to 12SQ7 Diode Plate	70 at 455 kc

(2) Audio Gain
.15 volts at 400 cycles across the volume control (R11) with control set at maximum will give approximately ½-watt output across the loudspeaker, LS1, voice coil.

(3) Oscillator Grid Bias
D-C voltage developed across the oscillator grid leak (R1) averages 7.0 volts at 1000 kc.

(4) Socket Pin Voltages
Figure 2 shows voltages from all tube pins to B–. Voltage readings much higher or lower than those specified may help localize defective components or tubes.

25. #1204 Lockwashers
26. Field Screws
27. Field & Coil Assembly

"Vistac" has been applied to the following parts of the clock movement:

1. Time set shaft before assembling, and time set shaft spacers where they touch front plate and base plate.
2. Base plate stud where the switch lever touches it.
3. Both ends of the shaft for the intermediate gear and shaft assembly.
4. Switch lever assembly where it touches the front plate.

If it is necessary to replace any of the above parts, a very small amount of "Vistac" should be applied.

C1X68		No. 4-40 x 1/4" Rd. Hd. M/S

CLOCK INSTRUCTIONS

1. CONTACT ADJUSTMENT

A. Set switch to "Alarm" position so that cam follower rests on timing cam. Contacts shall be adjusted to .017" min. gap.
B. With switch in "Off" position, contacts shall remain open as in "A" and there shall be clearance between cam follower and cam.
C. With switch in "On" position, contacts shall be closed.
D. Set switch to "Alarm" position, turn alarm set knob until cam follower drops into slot of timing cam. The contacts shall be closed.
E. Check for proper contact pressure by depressing lower contact strip, using a small pointed tool. If upper contact strip follows the lower a noticeable amount before the contacts separate, the pressure is sufficient.
F. To insure that contacts close, connect a small lamp in series with the switch assembly when testing.

2. TIMING

A. Set minute and hour hands to 12 o'clock.
B. Set timer dial so that the 12 o'clock mark lines up with small line on the dial. In this position the indicator on the hour hand should also line up with the line on the dial.
C. Adjust timer for contact closure at 6:55 o'clock when dial is set for alarm to operate at 7:00 o'clock. On repeat tests the contacts shall close at 6:55, plus or minus 3 minutes. At all other settings, the contacts shall close within 12 minutes ahead or 2 minutes after the time for which the dial is set.

3. VIBRATOR ADJUSTMENT

A. Vibrator shall start buzzing 10 minutes plus or minus 5 minutes after contact closure occurs.
B. When vibrator is in "Shut-off" position the shut-off spring shall lift the vibrator sufficiently above the cam, so that the cam will not contact vibrator in any position.
C. Adjust vibrator for maximum sound.
D. Vibrator shall be shut off before completion of buzzing period.

4. NOISE PREVENTION

Vistac has been applied to such parts as are specified in notes under exploded view of movement. When the parts specified are replaced, a very small amount of Vistac should be applied.

5. GENERAL

A. Alarm set knob to be sufficiently tight on shaft to permit setting of "Alarm" disc in clockwise or counter-clockwise direction, but shall loosen when cam is turned against vibrator.
B. Switch knob shall turn freely.
C. Alarm disc shall not rub against the dial in any position. Prongs must be fully seated in alarm set groove.

6. CAUTION

A. This radio alarm clock will operate satisfactorily only on a circuit supplied with regulated alternating current of the voltage and frequency stamped on name plate.
B. If clock loses time, or hour and minute hands fail to rotate, check clearance of time setting shaft from case back or any obstruction behind the Musalarm. This shaft must be allowed to rotate while clock is in operation.
C. It is common practice for people to disconnect their radios during a thunder storm, or to use the outlet for a vacuum cleaner, or when moving furniture in housecleaning. The clock will, of course, stop when disconnected and start immediately when plugged in again. However, it will be necessary to reset the clock to the proper time if disconnected for any reason.

ELECTRICAL SPECIFICATIONS

Power Supply ..... 105-125 Volts D.C. or 50-60 Cycles A.C. 30 Watts

Frequency Range ..... 532.5 to 1620 kc.

Intermediate Freq. ..... 455 kc.

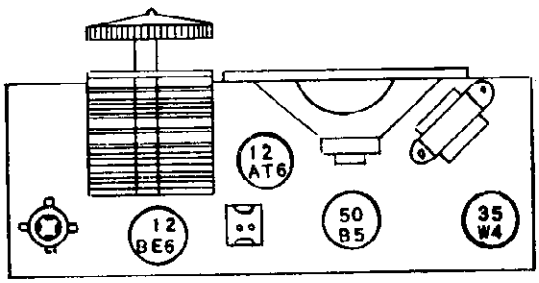
Tuning ..... Two gang capacitor

Speaker ..... 4 inch PM 3.5 ohm voice coil impedance

Power Output ..... 1 watt undistorted 1.5 watt maximum

Sensitivity ..... 800 Microvolts at 50 milliwatts Output

Selectivity ..... 120 kc broad at 1000 times signal at 1000 kc.



Remove back to replace tubes

ALIGNMENT PROCEDURE

- Output meter across 3.5 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				*SETTING TUNER*	*ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)*

LOCATION OF TUBES

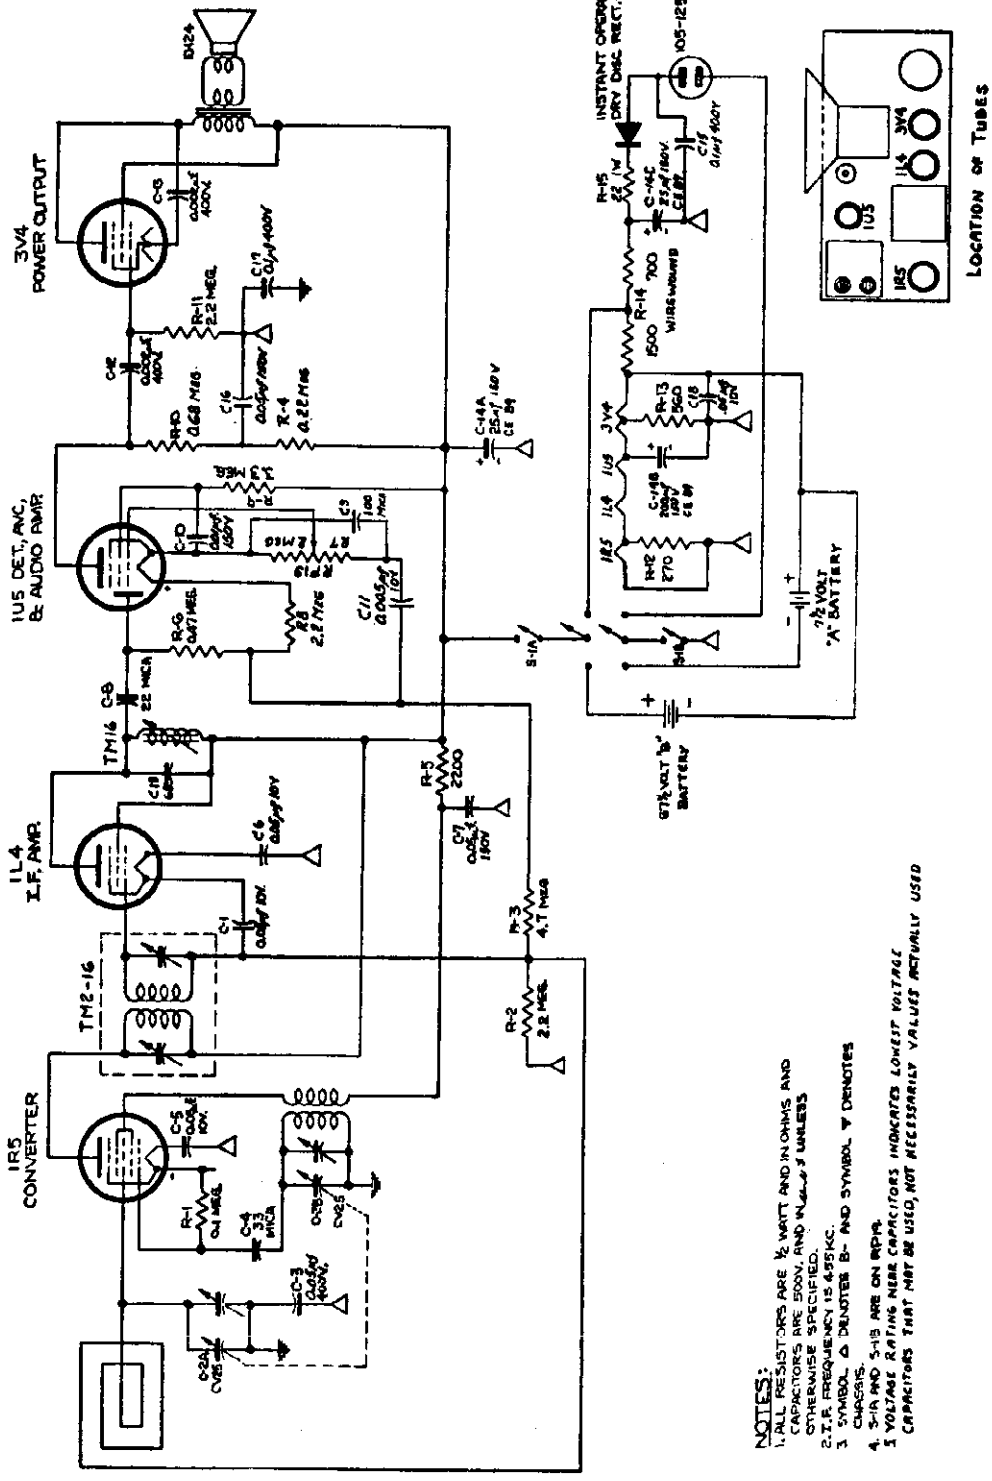
Battery: The battery is an Eveready type 753 battery pack or equivalent. It should be mounted in the compartment provided in the bottom of the cabinet, with plug facing front of cabinet. Battery should be removed when it is dead or if the set is not to be used on battery operation for several months.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section (A) of tuning capacitor. Connect ground clip of generator to the chassis. An output meter may be clipped directly across the voice coil lugs. Align the I.F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (B) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (A) (on rear section) for maximum response.

MODELS G-415, H-415 TEMPLETONE RADIO MFG. CORP.



TEMPLETONE RADIO MFG. CORP. MODELS G-415, H-415

This Radio has 4 tubes plus an instant operating dry disc rectifier. It is a 3-way portable superheterodyne receiver using the latest octal type of low-drain electronic miniature tubes.

Operation: The set operates from 105 to 120 volts, A.C. or D.C. power supply or from self-contained batteries. Power drain is approximately 18 watts on electric operation. Because it uses an instant operating dry disc rectifier, no warm up time is necessary on either A.C., D.C., or battery operation. The set will play immediately after the power switch is turned on. When operated on direct current (D.C.), if no reception is obtained, reverse the line plug in the power outlet.

Range: This Radio covers the broadcast band from 540 to 1625 kilocycles. Since the scale is calibrated 55 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

Controls: Three controls are provided. The left-hand control puts the set into operation and increases the volume with clockwise rotation. The right-hand control tunes the dial to the desired station. The slide switch selects electric operation in the upper position, and battery operation in the lower position.

Antenna: No outside aerial is required as adequate pickup is obtained by the self-contained loop antenna. In areas of poor reception or for weak or distant stations the loop antenna has a directional effect. The set or loop antenna may be turned to the direction of maximum reception.

Battery: The batteries comprise: one 7½ volt "A" unit Temple #GB1 or equivalent and one 67½ volt "B" unit Eveready type 467, Burgess #XX45, Ray-O-Vac #4367, Winchester #1710 or equivalent. They should be mounted in the spaces provided in the cabinet. Batteries should be removed when they are dead or if the set is not to be used on battery operation for several months.

This receiver uses a new "A" battery with the latest type construction, the Temple GB1, that eliminates the need for using five (5) flashlight cells and the attendant difficulties with the ten (10) contacts required for the flashlight batteries. Since it may not at once be readily available all over, it is suggested that a spare GB1 be kept on hand.

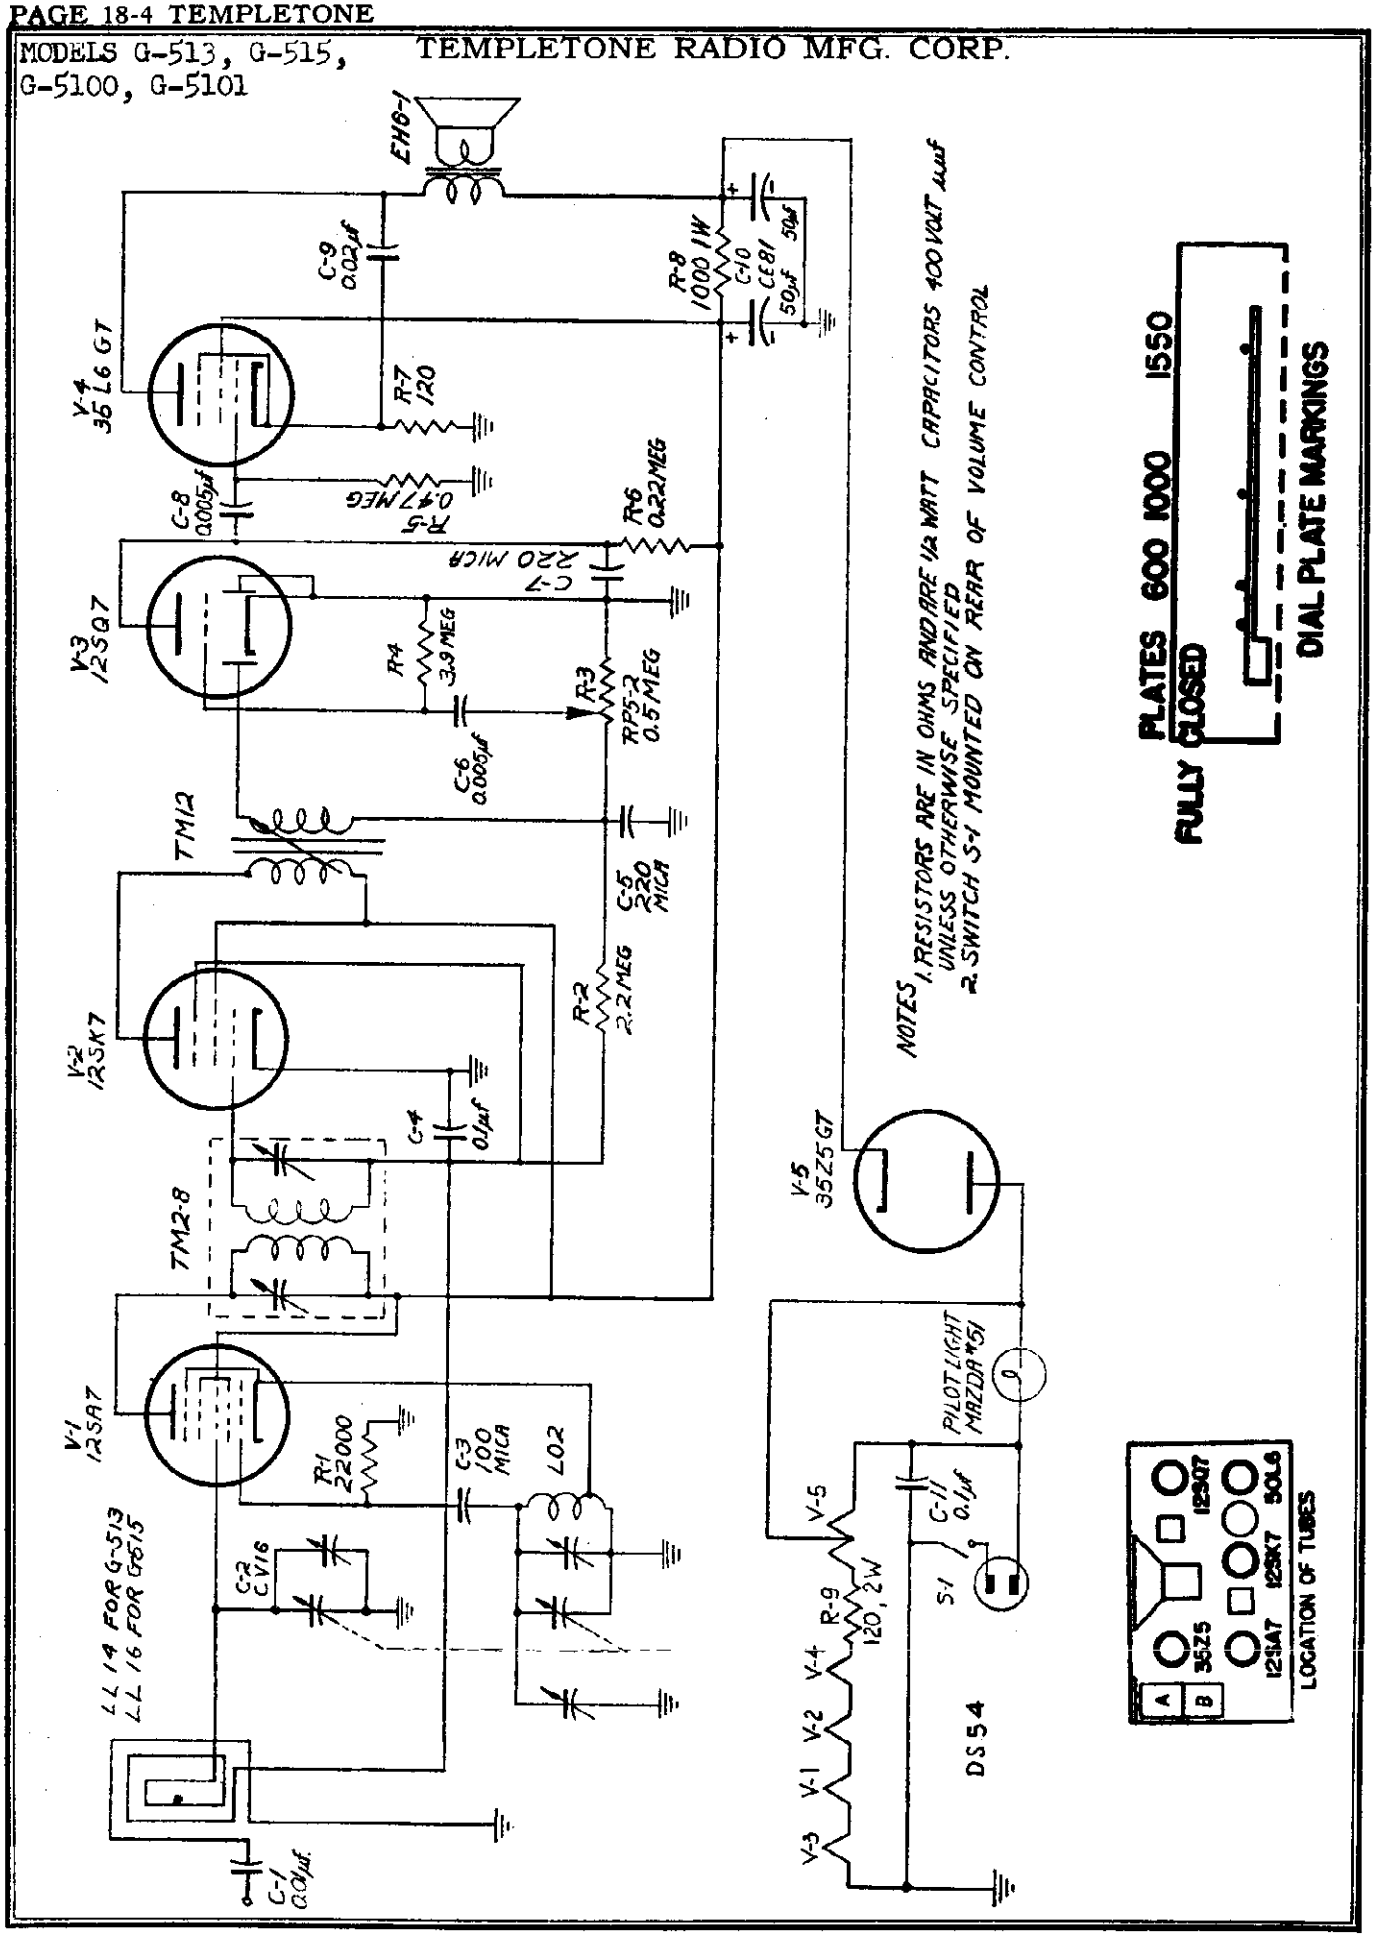
Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception.

The Signal Generator may be connected throught a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section of the tuning capacitor. Connect ground clip of generator to the B— terminal. An output meter may be clipped directly across the voice coil lugs. Align the I.F. trimmers and iron core to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments broad.

Provisions are made to align the R.F. trimmers with the receiver in the metal cabinet. Remove the two plug buttons on the right side of the cabinet and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and the pointer at the extreme right end of its travel, adjust the oscillator trimmer (on front section of tuning capacitor) to 1625 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (on rear section) for maximum response.

MODELS G-513, G-515, G-5100, G-5101

TEMPLETONE RADIO MFG. CORP.



radio is a 5-tube super-heterodyne receiver using the latest type of low-drain electronic tubes.

Operation: The set operates on 110 to 120 volts, 50 or 60 cycles A. C. and 110 to 120 volts D. C. Power drain is approximately 25 watts.

When operated on direct current (D.C.), if no reception is obtained after approximately one minute of warm-up time, reverse the line plug in the power outlet.

Range: covers the broadcast band from 540 to 1620 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

Controls: Only two controls are required for operation. The left-hand control puts set into operation, increases the volume with clockwise rotation, and includes the power switch. The right-hand control tunes the dial to the desired station.

Antenna: For normal reception, no outside aerial is required, as more than adequate pickup is obtained by the self-contained loop antenna.

At installations remote from the stations desired to be heard, improved results may be obtained by rotating the receiver for maximum response, as the loop antenna has a marked directional effect on weak signals. Reception can also be improved, and the directional effect reduced, by attaching a length of insulated wire approximately 15 to 25 feet long, to the antenna connection provided at the back of the cabinet. This wire may be laid on the floor along one side of the room, or concealed under the rug. **Under no circumstances should a ground be attached to the chassis—such ground is automatically provided through the power lines.**

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. An output meter may be clipped directly across the voice coil lugs.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section (B) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers remove the 0.01 mf capacitor and connect the Signal Generator leads or two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (A) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (B) (on rear section) for maximum response.. With tuning capacitor plates fully meshed, the receiver should tune to 532 kc; however, no adjustment is required at this point. For checking purposes, four fine marks are engraved on the dial plate. These represent, in order, the pointer position with capacitor plates fully meshed, and the pointer settings for 600, 1000 and 1550 kc.

MODEL G-521 TEMPLETONE RADIO MFG. CORP.

Alignment: No attempt should be made to realign this receiver until it has determined that a poor tube, or some local condition is not responsible for faulty reception. The Signal Generator may be connected through a 0.01 mf capacitor (used as a dummy antenna) to the lug on the R. F. section (B) of the tuning capacitor. Connect ground clip of generator to the common negative of the electrolytic capacitor. An output meter may be clipped across the voice coil lugs. Align the I. F. trimmers to 455 K.C. using the least possible input from the Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

The short wave band trimmers must be aligned before attempting to align the broadcast band. To align the short wave band turn the bandswitch to the short wave position and connect the Signal Generator through a 0.01 mf capacitor and a 400 ohm resistor in series (used as a dummy antenna) to the antenna connection at the back of the cabinet. With the tuning capacitor plates completely out of mesh and the pointer at the extreme right end of travel, adjust the short wave oscillator trimmer (A) to 18.5 megacycles. With both tuning capacitor and Signal Generator adjusted to 6 megacycles, adjust the short wave antenna coil slug (C) for maximum response. Readjust both the Signal Generator and the tuning capacitor to 18 megacycles and tune the short wave R. F. trimmer (B) for maximum response.

With the short wave band aligned, the broadcast band trimmers may now be aligned. To align the broadcast band turn the bandswitch to the broadcast position. Remove the 0.01 mf capacitor and the 400 ohm resistor and connect the Signal Generator to two or three turns of heavy wire, forming a self supporting loop of about 7 or 8 inches diameter placed about a foot away from the receiver's loop antenna. Again use the least possible input from the Signal Generator. With the tuning capacitor completely out of mesh and the pointer at the extreme right end of travel, adjust the broadcast oscillator trimmer (E) to 1620 kilocycles. With the dial pointer set to 600 KC adjust the padder (F) while rocking the signal generator dial for maximum audio output. Readjust both Signal Generator and dial pointer to 1550 kilocycles and adjust the R. F. trimmer (D) for maximum response.

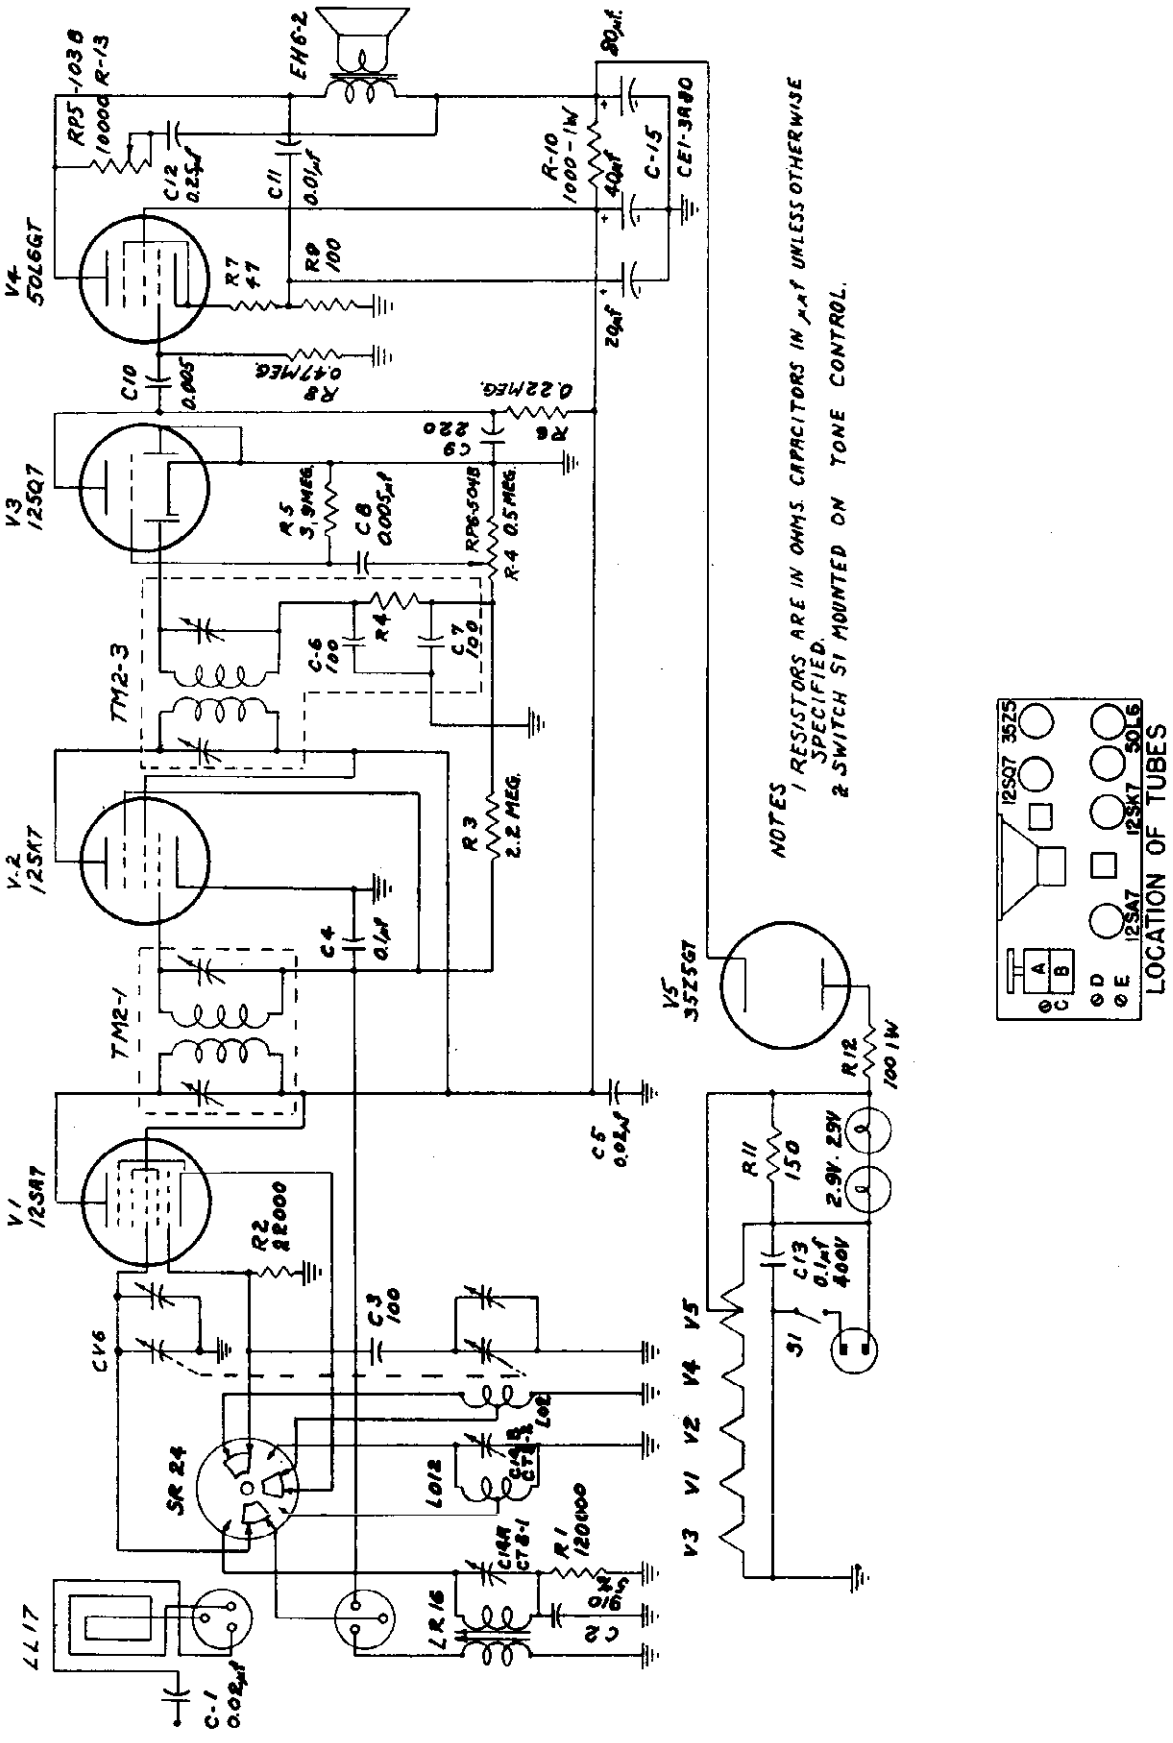
MODEL G-522

TEMPLETONE RADIO MFG. CORP.



OPERATING INSTRUCTIONS and SERVICE NOTES.

Model G-522 is a 5-tube, two band superheterodyne receiver using the latest types of low drain electronic tubes.

Operation: The set operates on 105 to 120 volts 50 or 60 cycles A. C. and 105 to 120 volts D. C. Power drain is approximately 30 watts.

When operated on direct current (D. C.) if no reception is obtained after approximately one minute of warm up time, reverse the line plug in the power outlet.

Ranges: Model G-522 has both a broadcast and a short wave range. It covers the broadcast band from 532 to 1700 kilocycles. Since the broadcast dial scale is calibrated from 55 to 160 the actual frequency of the station may be obtained by adding zero to the dial calibration. The range of the short wave band covered in Model G-522 is from 5.6 to 12.5 megacycles. The short wave dial scale is calibrated directly in megacycles.

Controls: Four controls are provided for the operation of the radio set. The control at the extreme left includes the power switch and the tone control; this turns the set on with clockwise rotation and provides a continuous variation in tone from full base at the counter-clockwise end to full treble in the extreme clockwise position. The second control is the volume control; this increases the volume with clockwise rotation. The third control is the bandswitch. In its counter-clockwise position it selects broadcast band operation. In its clockwise position it switches to operation on the short-wave band. The last control is the tuning control which permits accurate tuning of the slide rule dial through a smooth vernier action.

Antenna: For normal reception, no outside aerial is required, as more than adequate pickup is obtained by the self contained loop antenna. On the broadcast band, at installations remote from stations desired to be heard, improved results may be obtained by rotating the receiver for maximum response, as the loop antenna has a marked directional effect on weak signals. Reception can also be improved, especially on the short wave band, by attaching a length of insulated wire approximately 15 to 25 feet long, to the antenna connection provided at the back of the cabinet. This wire may be laid on the floor along one side of the room, or concealed under the rug. **Under no circumstances** should a ground be attached to the chassis — such ground is automatically provided through the power lines.

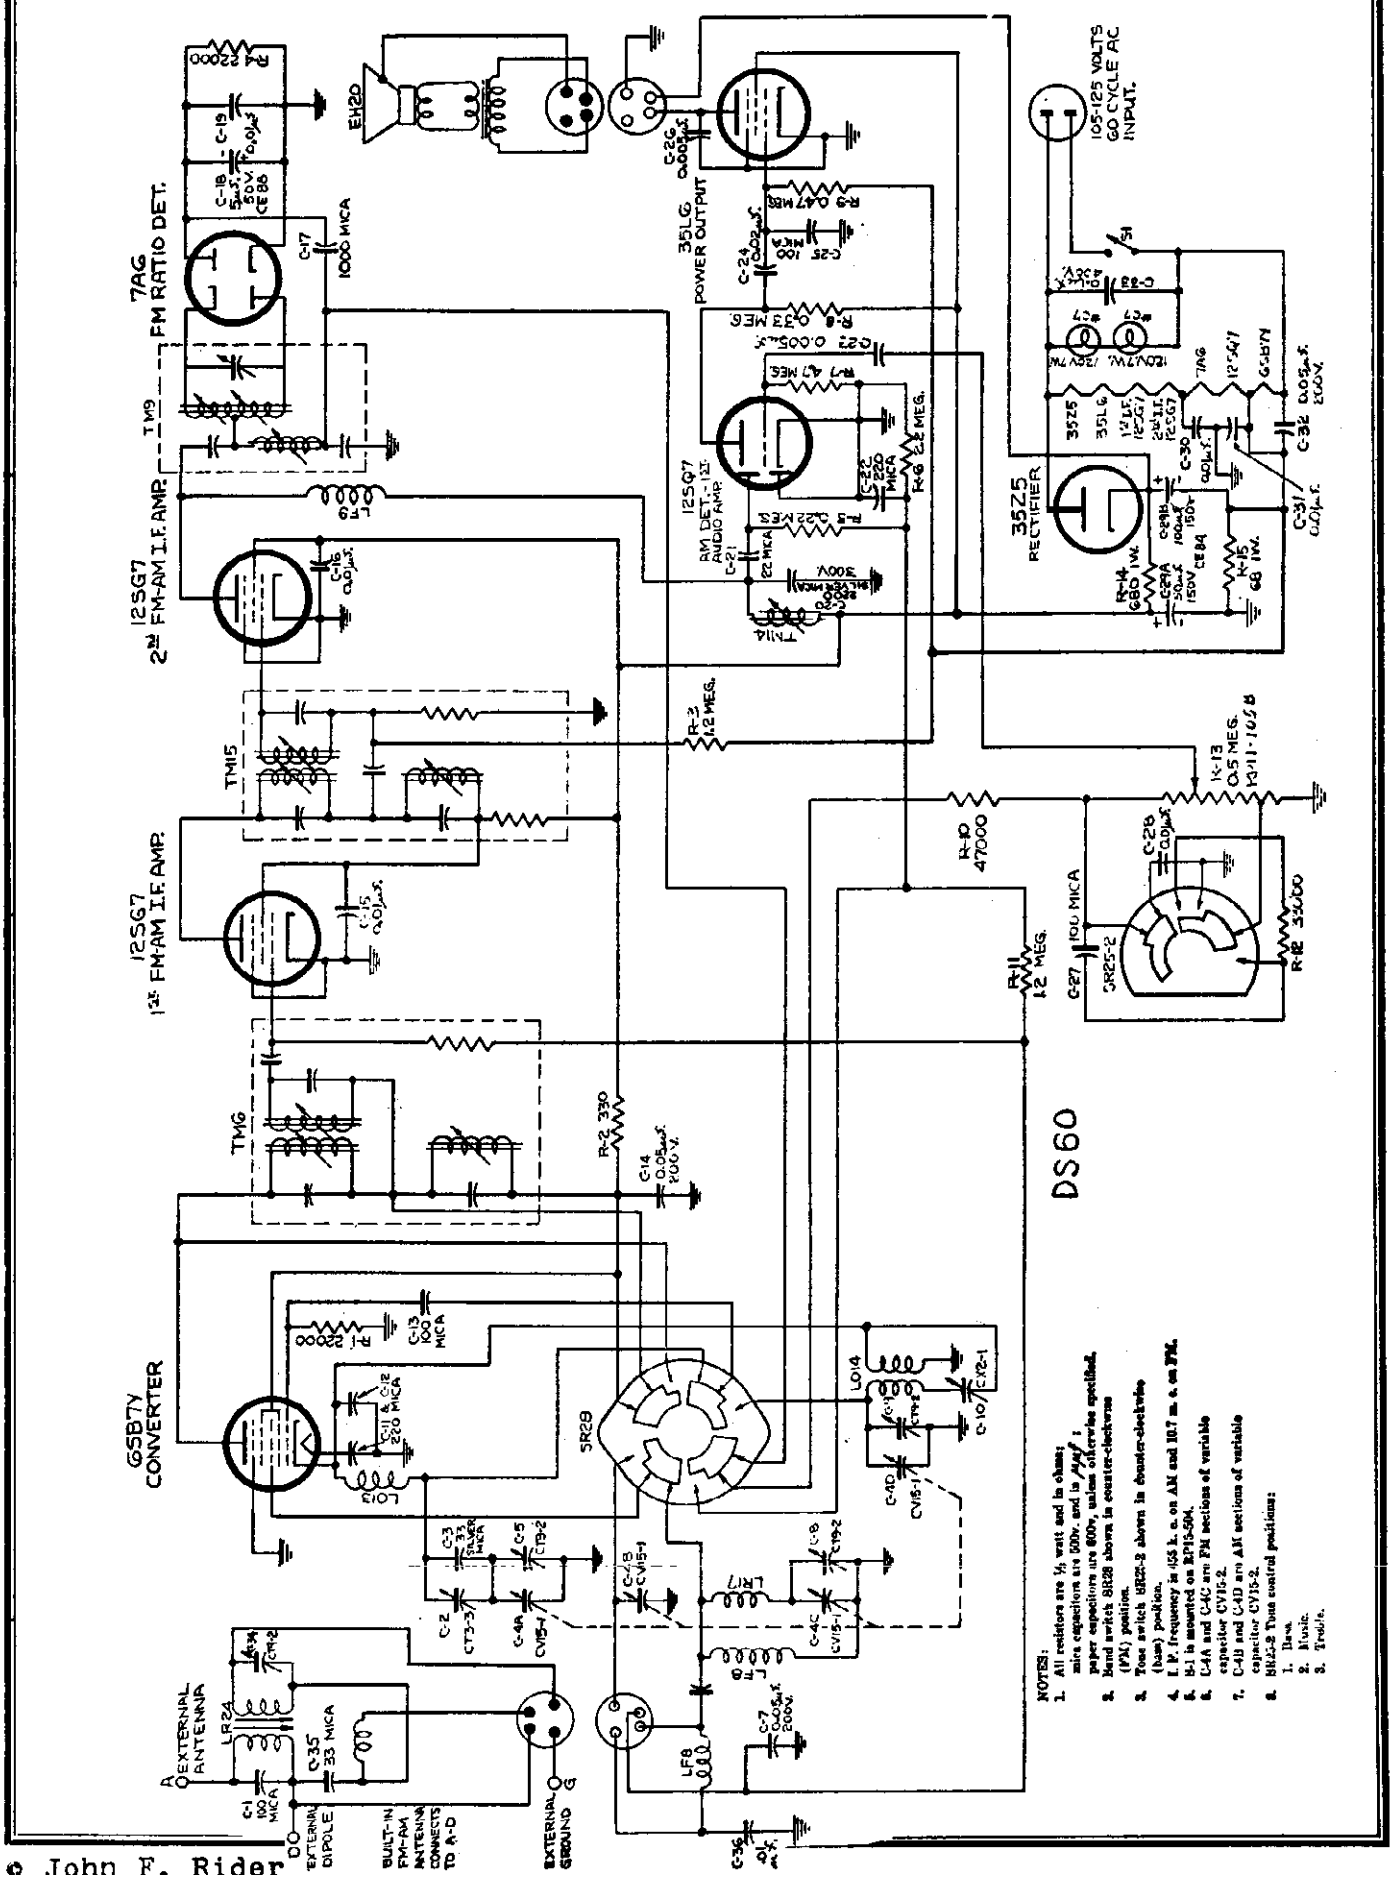
Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. The Signal Generator may be connected through a 0.01 mf capacitor (used as a dummy antenna) to the lug on the R. F. section (B) of the tuning capacitor. Connect ground clip of generator directly to chassis. An output meter may be clipped across the voice coil lugs. Align the I. F. trimmers to 455 kc using the least possible input from the Signal Generator to avoid developing A. V. C. voltage which would make the tuning adjustments very broad.

To align broadcast R. F. trimmers, remove the 0.01 mf capacitor and connect the Signal Generator to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter placed about a foot away from the receiver's loop antenna. Again use the least possible input from the Signal Generator. Turn the bandswitch to the broadcast position. With the tuning capacitor plates completely out of mesh and the pointer at the extreme right end of travel, adjust the broadcast oscillator trimmer (A) to 1700 kc. Re-adjust both Signal Generator and tuning capacitor to 1550 kc and adjust R. F. trimmer (B) for maximum response. With tuning capacitor plates fully meshed, the receiver should tune to 532 kc, however, no adjustment is required at this point.

To align the short wave band, turn the bandswitch to the short wave position and connect the Signal Generator through a 0.01 capacitor and a 400 ohm resistor in series (used as a dummy antenna) to the antenna connection at the back of the cabinet. With the tuning capacitor plates completely out of mesh and the pointer at the extreme right end of travel, adjust the short wave oscillator trimmer (E) to 12.5 megacycles. With both tuning capacitor and Signal Generator adjusted to 6 megacycles adjust the short wave antenna coil slug (C) for maximum response. Re-adjust both the Signal Generator and the tuning capacitor to 10.5 megacycles and tune the short wave antenna trimmer (D) for maximum response. With tuning capacitor fully meshed, the receiver should tune to 5.6 megacycles, however, no adjustment is required at this point.

For checking purposes five marks are engraved on the front of the dial plate. These represent in order, the pointer position with the capacitor plates fully meshed and the pointer settings for 600 kc or 6 mc, 1000 kc 10.5 mc, and 1550 kc.

MODEL G-724 TEMPLETONE RADIO MFG. CORP.



ALIGNMENT PROCEDURE:

Dummy Antenna	Signal Generator Connection	Signal Generator Frequency	Band Switch Position	Radio Dial Setting	Adjust	Remarks
0.01 MFD	Terminal T	455 KC AM	Broadcast	1625 KC	E G-1 F-1	Adjust for maximum output Repeat for fine adjustment
0.01 MFD	Pin 4 of 12SG7 2nd FM-AM IF with FM Signal Gen.	10.7 MC FM	FM	108 MC	H-2	Adjust for maximum output (Broad adjustment)
0.01 MFD	"	10.7 MC FM	FM	108 MC	H-4	Adjust for maximum output
0.01 MFD	"	10.7 MC AM	FM	108 MC	H-1 or H-3	Adjust whichever is required for minimum output
						Repeat last two steps for fine adjustment until settings for maximum FM output coincide with settings for minimum AM output.
0.01 MFD	Pin 8 of 6SB7Y Converter	10.7 MC FM	FM	108 MC	G-3 — G-2	Adjust for maximum output
0.01 MFD		"	FM	108 MC	F-3 — F-2	Adjust for maximum output
						Repeat last two steps for fine adjustment
			Broadcast	535 KC	Pointer	Adjust pointer to reference mark
100 MMFD	"A" Post on Cabinet	600 KC AM	"	600 KC	J and Core on Ant. Coil in Cab.	Adjust for maximum output
"	"	1550 KC AM	"	1550 KC	B and trimmer on Ant. Coil	Adjust for maximum output
300 OHM Resistor	"	92 MC FM	FM	92 MC	D	Adjust for maximum output
"	"	106 MC FM	FM	106 MC	A and C	Adjust for maximum output

Operation: The set is designed for operation on 105 to 125 volts, 60 cycles A. C. It will also operate on 120 D. C. Power drain is approximately 36 watts for the radio.

Ranges: Model G-724 has both a broadcast and FM range. It covers the broadcast band from 535 to 1625 kilocycles. Since the broadcast dial scale is calibrated from 53.5 to 160, the actual frequency of the station may be obtained by multiplying the dial calibration by ten. The range of the FM band covered in Model G-724 is from 87.6 to 108.4 megacycles. The FM dial scale is calibrated directly in megacycles.

MODEL G-724 TEMPLETONE RADIO MFG. CORP.

Antenna: This radio will operate without an external antenna. For normal reception more than adequate pickup is obtained by the self contained antenna. .At installations remote from station desired to be heard on the broadcast band, improved results may be obtained by attaching twenty or thirty feet of insulated wire to the antenna connection provided in the rear of the cabinet. The wire may be concealed under the rug or laid on the floor along one side of the room.

For normal reception on FM, no outside aerial is required as sufficient signal pickup is secured from the built-in FM antenna. However, in poor receiving locations provision is made for improved results, which may be obtained by the addition of an outside antenna of correct design, properly installed. (Your dealer can supply and install a suitable FM antenna for your FM Radio).

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube or some local condition is not responsible for faulty reception. The following is a list of the minimum equipment necessary to realign this receiver.

1—AM signal generator covering 455 KC, 600 KC, 1550 KC and 10.7 MC

2—FM signal generator covering 10.7 MC, 92 MC and 106 MC

3—Output meter, rectifier type, approximately 0 to 2 volts RMS

4—Dummy antennas

0.01 MFD Capacitor

300 Ohm Risistor

100MMFD Mica Capacitor

In the following alignment procedure the high side of the signal generator is connected to the terminal indicated in the "Signal Generator Coupling" column below. The ground side of the signal generator is connected directly to the chassis. The output meter should be connected across the voice coil of the speaker for all measurements.

In adjusting the radio frequency trimmers and padders it is advisable to "rock" the variable capacitor gang slightly across the signal being delivered by the signal generator until that particular signal has been accurately peaked.

The location of the trimmers, padders and slugs referred to in the alignment procedure chart on page three are shown in the tube and trimmer location diagram below.

TU-30		1R5 - 1U4 - 1S5 - 3V4

Remove chassis from cabinet for alignment. A signal generator is required having the following frequencies: 455 KC and 1400 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD. condenser. The ground lead from the generator may be connected to any spot on the metal chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the movable trimmers in the IF cans, until a maximum reading is noted on the output meter.

The volume control of the receiver should be turned to maximum during the IF and all subsequent alignment and the generator output as low as possible to prevent the AVC from working and giving false readings.

SECOND STEP: With the leads from the generator still connected as in IF alignment, adjust the generator to 400 KC. Set the dial pointer to 1400 KC on the dial scale. Adjust the oscillator trimmer until the signal is tuned in.

THIRD STEP: Remove the generator leads from the condenser. Connect the hot lead from the generator through a 200 MMFD. condenser to one of the leads which project from the back of the loop antenna. Connect the ground lead of the generator to the remaining lead. With the generator and the receiver still tuned to 1400 KC, adjust the antenna trimmer until a maximum reading is noted on the output meter.

BATTERY LOCATION.

BATTERY SERVICING

(See Figure No. 1)

To replace batteries, loosen and remove the two screws at the left and right hand corners of the cabinet back. Remove the back and pull out the plug from each battery. Never pull on the wires connected to the plugs as they may break. Always grasp the plug form between the fingers, or use a flat blade to pry out the plug. Observe with care the position of the batteries and plugs when replacing. Be sure that batteries and plugs are replaced as shown in the "Battery Location" diagram. (Figure No. 1)

After the batteries have been installed, replace the back. Make sure that the two wires from the loop antenna are held in place between the brackets of the cabinet and the back by the two fastening screws.

TUNING RANGE — 540 KC to 1720 KC

Read aud follow instructions carefully before attempting operation of this receiver.

POWER SOURCES: This receiver is designed for operation on either an external power source or on the enclosed batteries.

AC OR DC OPERATION: This receiver may be operated on 50 to 60 cycle, 110 to 125 volt AC current or 110 to 125 DC current.

CAUTION: Never plug this receiver into a 220 volt line as this will seriously damage the component parts which hae been designed for 110 to 125 volt operation only.

To operate on AC or DC open the small door at the lower right hand corner in the back of the cabinet. Pull out the power cord and plug into a convenient outlet of the proper voltage and current. Follow instructions under "Controls."

To operate on the enclosed batteries, follow instructions under "Control."

CONTROLS: This receiver has three control knobs which are located on the front panel of the cabinet.

STATION SELECTOR KNOB: The right hand knob is the station selector. Rotate this knob to the right or left to select your desired station. The dial scale is calibrated in kilocycles. By mentally adding a zero to the numbers on the scale, the result will be read directly in (KC) kilocycles. (i.e., 60 plus 0 equals 600 KC or 140 plus 0 equals 1400 KC).

POWER SELECTOR SWITCH: The center knob is the power selector. It has three positions which are indicated on the front panel. The extreme left hand position is the "OFF" position. The small dot on this knob must point to "OFF" when the receiver is not in use. The center position is "AC-DC" and is used when it is desired to operate the receiver from a power line source. The extreme right hand position is "BATT" and is used when it is desired to operate on the enclosed batteries.

AC OPERATION: When an AC power source is used, set the power selector knob to "AC-DC" after the power cord has been plugged into a convenient outlet. The receiver is now ready for operation.

DC OPERATION: If the receiver does not operate after a few seconds, reverse the power cord plug in the outlet and it will operate properly.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the primary of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the top of the ANT. section of the gang condenser. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies; 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through the .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the trimmers of the first and second I. F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator leads from the gang condenser. Loosely couple the generator to the receiver loop by using a complete turn of wire. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer until a maximum signal is noted on the output meter. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

MODEL R-705,
Electro-Tuner

THEORY OF OPERATION

(The switch numbers in this discussion refer to Fig. 1)

The Delco model R-705 is an auto radio receiver using a conventional superheterodyne circuit, but which introduces an entirely new method of automatic station selection. Depressing a single push button will automatically select and tune in any broadcast station of satisfactory signal strength without requiring a previous push button set-up. This automatic tuning is accomplished by electronically controlling a motor driven permeability tuned tuner. Rectified voltage from the received broadcast signal actuates a 6SN7 tube which in turn instantaneously operates a relay and a solenoid switch disconnecting the motor and stopping the tuner on the frequency of the station.

The Electro-Tuner of this radio sweeps the broadcast band first in one direction and then in the other. In order to do this the tuner driving motor is reversed at each end of the broadcast band. The tuner sliding mechanism trips the reversing switch (5) each time the tuner reaches the end of its movement. This switch (5) alternately grounds opposite ends of the motor's center tapped field coil.

The nature of the Electro-Tuner's circuit is such that unless prevented the tuner would hunt for a broadcast signal after the radio is turned on until the receiver is warmed up and stations can be received. This would cause additional wear on the motor and would cause a change in stations when a change might not be desired. A mechanical interlock switch (6) prevents this hunting when the radio is turned on. It accomplishes this by keeping the motor circuit open when the radio is turned on until the tuning control is operated. When the tuning control is operated for the first time after the radio is turned on the interlock switch (6) is closed. It remains closed until the radio is turned off which causes the switch to open. The interlock switch will then remain open until the radio is turned on and the tuning control button is depressed.

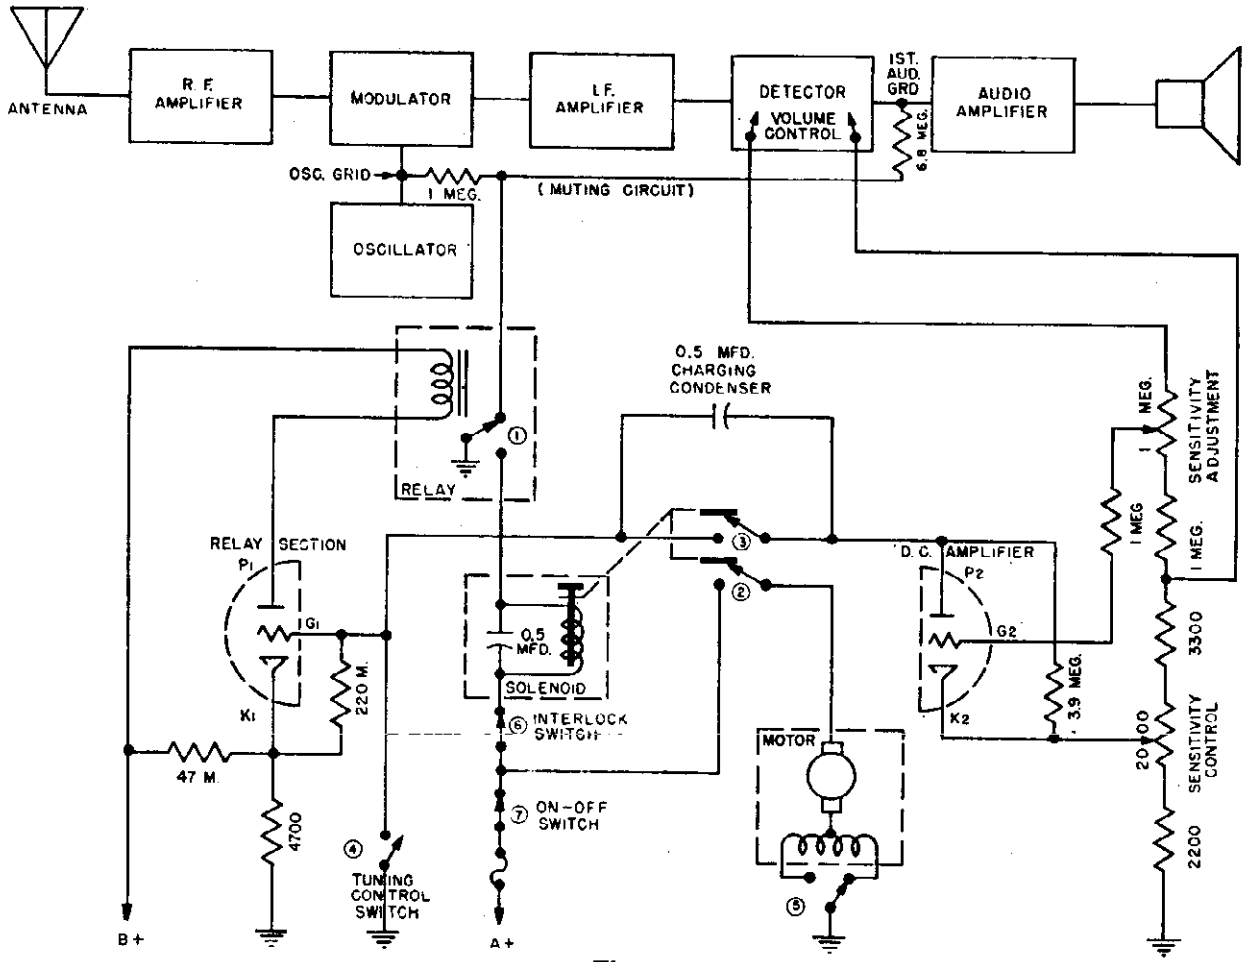

Fig. 1

Model R-705, see Vol. 17-1

MODEL R-705,
Electro-Tuner

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

Circuit Operation

The heart of the electrotuner is the 6SN7 twin triode tube and to more readily understand this explanation of the operation, assume the radio is warmed up, the tuner has been operated, and a station is being received. The wiring diagram, Fig. 1, is arranged to show these conditions.

A. With a signal being received, plate current flows in the relay section of the 6SN7 tube and through the coil of the relay switch, holding the relay switch contact (1) in the position shown.

1. The muting voltage is grounded and audio reaches the speaker.
2. The solenoid coil circuit is open and —
   a. The motor is not engaged.
   b. The motor circuit contacts (2) of the solenoid switch are open.
   c. The 6SN7 D. C. amplifier plate circuit contacts (3) of the solenoid switch are open.

B. The electrotuner is actuated by momentarily depressing the tuning knob, thereby setting off a chain of events which happen almost simultaneously.

1. The tuning control switch (4), ganged to the tuning knob, is closed when the tuning knob is depressed, thereby grounding the grid G_1 of the relay section of the 6SN7 tube which stops the plate current flow in the relay section.
   a. With no current flowing through the coil of the relay switch (1) the spring loaded contact arm of this switch opens which permits approximately —10 volts to be applied to the grid of the first audio tube, silencing the radio.
   b. With the solenoid coil circuit grounded at the relay switch contact (1) the solenoid coil is energized and pulls the plunger into the coil which:
      (1) Mechanically engages the motor clutch.
      (2) Closes the motor circuit contacts (2) of the solenoid switch which starts the motor driving the tuner.
      (3) Closes the D. C. amplifier plate circuit contacts (3) of the solenoid, connecting the plate (P_2) of the D. C. amplifier section to the grid (G_1) in the relay section of the 6SN7 tube.
   c. As the motor drives the tuner away from the received signal, the rectified voltage supplied from the detector stage to the grid (G_2) of the D. C. amplifier section of the 6SN7 tube disappears. This rectified voltage is negative in polarity with respect to the cathode voltage and is picked up from the detected signal at the input of the volume control in the detector stage through a potentiometer (sensitivity adjuster). The removal of this negative voltage from the grid (G_2) of the D. C. amplifier section of the 6SN7 tube drives it well above the cutoff voltage.
2. The tuning control switch (4) is opened when the tuning knob is released. This removes the ground from the grid (G_1) of the relay section of the 6SN7 tube and allows voltage to reach the plate (P_2) of the D. C. amplifier section.
   a. Plate current flows in the D. C. amplifier section since the grid (G_2) of the D. C. amplifier is well above the cutoff voltage.
   b. The plate current flows through the 220M ohm resistor and the resultant voltage drop keeps the grid (G_1) of the relay section of the 6SN7 tube biased below cutoff and current does not flow in the relay section.
   c. The motor continues driving the tuning mechanism across the broadcast frequencies and control of the motor and clutch is transferred from the tuning control switch to the D. C. amplifier section of the 6SN7 tube so that the tuner will stop on the first station with sufficient signal strength.

C. The Electro-Tuner is stopped by and on the first station of sufficient signal strength with another chain of events that are almost simultaneous.

1. As the tuning mechanism sweeps into a receivable signal the rectified signal appears across the sensitivity adjuster.

a. A portion of this rectified voltage is applied to the grid G_2 of the D. C. amplifier. Since this voltage is negative with respect to the cathode the D. C. amplifier is biased near cutoff, which reduces the plate current flow in this section. This low current reduces the voltage drop across the 220M ohm resistor allowing the grid G_1 of the relay section to rise above cutoff. The relay section of the 6SN7 tube starts conducting.

2. As the relay section of the 6SN7 tube starts conducting, it actuates the relay switch coil and pulls the contact arm (1) back to the position shown in the diagram.

   a. The muting voltage is removed from the audio circuit by grounding it through the contact arm of the relay switch.

   b. The solenoid circuit opens thus de-energizing the solenoid.

      (1.) The motor is mechanically declutched stopping the tuning mechanism on the received signal.

      (2.) The motor circuit contacts (2) of the solenoid switch are opened stopping the motor.

      (3.) The 6SN7 D. C. amplifier plate contacts (3) are opened removing the D. C. amplifier from the control circuit.

The Electro-Tuner has now tuned the radio to a station and when another station is desired, it is only necessary to depress tuning control momentarily.

Sensitivity Control

The sensitivity control is a continuously variable potentiometer located on the steering column control unit.

Electrically the sensitivity control is located in the cathode circuit of the 6SQ7 detector tube. When the potentiometer arm is in the position nearest ground the cathode of the D. C. amplifier section of the 6SN7 tube has the lowest possible applied cathode voltage. This means that the relative potential between the cathode and the grid of the D. C. amplifier is a minimum resulting in maximum plate current flow in this section.

Assume that the plate current in the D. C. amplifier section becomes low enough to stop the tuner when the grid (G_2) is two volts below the cathode. When the tuner is sweeping between stations and no signal is being received the grid (G_2) of the D. C. amplifier is approximately + 12 volts and the cathode is approximately + 7 volts when the sensitivity control is adjusted to the maximum voltage position. Our voltage differential from cathode to grid is now + 5 volts. To stop the tuner we need a rectified signal voltage of -7 volts which drives the grid two volts below the cathode.

If the sensitivity control is at the minimum voltage position with no signal the grid (G_2) is again + 12 volts and the cathode is approximately + 4 volts, making the differential from cathode to grid + 8 volts. Now, to stop the tuner we need a rectified signal voltage of -10 volts.

The local signal strength of the received station is proportional to the value of the rectified signal; the stronger the station the more negative the rectified signal voltage. Therefore, when the sensitivity control feeds maximum voltage to the cathode (K_2) it is in the position of maximum tuner sensitivity and the tuner will stop on relatively weak signals. When the sensitivity control is feeding the minimum voltage to the cathode (K_2) the tuner will stop only on relatively strong stations.

Sensitivity Adjuster

Local reception conditions vary so greatly over the U. S. A. that an additional adjustment is necessary so the tuner can be made to select only the locally strong stations at minimum position of the steering column sensitivity control. This adjustment has negligible effect on tuner operation when the sensitivity control is set so the tuner will stop on a maximum number of stations.

Electrically the sensitivity adjuster is a potentiometer which governs the amount of rectified signal voltage impressed on the grid (G_2) of the D. C. amplifier. Therefore it establishes the maximum signal strength necessary to stop the tuner when the sensitivity control is positioned to stop the tuner only on very strong stations.

MODEL R-705,
Electro-Tuner

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

Charging Condenser

No matter where the sensitivity controls are set, there will always be a few weak stations which will produce enough signal to stop the tuner but will not be strong enough to insure those stations being tuned in accurately. In order to prevent the tuner from stopping on such borderline signal strength stations, a charging condenser has been placed across the switch (3) coupling the plate (P_2) of the D. C. amplifier and the Grid (G_1) of the relay section of 6SN7 tube. Whenever the tuner stops on a station the rectified signal voltage must be maintained during the charging time of this condenser or the condenser will pass sufficient current to bias the grid (G_1) of the relay section beyond cut off causing the relay to open and the tuner to move on to the next station. This action will make the relay appear to chatter on some stations. This condition is normal and merely indicates that the received signal is not quite strong enough to stop the tuner accurately.

TROUBLE SHOOTING THE ELECTRO-TUNER

NOTE: This radio will appear to have many operating troubles if the correct "A" voltage is not used. This radio should be operated with "A" voltage between 5.5 and 7.5 volts measured at the fuse on the power supply. It is recommended that bench power supply leads be no smaller than #14 wire.

I. THE TUNER WILL NOT STOP ON ANY STATIONS.

A. When the sensitivity control (illustration #94) is at minimum sensitivity.
NOTE: Proper operation should receive at least one strong local station.
1. The tuner sensitivity needs adjusting (see page #1).

B. When the sensitivity control is at maximum sensitivity.
1. Insufficient rectified signal voltage reaches the tuner from the detector stage of the receiver. Sufficient rectified signal voltage will give a VTVM reading of 5 or more DC volts negative from grid to cathode of the DC amplifier section of 6SN7 tube.
a. Stations cannot be tuned in manually.
(1) Receiver is not operating. Service the radio and antenna in the conventional manner.
b. Stations can be received manually.
(1) The tuner sensitivity needs adjusting (See Page 1).
(2) The radio sensitivity needs adjusting.
(3) The antenna trimmer needs peaking. If trimmer will not peak use antenna adapter #4278.
(4) Open circuit between receiver and tuner.
(5) Antenna is faulty.
2. Sufficient rectified voltage reaches the tuner.
a. The 6SN7 tube is faulty.
b. The relay is not operating. The relay should operate with 7MA current.

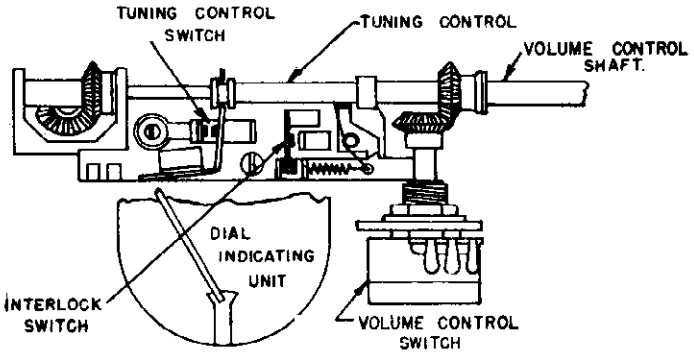

Fig. 2

II. THE TUNER WILL NOT START.

A. The tuner is completely inoperative.
1. The tuning control switch does not close when the tuning control is operated. (See Fig. 2)
2. The interlock switch does not close when the tuning control is operated. (See Fig. 2)
3. The reversing switch is open. (See Fig. 3)
4. The relay tension spring is disconnected. (See Fig. 4)
5. The 6SN7 tube is faulty.
6. The motor switch (Illus. No. 113B) does not close properly. This switch should close before the clutch fingers engage the slotted disc on the motor drive gear. (See Fig. 5). It should open before the clutch fingers engage the manual drive slotted disc. This may appear as intermittent trouble.

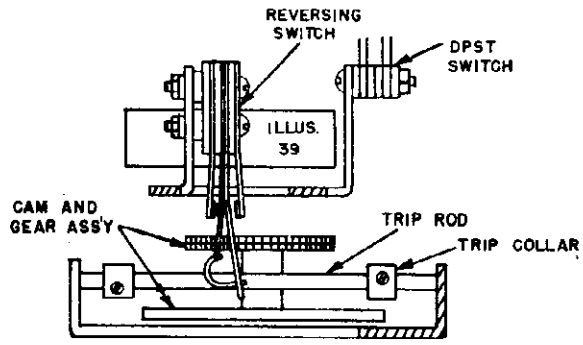

Fig. 3

B. The motor runs without driving the tuning mechanism.

1. The motor clutch does not engage.
   a. The motor drive gear slotted disc or the clutch fingers are worn.
   b. The clutch engaging yoke does not have enough travel. Adjust the solenoid core "hat" so that the clutch fingers extend into the slotted disc but not through it when the solenoid plunger is all the way in. Check the screw under the solenoid that holds the two pieces that make up the clutch yoke. If this screw is loose tighten it with the linkage in its extended position and solder these securely in place. (See Fig. 5)

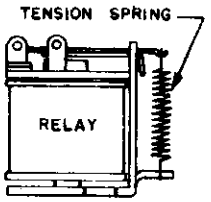

Fig. 4

2. One of the gears has failed.
   a. The motor drive gear friction safety clutch has failed. (See Fig. 5)
   b. The gear teeth are worn. (See Fig. 5)
   c. The gears are out of alignment or mesh. The three mounting screws that mount the gear housing to the motor control the position of these gears. (See Fig. 5)
3. The reversing switch has failed. The switch will not reverse or continually reverses.
   a. The switch is fouled on the trip rod. (See Fig. 3)
   b. The trip collars are improperly positioned. They should reverse the motor just before the cam follower reaches the point of the cam. (See Figs. 3 and 6)
4. There is backlash in the tuner slide mechanism.
   a. The tuner slide anti-backlash spring is disconnected. (See Fig. 6)
   b. The tuner sliding mechanism is binding. (See Fig. 6)

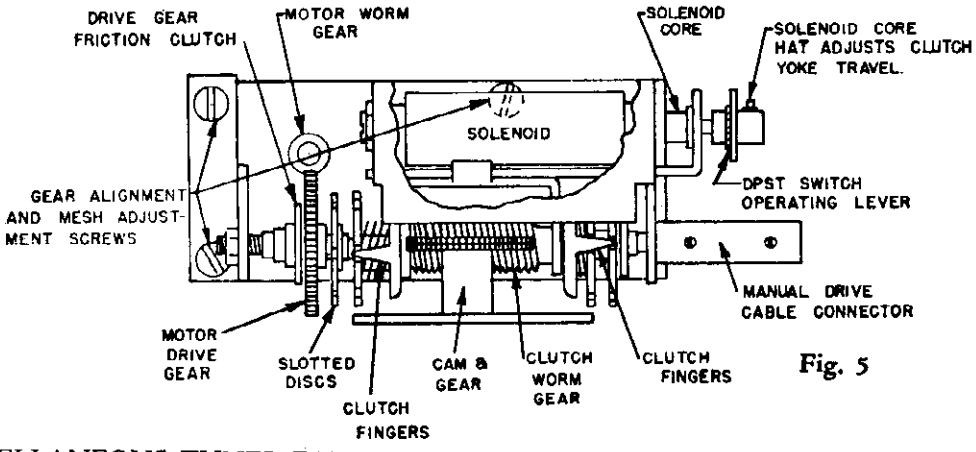

Fig. 5

III. MISCELLANEOUS TUNER FAILURES.

A. The tuner operates when the radio is turned on and before the tuning control is operated.
   1. The interlock is continuously closed. (See Fig. 2)

B. The tuner reverses before reaching the end of the broadcast band.
   1. The reversing switch is fouled on the trip rod. (See Fig. 3)
   2. The trip collars are improperly positioned. (See paragraph II, Part B, 3, b.)

C. The tuner will not tune stations accurately.
   1. There is mechanical loosening or binding if no stations are tuned in accurately.
   2. The 0.5 mfd. charging condenser is open if only weak stations are tuned in inaccurately.

D. The motor runs after stations have been tuned in and tuner has stopped.
   1. The motor switch (Illustration #113B) is continuously closed or shorted.
   2. The motor switch (Illus. #113B) does not open before the clutch fingers engage the manual drive slotted disc.

E. The tuner changes stations when the signal is decreased (viaducts, power lines, large buildings, etc.)
   1. The 0.5 mfd. charging condenser is shorted.

GENERAL

Tubes ..... Five
Speaker ..... 5-inch Electrodynamic
Antenna ..... Built-in Loop or External
Tuning ..... Manual
Tuning Range ..... 540-1,720 kc, 9-12 mc
Power Supply. 105-125 AC, 50/60 cycles or DC—30 watts

ALIGNMENT PROCEDURE

Volume Control maximum, Signal Generator output minimum for satisfactory output indication.

POWER-SUPPLY POLARITY

For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

CALIBRATION SCALE

The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	12SK7 grid in series with 0.1 mfd.	455 kc	Quiet point at 1,600 kc end of dial	C10, C9 2nd I-F Transformer
2	12SA7 grid in series with 0.1 mfd.			C8, C7 1st I-F Transformer
3	Antenna term. in series with 47 mmf.	10 mc*	10 mc	C21 (osc.)** C23 (ant.)
4	Antenna term. in series with 200 mmfd.	1,600 kc	1,600 kc	C14 (osc.)
5	Radiation loop consisting of two turns of wire 18 inches in diameter located 4 to 6 feet from receiver	1,300 kc	Resonance on signal	C15 (ant.)
6		600 kc	600 kc	C22 (osc.) Rock in

* It is recommended that this step be repeated using a received station of known frequency.
** Use minimum capacity if two peaks can be obtained.

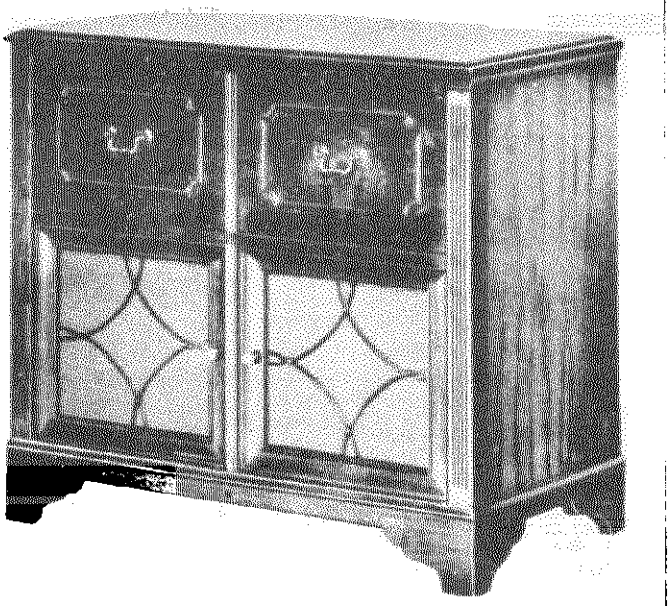
MODELS R-1253, R-1254

GENERAL

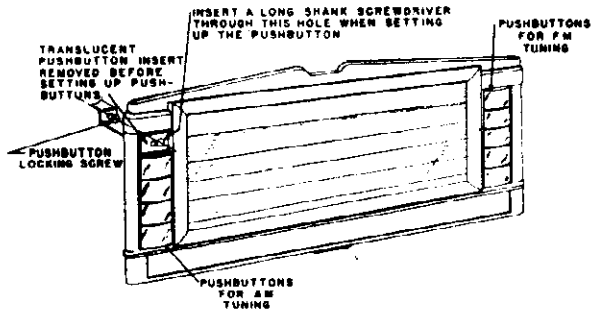
TUBES	Eleven plus rectifier
SPEAKER	12 inch P.M.
TUNING	Manual and mechanical push-buttons; five P.B. for "AM", five P.B. for "FM"
TUNING RANGE	(BC) 550 KC - 1700 KC (SW) 5.8 MC - 18 MC (FM) 88 MC - 108 MC
ANTENNA	Built-in loop, (BC); built-in dipole, (FM) and (SW); Provisions for external antennas
POWER SUPPLY	105-125 V. AC, 60 Cycles
POWER CONSUMPTION	120 Watts (140 watts with changer)



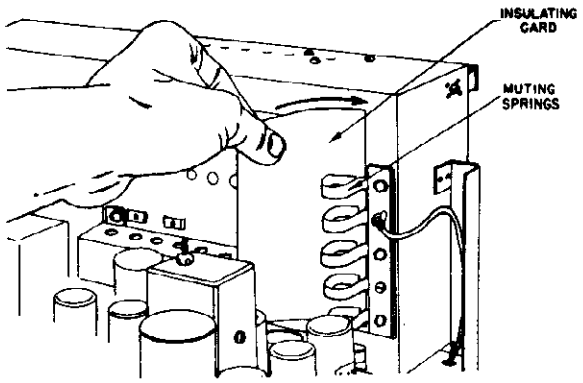
BUTTON SETTING

Insulate the muting switch contacts with the instruction card or a similar 4 x 6 inch paper card as shown before setting the left hand group of "AM" push buttons. The right hand group of "FM" push buttons do not require this treatment.

1. Select any one push button.
2. Pull translucent insert straight out.
3. Insert screw driver blade through large hole of push button into slot of locking screw.
4. Loosen locking screw about one-half turn. (Not more than one full turn.)
5. With push button depressed, carefully tune in desired station with the manual control and tighten the locking screw.
6. Replace the translucent insert with the proper station call letters inserted as follows.



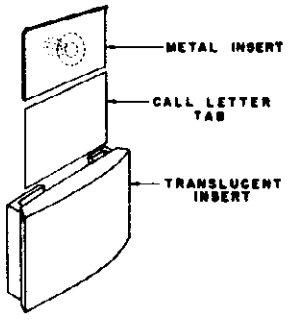
Setting the Push Buttons



Insulating the Muting Switch Contacts

INSERTING CALL LETTERS

1. Slide out metal insert from translucent insert assembly.
2. Insert desired call letter tab.
3. Replace metal insert behind call letter tab.
4. Replace translucent insert assembly into push button mechanism.



Call Letter Installation

MODELS R-1253, R-1254

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

DIAL AND PILOT LAMP REPLACEMENT

The two dial lamps are made accessible by removing the dial escutcheon at the front of the cabinet. The pilot lamp at the base of the cabinet is removed from the front of the cabinet by reaching under the cabinet directly behind the jewel. Slip the socket assembly straight back a short distance, releasing it from its mounting tongue. The socket and defective lamp may now be brought out in the open for replacement. Replace all lamps with 6-8 volt Mazda No. 44 or equivalent.

ALIGNMENT PROCEDURE

Removal of the receiver chassis from the cabinet requires the use of other calibration means than the dial glass. Calibration strips mounted on the pointer rails are provided for alignment purposes.

To use these calibration strips, it is necessary to remove the dial plate (brown metal cover) in the following manner:

1. Remove dial pointers. Pull them straight out of their spring clips.
2. Remove the two dial lamp sockets.
3. Remove dial plate fastened to the chassis with seven sheet metal schews.

With the variable condensers fully meshed, the right hand side of the pointer carriage will be indexed to zero on the calibration strips.

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the "FM" band to compensate for mechanical variations in the push button mechanism. The correction factor is approximately 5 times: AFC takes hold 100 kc before the station frequency is reached and releases before tuning 450 kc beyond the station frequency when receiving a 0.1 volt signal.

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

NOTE —

Dial Cord Layout

RESTRINGING DIAL CORD

To restring either the "FM" or "AM" dial drive system, cut a five foot length of 9 lb. test dial cord and follow the stringing procedure as illustrated. Note that the start and finish of both drives are located at the tension spring on the large driven pulley.

Index the pointer by closing the gang and attaching the pointer carriage so that the right hand side of the pointer carriage falls at the zero mark on the calibration strip. Refer to the calibration strip detail shown in the alignment procedure.

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODELS 980797, 980798, BUICK

GENERAL:

Mounting—Model 980797 on all 1948 series 40-60-90 Buick cars.
Model 980798 on all 1948 series 50-70

The model 980797 is similar to model 980744 and model 980798 is similar to model 980745. With the exception of parts and illustrations shown in this bulletin, all other information in Bulletin 6D-923 is applicable to models 980797 and 980798.

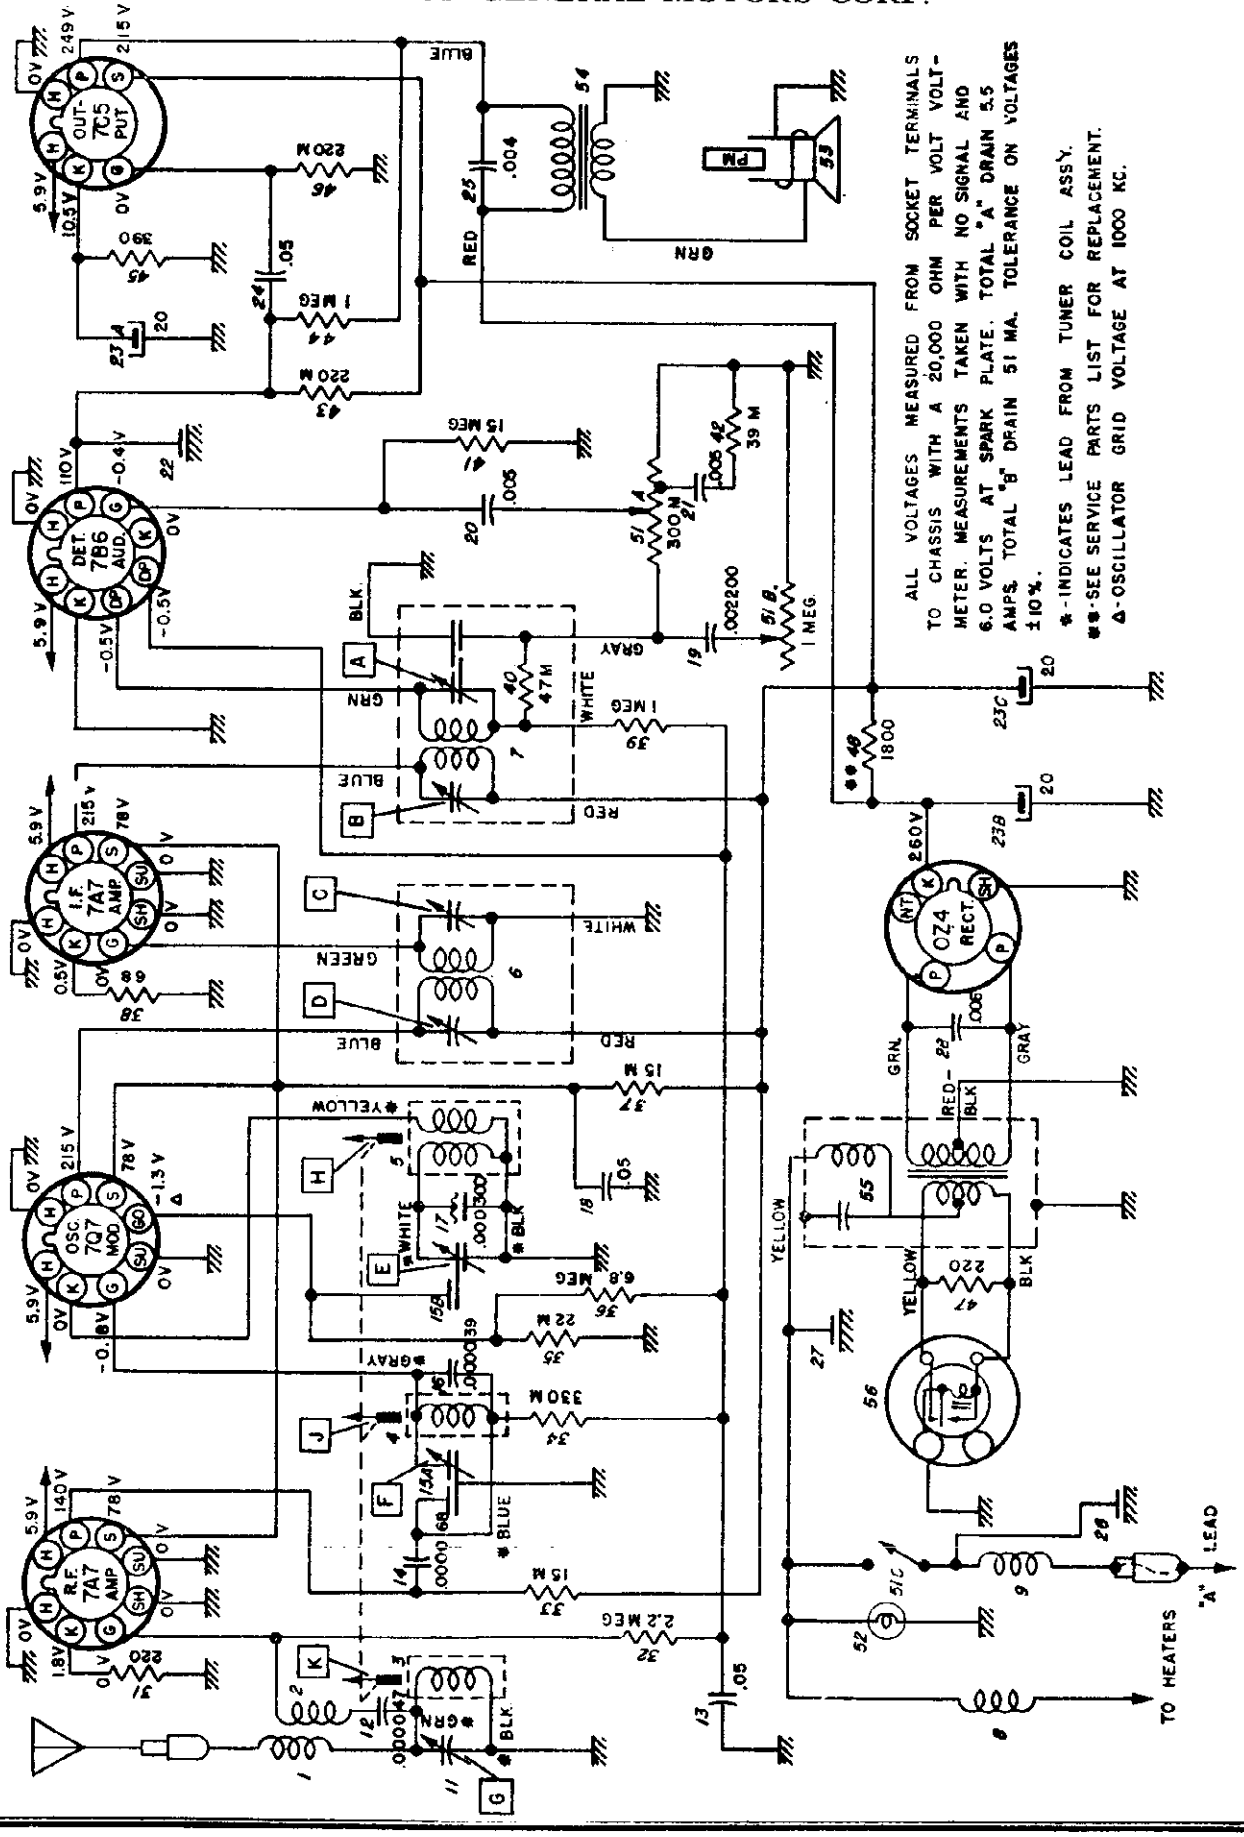
MODEL 982400
OLDSMOBILE

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.



UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODEL 982400
OLDSMOBILE

GENERAL

MOUNTING — All 1949 Oldsmobile Cars.

TUBES—Five, plus rectifier.

SPEAKER—6"x 9" Elliptical, Permanent Magnet.

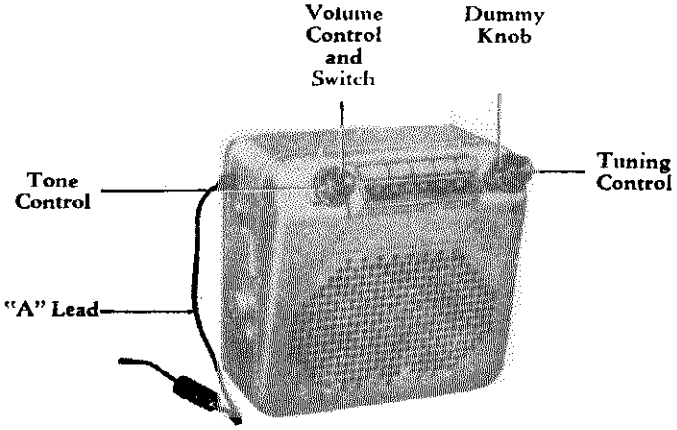
TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION—For Antennas Between 0.000050 - 0.000070 Mfd.

TUNING RANGE—550-1600 KC.

PUSH BUTTON SETUP PROCEDURE

Pull Push Button to the left and out. Tune in desired station manually. Push button all the way in.



MODEL 982400

ALIGNMENT PROCEDURE

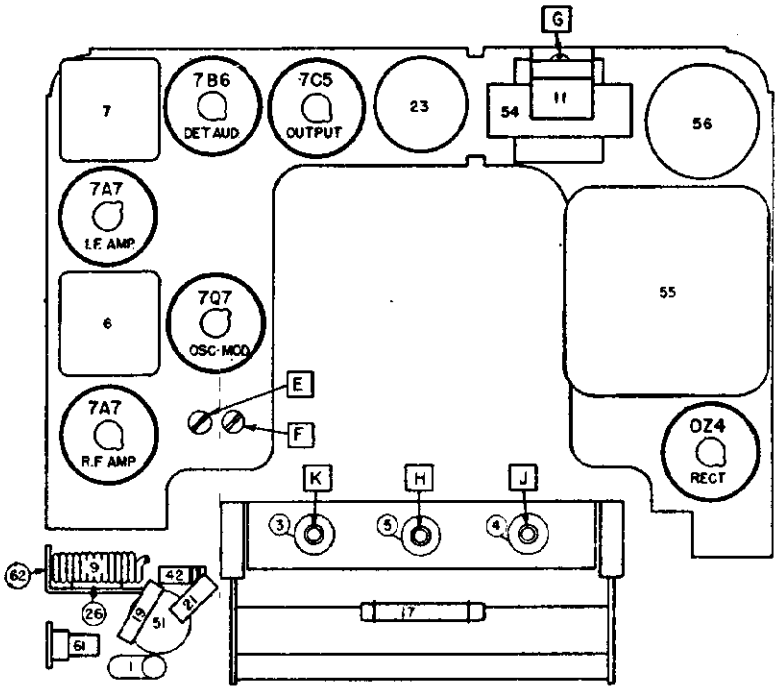
Output Meter Connections	Across Voice Coil
Generator Return	To Receiver Chassis
Dummy Antenna	In Series With Generator
Volume Control Position	Maximum Volume
Tone Control Position	Treble
Generator Output	Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect Signal Generator to	Signal Generator Frequency	Tune Receiver to	Adjust in Sequence For Max. Output
1	0.1 Mfd.	7Q7 Grid (Pin #6)	260 KC	High Frequency Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	1400 KC	Signal Generator Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G
5	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Generator Signal	L**

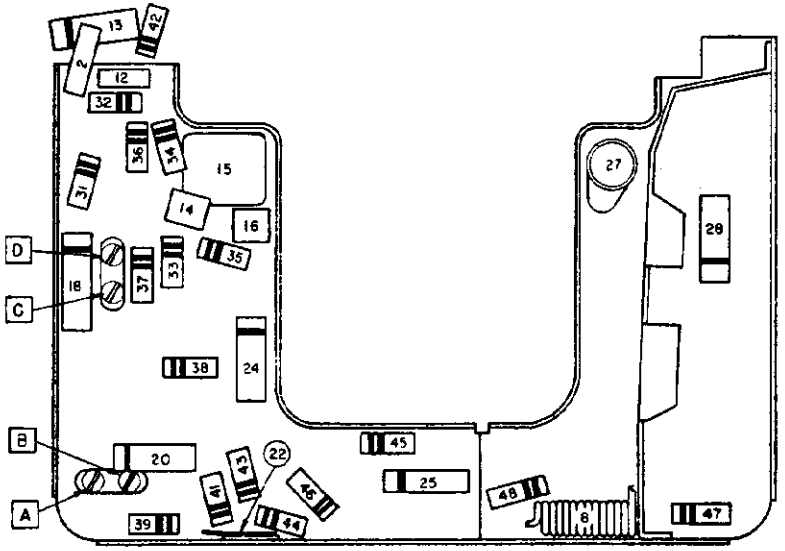
*Before making this adjustment check mechanical setting of oscillator core "H." The rear of the core should be 1 25/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustments should be made with an insulated screw driver, and core studs should be cemented in place with glyptal or household cement after alignment.

**L is the pointer adjustment screw which is on the connecting link, Illus. #88, between the pointer assembly and the parallel guide bar. It should be adjusted so that the dial pointer corresponds with the 1000 KC mark on the dial. (On the 1st "0")

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station near 1400 KC (see sticker on case).



PARTS LAYOUT — TUBE VIEW

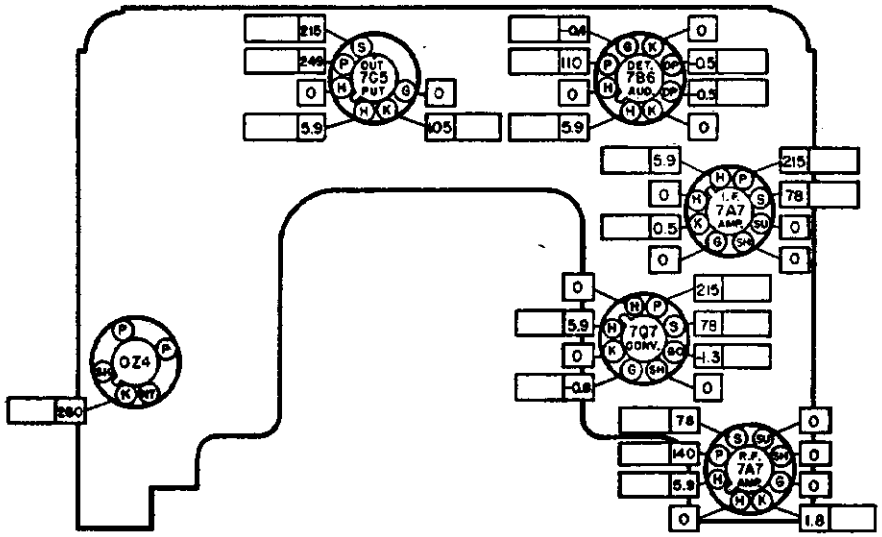


PARTS LAYOUT — CHASSIS VIEW

TUBE SOCKET VOLTAGE CHART

The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram on Page 3 are shown.

The blank spaces are provided so the service man may fill in the actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.



VOLT METER RESISTANCE ..... OHMS PER VOLT. READINGS TAKEN WITH ..... VOLTS AT SPARK PLATE. VOLTAGES MEASURED FROM SOCKET TERMINALS TO CHASSIS AND ARE POSITIVE UNLESS MARKED OTHERWISE.

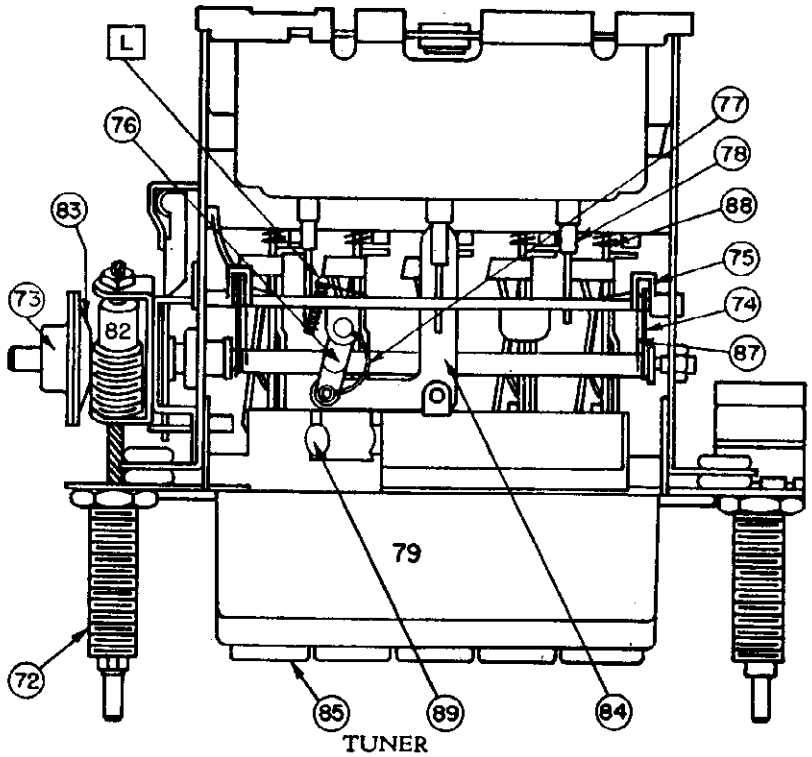
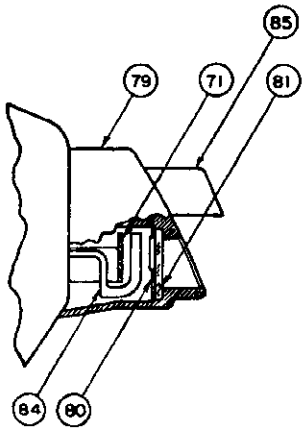
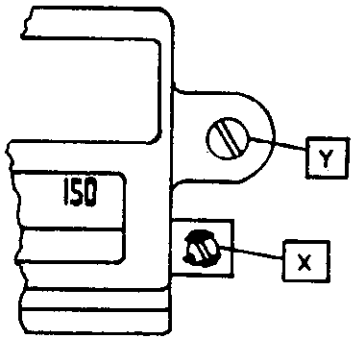
ESCUTCHEON MOUNTING



TUNER



ESCUTCHEON CROSS SECTION



ESCUTCHEON MOUNTING

SPECIAL INSTRUCTIONS

Unless special precautions are taken in removing the dial escutcheon, there is a possibility that the dial pointer tip will be broken. Therefore in removal of the escutcheon the following procedure is recommended.

1. **Loosen but do not remove the two screws holding the pointer back plate ("X" in Escutcheon Mounting Drawing Above) and loosen the shellac so that the back plate is free to move.**
2. **Remove the escutcheon mounting screws "Y" (see Escutcheon Mounting).**
3. **Carefully lift off the escutcheon (DO NOT FORCE). If the dial backplate is free to move slightly downward the escutcheon will come off easily.**

The same caution should be exercised when replacing the escutcheon.

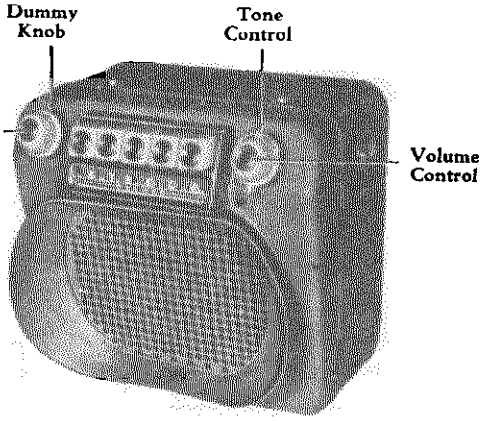
GENERAL

MOUNTING ..... All 1948 Pontiac Cars
TUBES ..... Six, Plus Rectifier
SPEAKER ..... 8" Round Permanent Magnet
TUNING ..... Manual and 5 P. B. Mechanical
ANTENNA TRIMMER COMPENSATION
For Antennas Between 0.000055 - 0.000075 Mfd.
TUNING RANGE ..... 550-1600 KC.



MODEL 984248

PUSHBUTTON SET-UP PROCEDURE

Move spring on bottom of button to the left and pull button off. Turn reset screw one turn counterclockwise and push all the way in. Hold the reset screw in and tune in the desired station manually. Carefully release and tighten the reset screw. Replace button. Repeat procedure to set up other buttons.

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil
Generator Return ..... Receiver Chassis
Dummy Antenna ..... In Series With Generator
Volume Control Position ..... Maximum Volume
Tone Control Position ..... Treble
Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust In Sequence For Max. Output
1	0.1 Mfd.	Grid Side R. F. Trimmer "F_1" (See Parts Layout)	260 KC.	High Frequency Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC.	High Frequency Stop	E
3	0.000068 Mfd.	Antenna Connector	1430 KC.	Signal Generator Signal	F, G
4	0.000068 Mfd.	Antenna Connector	600 KC.	Signal Generator Signal	*H
5	0.000068 Mfd.	Antenna Connector	1615 KC.	High Frequency Stop	E
6	0.000068 Mfd.	Antenna Connector	1430 KC.	Signal Generator Signal	F, G

*Rock Gang Condenser Back and Forth Through Signal During This Adjustment.

With the Radio Installed and the Car Antenna Plugged In Adjust the Antenna Trimmer "G" for Maximum Volume With the Radio Tuned To a Weak Station Near 1400 KC. (See Sticker On Case).

MODEL GMC-2233029

GENERAL

MOUNTING—All 1947 GMC F. C. Trucks.

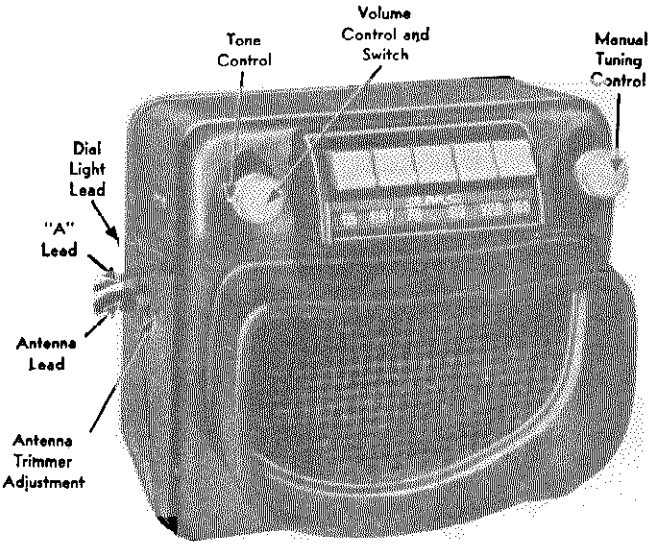
TUBES—Five, Plus Rectifier.

SPEAKER—6" x 9" Elliptical Electrodynamic.

TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION—
.000058-.000090 Mfd.

TUNING RANGE—550-1600 KC.



MODEL 2233029

PUSHBUTTON SET-UP

Press pushbutton to the left and pull out. Tune in desired station manually. Push button all the way in.

ALIGNMENT PROCEDURE

Volume Control Maximum.

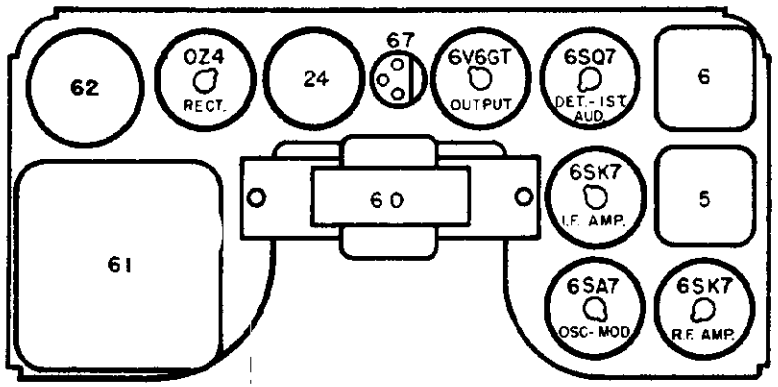
Signal generator output set to minimum.

Series Condenser Or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust Screws In Order
0.1 Mfd.	6SA7 Pin #8	262 KC	No broadcast Signal	A B C D
.000070 Mfd.	Antenna Connector	1615 KC	Extreme H. F. end of dial	*E F G
.000070 Mfd.	Antenna Connector	1400 KC	Signal generator	J H
.000070 Mfd.	Antenna Connector	1615 KC	Extreme H. F. end of dial	F G
.000070 Mfd.	Antenna Connector	1400 KC	Signal generator	J H

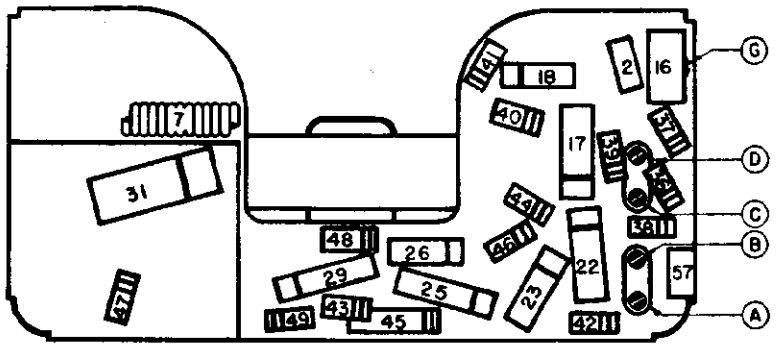
* Before making this adjustment check setting of oscillator core "K" with pointer against high frequency stop. The rear of the iron core should be 1¾" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustments are made by a bakelite screwdriver in slot in rear end of core. Reseal core studs to guide bar with glyptal.

Pointer calibration is made by tuning signal generator to 800 KC and the receiver to the signal. Adjust pointer to 800 KC with screw on pointer connecting link assembly.

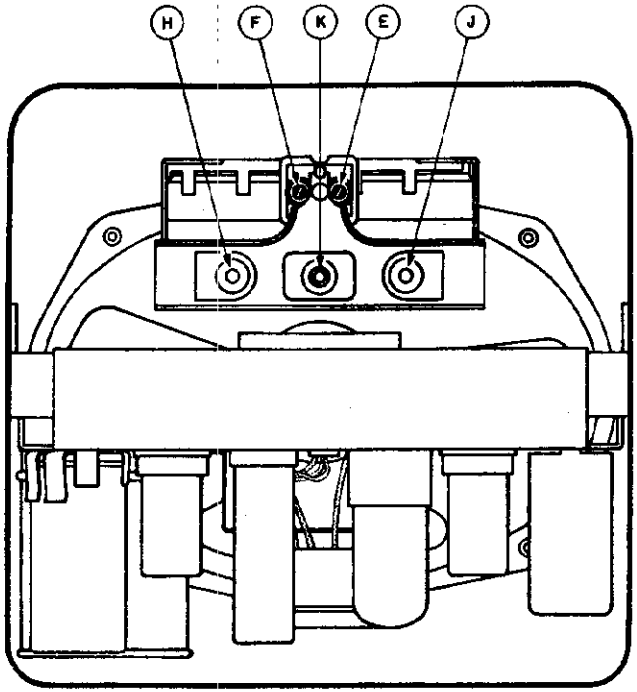
When radio is installed, adjust trimmer "G" to match car antenna at approximately 1400 KC.



PARTS LAYOUT — TUBE VIEW



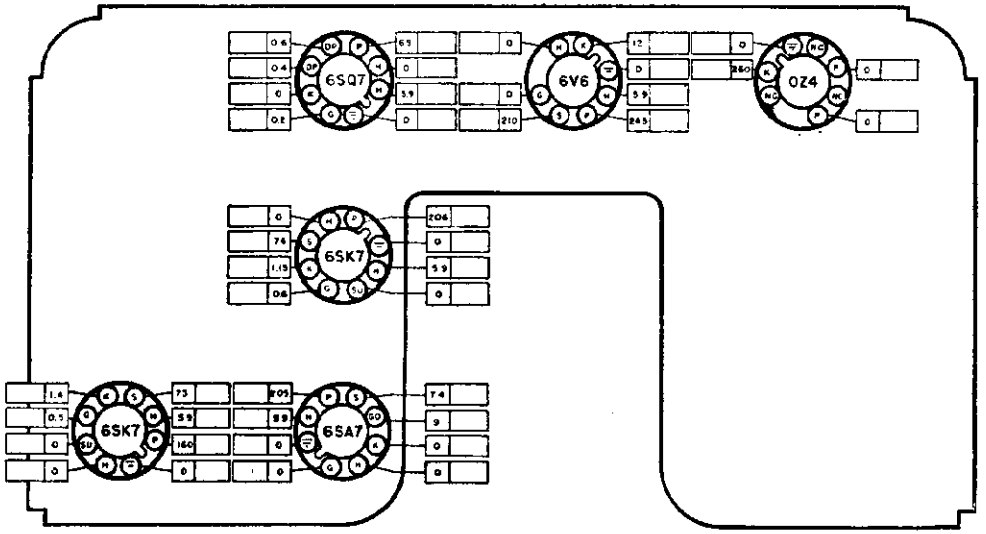
PARTS LAYOUT — CHASSIS VIEW



TRIMMER CHART

TUBE SOCKET VOLTAGE CHART

The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram on page 3 are shown below. The blank spaces are provided so the serviceman may fill in actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.



Voltages measured from socket terminals to ground. Voltmeter resistance .....ohms per volt. All readings taken with .....volts at spark plate. "A" current drain 6 to 6.5 amps with 6.0 volts at spark plate. "B" current drain 50 MA. with 6 volts at spark plate, voltage tolerance ±10%.

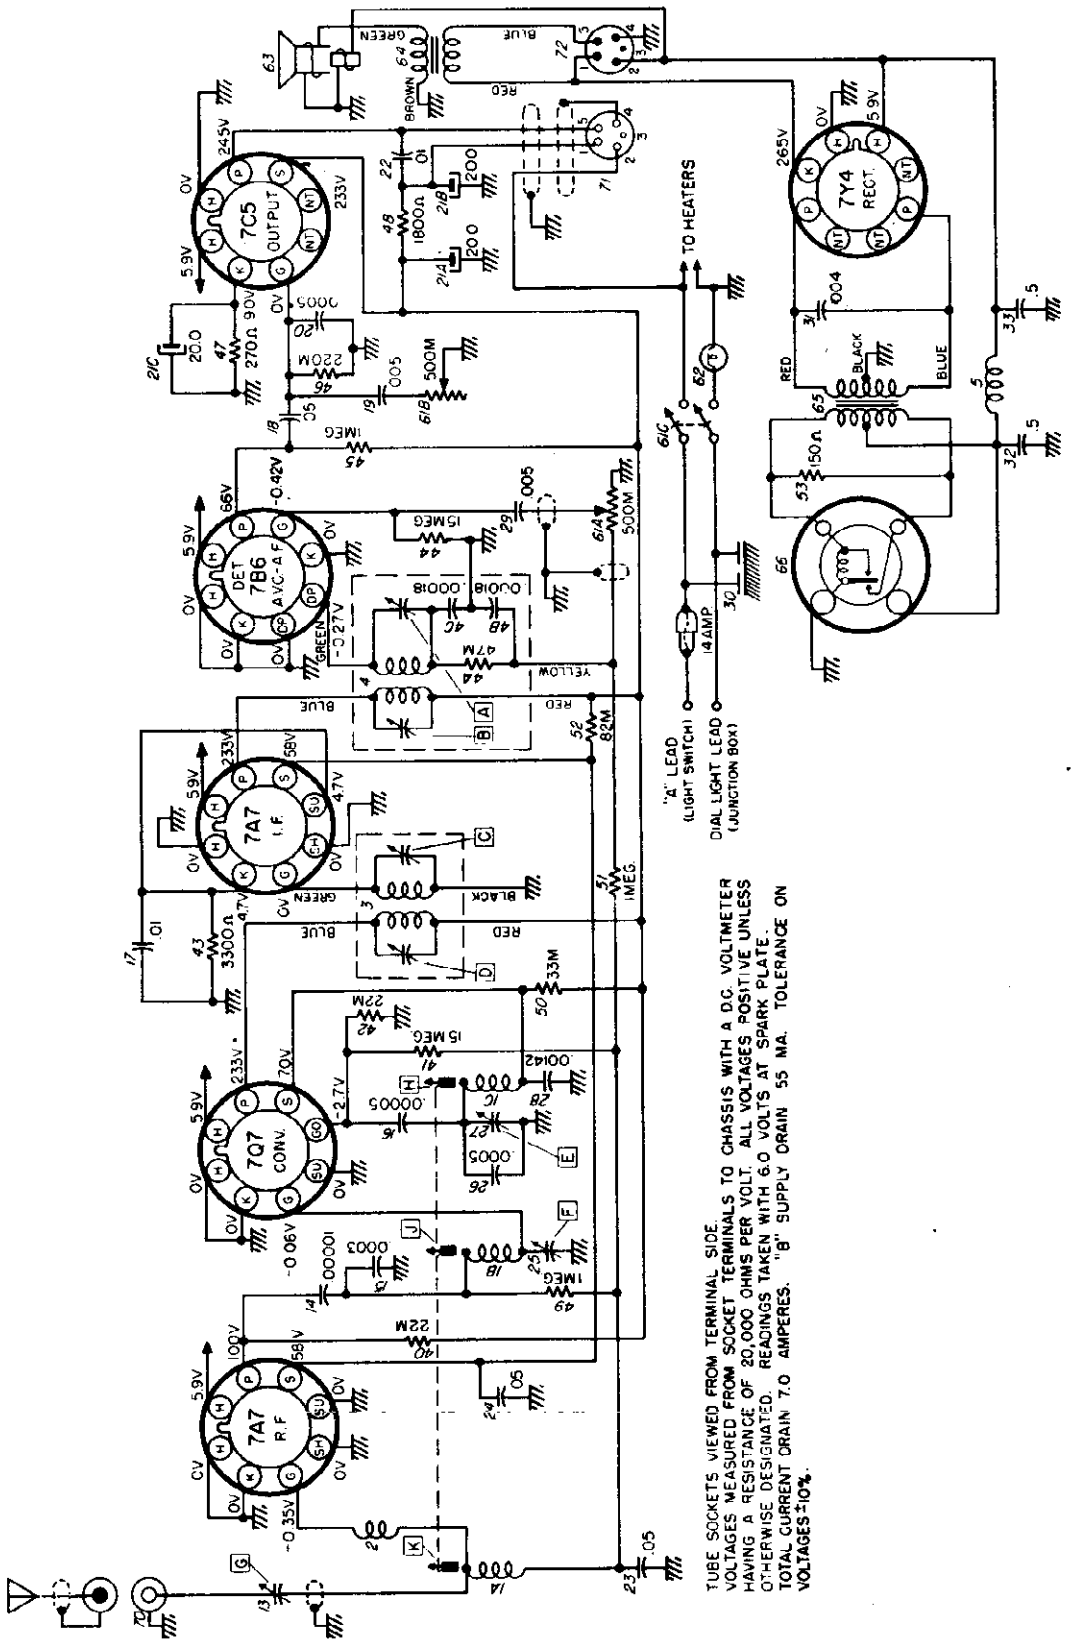
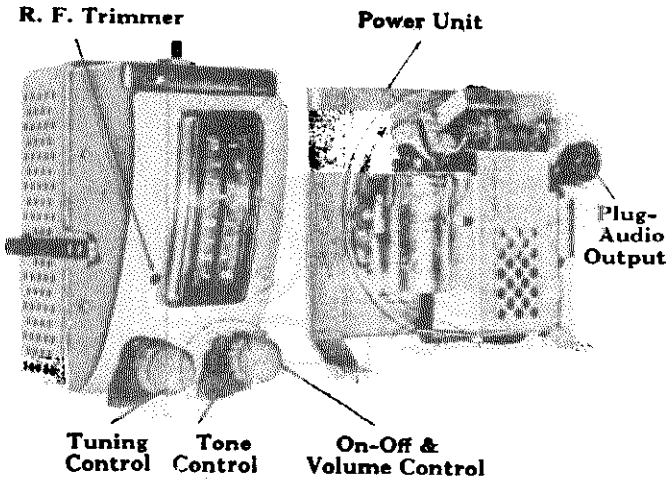
MODEL 986241

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.



UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODEL 986241



ALIGNMENT PROCEDURE:

Output Meter Connection ..... Across Voice Coil

Generator Return ..... To Receiver Chassis

Dummy Antenna ..... In Series With Generator

Volume Control Position ..... Maximum Volume

Tone Control Position ..... Treble

Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust In Sequence For Max. Output
1	0.02 Mfd.	7Q7 Grid (Pin #6)	257.5 KC.	High Frequency Stop	A, B, C, D
2	0.000065 Mfd.	Antenna Connector	1610 KC	High Frequency Stop	E, F, G
3	0.000065 Mfd.	Antenna Connector	1400 KC	Signal Generator Signal	H, J, K
4	0.000065 Mfd.	Antenna Connector	1610 KC	High Frequency Stop	F, G
5	0.000065 Mfd.	Antenna Connector	1400 KC	Signal Generator Signal	*Pointer Adjust. Screw

*Refer to the Pointer String Hookup drawing This should be adjusted so the pointer reads 1400 KC.

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station near 1400 KC.

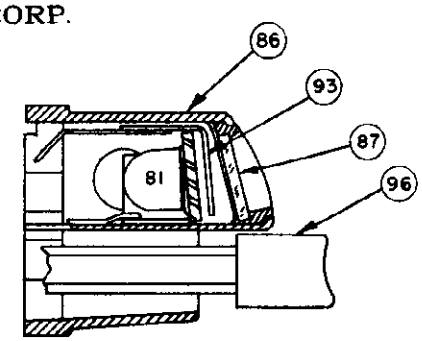
Signal Generator Return ..... To Chassis
Dummy Antenna ..... In Series with Generator
Volume Control ..... Maximum Volune
Tone Control ..... Treble
Generator Output ..... Minimum for Readable Indication



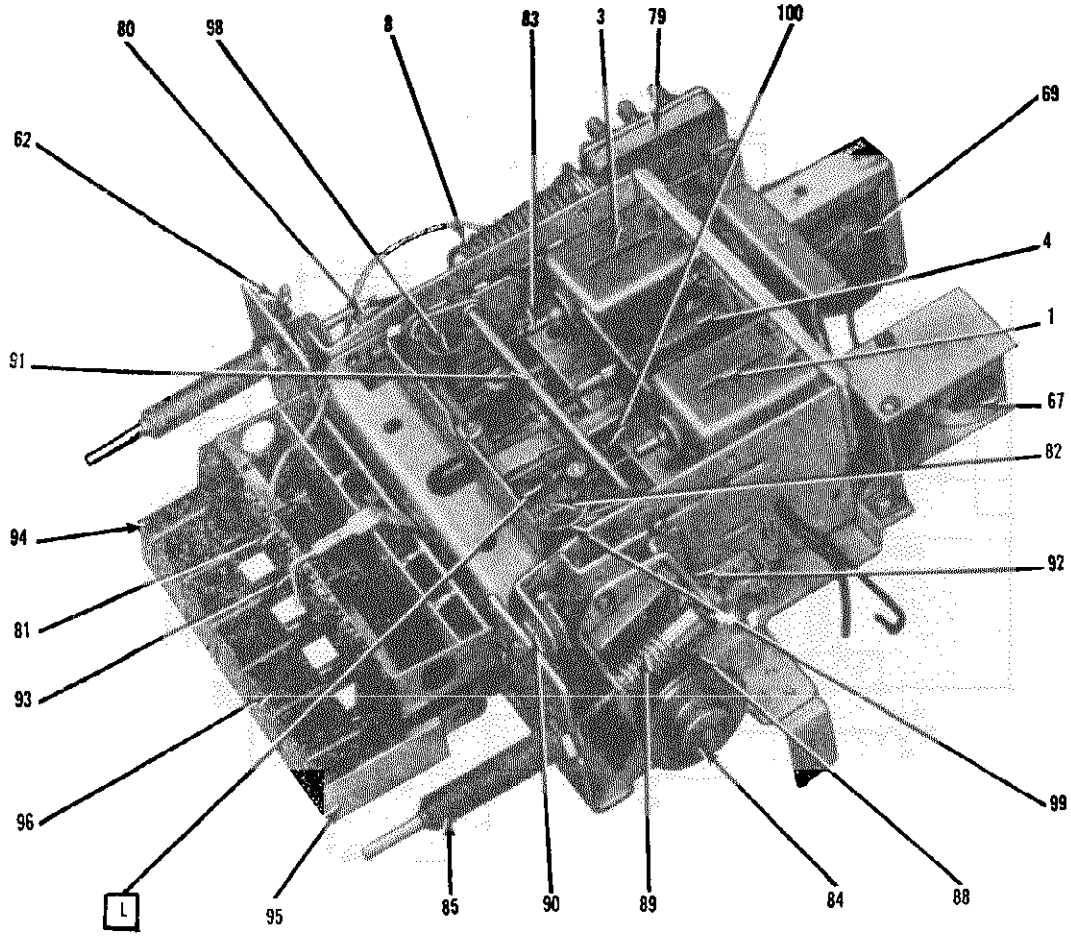
ESCUTCHEON CROSS SECTION

Steps	Series Condenser or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust In Sequence for Max. Output
1	0.1 Mfd.	6SA7 Grid (Pin #8)	260 KC	High Freq. Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	600 KC	Signal Gen. Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	F, G
5	0.000068 Mfd.	Antenna Connector	1430 KC	Signal Gen. Signal	L**

*Before making this adjustment check the mechanical setting of the oscillator core "H." The slotted end of the core should be 1¾" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form). Core adjustments are made from the mounting end of the coil form with an insulated screwdriver, and core studs should be sealed with glyptal or household cement after alignment.

**"L" is the pointer adjustment screw on the pointer connecting link (See tuner picture). Adjust so pointer reads 1430 KC.

With the radio installed and the car antenna plugged in adjust antenna trimmer "G" (See sticker on case) for maximum volume with the radio tuned to a weak station near 1400 KC.



TUNER

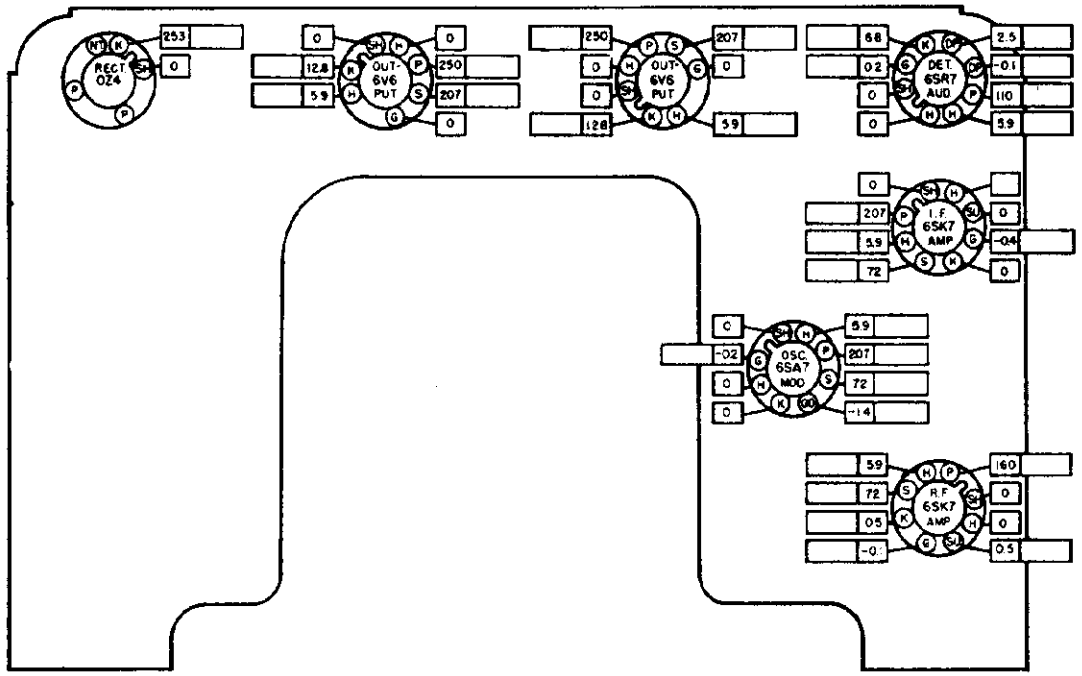
PARTS LAYOUT — CHASSIS VIEW

TUBE SOCKET VOLTAGE CHART



The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram, are shown above. The blank spaces are provided so that the serviceman may fill in actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.

Voltmeter resistance..... Ohms Per Volt.

Readings taken with .....Volts At Spark Plate.

All voltages measured from socket terminals to chassis.

GENERAL

MOUNTING—All 1948 Cadillac Cars.

TUBES—Six, Plus Rectifier.

SPEAKER — 6" x 9" Elliptical, Permanent Magnet.

TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION — 0.000060 - 0.000085 Mfd.

TUNING RANGE—550-1600 KC.

PUSHBUTTON SET-UP

Pull pushbutton to the right and out. Tune in desired station manually. Push button all the way in.

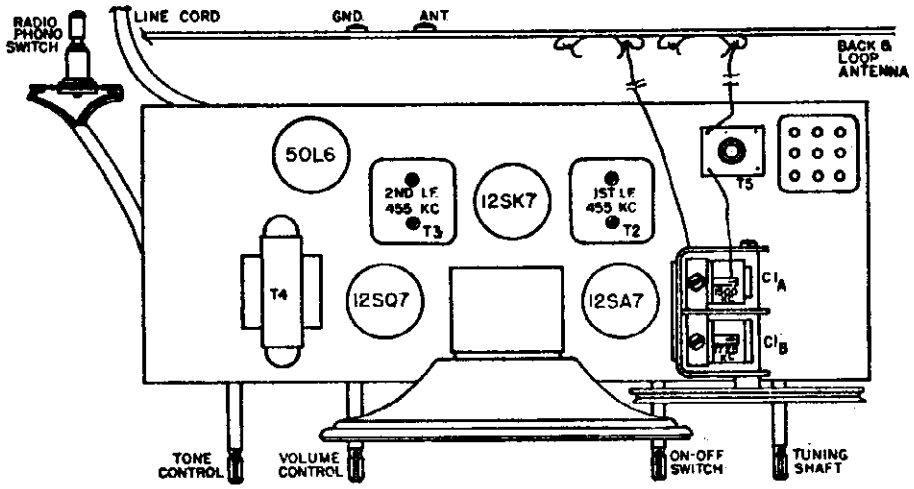
MODEL 12708 WARWICK MFG. CORP.



ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper **equipment.**

The alignment should be made with volume control fully on, and the output from the signal **generator as low as** possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 **milliwatts is** .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final **check.**

Position of Variable	Generator Frequency	Dummy Ant. Mid.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	* 12SA7 Grid (Stator of C1A)	T2	Input I.F.
Fully open	455 KC	.1	* 12SA7 Grid (Stator of C1A)	T3	Output I.F.
Fully open	1725 KC	.00025	* 12SA7 Grid (Stator of C1A)	C1B	Oscillator
Tune in signal from generator	1500 KC	.00025	**Loosely Coupled to Loop	C1A	Antenna

*Connect ground lead of signal generator to Common "B."

**Do not correct ground lead of signal generator.

DESCRIPTION

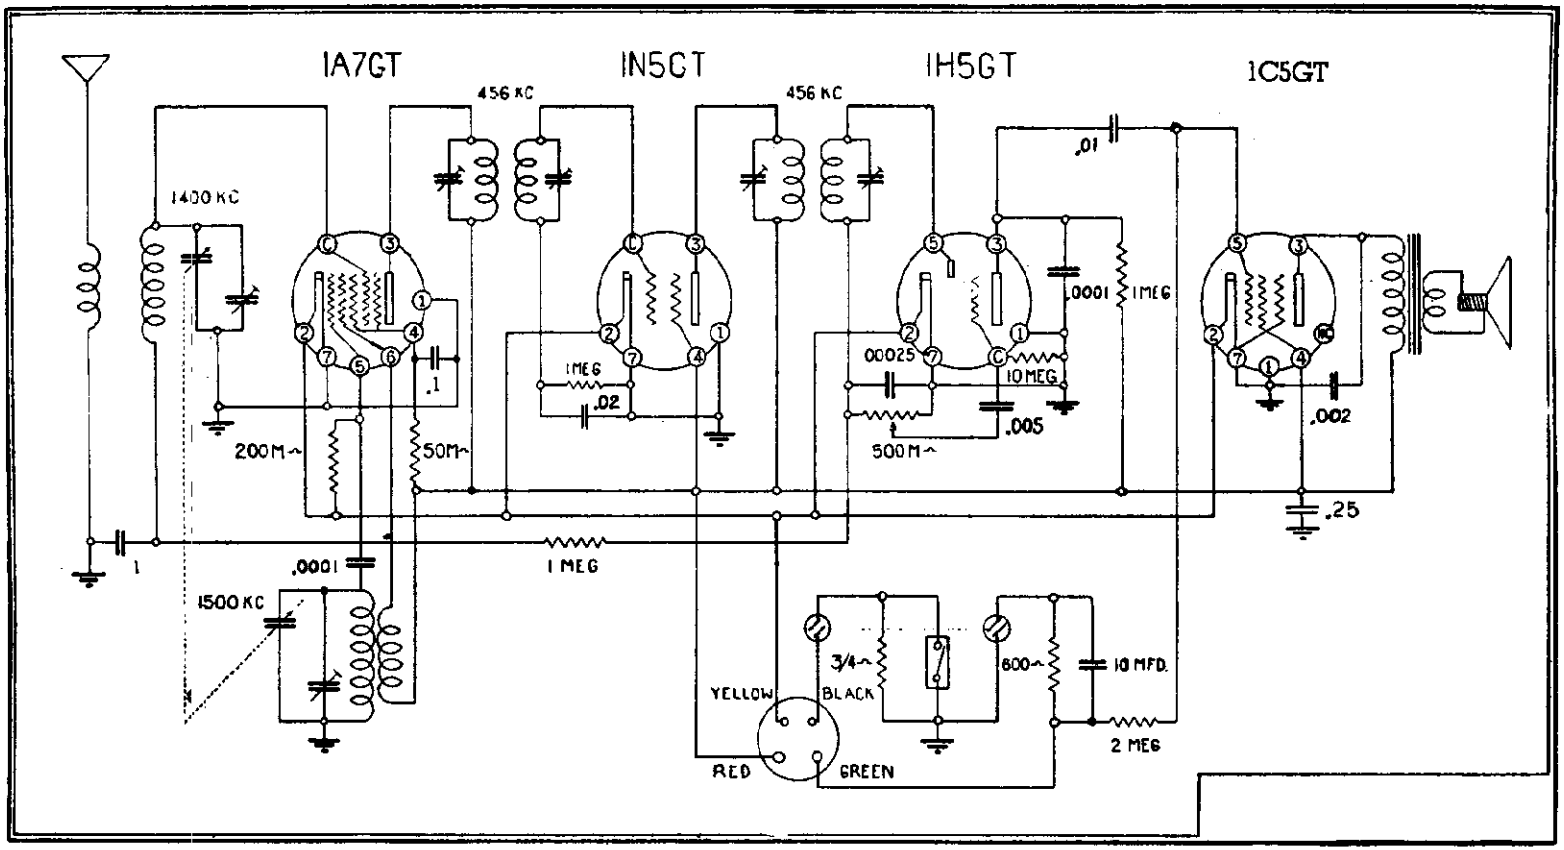
Model 12708 is a superhetrodyne radio receiver and phonograph combination designed for operation on a 117 volt 60 cycle A.C. power supply.

The tubes used are:—

12SA7—Mixer, Oscillator
12SK7—I. F. Amplifier
12SQ7—Det., AVC, Audio
50L6—Power Output
A83-391—Selenium Rectifier

This receiver covers the frequency range from 535 kilocycles to 1725 kilocycles (K.C.).

The record player used is the automatic type, capable of playing up to twelve 10 inch or ten 12 inch records automatically.

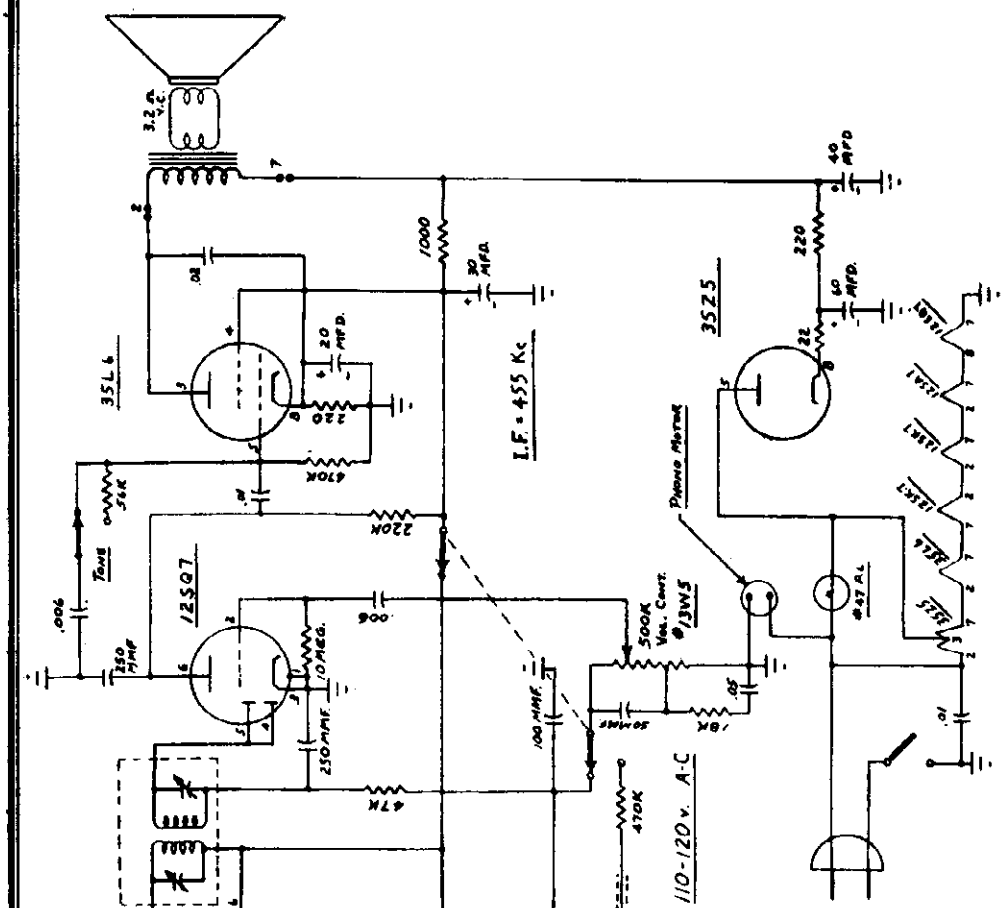


ALIGNMENT PROCEEDURE

I. F. ALIGNMENT: Turn volume control to FULL ON, connect signal generator to grid of the 1A7 tube through a .25 condenser. Connect ground of the signal generator to the ground lead of the receiver, set dial at 1000 K. C. and feed in a 456 K. C. signal and adjust first and second I. F. to maximum, then recheck first I. F.

R. F. ALIGNMENT: Turn dial to high frequency end, feed in a 1500 K. C. Signal to the receiver antenna lead through a .00025 mica condenser, adjust the 1500 K. C. oscillator trimmer until the maximum output is shown. Now, set generator at 1400 K. C. and tune in this signal on the receiver, then adjust the antenna trimmer to maximum output. This completes the alignment.

MODEL 4801 WATTERSON RADIO MFG. CORP.



The Watterson Model 4801 Receiver is a six tube (including rectifier) superheterodyne. The tubes used are a 12SA7 converter; two 12SK7 I. F. amplifiers; a 12SQ7 detector, AVC, and audio amplifier; a 35L6 beam power output; and a 35Z5 rectifier. The receiver tunes the broadcast band from 540 kc. to 1620 kc. A three position tone control is employed.

R. F. Alignment

Set signal generator to 600 kc. and receiver dial to approximately 600 kc. While "rocking" receiver dial, adjust oscillator padder for maximum output. Recheck adjustments at 1400 kc.

Connect "high" side of signal generator to the antenna lead of the receiver. Set gang to full open position and peak the oscillator trimmer using a 1620 kc. signal. Set the signal generator to 1400 kc., and tune receiver for maximum output. Now peak the antenna trimmer.

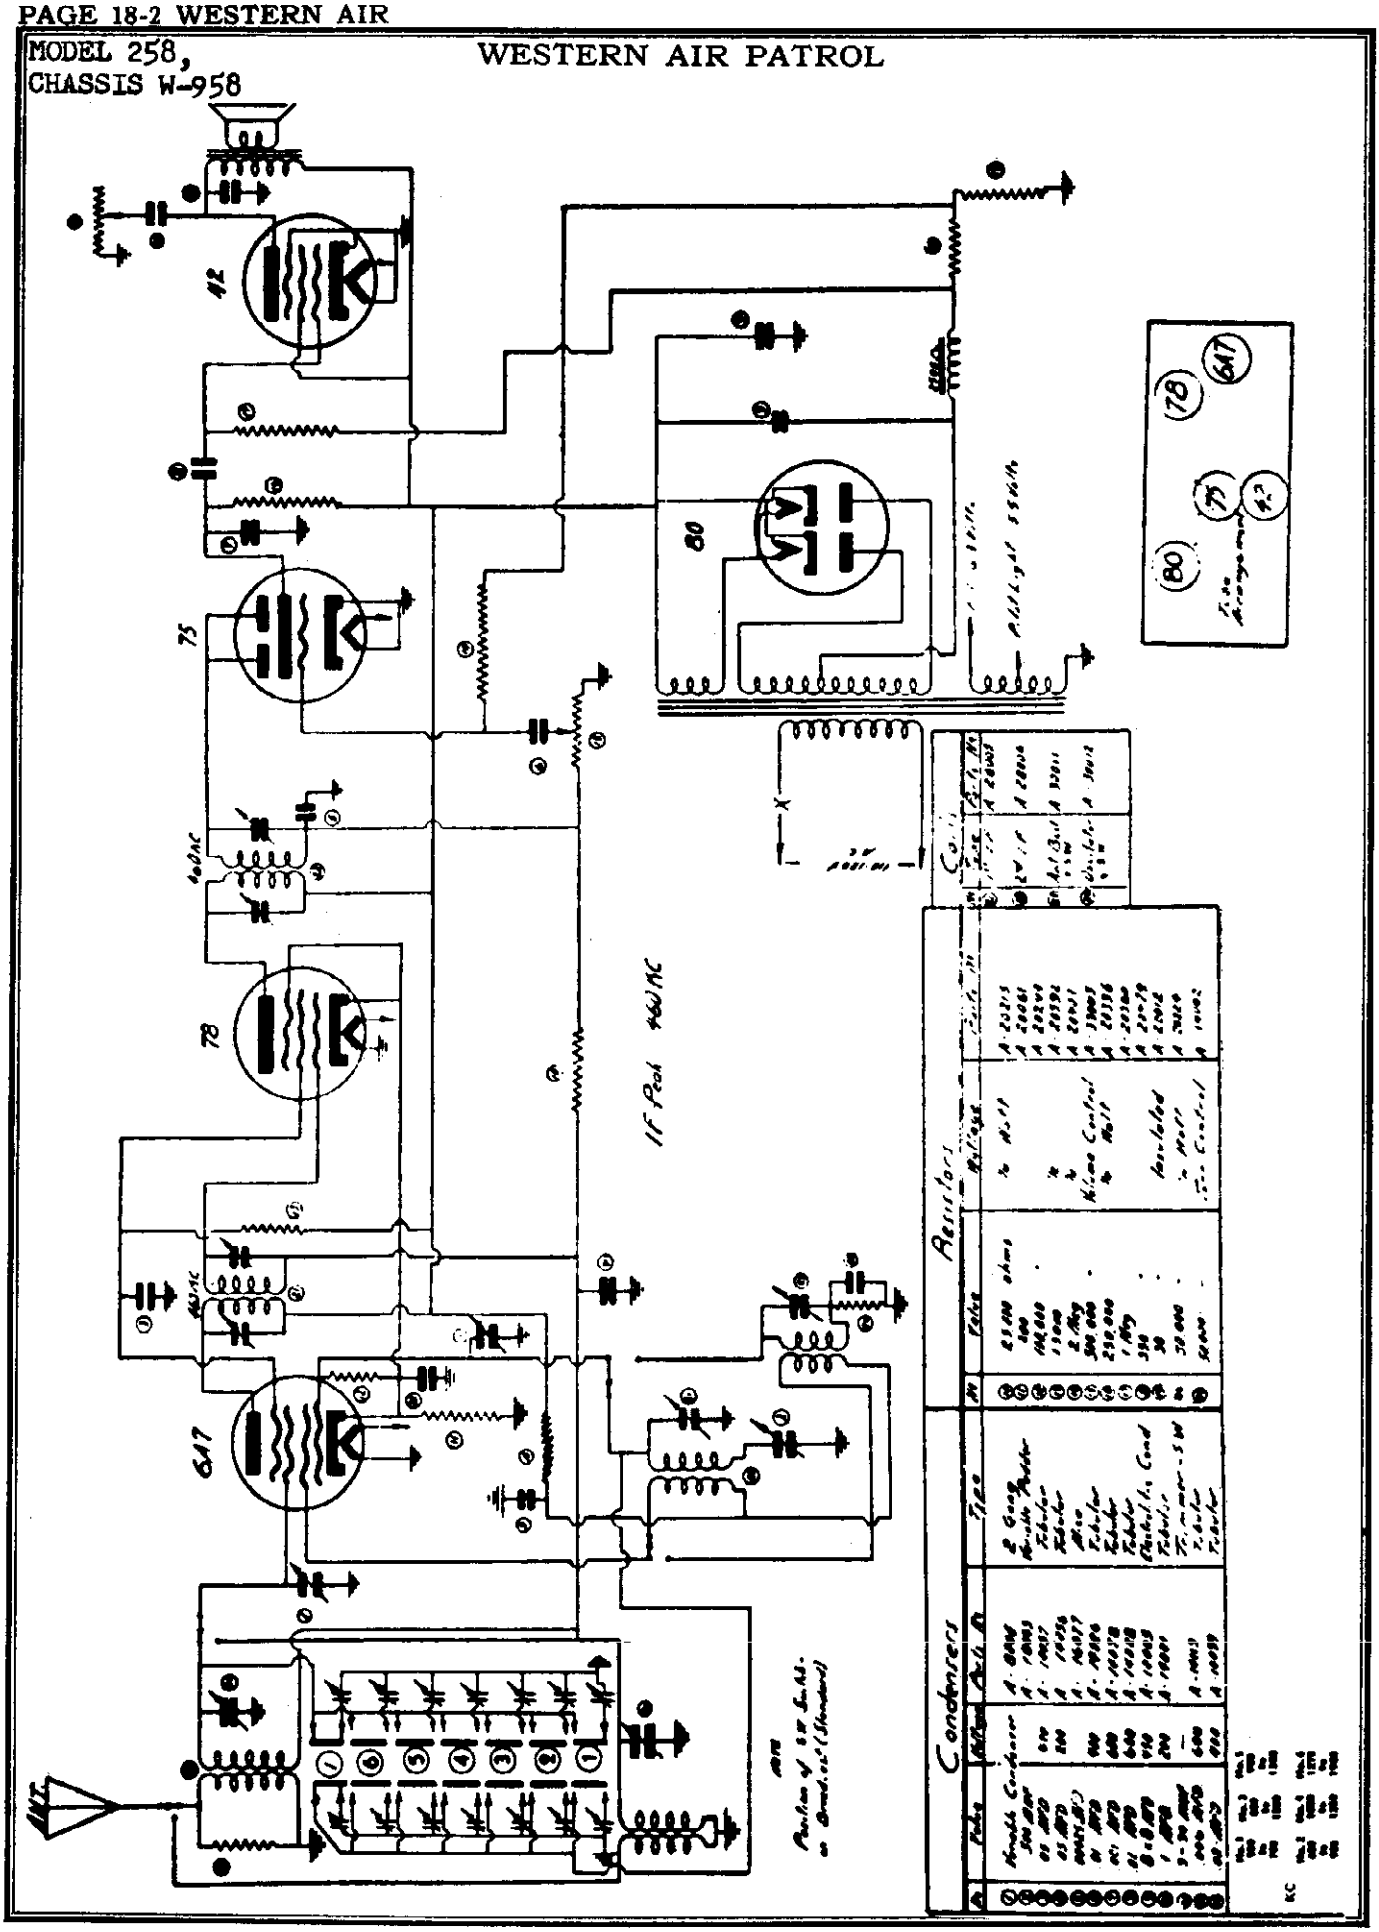
I. F. Alignment

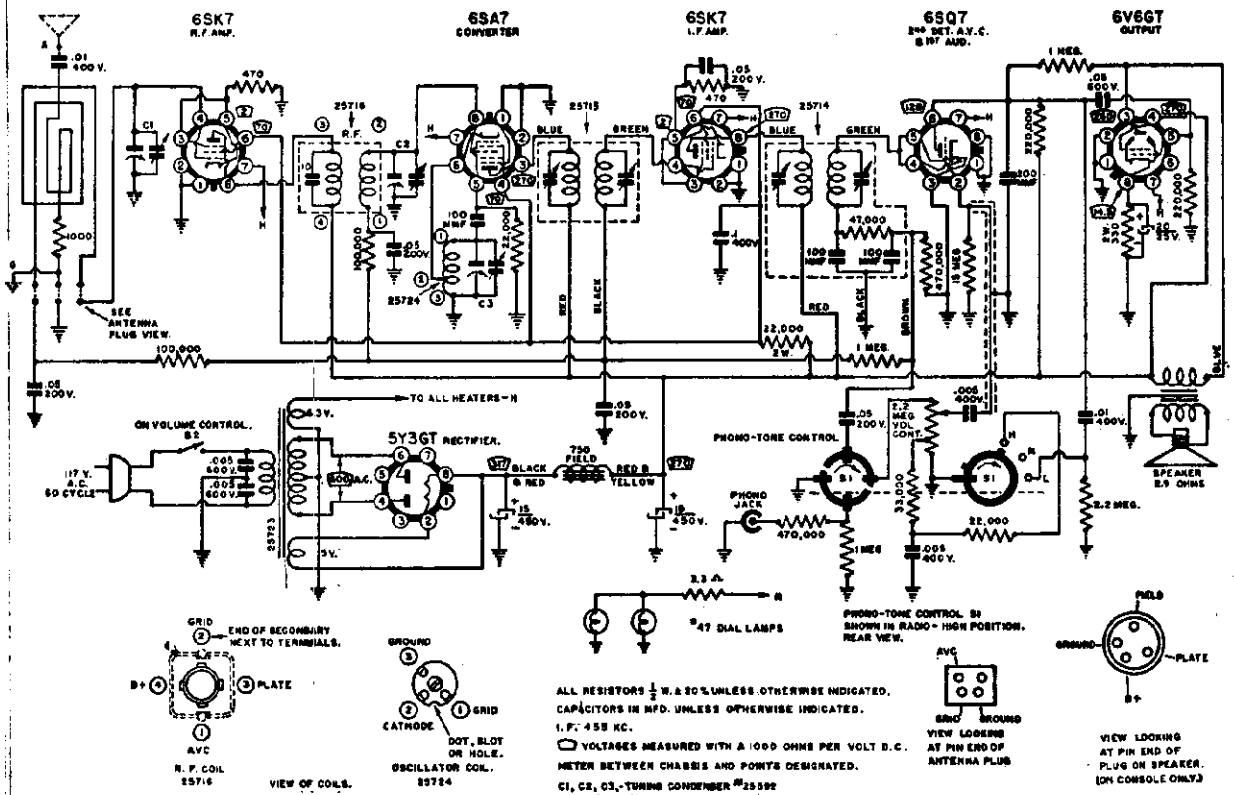
Connect the low side of an accurately calibrated signal generator through a .1 mfd. condenser to the chassis of the receiver and the "high" side of the generator through a .1 mfd. condenser to the R. F. grid (pin 8) of the 12SA7 converter tube. Set the signal generator to 455 Kc. with just enough signal to be audible in the speaker with the receiver volume control full on. If possible, an output meter should be used.

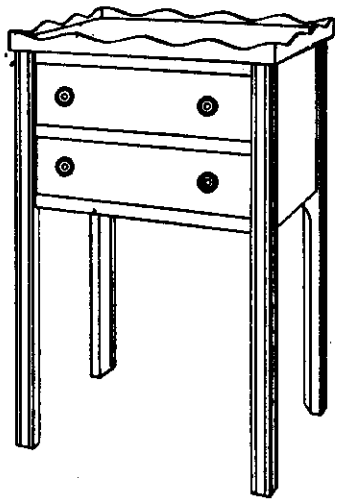
Adjust the second I. F. transformer and then the first I. F. transformer for maximum output. Recheck all adjustments.

MODEL 258,
CHASSIS W-958

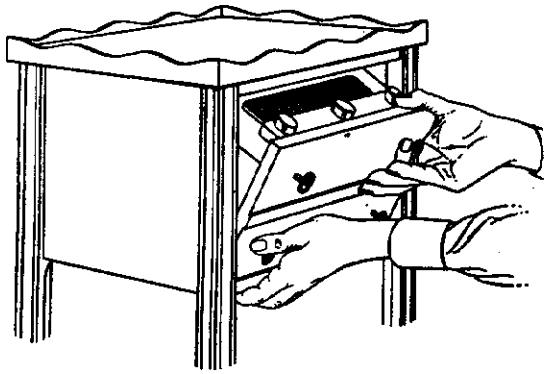
WESTERN AIR PATROL







DIAL SCALE REPLACEMENT—Remove chassis. Remove pointer track by removing the two wood screws holding it to the cabinet. Dial scale may now be lifted out from front of cabinet. When installing new scale —see that long screws in track bracket engage the notches in the ends of the scale.



Part No.	Description

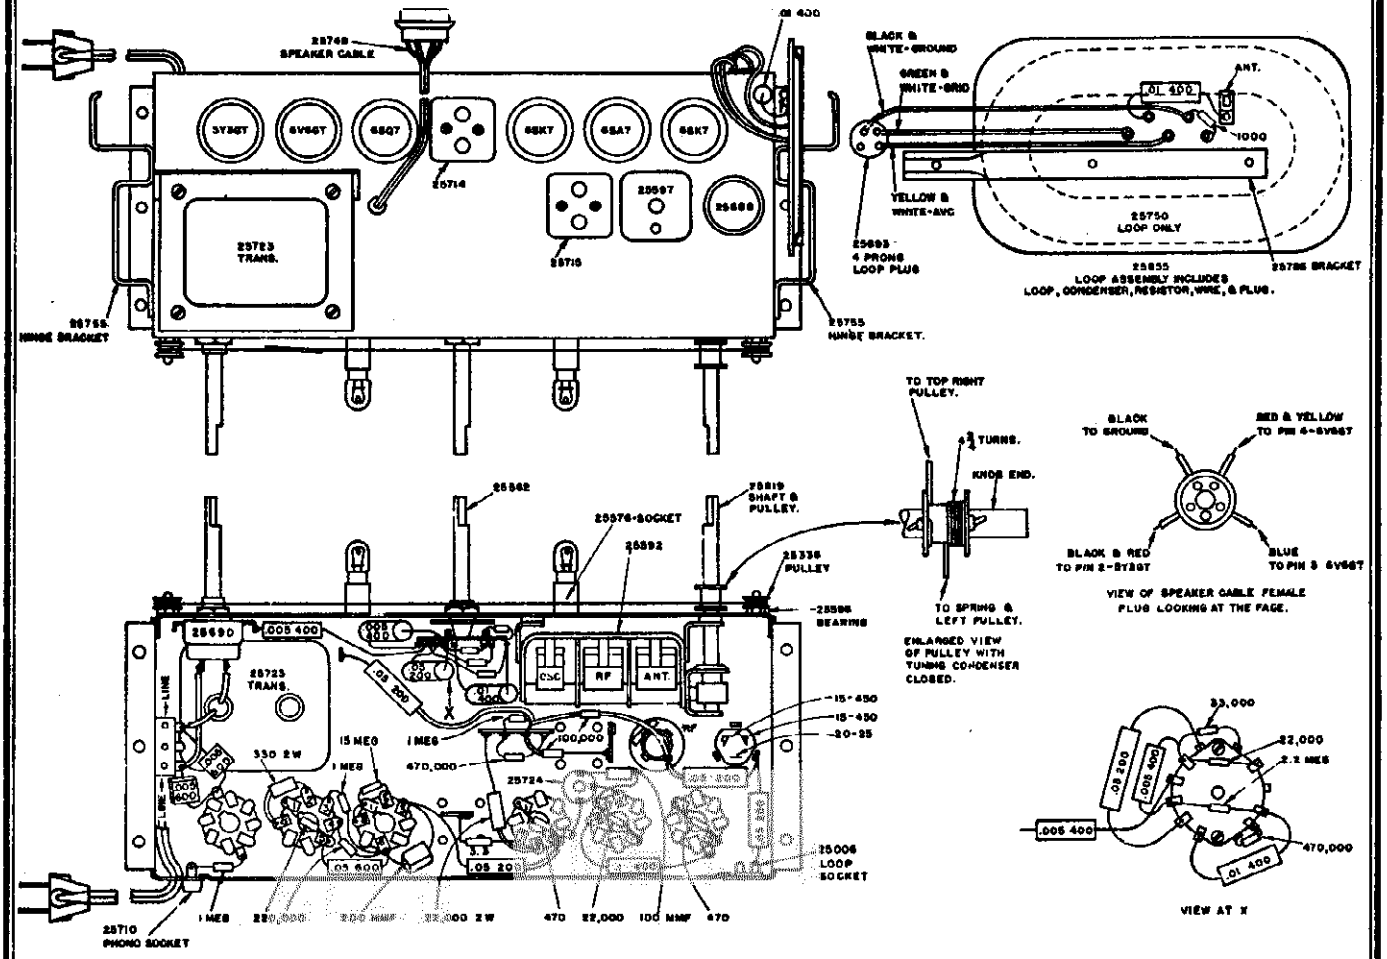
25728	Cabinet
25597	Coil—R. F.
25724	Coil—Oscillator
25688	Condenser—Filter 15-450, 15-450, 20-25
25592	Condenser—Tuning C-1, C-2, C-3
25690	Control—Volume (with AC Switch S-2)
25068	Cord—AC and Plug
25834	Cord—Dial (includes Spring and Pointer Coupling)
25779	Dial Scale—Glass
25578	Dial Pointer
25829	Knob—Tone
25696	Knob—Volume and Tuning
25710	Phono—Pick-Up Socket
25693	Plug—For Loop

Part No.	Description
25336	Pulley—Wood—Small
25819	Pulley—Manual Drive With Shaft
25607	Rubber—Grommets
25774	Screw—Set For Worm Gear (Tuning Condenser)
25576	Socket—Dial Lamp
25620	Socket—Octal
25006	Socket—For Loop
25754	Speaker—With Transformer
25562	Switch—Tone S-1,
25711	Track—Pointer
25715	Transformer—I. F. Input
25714	Transformer—I. F. Output
25713	Transformer—Output—Speaker
25723	Transformer—Power 60 Cycles

Note: Resistors and condensers not listed will be supplied on order—specify value.

MODEL D1612

WESTERN AUTO SUPPLY CO.



Generator to antenna clip through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (complete out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping pointer coupling on dial cord.

DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 25834 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

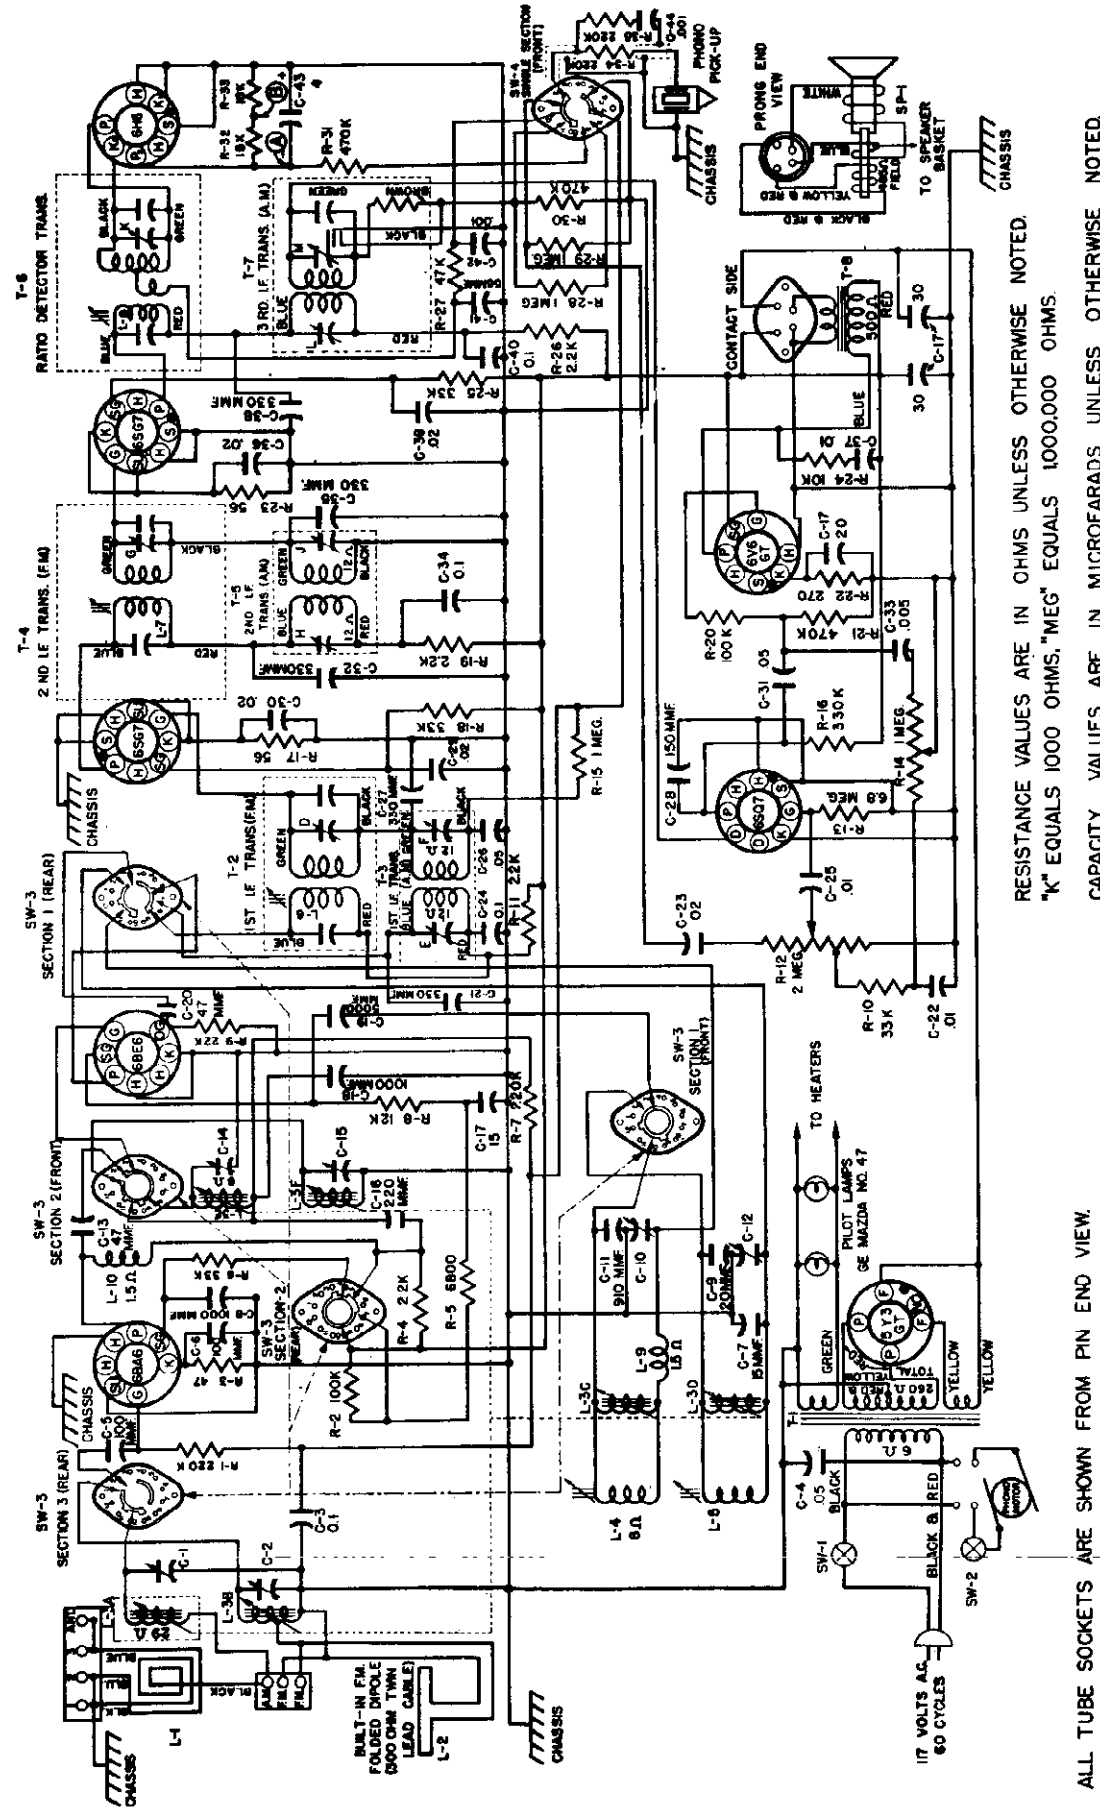
INSTALLING CHASSIS AND FRONT ASSEMBLY IN CABINET—Just reverse the procedure given above for removal of chassis—connect speaker socket, carefully place set in position shown in the picture, and it will then drop down on the hinge pins and be ready to operate in normal manner.

ALIGNMENT—Sets are properly aligned at the factory with precision equipment and the adjustments should not be disturbed unless a coil, tuning condenser or IF transformer has to be replaced or the set has been subject to damage or tampering. Alignment should only be done with the aid of an accurate signal generator and output indicating instrument.

TO PROPERLY ALIGN—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a Signal Generator adjusted to 455 KC, connected to the grid of the 6SA7 through a .1 Mfd. condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, carefully place loop in normal relation to chassis, connect Signal

REMOVAL OF CHASSIS FROM CABINET—The chassis proper is mounted to the cabinet front and the assembly is supported on "hook" hinges within the cabinet. For general inspection and tube replacement, the assembly may be removed. First remove the power cord from the wall outlet. Tilt the front to the partial open position shown in the picture, then carefully lift up and slightly forward until the assembly is "free." While holding the assembly just below and in front of the cabinet, reach inside and disconnect the speaker cable by pulling forward on the cable and plug. The assembly may then be placed on the floor or a table for inspection.

WESTERN AUTO SUPPLY CO. MODEL D1752



MODEL D1752 WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

First determine if factory adjustments of the permeability tuner cores have been altered. This may be done by checking core positions against dimensions shown in tuner illustration. Broken wax seals on the core adjustments may also indicate altering. If the slug adjustments have been changed, it will be necessary to first adjust them in accordance with the dimensions given in tuner illustration before proceeding with alignment.

The following equipment is necessary to properly align this receiver:

1. AM signal generator with frequency coverage from 455 kc. to 1700 kc.
2. FM or CW signal generator covering the FM band from 87.25 mc. to 108.75 mc. and the 10.7 mc. frequency for FM IF alignment.
3. Vacuum Tube Voltmeter (VTVM).
4. Output meter—to match 4 ohms, 5 watts maximum.
5. Insulated alignment screwdriver.
6. Dummy antenna—0.1 mfd. capacitor, 300 ohm carbon resistor and inductive loop (fashioned from several turns of wire).

NOTE: **Oscilloscope equipment not required if aligned according to the following procedure:**
The accuracy of the AM RF and AM antenna slug adjustments may be determined by noting the trimmer adjustment at each end of the band when the oscillator is set for proper coverage. The proper setting of the AM or FM oscillator slugs is indicated by proper tracking of the receiver at the center of the respective band. The FM RF and FM antenna slugs must be adjusted to dimensions given in the permeability tuner illustration.

Reference Notes to Alignment Chart on Following Page.

Note 1—If 1620 kc. signal is received lower in frequency than the 1620 kc. dial calibration, turn BC oscillator shunt tracking adjustment (L-4) outward. Retrack at 535 kc. (Step 2). If higher than the 1620 kc. dial calibration, screw adjustment inward and retrack at 535 kc. Repeat until 535 kc. and 1620 kc. signals coincide with their respective dial calibrations.

Note 2—Adjust input voltage to give approximately 5 volts AVC before final adjustment is made.

For STEPS 6 and 8A—Voltmeter "common" lead to chassis.

For STEP 7—Voltmeter "common" lead to point "B" on wiring diagram. The desired zero position is at the point where the meter indicates a polarity change from plus to minus or vice-versa.

Note 3—For all tests requiring an FM signal, the generator output (22.5 kc. deviation, 400 cycles) must be adjusted to give approximately one-half watt receiver output before final adjustments are made. Either STEP 8A or 8B may be used depending on equipment available.

Note 4—If 108.75 mc. signal is received lower in frequency than the 108.75 mc. dial calibration, turn FM oscillator shunt tracking adjustment (L-5) outward. Retrack at 87.25 mc. (STEP 9). If higher than the 108.75 mc. dial calibration, screw adjustment inward and retrack at 87.25 mc. Repeat until 87.25 mc. and 108.75 mc. signals coincide with their respective dial calibrations.

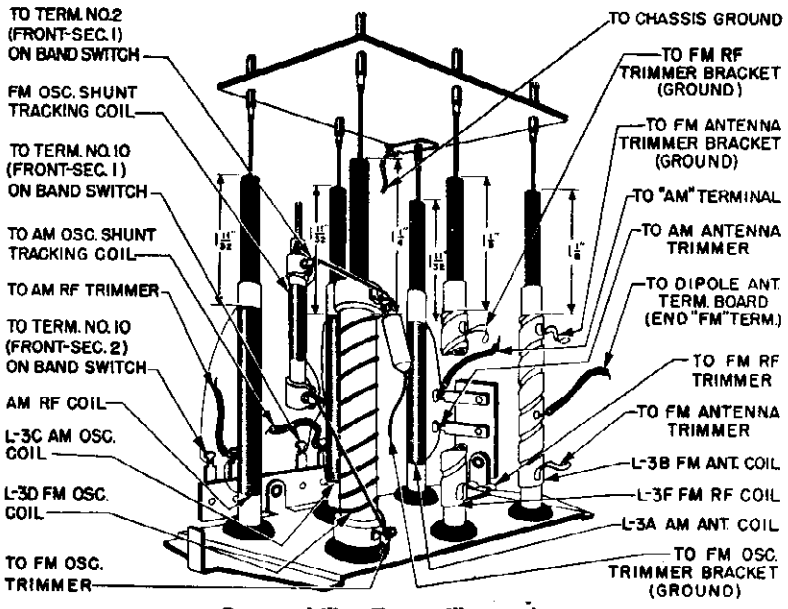
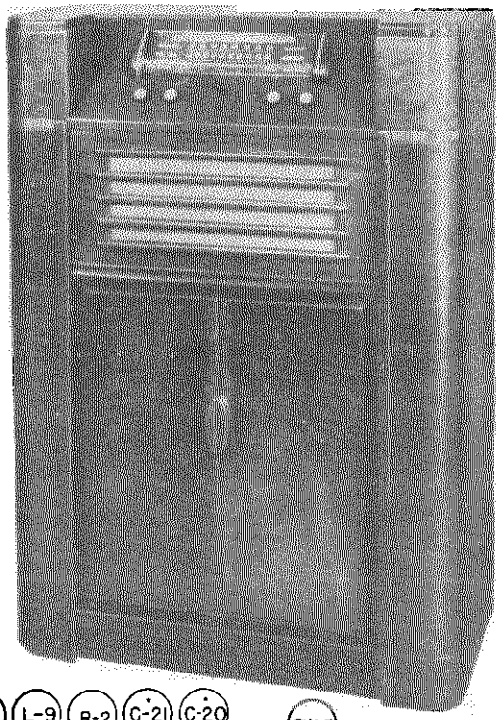
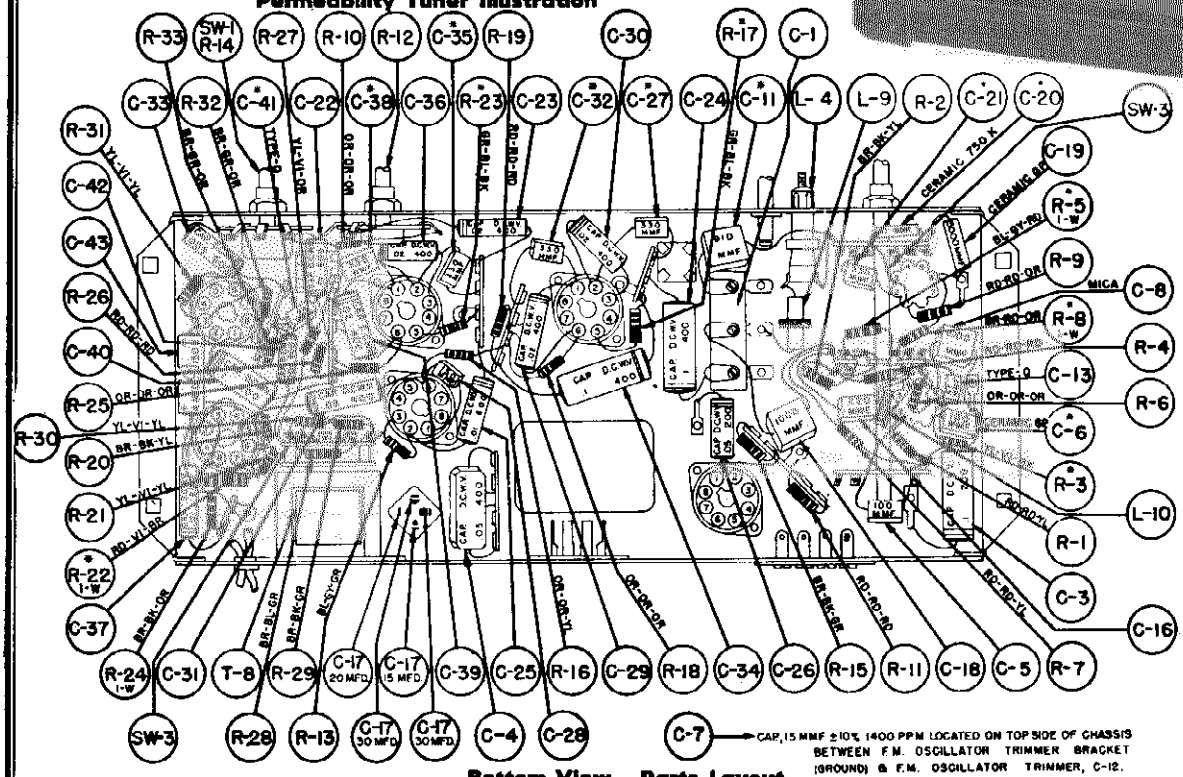
WESTERN AUTO SUPPLY CO.

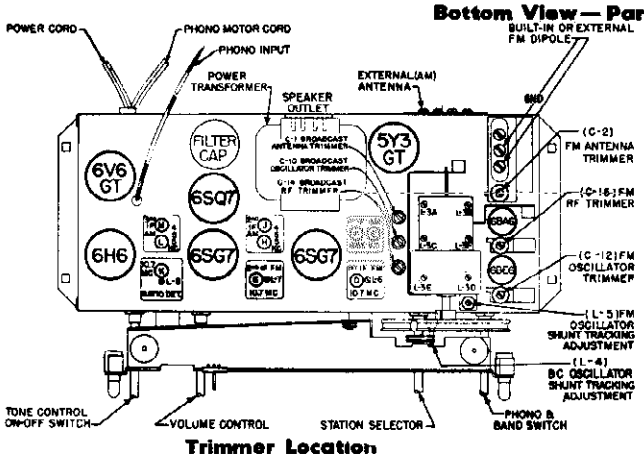


Permeability Tuner Illustration

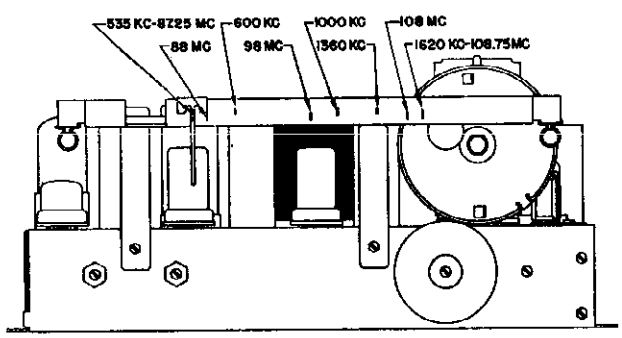




Bottom View—Parts Layout



Trimmer Location

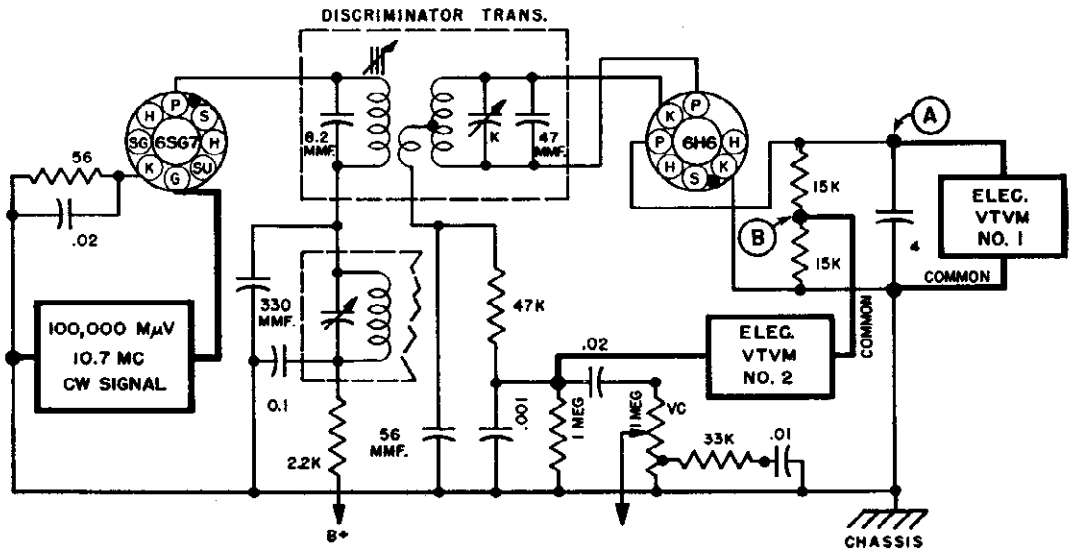


Calibration Points

RATIO DETECTOR

Proper operation of the ratio detector stage is extremely important for best performance on the FM band of this receiver.

The performance of the ratio detector stage may be checked by closely following the procedure and diagram given below.



Wiring Diagram—Ratio Detector

1. After setting up the signal generator and VTVM, turn the trimmer adjustment screw "K" until tight. Turn the core adjustment "L" to maximum counterclockwise position. These two adjustments are on the top of the Ratio Detector transformer. (See Trimmer Location diagram.)

2. Now turn adjustment "L" clockwise until VTVM in No. 1 position indicates maximum voltage. This maximum value should be from five to seven volts with input as indicated in above diagram. Then slowly turn adjustment "K" in a counterclockwise direction, observing VTVM in No. 2 position. It will approach a maximum value and then rapidly drop to zero. If adjustment "K" is turned beyond this point, VTVM in No. 2 position will indicate a polarity change. The proper adjustment of "K" is at the point where the VTVM indicates zero volts between the polarity change.

3. Shift the 10.7 mc. signal to 10.725 mc. (10.7 mc. +25 kc.). VTVM in No. 2 position should now indicate a plus .3 volts minimum.

4. Change the 10.725 mc. signal to 10.675 mc. (10.7 mc. —25 kc.). VTVM in No. 2 position should indicate a minus .3 volts minimum. STEPS 3 and 4 constitute a sensitivity check on the ratio detector transformer.

5. Place the polarity switch of VTVM in No. 2 position to "plus" position and observe VTVM as the frequency of the signal generator is increased above 10.7 mc. It should indicate an increasing positive voltage. Continue increasing the frequency until the meter indicates a peak and begins to decrease. Reduce the generator frequency slightly until the peak is obtained. Record the generator frequency.

6. Set the polarity switch of VTVM to "minus" position. Repeat STEP 5, reducing the generator frequency from 10.7 mc. instead of increasing. Record the generator frequency when VTVM in No. 2 position indicates a peak.

7. The difference between the generator frequencies noted in STEPS 5 and 6 is the "Static Band Width" of the Ratio Detector transformer. This should be approximately 220 kc.

MODEL D1752 WESTERN AUTO SUPPLY CO.

ELECTRICAL AND MECHANICAL DATA

Frequency Range.....(AM) 535 KC to 1620 KC
Intermediate (FM) 87.25 MC to 108.75 MC

NOTE: All DC voltages measured with a 1000 ohm-per-volt meter from B— to socket contact indicated. All voltages are positive DC unless otherwise marked. Volume control full on. Zero signal input. Tone control in clockwise position. Band switch in "AM" position. Line voltage 117 volts, 60 cycle AC.

CHASSIS REMOVAL – Remove the receiver power cord from the electrical outlet before starting to remove chassis.

1. Turn the tuning control so that the dial pointer is in the extreme left-hand position (low frequency end).
2. Unhook the dial cable from dial pointer and slide the pointer to center of cutout in the pointer track. The dial pointer may be removed, if necessary, by turning it clockwise and clearing it through the cutout.
3. Remove the loop and dipole antennae leads from their respective terminals.
4. Detach the phono-motor cord (plug and socket connection).
5. Remove the phono input leads at the terminal board on the chassis shelf and remove the speaker plug from receptacle at back of chassis.
6. Remove knobs and the four chassis mounting screws. The chassis can now be removed from the cabinet.

DRIVE CORD REPLACEMENT

The drive cord should be replaced as shown on the accompanying illustration using a new 10X66 drive cord assembly for the purpose. After the cord has been installed, stretch the tension spring and fasten the free end of the cord to it.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

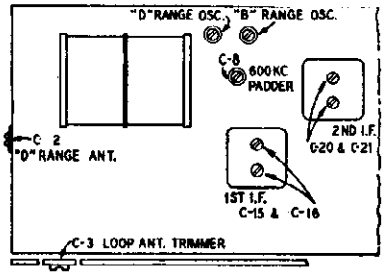
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	50 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)
	600 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	600 KC (C8) See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.					
RANGE D	18.3 MC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 MC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output See Note A	Ant. Range B (C3)



NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth and adjust the trimmer until peak of greatest intensity is obtained.

SPECIFICATIONS

Power Consumption .....45 Watts (At 117 volts AC)

Power Output .....4 Watts Maximum 2.3 Watt 10% Harmonics

Selectivity .....40KC Broad at 1000 times Signal

Intermediate Frequency .....455 KC

Speaker .....12" PM Dynamic

Tuning Frequency Range

B Range .....540 to 1600 KC

D Range .....5.75 to18.3 MC

Sensitivity (For .05 watt output—External Antenna).

B Range .....9 Microvolts Average

D Range .....20 Microvolts Average

REMOVAL OF CHASSIS FROM CABINET

Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assemblies may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

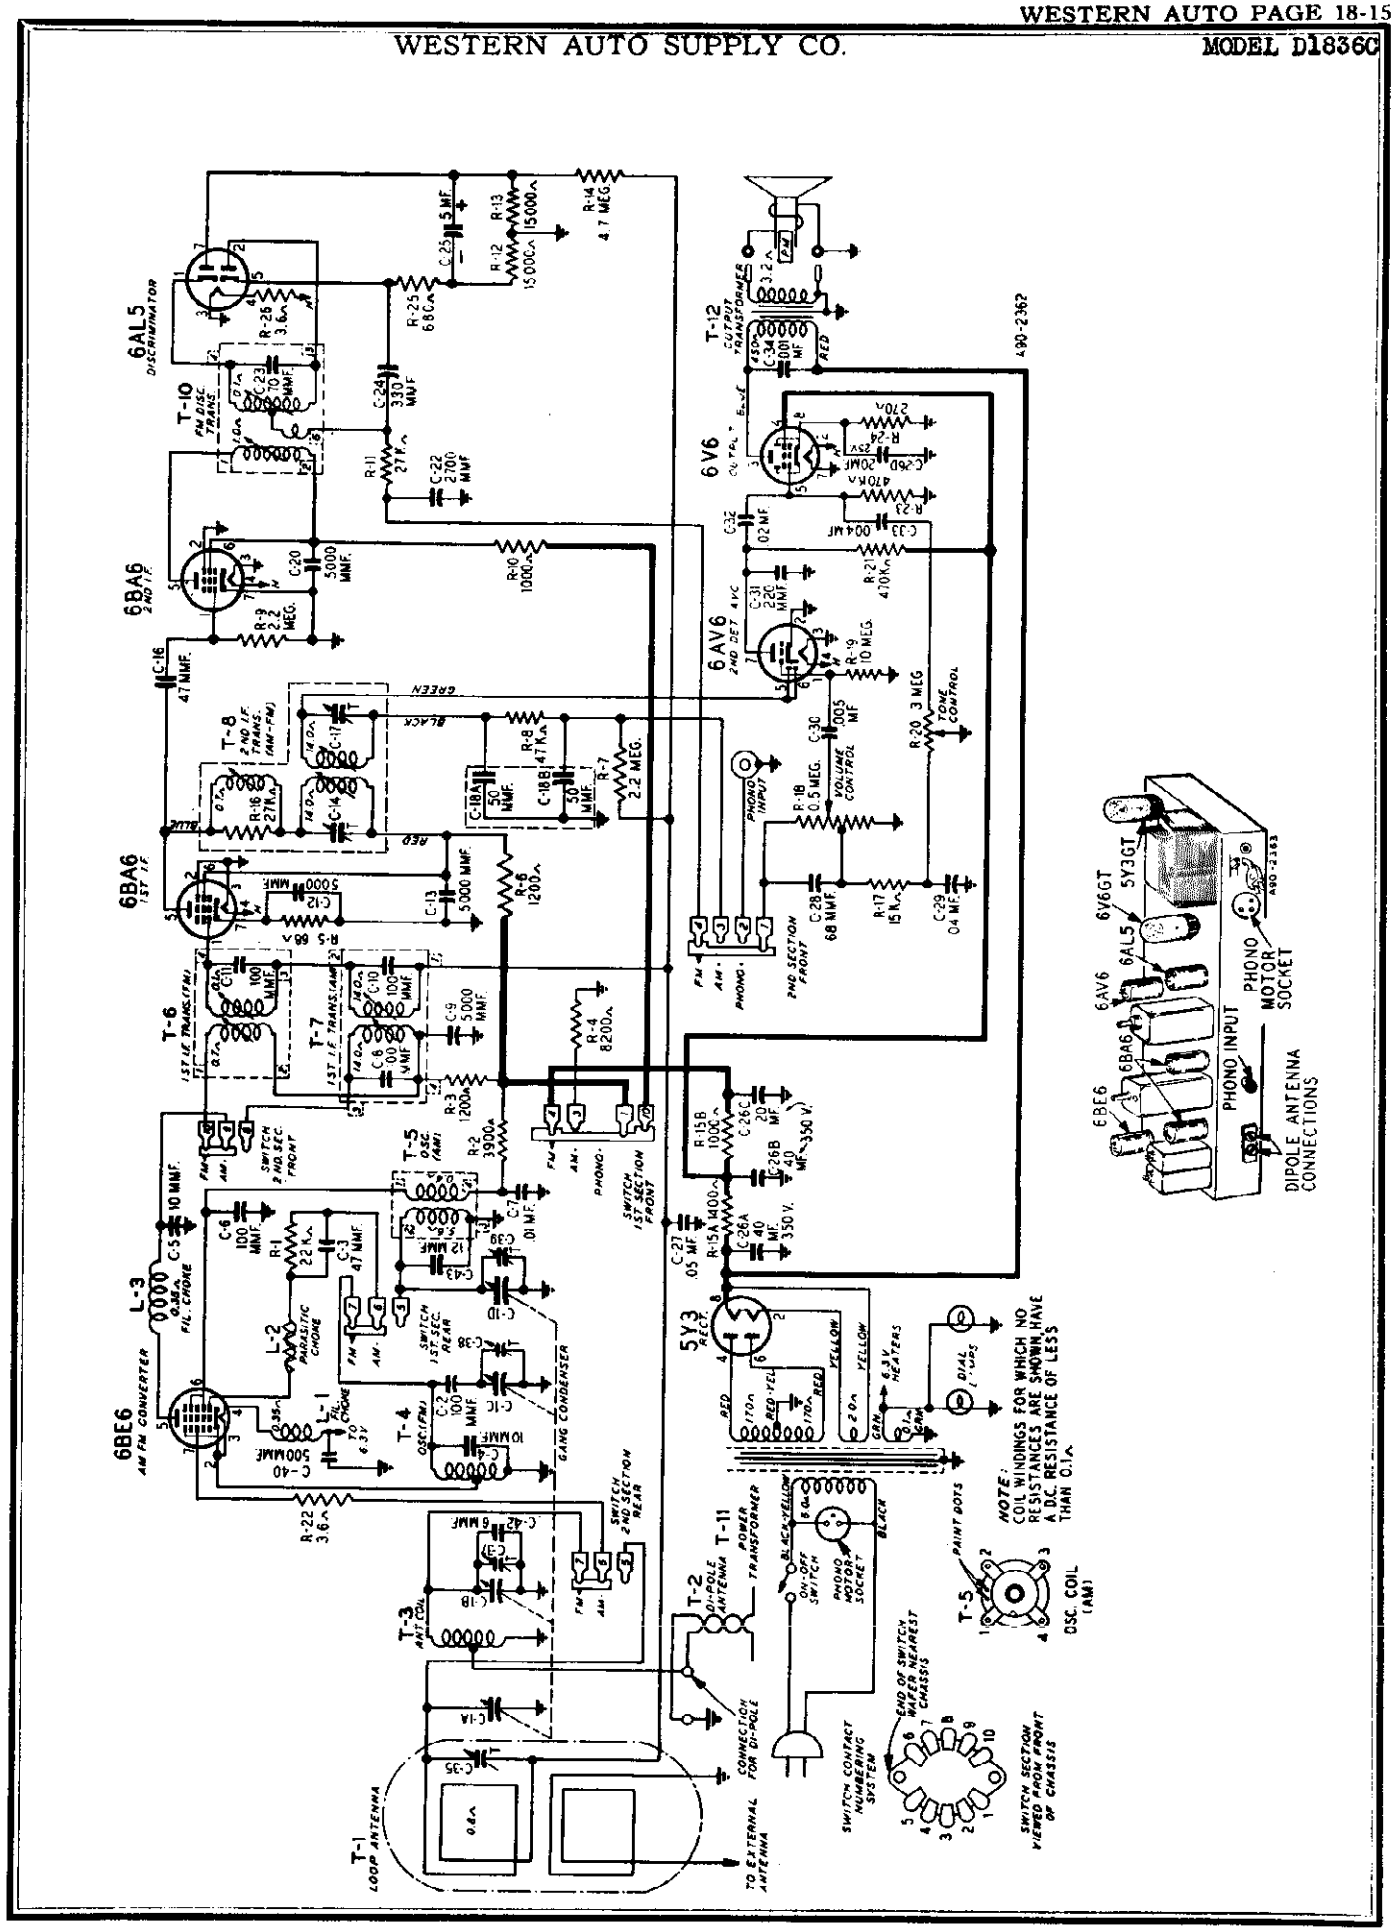
WESTERN AUTO SUPPLY CO. MODEL D1836C



ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS (I-F ONLY) TRIMMERS (OSC. & ANT.)
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. Pri. & Sec.
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BE6 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-39
1400 KC	External Antenna Lead	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-35

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 100 K ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

	SIGNAL GENERATOR					
	FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUSTMENT FOR MAX. METER DEFLECTION

	10.7 MC	Unsolder lead from Pin 7 to band switch. Insert 100K ohm resistor between Pin 7 & Ground and feed signal into Pin 7 of 6BE6	.01 mf	FM	Same as above	1st I-F Pri. Note C
	10.7 MC	Same as above	.01 mf	FM	Same as above	1st I-F Sec. Note C
	RECHECK I-F ADJUSTMENTS IN ORDER GIVEN					
Ant. & Osc.	108.5 Note D	Disconnect dipole and connect generator to dipole terminals with resistor in series.	300 ohms	FM	Rotor to Full Open	Osc. C-38
	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-37
	RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN					

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it to the audio takeoff point at the 1 megohm resistor (R-14) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it to the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

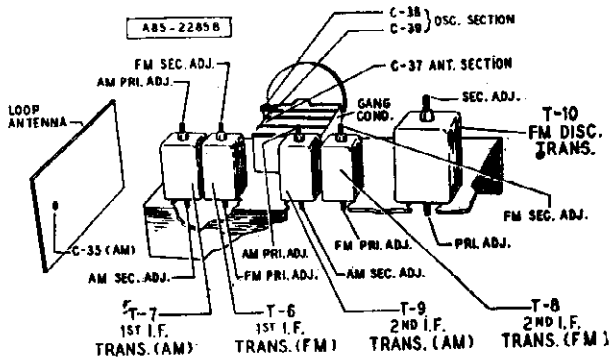
NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

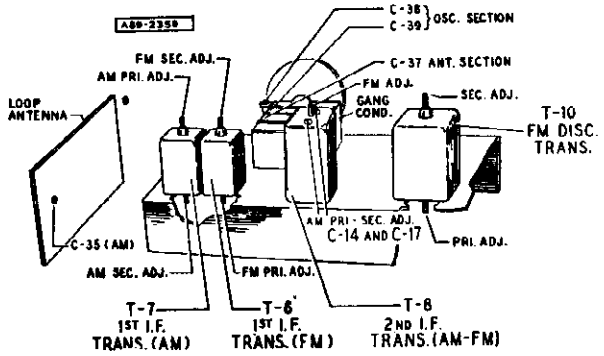
NOTE E—2nd I-F Trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

MODELS D1836A, D1836B, D1836C

WESTERN AUTO SUPPLY CO.



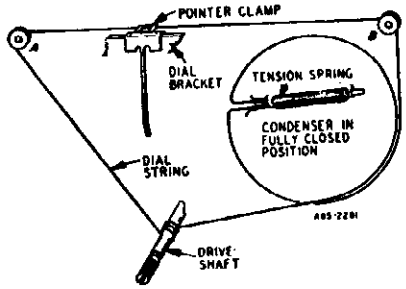
MODEL D1836A
MODEL D1836B



MODEL D1836C

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.



REMOVAL OF CHASSIS FROM CABINET

Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assembly may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

ELECTRICAL SPECIFICATIONS

Power Consumption—
117 volts AC 60 watts

Power Output—
4.5 watts maximum
2.5 watts 10% distortion

Speaker—12" PM dynamic

Frequency Ranges—
Broadcast 540-1600 KC
Frequency Modulation 88-108 MC

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

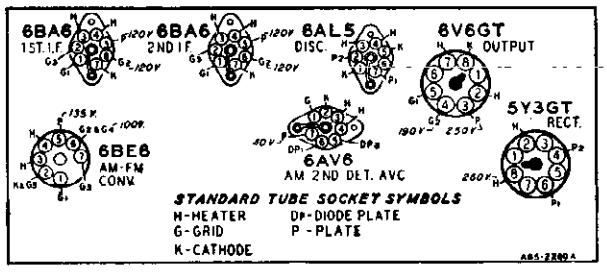
Selectivity — AM — 50 KC broad at 1000 times signal, measured at 1000 KC

I.F. FM—200 KC broad at 2 times down

I.F. FM—700 KC broad at 200 times down

AM Sensitivity—(For .5 watt output with external antenna)
20 microvolts average

FM Sensitivity—(For .5 watt output)
200 microvolts average



Use only No. 51 dial lamps.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .....117 Volts AC
Signal Input .....None
A Variation of ±10% is usually permissible.

WESTERN AUTO SUPPLY CO.

MODEL D1836A

NOTICE: There is a model number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information on this label.

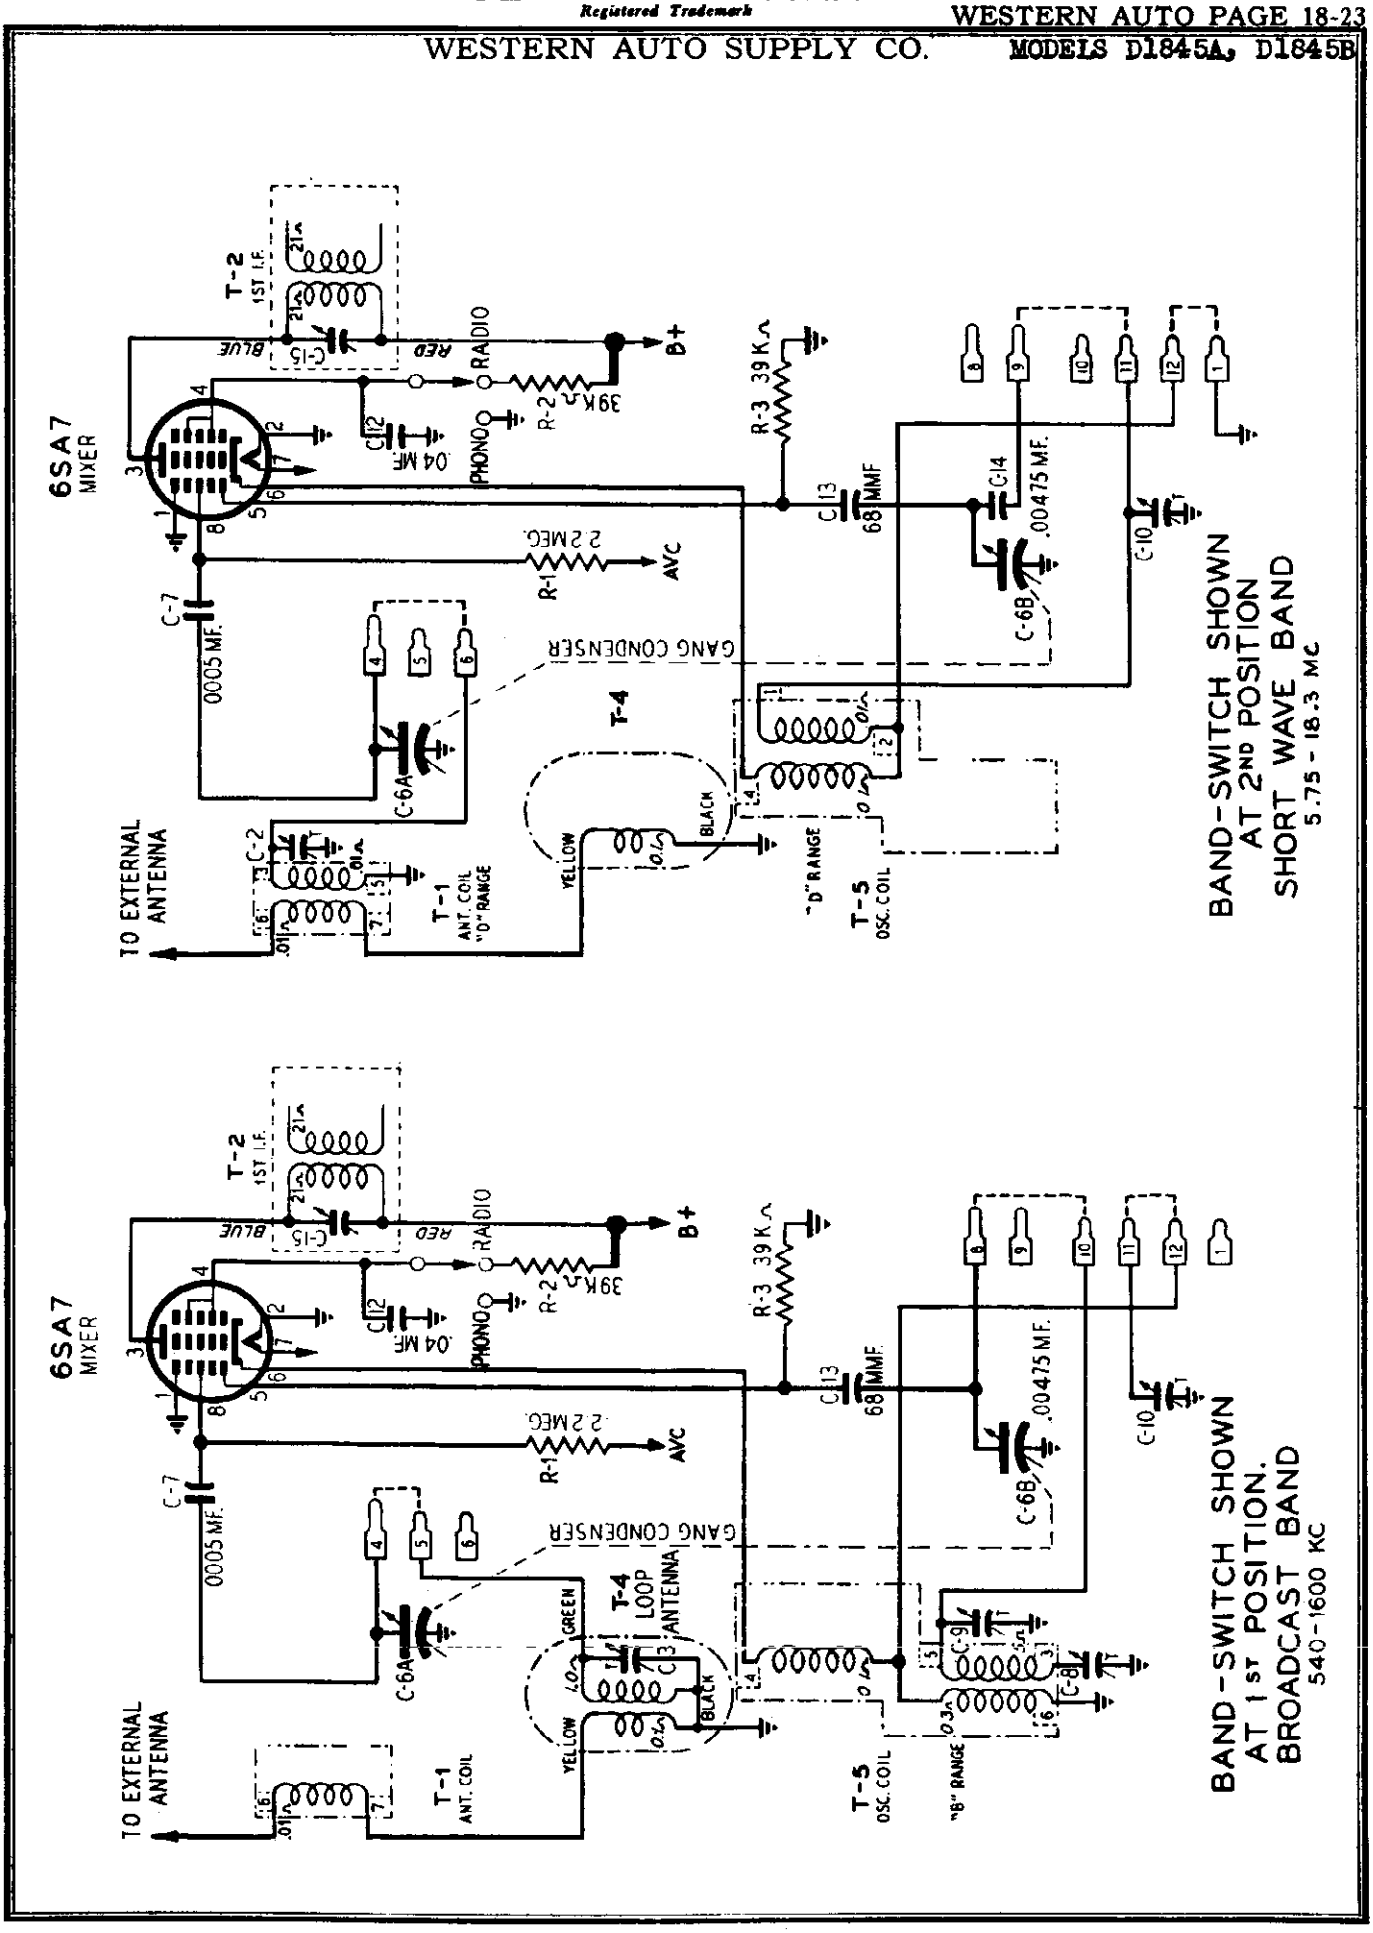
RECORD CHANGER: Oak Model 6666, RCD.CH. 15-1

WESTERN AUTO SUPPLY CO. MODELS D1845A, D1845B



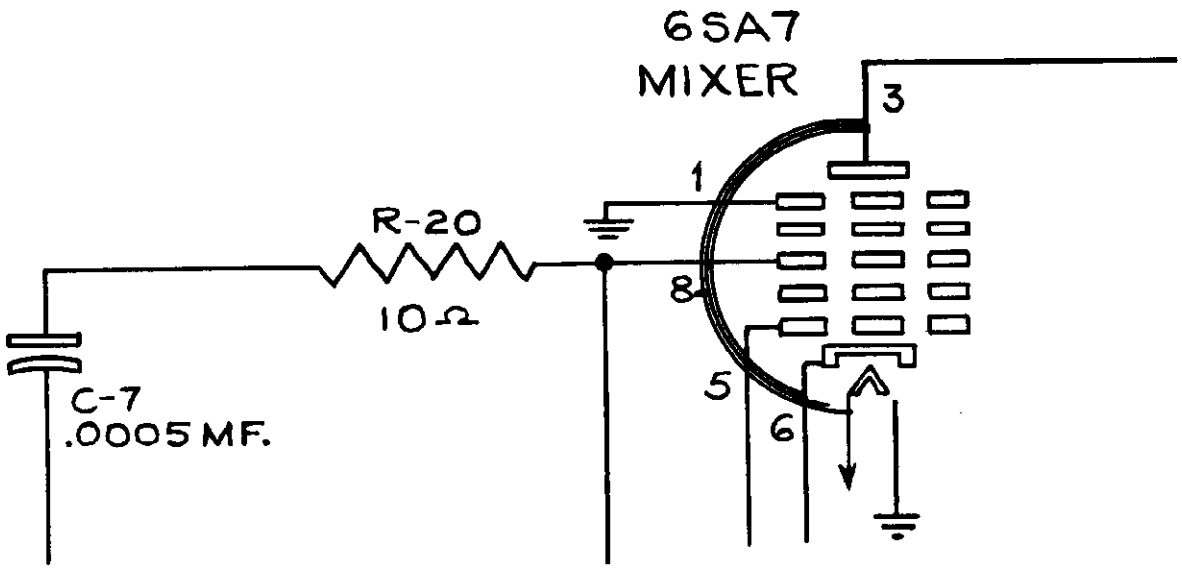
SUPPLEMENTARY SERVICE DATA

TRUETONE MODEL D1845B

A resistor has been added to the circuit to eliminate parasitics in the 6SA7 tube.

Ref. No.	Part No.		Description
R-20	B85100	10 ohm	carbon

The addition is shown in the partial schematic below:



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

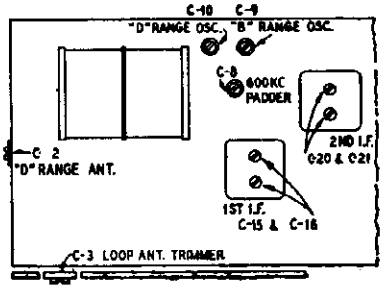
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver. Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	50 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)
	600 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	600 KC (C8) See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.					
RANGE D	18.3 MC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 MC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3) See Note A



NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth and adjust the trimmer until peak of greatest intensity is obtained.

B85100	R-20	10 ohms	0.5 W	Carbon

REMOVAL OF CHASSIS FROM CABINET

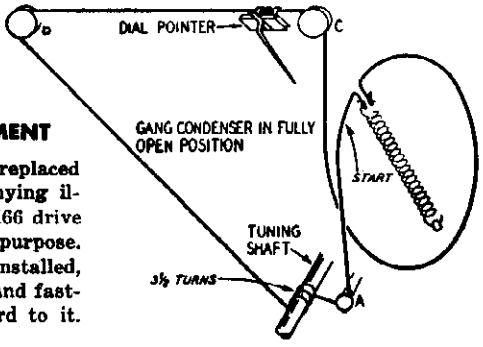
Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assemblies may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

DRIVE CORD REPLACEMENT

The drive cord should be replaced as shown on the accompanying illustration using a new 10X66 drive cord assembly for the purpose. After the cord has been installed, stretch the tension spring and fasten the free end of the cord to it.



SPECIFICATIONS

Power Consumption (at 117 Volts AC) ..... 45 Watts (normal) 70 Watts (phono operating)

Power Output ..... 4 Watts, Maximum 2.3 Watts, 10% Harmonics

Tuning Frequency Range

B Range ..... 540-1600 Kilocycles

D Range ..... 5.75-18.3 Megacycles

Speaker ..... 8" PM Dynamic

Intermediate Frequency ..... 455 KC

Selectivity ..... 40 KC Broad at 1000 Times Signal

Sensitivity (For 0.5 Watt Output, with External Antenna)

B Range ..... 9 Microvolts Average

D Range ..... 20 Microvolts Average

MODEL D2622

L4	Oscillator Coil	69A5
L5	Choke Coil (Filter)	74A1
T1	Transformer, Output	*

*When ordering, specify all numbers on speaker and transformer.

MISCELLANEOUS

Description	Part No.
Background, Dial	X22C3-1
Bracket, Loop Retainer	15A14
Buttons (Cabinet Back), Snap	13A1-2-47
Cover, Back	43B21-1
Drum and Hub Assembly	A1012
Grommet, Rubber 7/16" x 3/16" (Gang Mtg.)	12A1-2
Knob, Mahogany	33A10-2
Pilot Light #47	81A1-8
Pilot Light Socket and Leads	82A2-1
Pointer	25A4-1
Pulley, Fibre Dial	17A1-3
Scale, Dial	21B26
Shaft, Tuning	28A1-1
Socket, Octal Tube	87A10-2
Speaker (5" PM) and Output Transformer	78B4-4
Spring, Dial Cord Tension	19A1-3
Washer, Flat Fibre Insulating	5A1-6
Washer, Offset Fibre Insulating	5A2-5
Washer, C	4A4-1
Washer, Spring	4A8-3-0

IMPORTANT—Check to see that dial pointer reaches each end of dial scale when Station Selector Control is turned from one end to the other.

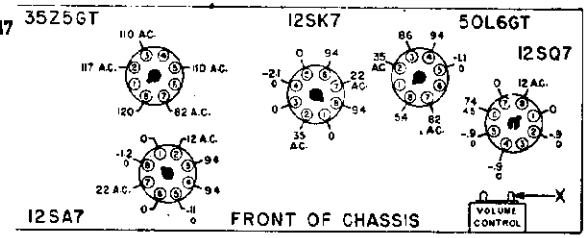
Volume control—Maximum for all adjustments.

Connect radio chassis to ground post of signal generator with a short heavy lead.

Connect output meter across voice coil of speaker.

Allow chassis and signal generator to warm up for several minutes.

Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed in the following sequence.



Bottom View of Chassis, Showing Voltages

All readings made between Tube Socket Terminals and Switch Lug on volume control (Point "X" on drawing).
Measured on a 117 Volt A.C. line.
Volume control full on.
Dial tuned to low frequency end, no signal.
Voltages indicated obtained on Vacuum Tube voltmeter.
A second voltage reading is shown made with a 1000 ohm-per-volt meter when use of this instrument would result in appreciably lower readings.

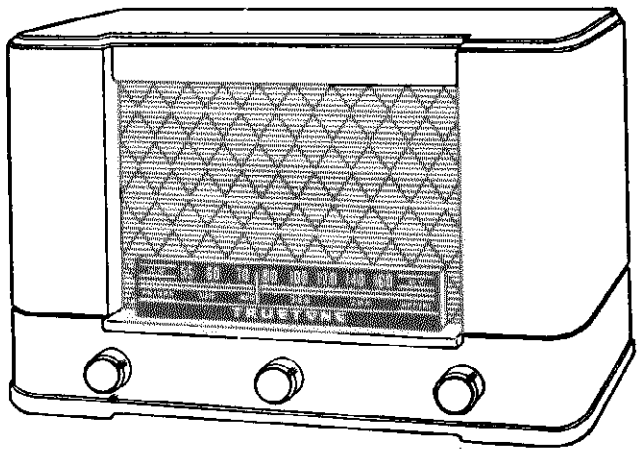
25006	Socket—For Loop
25712	Speaker—With Transformer
25562	Switch—Tone S-1,
25711	Track—Pointer
25715	Transformer—I. F. Input
25714	Transformer—I. F. Output
25713	Transformer—Output—Speaker
25723	Transformer—Power 60 Cycles

Note: Resistors and condensers not listed will be supplied on order—specify value.
We cannot supply speaker cones. We can replace or repair a damaged speaker for a nominal price if it is returned to our factory, transportation charges prepaid.



TO PROPERLY ALIGN—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a Signal Generator adjusted to 455 KC, connected to the grid of the 6SA7 through a .1 Mfd. condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, carefully place loop in normal relation to chassis, connect Signal Generator to antenna clip through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (complete out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping pointer coupling on dial cord.

DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 25834 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

COILS

Symbol	Description
L1	Antenna Coil (3 ohms)
L2	Oscillator Coil (3 ohms)
L3	1st I.F. Transformer
L4	2nd I.F. Transformer
L5	R.F. Choke (14.5 ohms)
T1	Output Transformer

VOLTAGE DATA

All readings made between tube socket terminals and chassis. Voltages indicated have been obtained using a Vacuum Tube Voltmeter. A second voltage reading is shown made with a 1000 ohm-per-volt meter, when use of this instrument would result in appreciably lower readings. The voltages were measured using a fresh battery, volume control full on, dial at the high frequency end, and no signal.

VOLTAGE CHART — BOTTOM VIEW

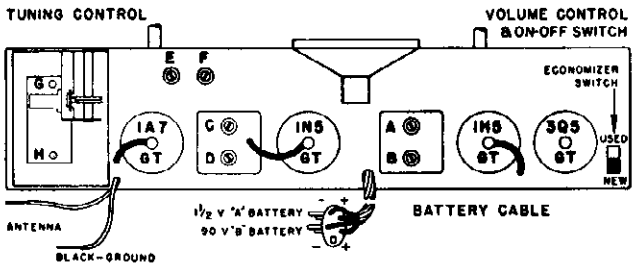
	T1	Output Transformer (Specify full speaker part no. including mfg. code when ordering)

MISCELLANEOUS (Alphabetical)

Part No.	Description
35C20	Cabinet, D-2663
A1026	Cable, Battery (complete with plug)
90A1-2	Cap, Grid
50A1-1	Cord, Dial (5" on tuner and 53" on dial drive)
A1035	Drum and Hub, Tuning
23A7-1	Escutcheon
33A10-2	Knob
88A4-4	Plug, Battery, 5 Prong
25A10-1	Pointer, Dial
17A1-3	Pulley, Fibre Dial
21B14-1	Scale, Glass Dial
27A4	Screw studs (for iron cores)
28A11-1	Shaft, Tuning
A1040	Shaft and pulley (Tuner)
87A8	Shield, Tube
87A10-2	Socket, Octal Tube
78B10	Speaker and Output Transformer (Specify complete part number including mfg. code when ordering.)
19A1-5	Spring, Dial Drum Cord Tension
19A3-1	Spring, Hairpin (To hold Ant.-Osc. coils)
19A6	Spring, Tuner, back bearing takeup
19A5	Spring, Tuner, front bearing takeup
19A1-4	Spring, Tuner Slide Cord Tension
18A1	Spring, Tuner Slide Pressure
77A1-6	Switch, SPST (Economizer)
9A8-1	Terminal, Tuner Slide Cord
4A4-1	Washer, C
4A6-5-0	Washer, Spring (coils)
4A6-3-0	Washer, Spring (shaft)

C. R. & T. C. Form 41A5-1

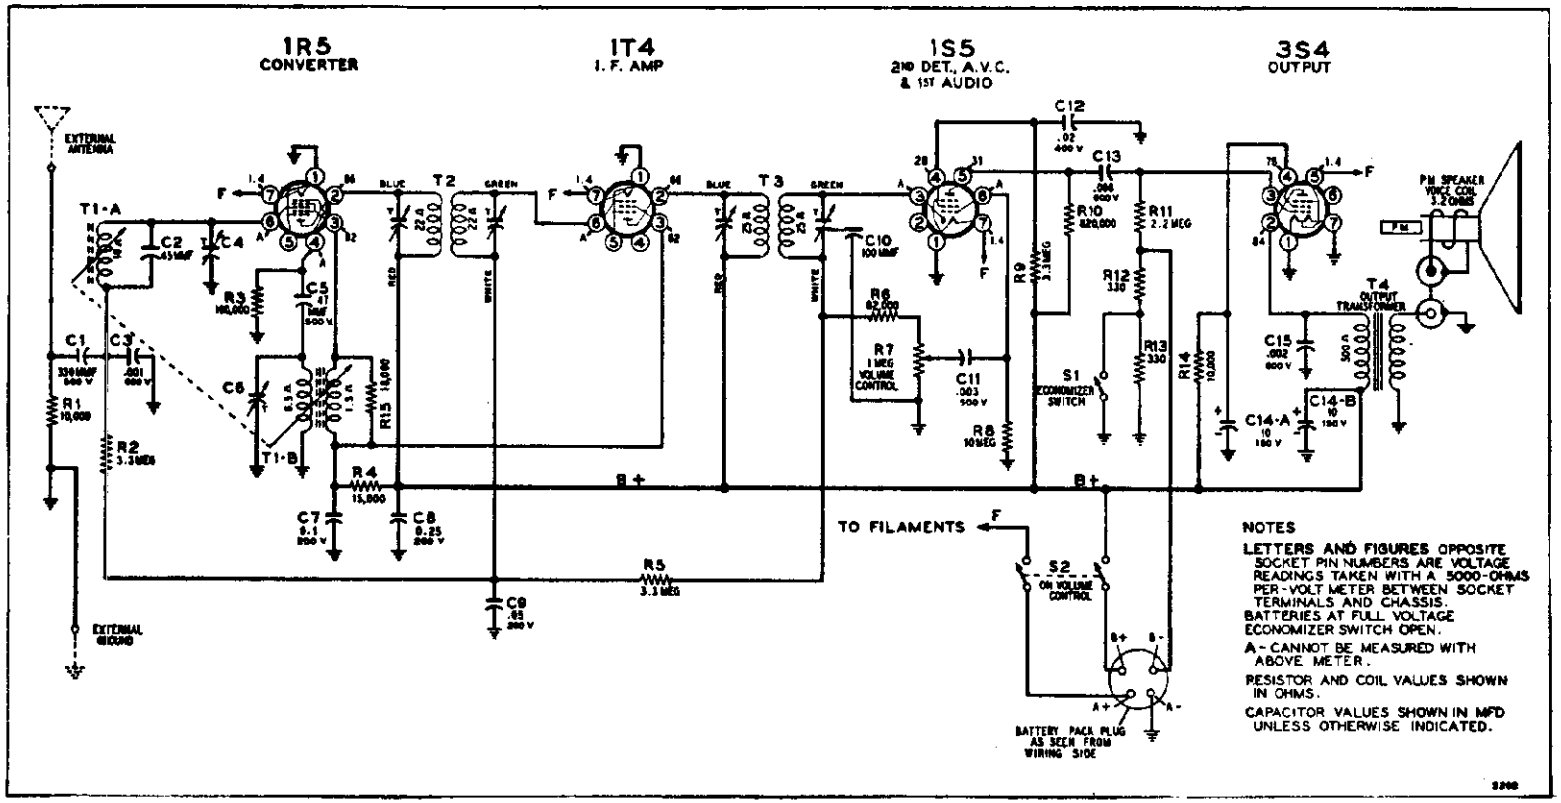
- **IMPORTANT—Check to see that dial pointer reaches each end of dial scale when Station Selector Control is turned from one end to the other.**
- Volume control—Maximum for all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead, when needed (see below).
- Connect output meter across voice coil of speaker.
- Allow chassis and signal generator to "heat up" for several minutes.

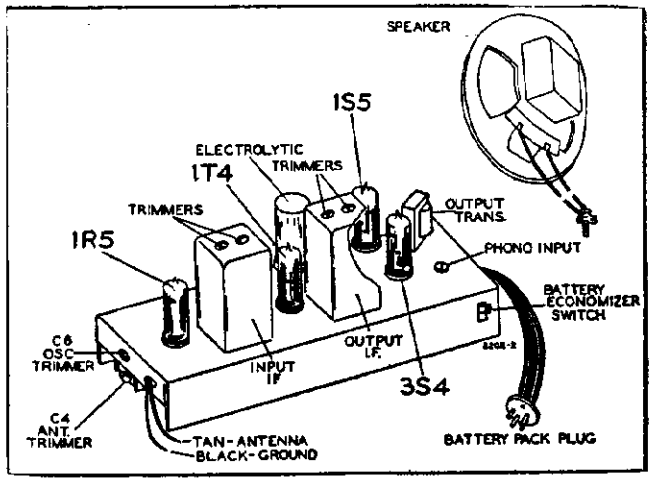


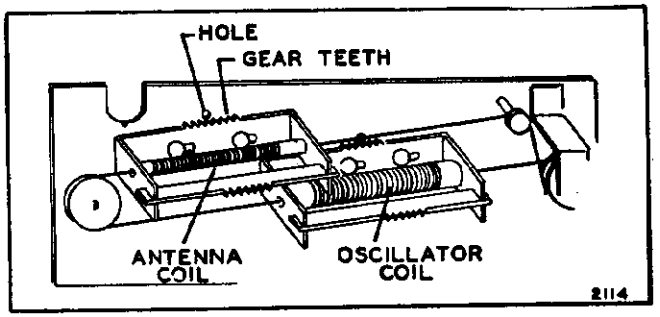
- **Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed in the following sequence.**

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Receiver Dial Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Type of Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	C-D—2nd I.F.	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	A-B—1st I.F.	Input I.F.	Adjust to maximum output
BROAD-CAST	1630 KC.	.0002 MFD.	Antenna Lead	High frequency end of dial	E—(See note below) F—(See note below)	Oscillator Antenna	Adjust to maximum output
	1300 KC.	.0002 MFD.	Antenna Lead	1300 KC.	G H	Oscillator Antenna	Adjust to maximum output

NOTE: Before adjusting trimmers "E" and "F", make sure that each iron core is 1⅝" or more outside of its coil form. If necessary, turn adjustments "G" and "H" to accomplish this.

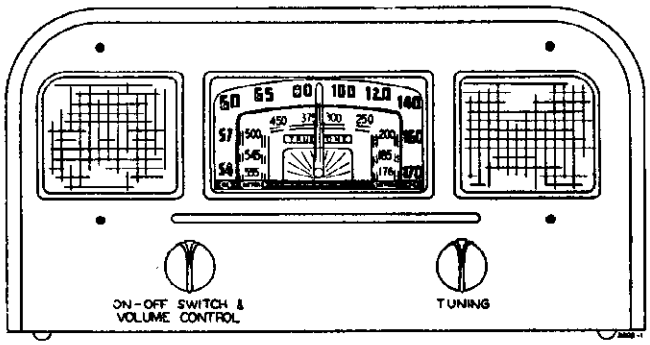






The antenna coil assembly is movable left or right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of a screwdriver blade in the hole and engaging the blade in the gear teeth of the coil form.

WESTERN AUTO SUPPLY CO. MODEL D2665



If the battery pack needs replacement, use Wizard Battery Pack No. B-6411 (500 hours), No. B-6420 (750 hours), or No. B-6430 (1000 hours). Each of these packs contains a 1½-volt "A" battery and a 90-volt "B" battery.

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output load.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Volume control at maximum for all adjustments.
- Connect ground post of signal generator to radio chassis.

SIGNAL GENERATOR			Tuner Setting	Adjust for Maximum Output (in order shown)
Frequency	Coupling Capacitor	Connection to Radio		
455 kc	.1 mf	Grid (pin 6) of 1R5	Iron cores all the way out	Trimmers on output and input I.F. cans
1700 kc	.1 mf	Grid (pin 6) of 1R5	Iron cores all the way out	Oscillator trimmer C6
1700 kc	200 mmf	Antenna lead	Iron cores all the way out	Antenna trimmer C4
1400 kc	200 mmf	Antenna lead	Turn dial to 1400 kc	Adjust position of ant. coil (see coil view)*

*This adjustment and the previous adjustment are interlocking; therefore repeat the two adjustments alternately for best results.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivities at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with speaker connected.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 kc and 455 kc signals modulated 30% with a 400-cycle audio signal.

Variations in sensitivities of plus or minus 25% are usually permissible.

SIGNAL GENERATOR				Input for 50-Milliwatt Iutput
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection	
1000 kc	200 mmf	External antenna lead	Chassis	45 microvolts
1000 kc	.1 mf	Converter 1R5 (pin 6)	Chassis	129 microvolts
455 kc	.1 mf	Converter 1R5 (pin 6)	Chassis	120 microvolts
455 kc	.1 mf	IF amp. 1T4 (pin 6)	Chassis	3400 microvolts
400 cycles	.1 mf	AF amp. 1S5 (pin 6)	Chassis	.027 volts
400 cycles	.1 mf	Power amp. 3S4 (pin 3)	Chassis	2.5 volts

LIST OF REPLACEMENT PARTS

When ordering parts, specify number, model number, and series

ELECTRICAL SPECIFICATIONS

Power Supply.....Battery: See types above
"A"-1½-volts, 250 milliamperes
"B"-90 volts, 10.5 milliamperes

Frequency Range....540 to 1700 kc.

Intermediate Freq...455 kc.

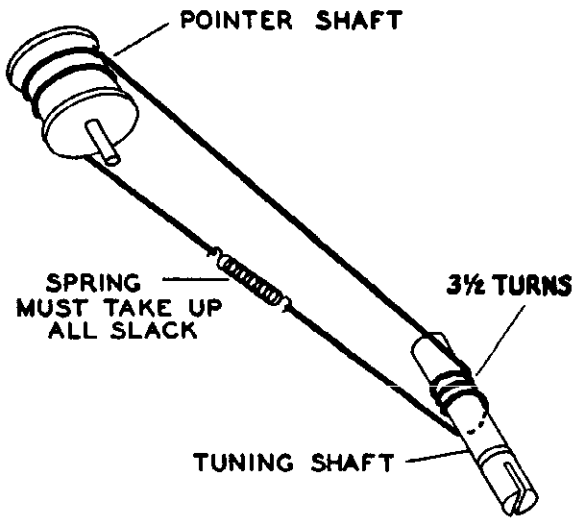
Selectivity.....At 1000 kc, 49 kc at 1000 x signal

Sensitivity.....40 microvolts average for 50-milliwatt output.

Power Output.....0.120 watt undistorted.
0.140 watt maximum.

Loud Speaker.....5-inch; P. M.; voice coil impedance 3.2 ohms.

Tube Complement....1R5, converter
1T4, I. F. amplifier
1S5, detector, AVC, audio
3S4, output amplifier



Replacement of Dial Pointer Drive Cord

RADIO RECEIVER

This is a 5-tube superhetrodyne radio receiver for operation on a 105-125 volt A.C. or D.C. power supply. The tubes used are a 12SA7 as an oscillator-converter, a 12SK7 as an I.F. amplifier, a 12SQ7 as an AVC, detector and 1st audio amplifier, a 50L6GT as an output and a 35Z5GT as a power amplifier.

This receiver covers the broadcast band (from 530 to 1620 kilocycles). The dial calibrations read in kilocycles (KC) (less the final zero)

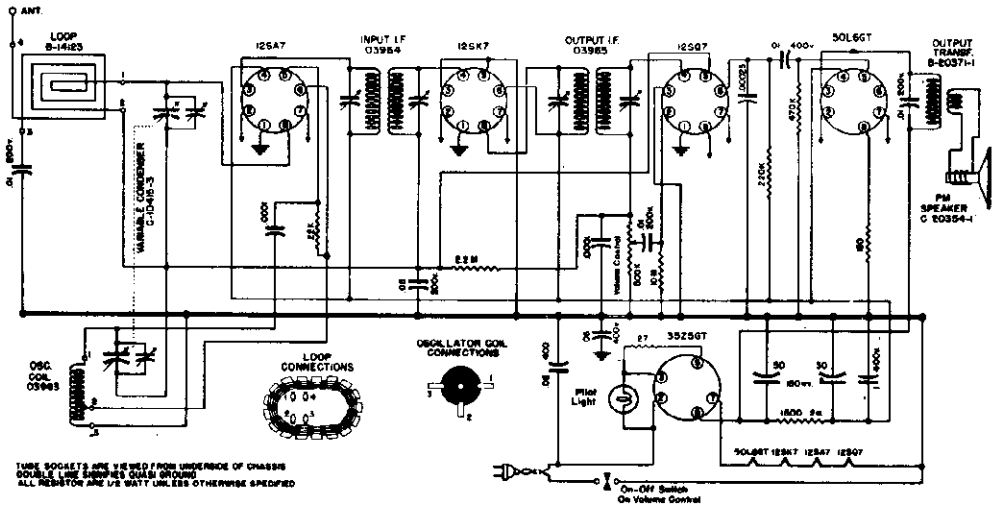
CONTROLS

VOLUME CONTROL: (Bottom knob)

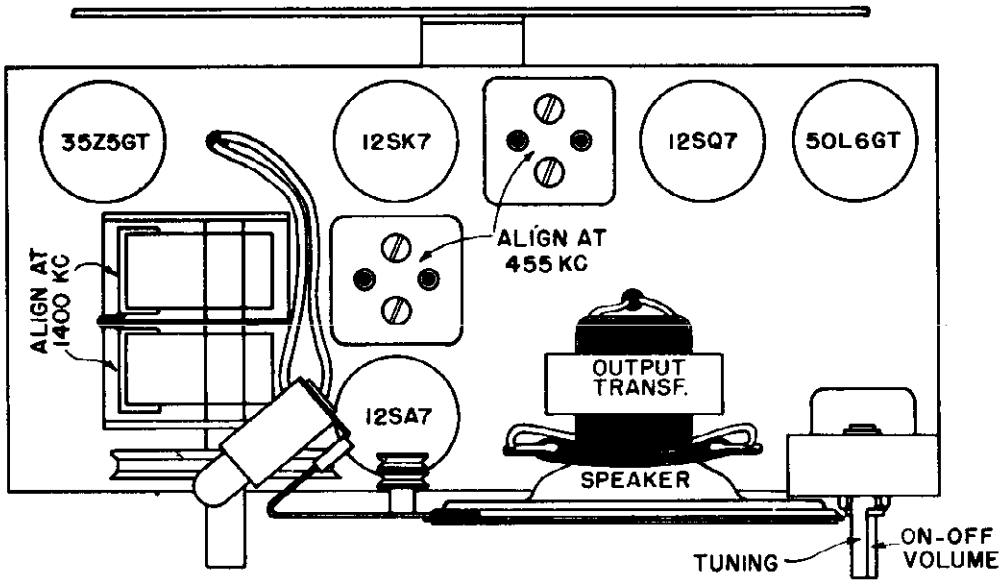
Turning knob clockwise turn the receiver on and turning further increases the volume.

TUNING CONTROL: (Top knob)

This knob is used to select stations. Tune station until it is at maximum clearness. Never attempt to reduce volume by de-tuning station -- always use the volume control.



TUBE LAYOUT

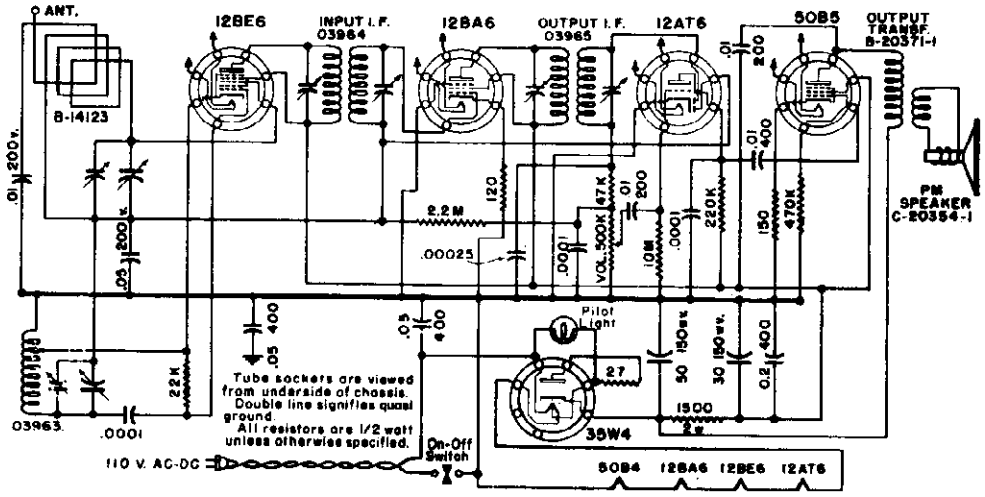


MODEL D2693B

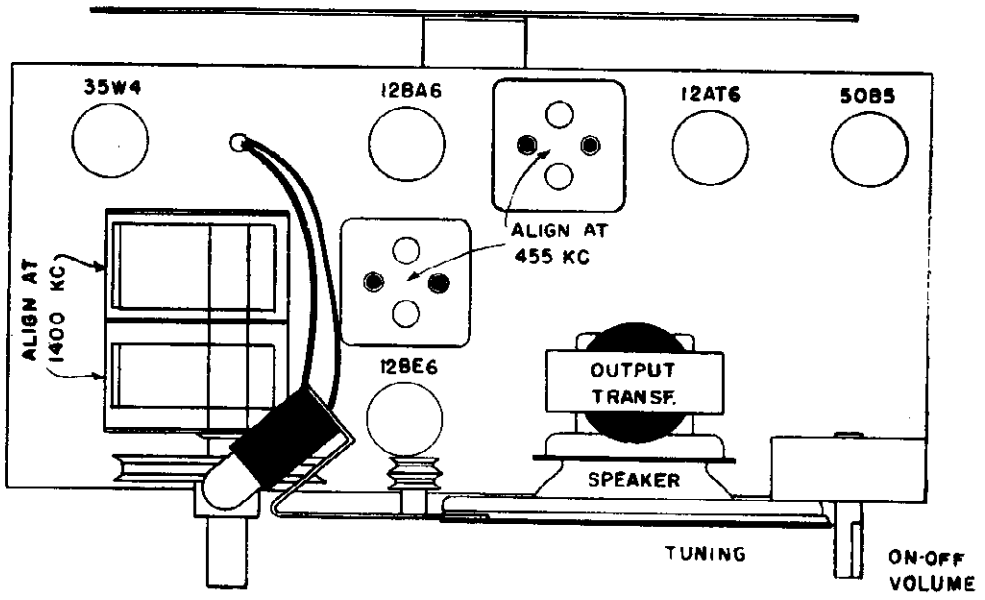
WESTERN AUTO SUPPLY CO.

This is a 5-tube superhetrodyne radio receiver for operation on a 105-125 volt A.C. or D.C. power supply. The tubes used are a 12BE6 as an oscillator converter, a 12BA6 as an I.F. amplifier, a 12AT6 as an AVC, detector and 1st audio amplifier, a 50B5 as an output and a 35B4 as a power rectifier.

This receiver covers the broadcast band (from 530 to 1620 kilocycles) The dial calibrations read in kilocycles (KC) (less the final zero)



TUBE LAYOUT



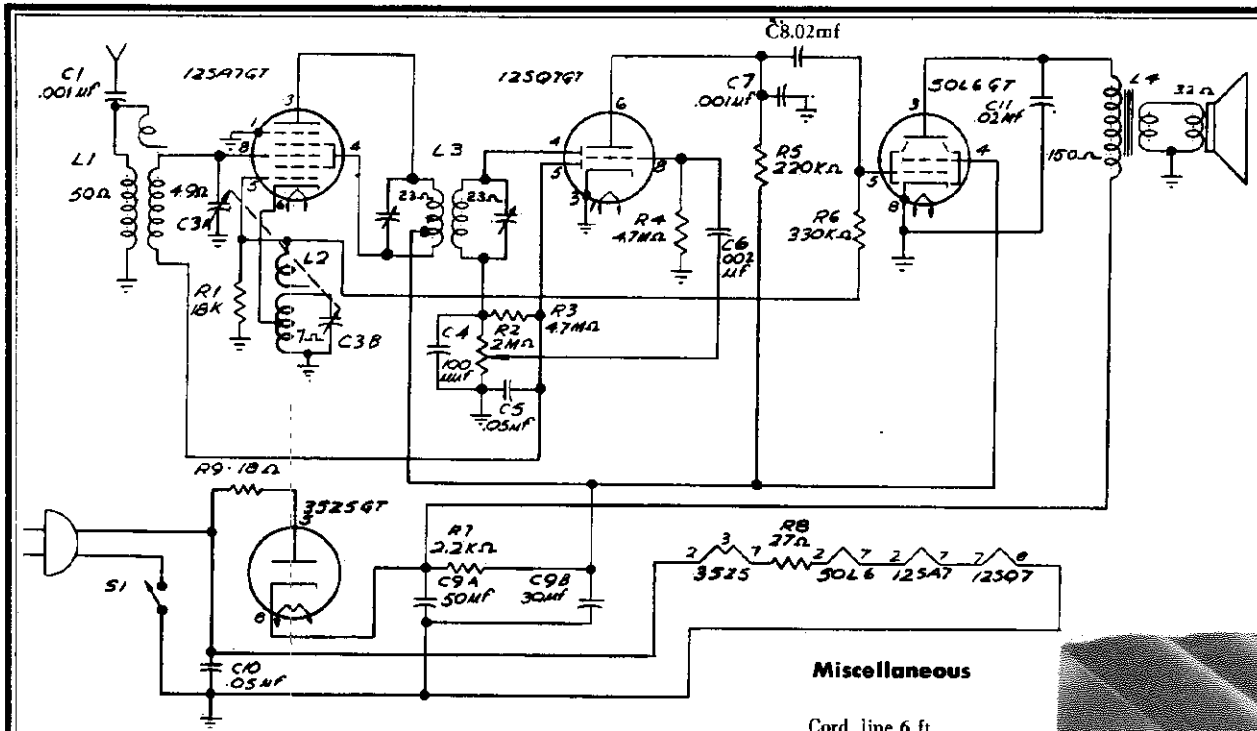
CONTROLS

VOLUME CONTROL: (Bottom knob)

Turning knob clockwise turn the receiver on and turning further increases the volume.

TUNING CONTROL: (Top knob)

This knob is used to select stations. Tune station until it is at maximum clearness. Never attempt to reduce volume by de-tuning station -- always use the volume control.



Sensitivity (for 0.5 watt output) ..... 600 microvolts average

Power output (in voice coil):

Undistorted ..... 0.8 watts

Maximum ..... 2.5 watts

Tuning range ..... 520 to 1590 kc

Intermediate frequency ..... 455 kc

Power consumption ..... 30 watts

Selectivity ..... 1. A.C.A.—3 to 1. 2. A.C.A.—12.5 to 1

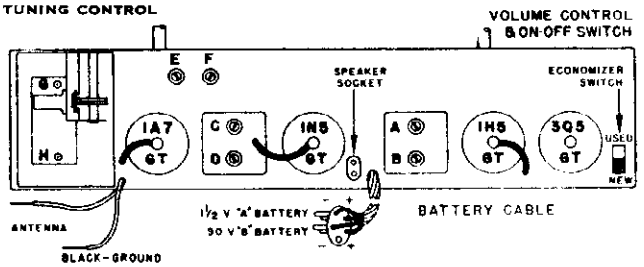
MODEL D2762 WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

- **IMPORTANT—Check to see that dial pointer reaches each end of dial scale when Station Selector Control is turned from one end to the other.**
- **Volume control—Maximum for all adjustments.**
- **Connect dummy antenna valve in series with generator with a short heavy lead.**
- **Connect dummy antenna valve in series with generator output lead, when needed (see below).**
- **Connect output meter across voice coil of speaker.**
- **Allow chassis and signal generator to warm up for several minutes.**



- **Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as indicated in the chart below.**

Band	Signal Generator Frequency	Dummy Antenna	Connection to Radio	Receiver Dial Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Type of Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	C-D—2nd I.F.	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 1A7 (Cap)	High frequency end of dial	A-B—1st I.F.	Input I.F.	Adjust to maximum output
BROAD-CAST	1630 KC.	.0002 MFD.	Antenna Lead	High frequency end of dial	E—(See note below) F—(See note below)	Oscillator Antenna	Adjust to maximum output
	1300 KC.	.0002 MFD.	Antenna Lead	1300 KC.	G H	Oscillator Antenna	Adjust to maximum output

NOTE: Before adjusting trimmers "E" and "F", make sure that each iron core is 1⅜" or more outside of its coil form. If necessary, turn adjustments "G" and "H" to accomplish this.

VOLTAGE DATA

All readings made between tube socket terminals and chassis. Voltages indicated have been obtained using a Vacuum Tube Voltmeter. A second voltage reading is shown made with a 1000 ohm-per-volt meter, when use of this instrument would result in appreciably lower readings. The voltages were measured using a fresh battery, volume control full on, dial at the high frequency end, and no signal.

1A7—1st Det. Osc. 1H5—2nd Det., A.V.C. and 1st Audio.
1N5—I. F. Amplifier 3Q5—Power Output.

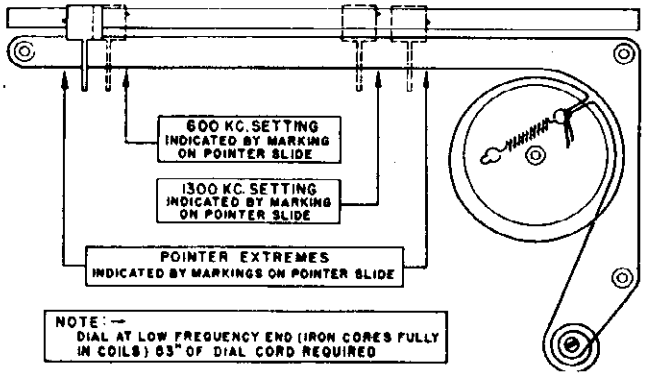
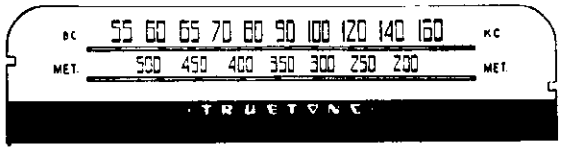
POINTER SETTINGS AND DIAL CORD STRINGING

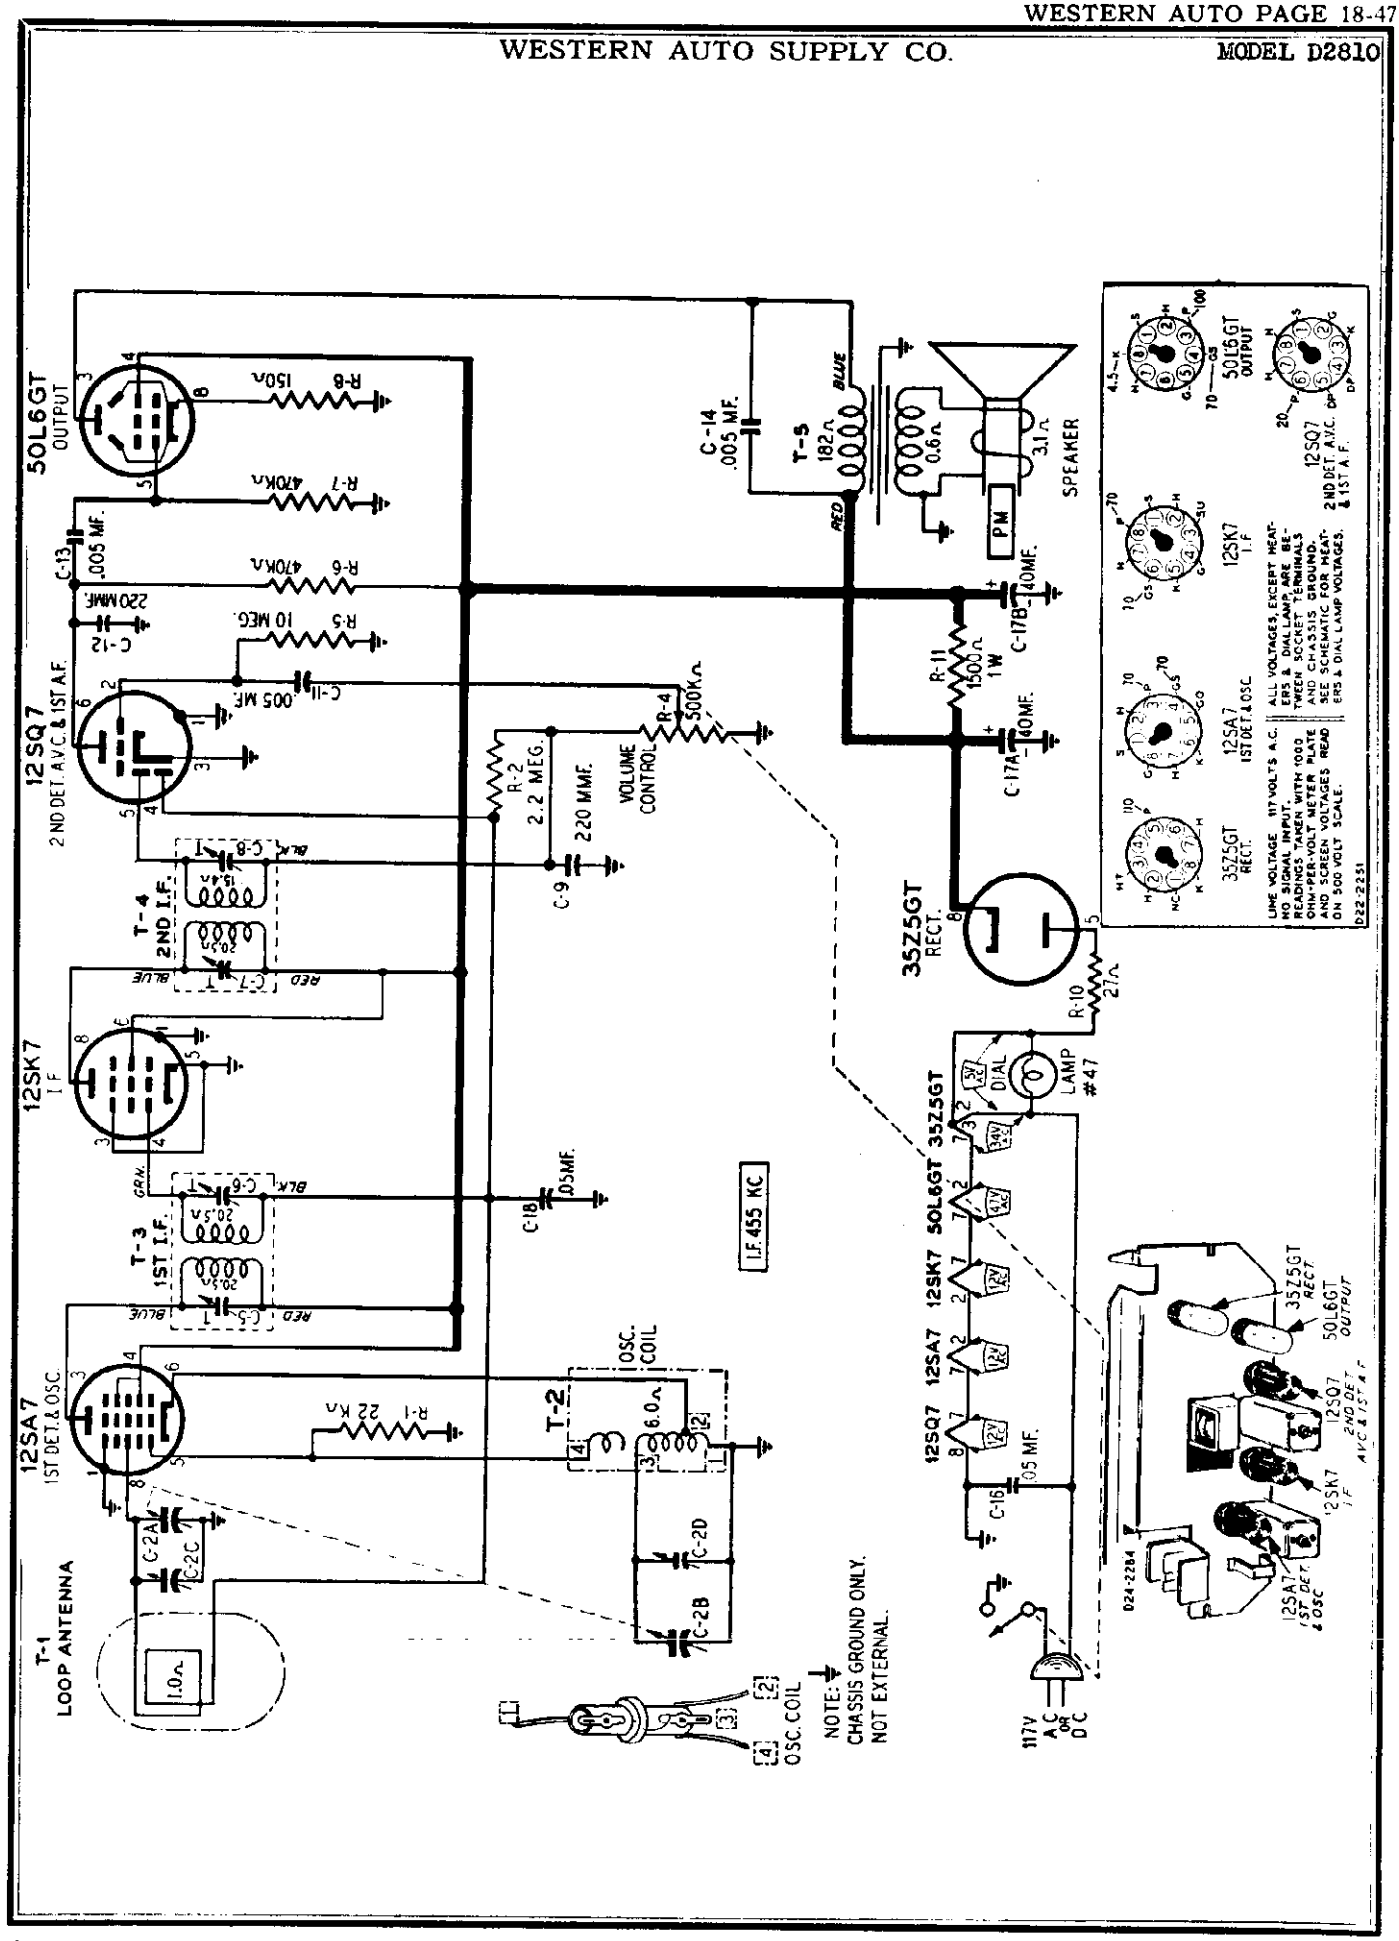




POWER SUPPLY

This receiver is designed to operate on a single unit Ensign AB48, Ray-O-Vac No. AB-82, Burgess 17G-D60, Eveready 748, Bond 0528 or General 60DL-11L Battery. No other batteries are required as this battery is a combination 90 volt "B" battery and a 1½ volt "A" battery. The life of this battery is approximately 750 hours. The "A" and "B" sections are so proportioned that equal life may be expected from both. The "A" section will give satisfactory performance as low as 1.2 volts and the "B" section as low as 68 volts. This battery life may be expected with an average usage of several hours daily. If the reception becomes weak when the Economizer Switch is in the "USED" position, a new battery should be installed. A battery compartment is provided in the rear of the cabinet, and the battery cable simply plugs into the battery.

WESTERN AUTO SUPPLY CO. MODEL D2810



MODEL D2810 WESTERN AUTO SUPPLY CO.

SPECIFICATIONS

Power Output....1.5 watt maximum, .9 watt (10% distortion)
Intermediate Frequency.....455 KC
Speaker.....5" PM Dynamic

5 Tube Superheterodyne, including Rectifier Tube.
Tuning Frequency Range.....540 to 1600 KC
Power Consumption.....30 watts (At 117 volts AC)

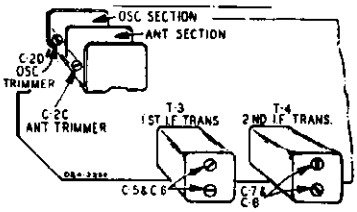
ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter: Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 50 mmf.
Blocking Condenser—.1 mf.

SIGNAL GENERATOR					
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
455 KC	Control Grid 12SK7—I.F. Prong No. 4	Chassis Base Through .1 mf. Condenser	.1 mf.	Turn Rotor to full open	2nd I.F. (C7) & (C8)
455 KC	Control Grid 12SA7—1st Det. Prong No. 8	Same As Above	.1 mf.	Turn Rotor to full open	1st I.F. (C5) & (C6)
1620 KC	Control Grid 12SA7—1st Det. Prong No. 8	Same as Above	.1 mf.	Turn Rotor to full open	Oscillator (C-2D)
1400 KC	Reassemble chassis in cabinet See Note B	Same As Above	50 mmf.	Set pointer to 1400 KC. See Note A	Antenna (C-2C)

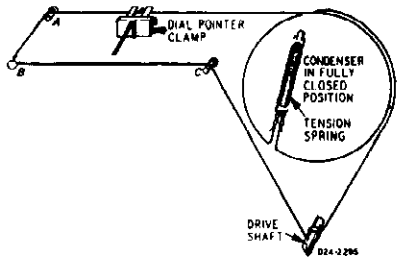


Note A—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

Note B—Wind 2 turn loop of heavy enameled wire 6" diameter. Connect to signal generator. Place loop of wire 6" from loop on set and in the same plane.

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the fully closed position. Use a new 10X66 drive cord assembly or a piece of cord 45 inches long and fasten one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing toward the front of the chassis. After string is installed, stretch the tension spring and fasten free end of cord to spring.



REPLACEMENT PARTS LIST

NOTICE: There is a model number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MISCELLANEOUS

			LIST PRICE
12A479		5" PM Speaker	$4.40
3A435		Molded Octal Tube Socket	.15
55X321		Cabinet, Plastic	4.90
14X411		Grille Cloth	.25
10A297		Knob	.10
13X328		Line Cord and Plug Assembly	.85

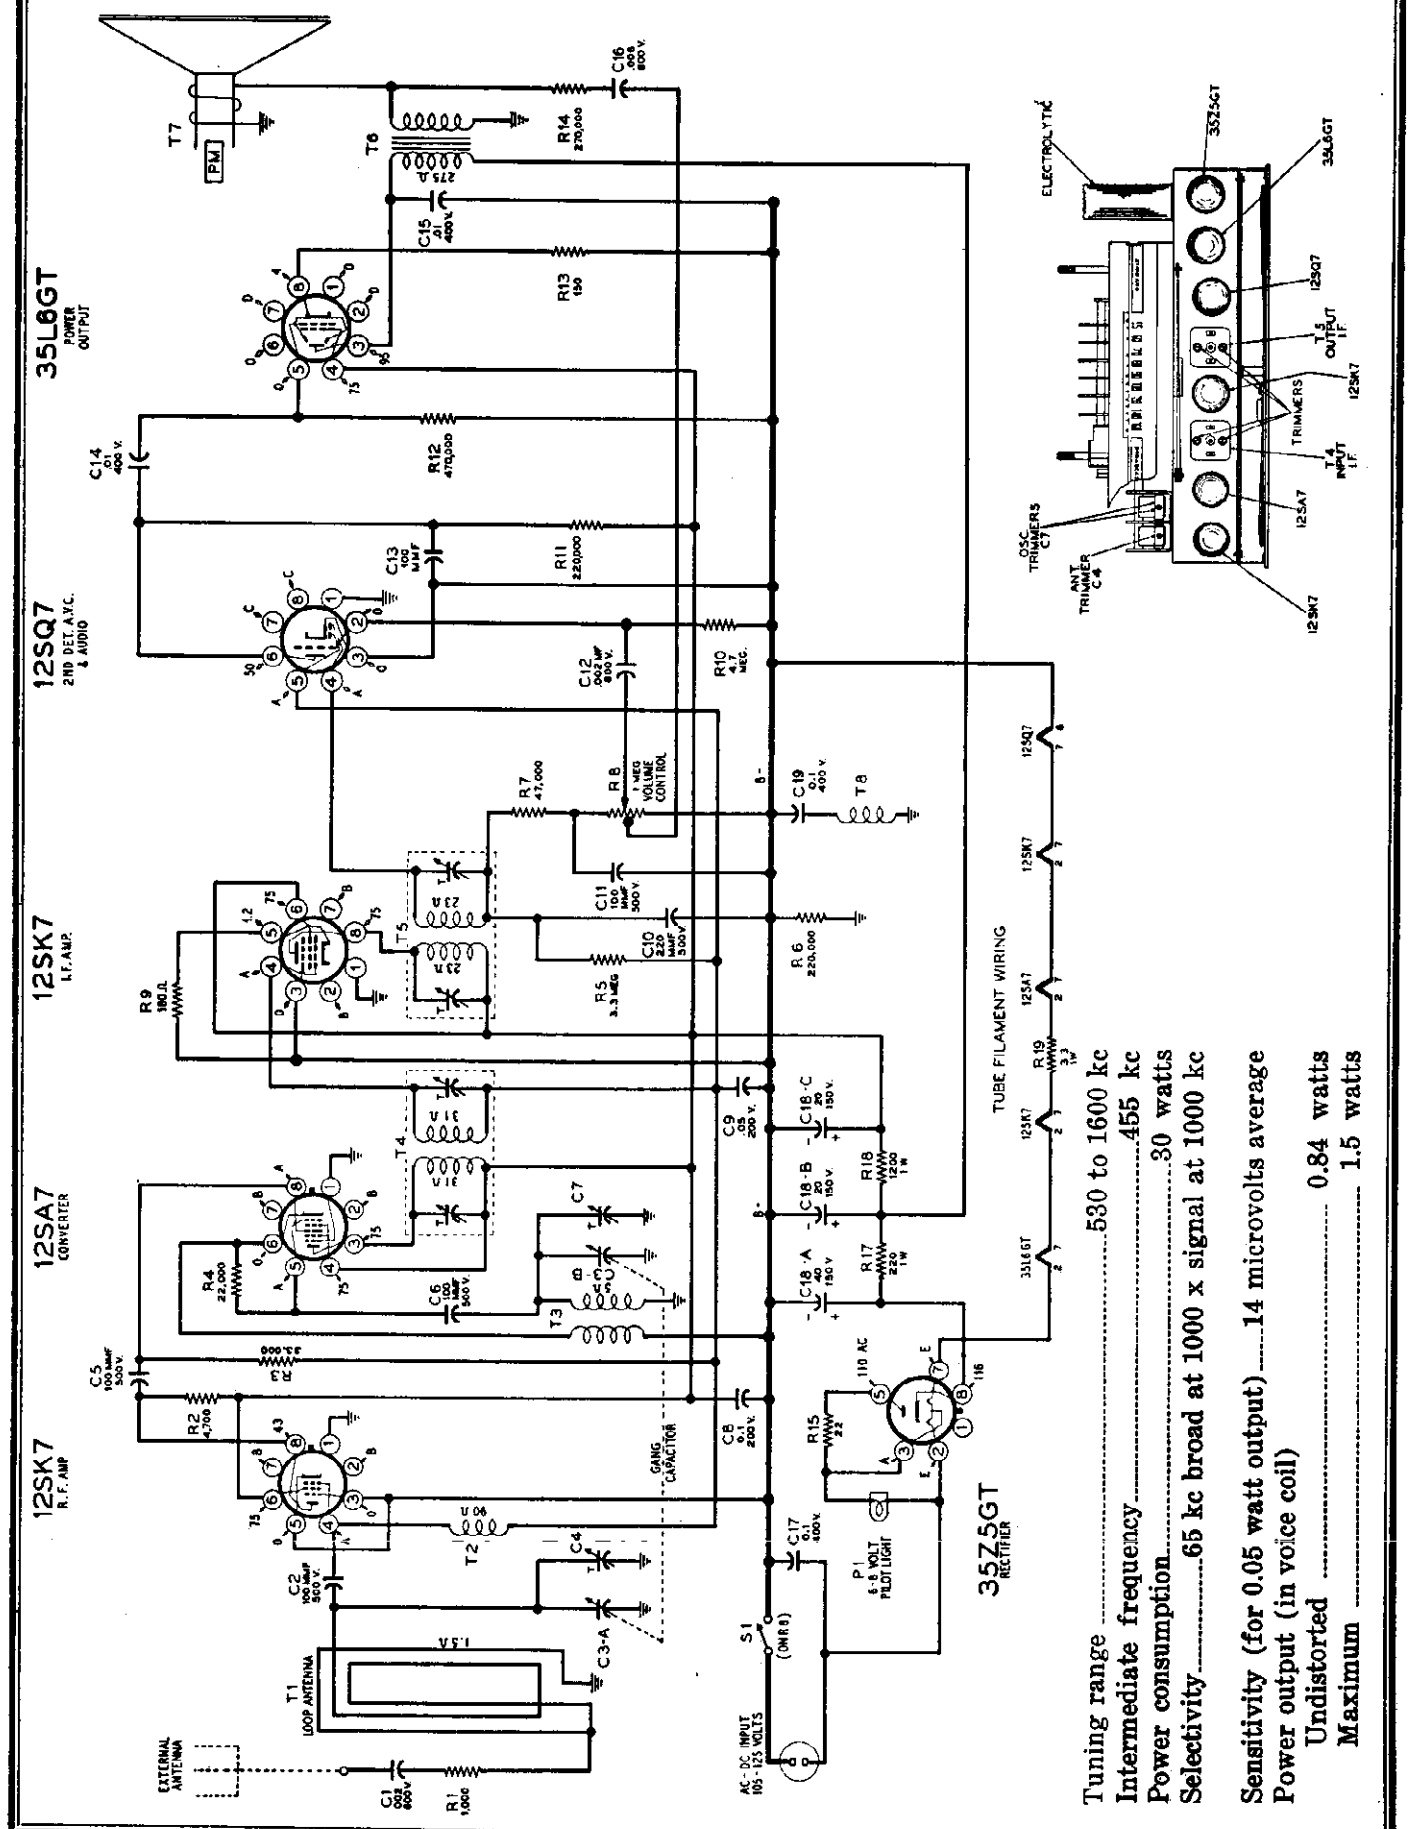
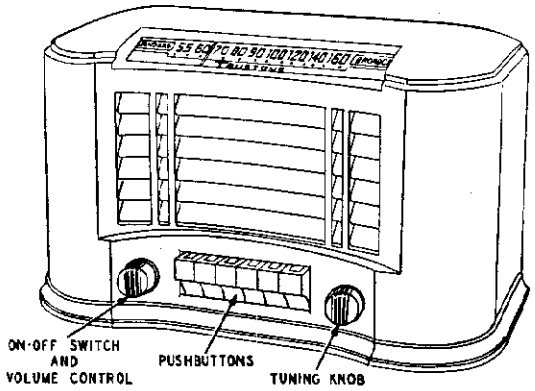
WESTERN AUTO SUPPLY CO. MODEL D2815



Tuning range ..... 530 to 1600 kc
Intermediate frequency ..... 455 kc
Power consumption ..... 30 watts
Selectivity ..... 65 kc broad at 1000 x signal at 1000 kc

Sensitivity (for 0.05 watt output) ..... 14 microvolts average
Power output (in voice coil)
Undistorted ..... 0.84 watts
Maximum ..... 1.5 watts

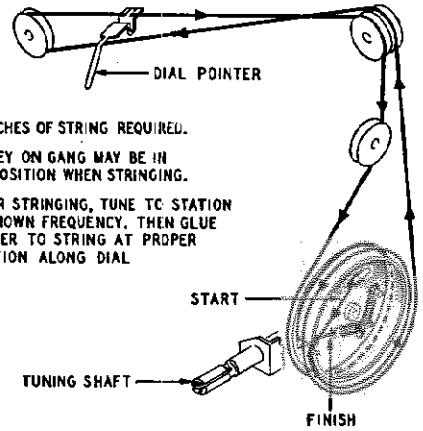


ALIGNMENT PROCEDURE

(Refer to Chassis View)

- Output meter across 3.2-ohm output load.
- Volume control at maximum.
- Connect ground post of signal generator to B— of radio.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR			*TUNER SETTING*	*ADJUST FOR MAXIMUM OUTPUT (in order shown)*
Frequency	*Dummy Antenna*	*Connection to Radio*		
455 kc	0.1 mf	Stator of antenna section of gang	Rotor full open (plates out of mesh)	Trimmers on output and input I.F. cans
1600 kc	0.1 mf	Stator of antenna section of gang	Rotor full open (plates out of mesh)	Oscillator trimmer C7
1400 kc	200 mmf	External antenna clip	1400 kc	Antenna trimmer C4



COILS AND TRANSFORMERS

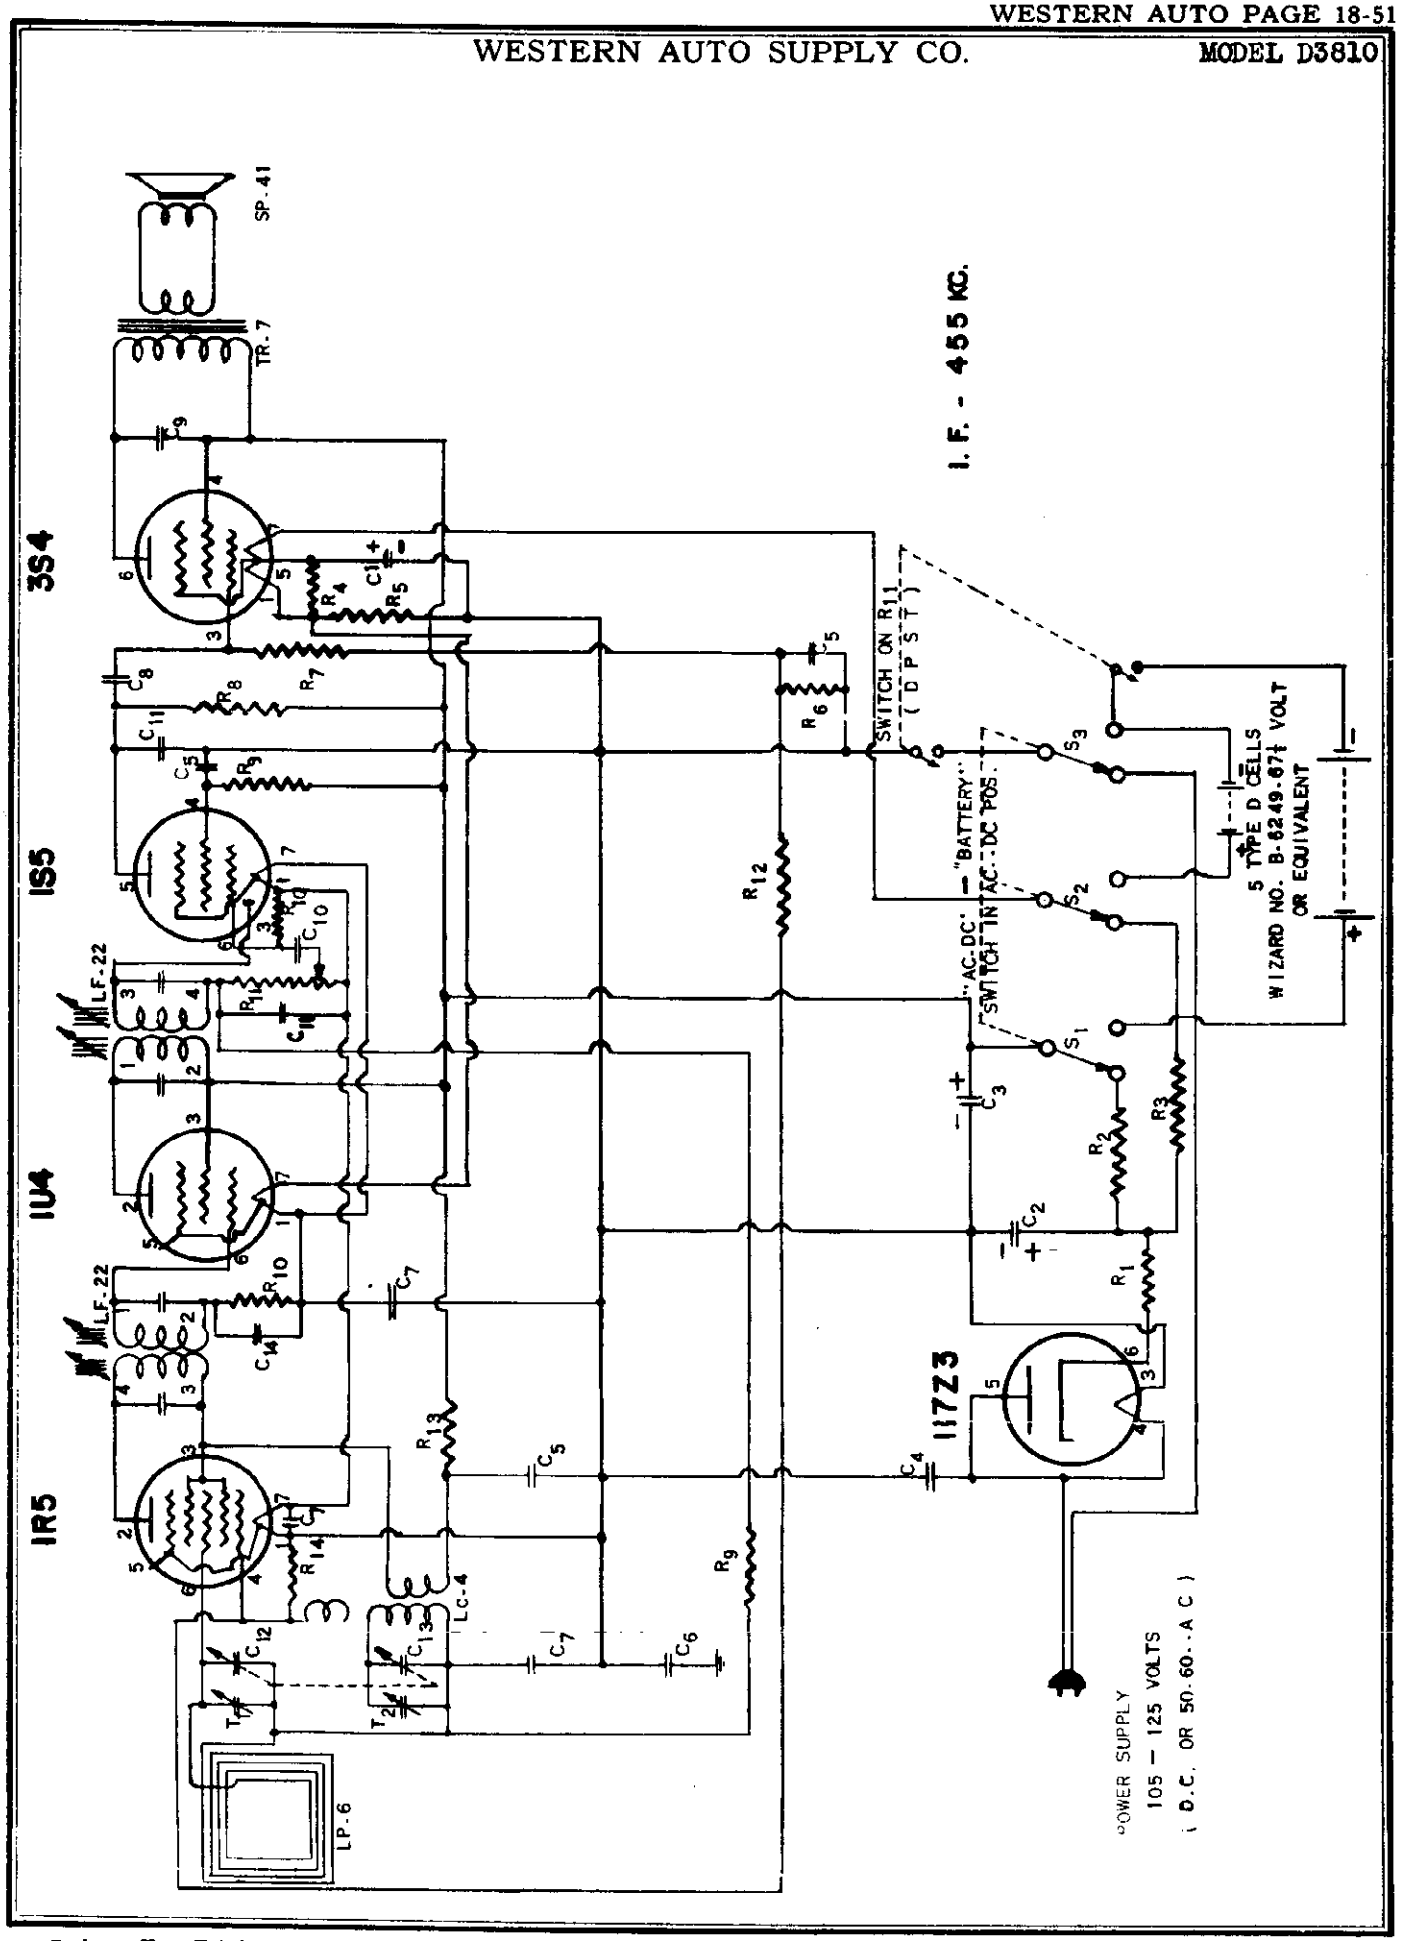
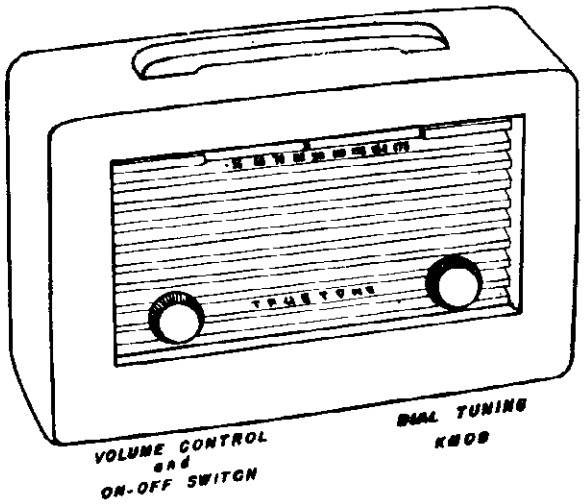
WESTERN AUTO SUPPLY CO. MODEL D3810



MODEL D3810 WESTERN AUTO SUPPLY CO.



ALIGNMENT PROCEDURE

- Output meter across 3.5 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

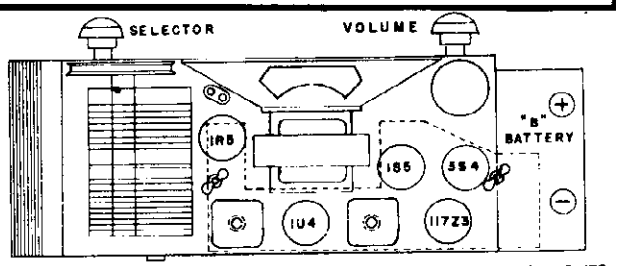
SIGNAL GENERATOR				*SETTING TUNER*	*ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)*
Frequency	*Coupling Factor*	*Connection to Receiver*	*Ground Connection*		
455 kc	.1 mfd	1R5 Grid	B—	Rotor full open (Plates out of mesh)	Input and output trimmers on IF cans
1700 kc	.1 mfd	1R5 Grid	B—	Rotor full open (Plates out of mesh)	Oscillator trimmer T2
1500 kc		Radiating Loop		1500 kc*	Antenna trimmer T1

* Five markings on the dial bracket represent respectively 530 kc., 600 kc., 1000 kc., 1500 kc., and 1700 kc., reading from left to right. These points are to be used for the alignment of the receiver.

POWER SUPPLY

This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages.....105 - 125 Volts, A.C. or D.C.

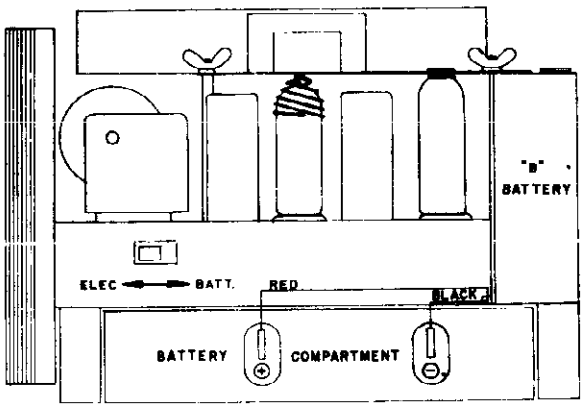


TO REPLACE TUBES, UNSCREW WING NUTS, AND REMOVE TUBE SPRING PLATE

The battery supply to be used with this receiver is as follows:

"A" supply ..... 7½ volts. Use five type "D" flashlight cells; Wizard No. B-6732 or Burgess No. 2 or Eveready No. 950 or equivalent.

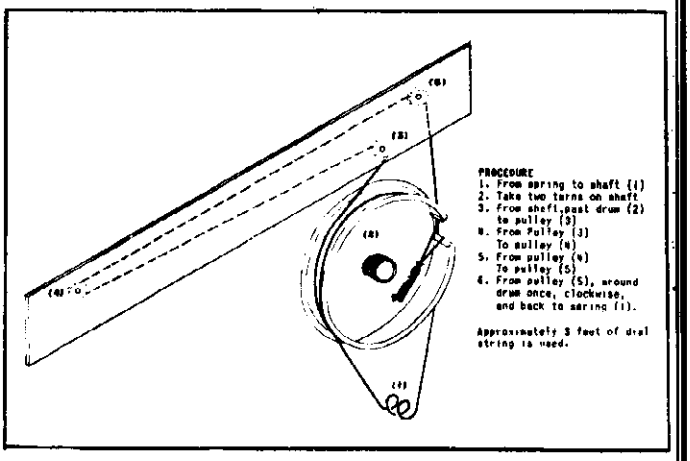
"B" supply ..... 67½ volts. Use Wizard No. B-6249 or Burgess No. XX45 or Eveready No. 467 or equivalent.



WESTERN AUTO SUPPLY CO. MODEL D3810

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 50-60 cycles AC 15 watts
Batteries	A—7½ volts. 50 ma. B—67½ volts. 8 ma. average.
Frequency Range	530 to 1700 kc.
Intermediate Freq.	455 kc.
Tuning	Two-gang capacitor
Antenna	Built-in loop
Speaker	4 inch PM; voice coil Impedance 3.5 ohms.
Power Output	80 milliwatts undistorted 140 milliwatts maximum
Sensitivity	500 microvolts per meter for 50 milliwatt output
Selectivity	55 kc broad at 1000 times signal at 1000 kc.



Replacement of Drive Cord

REPLACEMENT PARTS LIST

When ordering parts, specify part number, model number and series.

SUPPLEMENTARY SERVICE DATA

TRUETONE MODEL D4630A

A 6" PM Dynamic speaker is used with some of the model "A" receivers. This speaker, complete with cable and plug is directly interchangeable with the 12A386 Electro Dynamic speaker listed in the Replacement Parts List.

The new speaker is shipped with some receivers in place of the speaker listed in the parts list.

DESCRIPTION OF NEW PART:

12A472 6" PM Dynamic Speaker complete with Cable & Plug

SUPPLEMENTARY SERVICE DATA

TRUETONE MODEL D4630B

Model "B" receivers of the above model use either an Electro Dynamic speaker 12A467 and Chassis Speaker Cable 13X556 or a PM Dynamic speaker 12A471 and Chassis Speaker Cable 13X556 in place of the Electro Dynamic speaker 12A386 and Chassis Speaker Cable 13X424 used with model "A" models.

The two new speakers are directly interchangeable when used with model "B" receivers.

DESCRIPTION OF NEW PARTS:

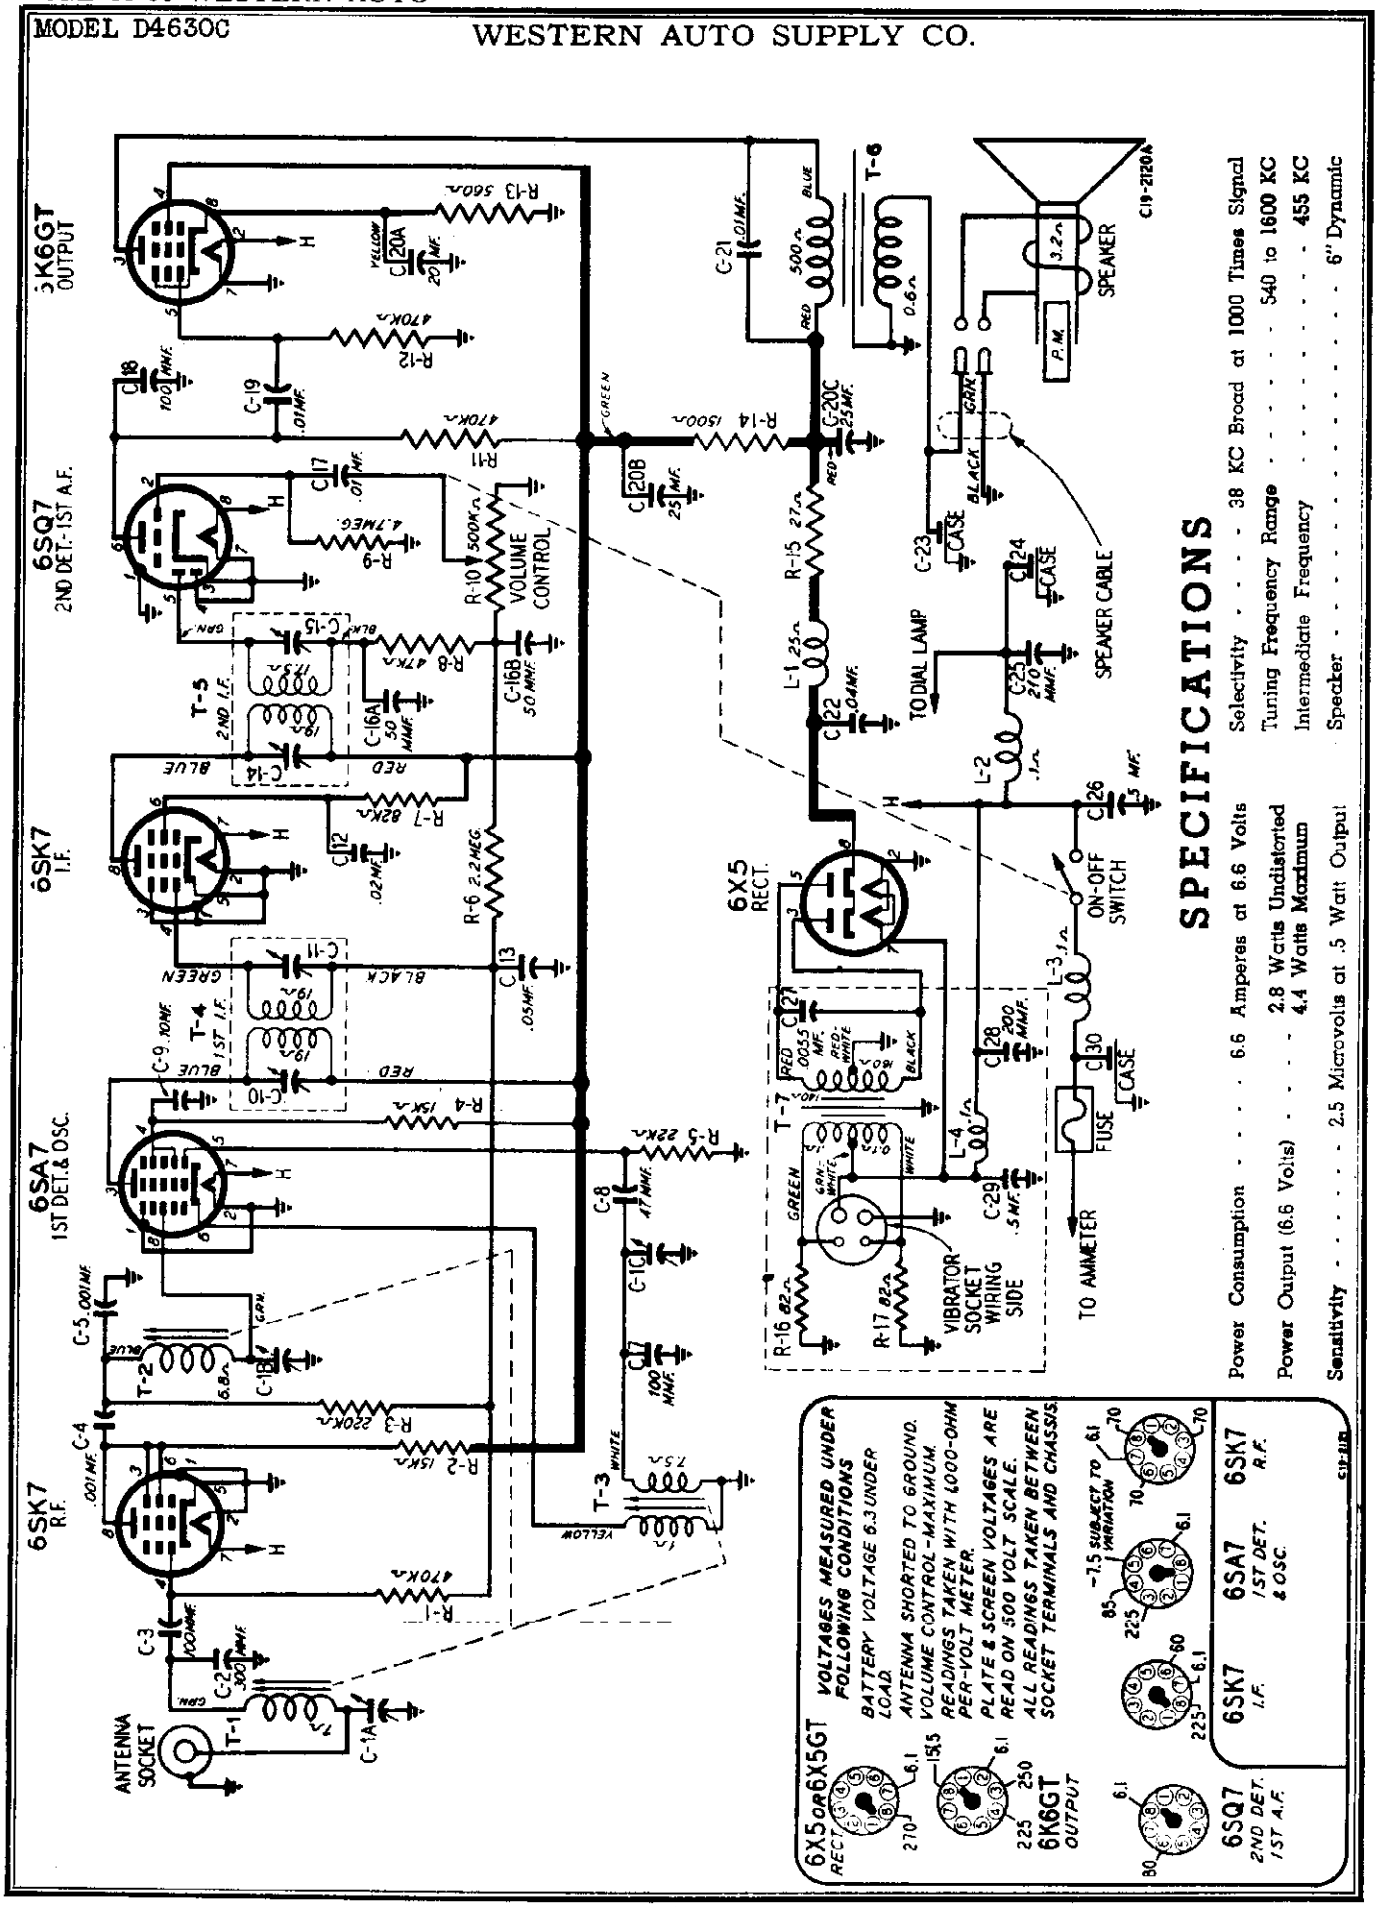
12A467 6" Electro Dynamic Speaker complete with Cable and Plug.

12A471 6" PM Dynamic Speaker complete with Cable and Plug.

13X556 10" Chassis Speaker Cable complete with Socket.

MODEL D4630C

WESTERN AUTO SUPPLY CO.



SPECIFICATIONS

Power Consumption	6.6 Amperes at 6.6 Volts
Power Output (6.6 Volts)	2.8 Watts Undistorted 4.4 Watts Maximum
Sensitivity	2.5 Microvolts at .5 Watt Output

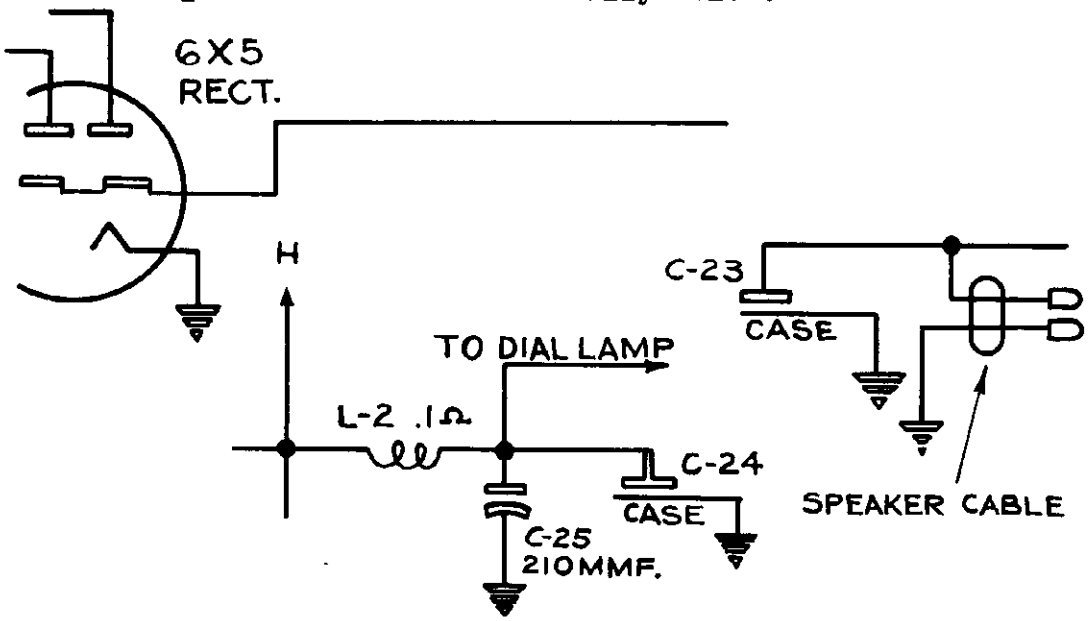
TRUETONE MODEL D4630-E

Model "E" chassis of this model differ from the Model "D" of this model by the addition of the following changes:

Parts List Changes:

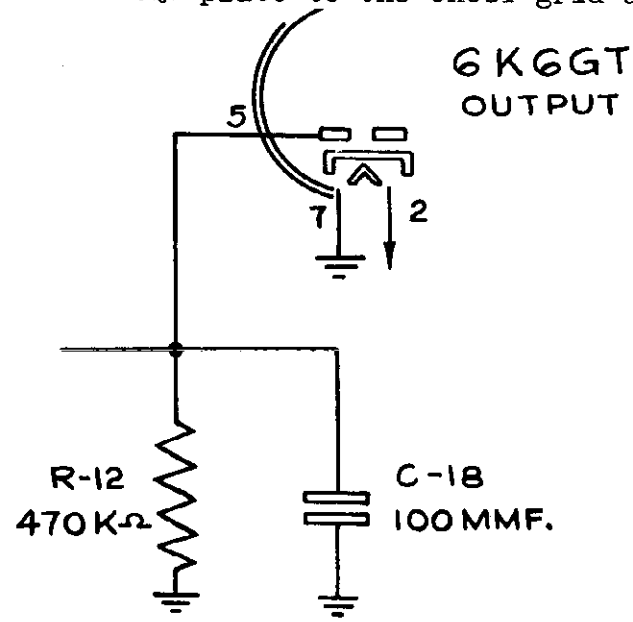
9A1369 - L-2 Field & Pilot Light Filter Reactor
C-23, C-24 (Part of chassis case)

The changes are shown schematically below:



SUPPLEMENTARY SERVICE DATA
TRUETONE MODEL D4630-F

Model "F" chassis of this model differ from the Model "E" of this model by the repositioning of the 100 mmf condenser (C-18) from the 6SQ7 plate to the 6K6GT grid as shown below.



MODELS D4630A, D4630B, D4630C, D4630D, D4630E, D4630F

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antenna—.05 mf., See Note A.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	IRON CORE SETTING	ADJUST TRIMMERS TO MAXIMUM (See Figs. 3 and 4)
I.F. 455 KC	Control Grid (prong No. 8) 6SA7 1st Det. Tube	.05 mf.	Extreme Position out of Coil	1st I.F. (C10 & (C11) 2nd I.F. (C14) & (C15)
OSCILLATOR 1600 KC	Antenna Cable See Note A	See Note A	Extreme Position out of Coil	Oscillator (C1C)
1400 KC ADJUSTMENT 1400 KC	Antenna Cable	See Note A	Tune to Max. Output with Tuning Knob	Int. (C1B) Ant. (C1A)

Reassemble Radio—Install in Car—Connect Car Antenna to Radio.

Car Antenna Readjustment—Tune in weak signal near 1400 KC—Readjust Antenna Trimmer C1A for maximum output.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

NOTE A—Insert the antenna cable plug in the antenna socket on the chassis. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

CALIBRATION—To calibrate the radio see article "Calibrating the Radio"

LOCATING THE CONTROL UNIT ASSEMBLY

This auto radio is supplied with a Crowe control. This control, in conjunction with suitable control plates and mounting brackets, can be mounted in the instrument panel of practically all widely sold automobiles. If the control cannot be mounted in the instrument panel of the car, it may be mounted under the panel or on the steering column.

The control plates, dial assembly, brackets, knobs, and small items such as screws are put up in kit form for each make of automobile.

The tuning control unit, volume control fitting, and flexible shafts are packed with each radio.

Two 27 inch flexible shaft assemblies are supplied unless otherwise specified. Two 20 inch or 36 inch flexible shaft assemblies are available if needed.

First Attach Flexible Shafts to Control Units and Mount Units and Control Plate

The control plate and control units are mounted as explained in the instructions packed with the plate kit. The flexible shafts must be attached to the control units before they are attached to the radio. Attach the shafts by means of the knurled couplings.

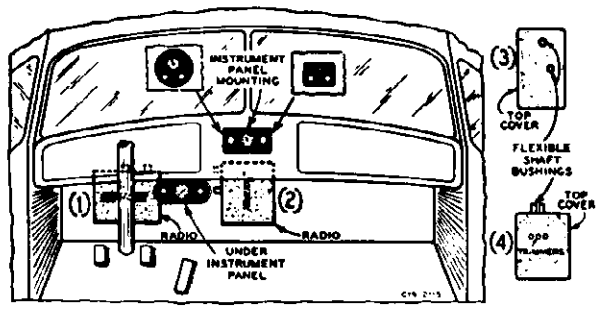


Fig. 1 Control Unit and Chassis Mountings

LOCATING THE RADIO AND DRILLING MOUNTING HOLES

The radio is to be mounted on the fire wall, as shown in Fig. 1, and is generally located over the steering column.

Position 1 is most desirable, position 2 is next best. Mounting positions 3 and 4 should be used only when absolutely necessary.

POSITION 1 — Radio mounted horizontally, with back cover against the fire wall and located over the steering column.

POSITION 2 — Radio mounted vertically, with back cover against the fire wall and located at middle of fire wall.

POSITION 3 — Radio mounted vertically, with side opposite shaft bushings against the fire wall. The radio may also be mounted horizontally in this position.

POSITION 4 — Radio mounted vertically, with small end against the fire wall. The radio may also be mounted horizontally in this position.

If the radio is located over the steering column (Position 1), it may be mounted vertically. Likewise, if the radio is located at the middle of the fire wall (Position 2) it may be mounted horizontally. If necessary to do so, the radio may be mounted on the right side of the fire wall, although this is generally not advisable.

In the middle position, the 27 inch flexible shaft assemblies furnished may be too long and it will be necessary to order the 20 inch shaft assemblies. The first step is to inspect the fire wall to determine at which point there is space available. The contours of the fire wall and the location of the car controls, wires, etc., will determine to a great extent the position of the radio. Lift the radio case up and temporarily hold it in the proposed position.

The radio should be mounted in such a way that the flexible shaft bushings are convenient to the control unit, and as high as possible.

SUPPRESSION OF MOTOR NOISE

The following procedure has been found to be effective in reducing motor noise to a satisfactory level in most cars. Follow the steps in the order given. Additional procedure, which may be required in exceptional cases of motor noise, is not covered here and will be found by referring to current literature on this subject.

GENERATOR CONDENSER — A generator condenser is required in all cases. Connect the condenser lead to the battery terminal of the generator. The case and mounting strap connect the other side of the condenser to ground. This unit must, therefore, be well grounded at its mounting.

CAUTION—In cars with automatic regulators, it is important not to connect the condenser across the field terminal. Most manufacturers at the present time have a recommendation for the proper post at which to connect the condenser.

DISTRIBUTOR SUPPRESSOR — A distributor suppressor will be required in most cases. Remove the high tension lead to the distributor. Insert a distributor suppressor and connect the wire to the other end of the suppressor (See Fig. 5). If this is not practical, cut the high tension lead close to the distributor and use a wood screw end type distributor suppressor in this line.

Withdraw Antenna Cable Plug

Turn on the radio and start the motor.

If motor noise is heard, proceed as follows:

BONDING CABLES, STEERING COLUMN, ETC.—Try grounding to the fire wall all cables and tubing which pass through it such as oil lines, gas lines, etc. It is also possible for the steering column, foot pedals, and brake lever to carry interference to the back of the fire wall at which point it may affect the radio. By means of a file, contact can be established between any of these parts and the fire wall or frame in order to determine whether such a ground will reduce the noise. To bond the parts to the fire wall or frame, clean the point of contact, wrap a length of one inch braided shielding around the part, and solder the connection. Then solder the end of the shielding to the fire wall or frame or ground it under a screw head if one is convenient.

Sufficient play should be left in the bonding shielding so that movement of the parts will not loosen this shielding.

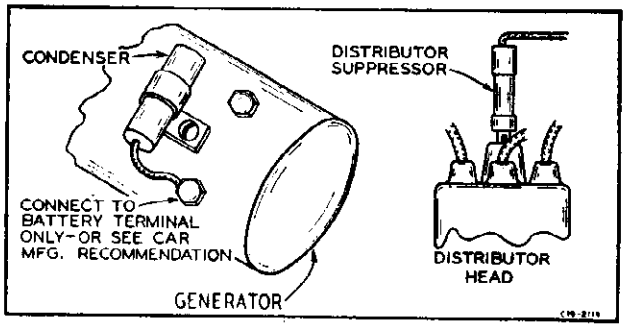

Fig. 5—Generator Condenser and Distributor Suppressor

Then Reinsert Antenna Cable Plug

If motor noise is heard when the antenna cable is reconnected, proceed as follows until the noise is satisfactorily reduced:

BYPASS CONDENSERS — Try a .5 mfd. bypass condenser from the ammeter to ground and see if interference is reduced. Install this condenser permanently if there is an improvement.

In like manner, try a .5 mfd. condenser from car fuse to ground, switch to ground, tail light and stop light connections to ground, windshield wiper and various other 6 volt connections to ground, noting what effect these condensers have on the noise pickup.

Try a .5 mfd. condenser between the point at which the dome light lead leaves the pillar post and ground.

Try a .5 mfd. condenser from the "Hot" side of the coil primary to ground.

The electric gauges used for oil, water, and gas are often a source of interference and bypass condensers should be tried. The condenser should usually be connected to the end of the line nearest the measuring device rather than at the instrument panel.

HIGH AND LOW TENSION LEADS—In some cases, the high and low tension leads between the coil and distributor are run close together. In some cars, they are in the same conduit. If this is the case, remove the low tension lead from this conduit. In any event, keep the high and low tension leads as far apart from each other as possible. If separating the two leads is not sufficient, shield and ground the shield of the low tension lead.

GROUNDING MOTOR AND OTHER PARTS—The motor must, in every case, be well grounded to the frame of the car. If it is not, use a very heavy braided lead for this purpose, similar to a storage battery ground lead. In like manner, it may be necessary to check the grounding of the metal fire wall, instrument panel, transmission, radiator, hood, and muffler to the frame of the automobile. To obtain a good electrical connection, scrape off the paint, if necessary, at the point where ground contact is made.

PEENING ROTOR ARM—In extreme cases of motor noise, it is advisable to peen the distributor rotor arm, that is, increase the length of the arm by using a small machinist's hammer. This will lessen the gap between the rotor arm and the stationary contacts thus reducing the spark. Be sure, after peening the arm, that it does not strike the stationary contacts.

SPARK PLUG SUPPRESSORS—If motor noise persists, spark plug suppressors must be installed. One suppressor is put on each plug. These are not regularly supplied with the radio and must be purchased extra. Ninety-five percent of all cars will not require spark plug suppressors.

Care should be taken that a good mechanical and electrical connection is made between the spark plugs, suppressors, and plug wires.

WHEEL OR BRAKE STATIC—To determine if noise is being caused from this source, set the car in motion; then with the motor shut off and the clutch disengaged, apply the brakes. If the noise stops, the source of the static is in the wheels. The use of a front or rear wheel static eliminator will generally end the trouble.

WESTERN AUTO SUPPLY CO.

IMPORTANT—Locate the chassis in such a manner that the flexible shafts will have a minimum amount of bending. In general, there should not be more than two bends. The bends should be of a large radius. The larger the radius of the bends, the easier the controls will operate.

Other points to consider in choosing the radio location are as follows: Mount the radio case as high as possible to avoid interference with the feet of the people in the front compartment. Mount it also in such a way as to avoid interference with the pedals, cowl ventilator, etc.

Locating and Drilling the Mounting Holes

Having decided on the position of the radio, next locate the mounting holes. There are 8 mounting holes provided in the radio case, 2 in each side and 2 in each end, to which the "J" mounting bolts can be attached. Since only 2 holes are used, there are various ways the radio can be mounted.

In all types of mountings, the "J" bolts must always be on opposite sides of the radio case.

For mountings 1 and 2 (with back cover against fire wall), the "J" bolts should be positioned diagonally. By that is meant if one is mounted at the left and over the radio case, the other should be at the right, under the case.

For mountings 3 and 4, the "J" bolts should be fastened to the holes nearest the fire wall.

When it is determined which mounting holes are to be used and which position the radio is to be mounted in, select the proper two holes as indicated on the template. For example, if the radio is to be mounted in position 1, use the template holes joined by either of the lines numbered 1.

Hold the template in position on the fire wall and punch mark the centers for the desired mounting holes. Before drilling the holes, make sure there is nothing on the motor side of the fire wall that will be damaged by the drilling. Then drill the two 5/16 inch holes.

If there is insulating material such as cardboard or paint on the engine side of the fire wall, the cardboard should be cut away and paint should be scraped away so that the lock washer on the mounting bolt makes good electrical contact with the metal portion of the fire wall.

DO NOT MOUNT THE RADIO AT THIS TIME.

Attaching Flexible Shafts to Radio

The flexible shafts MUST BE ATTACHED TO THE CONTROL UNITS ON THE INSTRUMENT PANEL BEFORE THEY ARE ATTACHED TO THE RADIO.

Insert the spade ends (without coupling) of the flexible shafts into the correct shaft bushings (See Fig. 3) after loosening the 4 set screws in the bushings. Make sure that the spade ends of the shafts are properly fitted into the slotted receptacles. Do this by turning the control unit knob until it is felt that the spade end of the shaft has dropped all the way into position. Then tighten the set screws in the shaft bushings until they hold the casing of the flexible shaft securely.

ANTENNA

A shielded antenna cable (30 mmf. capacity) with bayonet connector plug is required.

The plug on the antenna cable is inserted in the socket at the side of the radio case as shown in Fig. 3. The wire at the other end of the cable is connected to the antenna.

LOW CAPACITY ANTENNA

This radio is designed for a low capacity car antenna. The total capacity of antenna and shielded cable should be 40 to 70 mmf.

Types of Low Capacity Antennas—"Fishpole" type, such as door hinge and cowl; over-the-roof types which are short and are mounted quite a distance from the metal roof of the car.

Mount the antenna on the same side of the car as the radio.

HIGH CAPACITY ANTENNA

If this radio is to be installed with a high capacity car antenna (70 to 500 mmf. total capacity of antenna and shielded cable), a 24 inch shielded adapter extension cable is necessary. The adapter is inserted in the socket at the side of the radio case. Then the antenna cable plug is inserted in the socket at the other end of the adapter.

Types of High Capacity Antennas—Over-the-roof types which are long and are mounted close to the metal roof of the car; ordinary built-in roof antennas (not metal roof). Under-car antennas (these are usually high capacity) are not recommended for this radio.

ANTENNA CABLE

CAUTION—Be careful not to bend the antenna cable too sharply or to clamp it tightly as the small wire inside the cable may be broken.

Keep the antenna cable as far away from car wiring as possible and ground the pigtail of the antenna cable shield at the antenna end, otherwise ignition noise may be picked up. The length of the pigtail from the grounding point to the end of the antenna cable should be kept as short as possible, preferably not over one inch.

For the "fish pole" and over-the-roof type antennas, the antenna lead must be shielded the entire distance from the radio to the point where the lead goes through the car body to the outside.

When the antenna cable is connected to an antenna lead coming down the pillar post, the shielded cable should be pushed several inches up into the pillar post.

MOUNTING SPEAKER BEHIND INSTRUMENT PANEL GRILLE OR ON FIRE WALL

Instrument Panel Mounting

Most late model automobiles have a grille in the instrument panel behind which a speaker can be mounted. The speaker of this radio is intended to be mounted in this manner.

In Fig. 2 is shown methods of mounting which are applicable, with minor changes, to most cars. The strap bracket, only a part of which is

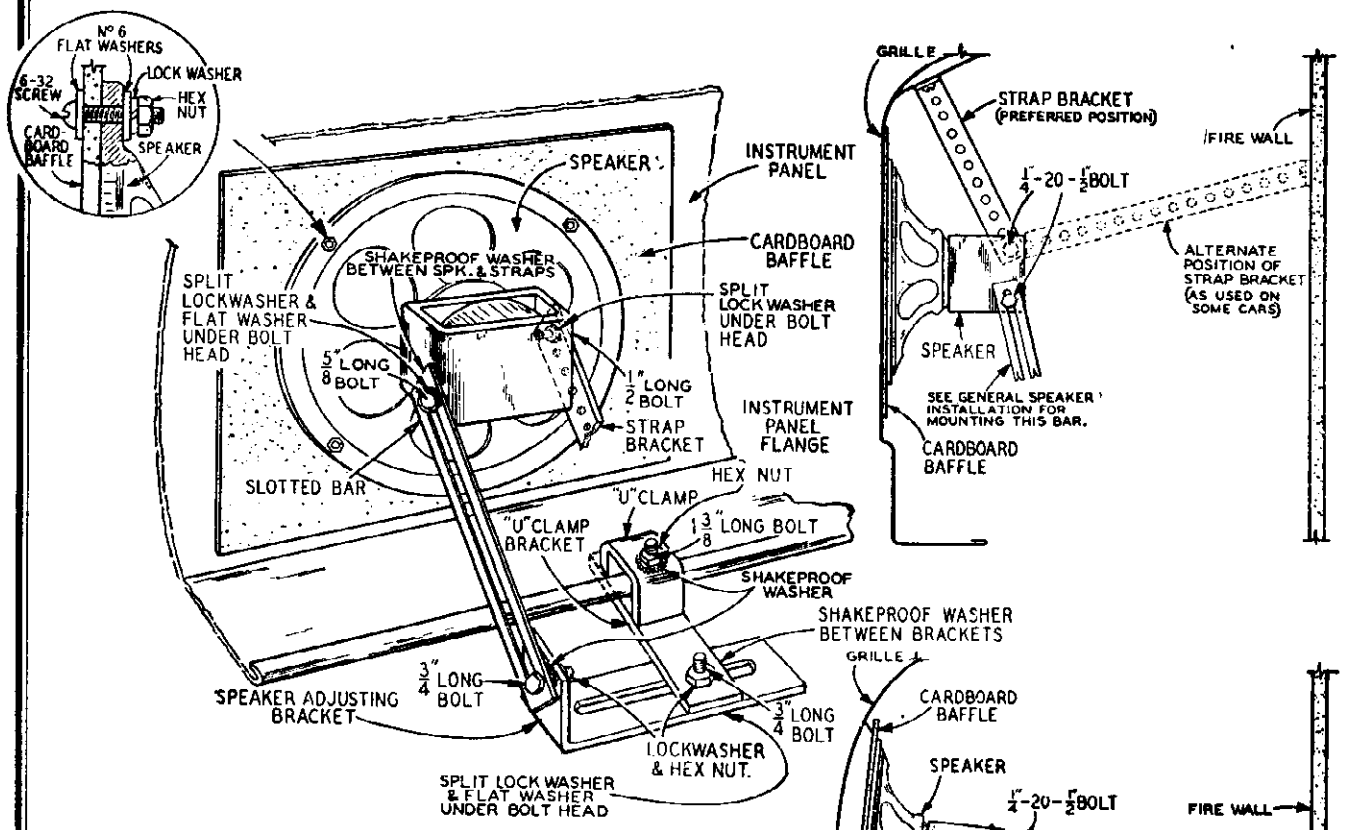

Fig. 2—Typical Methods of Mounting Speaker Behind Instrument Panel Grille

shown, may be cut to any desired length and attached to the fire wall or any convenient part behind the instrument panel. In some installations it will also be necessary to cut the slotted bar at the score mark because of space requirements.

The cardboard speaker baffle should be cut to a size necessary to cover the entire grille opening. The speaker is then attached to the baffle by means of the 4 screws, a flat washer being placed under the head of the screw to prevent it from tearing through the cardboard. Place a flat washer, lock washer, and hex nut on the other end of the screw in the order named. The sponge rubber strip may be attached to the cardboard baffle by means of the adhesive edge in order to prevent rattle between the baffle and the grille. In some cars, the grille opening may be so small the cardboard baffle cannot be used. In this case, the sponge rubber strip should be attached around the edge of the speaker rim.

Connect the 3 prong plug on the speaker cable to the 3 hole socket on the speaker cable coming from the chassis.

Mounting Speaker on Fire Wall

On cars where it is impossible to mount the speaker behind the instrument panel, a kit of parts is available to enable the speaker to be mounted on the fire wall. The part number of this kit will be found in the Replacement Parts List. Complete instructions for mounting are supplied with the kit.

WESTERN AUTO SUPPLY CO.

FINAL INSTALLATION ITEMS

Before Mounting Radio

Before mounting the radio to the fire wall, it is advisable in most cases to complete the wiring connections.

Battery Cable and Fuse

The battery connection is made at the ammeter. The end of the battery cable with the connecting lug is secured to one of the posts at the back of the ammeter in the instrument panel. The other end of the cable with the fuse receptacle connects to the battery cable from the radio after the fuse has been inserted. A 14 ampere fuse is used.

Dial Lamp Cable

Insert the dial lamp assembly in the receptacle as indicated in Fig. 3. The dial lamp used in this unit is a 6-8 volt automobile type lamp (Bulb No. 51).

Adjusting Antenna Trimmer

After the antenna is connected, tune in a weak signal at approximately 1400 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna trimmer (C1A) up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

Bolting Radio in Place

Insert the "J" mounting bolts through the mounting holes from the driver's side of the fire wall. Then from the motor side, place a lock-washer, flat washer, hex nut, and lock nut loosely on one bolt (See Fig. 3). On the other bolt, place the same parts except for the lock-washer.

Now raise the radio into position and hook the two "J" bolts into the mounting holes in the case.

Tighten the nut on one bolt until it just begins to feel snug. Then tighten the nut on the other bolt a like amount.

Then from the inside, position the radio. Next tighten one of the nuts a slight additional amount and then the other nut a like amount. See if radio is still properly positioned and then complete the tightening of the nut on both mounting bolts.

After the radio is in place, fasten the flexible shafts and electrical cables in position at the nearest convenient point.

Calibrating the Radio

To calibrate the radio, tune in a station of known frequency, loosen the knurled nut at the tuning control clamp fitting and turn the flexible shaft with the fingers until the dial pointer indicates the frequency of the station being received.

Slide the flexible shaft in or out of the tuning control clamp fitting until a smooth action with a minimum of backlash is obtained.

The knurled nut should then be tightened with the fingers.

Readjusting Flexible Shafts

When the radio is in position on the fire wall, loosen the flexible shaft casing set screws on the chassis. Allow the casing to position itself so that it does not bind. Then retighten the set screws.

Replacing Tubes and Vibrator

To replace the tubes or vibrator, remove the screw at each end of the top cover. Pry off the cover. The tubes and vibrator are now accessible for replacement.

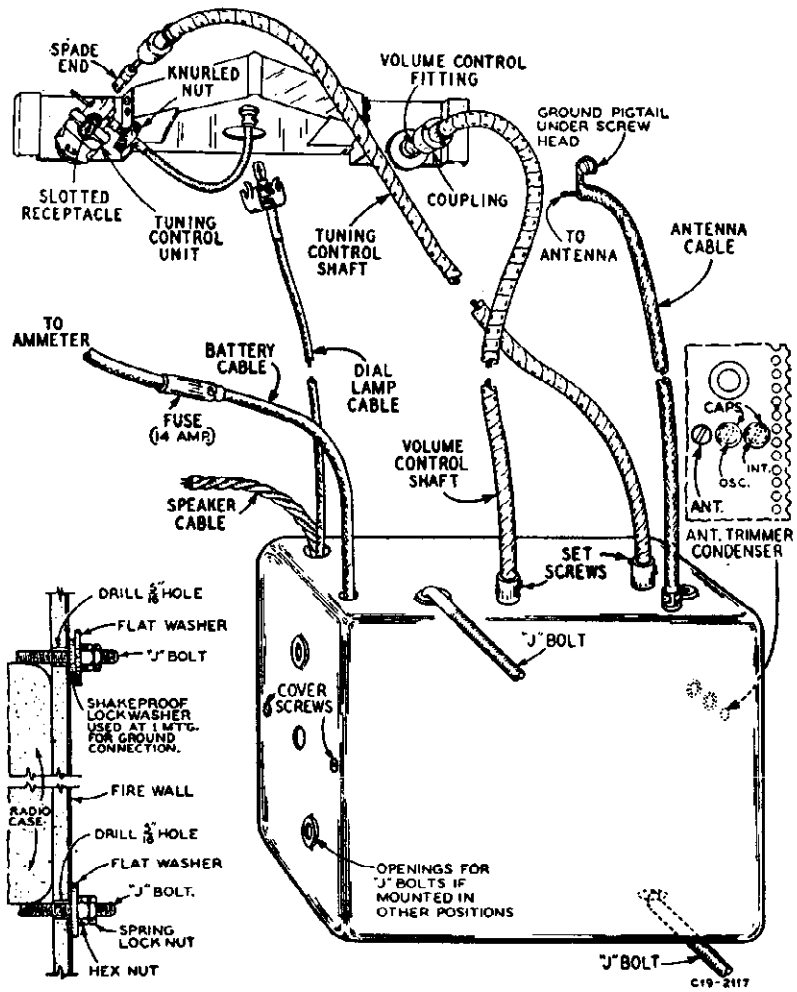

Fig. 3—General Installation View

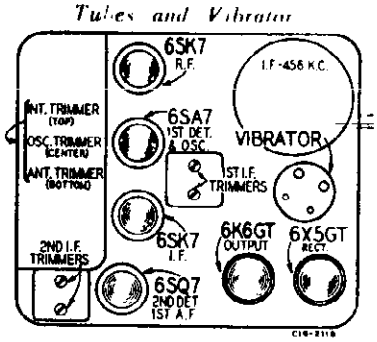
Fig. 4—Location of Tubes and Vibrator



REPLACEMENT PARTS LIST

NOTICE: There is a power rating label on the radio. This label specifies the power supply on which the radio may be used, and identifies the radio as to series, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

INSTALLATION ITEMS

CABLE AND FLEXIBLE SHAFT ASSEMBLIES

	Quantity Used	
18A53	2	27" Tuning Control and Volume Control Flexible Drive Shafts
18A54	2	20" Same as above
18A55	2	36" Same as above
13X390	1	Battery Cable (long section with Fuse Receptacle)
7A162	1	Dial Lamp Socket and Cable Assembly
13X336	1	"A" Cable (Short Section connected to Chassis)
13X582	1	Speaker Cable Assembly (on chassis)

INSTRUMENT PANEL SPEAKER MOUNTING PARTS

26A276	1	Speaker Mounting Kit (For mounting speaker on Instrument Panel) complete with Speaker Baffle, Brackets, Clamps, Nuts, Bolts, and Washers
25X789	1	Strap Bracket only
25X787	1	Speaker Adjusting Bracket ("L" Shaped)
30X154	1	"U" Clamp
25X786	1	Bracket for "U" Clamp
25X785	1	9" Slotted Speaker Bar
14X256	1	Cardboard Speaker Baffle
8X108	1	Sponge Rubber Strip

FIRE WALL SPEAKER MOUNTING PARTS

26A380	1	Speaker Mounting Kit (for mounting speaker on Fire Wall) complete with Speaker Housing, Grille Cloth, Speaker Screen, Washers, and Nuts
14X321	1	Speaker Housing only
14X322	1	Grille Cloth
14X320	1	Speaker Screen

MISCELLANEOUS ITEMS

26A277	1	Radio Mounting Bolt Kit complete with "J" Bolts, Nuts, and Washers
20X339	2	"J" Bolts only
16X27	1	14 Ampere Fuse
21A6	1	Distributor Suppressor
48X27	1	Generator Condenser
7A32	1	No. 51 Pilot Light Bulb
21A7		Spark Plug Suppressors (Not shipped with Radio)
21A5	1	Choke-Condenser Unit (Not shipped with Radio)

MODEL D4630E — WESTERN AUTO SUPPLY CO.

REPLACEMENT PARTS LIST

NOTICE: There is a model number label on the radio. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MISCELLANEOUS

12A474	6" PM Speaker
3A303	Tube Socket—Octal (8 prong)
3A316	Vibrator Socket (4 prong) moulded
19A41	Vibrator
28X52	Spring Clamp for Vibrator
32X134	Shield for Filter Assembly
32X105	Shield for Power Transformer
34X300	Top Cover for Chassis Case less Name Plate
34X301	Bottom Cover for Chassis Case
28X48	Spring Clips to Ground Covers to Case

TRANSFORMERS AND COILS

13X336	1	"A" Cable (Short Section connected to Chassis)
13X582	1	Speaker Cable Assembly (on chassis)

INSTRUMENT PANEL SPEAKER MOUNTING PARTS

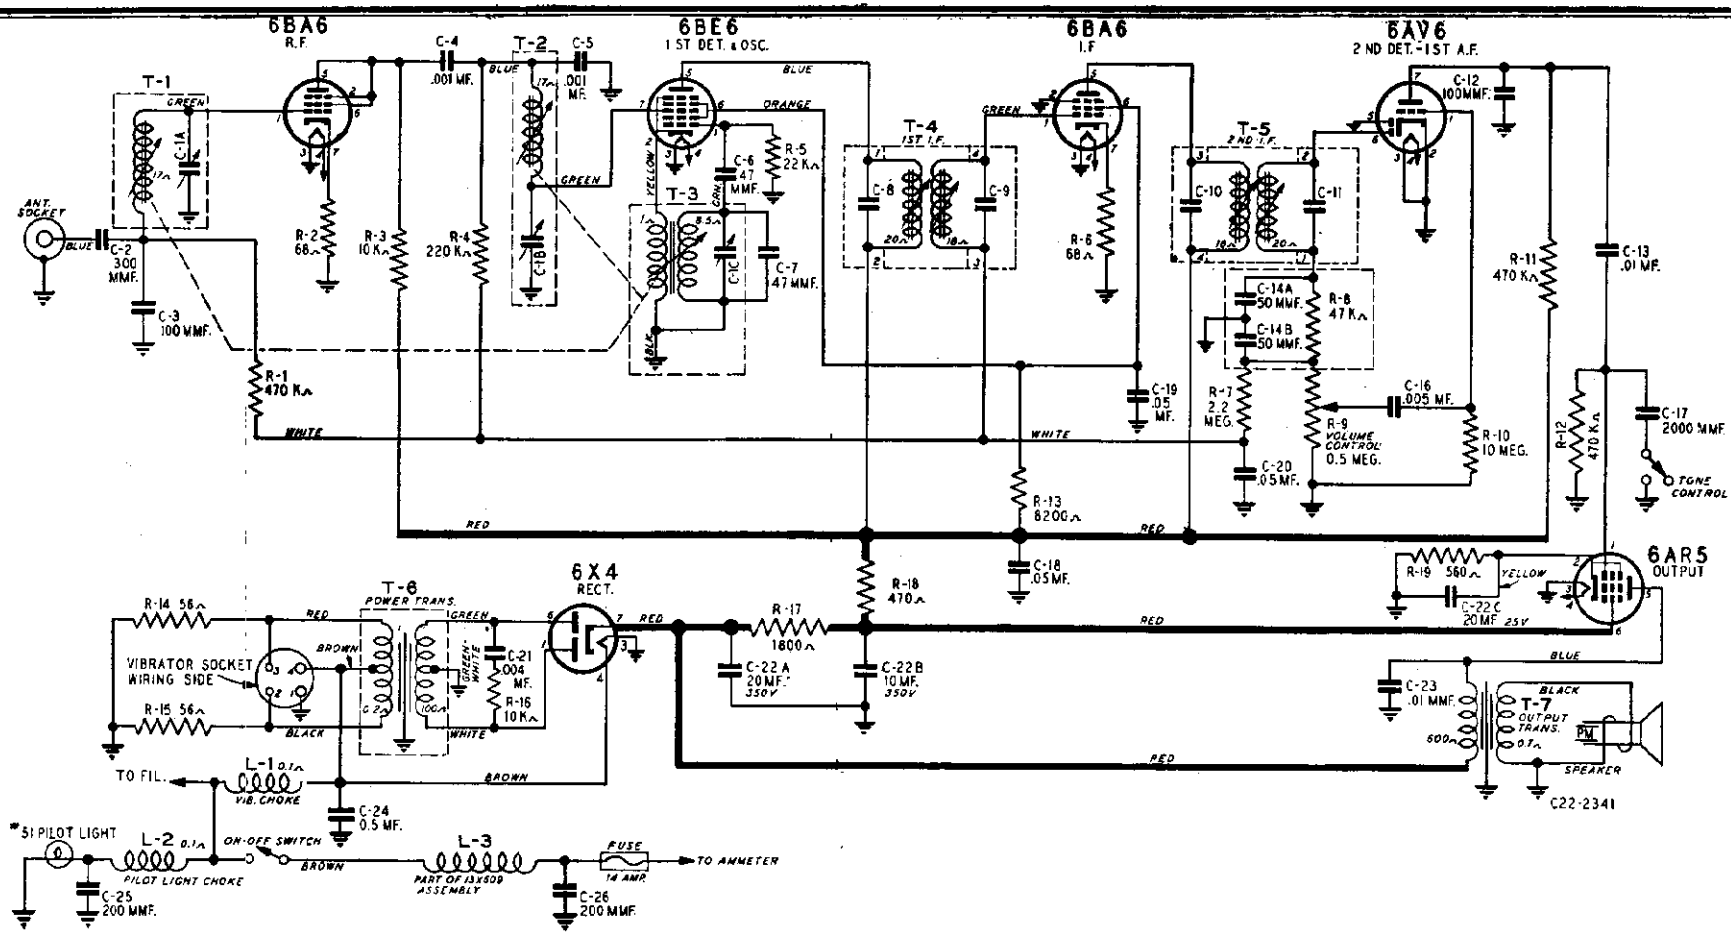
26A276	1	Speaker Mounting Kit (For mounting speaker on Instrument Panel) complete with Speaker Baffle, Brackets, Clamps, Nuts, Bolts, and Washers
25X789	1	Strap Bracket only
25X787	1	Speaker Adjusting Bracket ("L" Shaped)
30X154	1	"U" Clamp
25X786	1	Bracket for "U" Clamp
25X785	1	9" Slotted Speaker Bar
14X25C	1	Cardboard Speaker Baffle
8X108	1	Sponge Rubber Strip

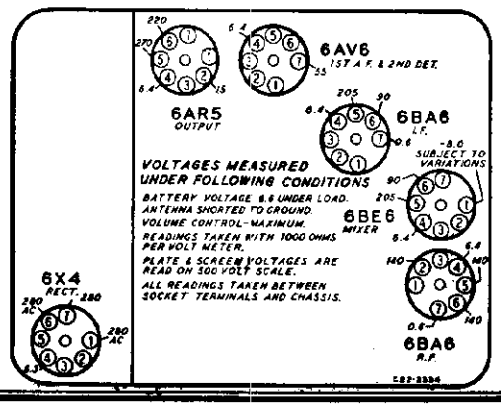
FIRE WALL SPEAKER MOUNTING PARTS

26A380	1	Speaker Mounting Kit (for mounting speaker on Fire Wall) complete with Speaker Housing, Grille Cloth, Speaker Screen, Washers, and Nuts
14X321	1	Speaker Housing only
14X322	1	Grille Cloth
14X320	1	Speaker Screen

MISCELLANEOUS ITEMS

26A277	1	Radio Mounting Bolt Kit complete with "J" Bolts, Nuts, and Washers
20X339	2	"J" Bolts only
16X27	1	14 Ampere Fuse
21A6	1	Distributor Suppressor
48X27	1	Generator Condenser
7A32	1	No. 51 Pilot Light Bulb
21A7		Spark Plug Suppressors (Not shipped with Radio)
21A5	1	Choke-Condenser Unit (Not shipped with Radio)





SPECIFICATIONS

Power Consumption 6.6 Amperes at 6.6 Volts

Power Output (6.6 Volts) 2.2 Watts Undistorted
4.0 Watts Maximum

Sensitivity.....4 Microvolts at 1 Watt Output

Selectivity.....55 KC Broad at 1000 Times Signal

Tuning Frequency Range.....540 to 1600 KC

Intermediate Frequency.....455 KC

Speaker .....5¼" Dynamic

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

NOTE A—Insert the antenna cable plug in the antenna socket on the chassis. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

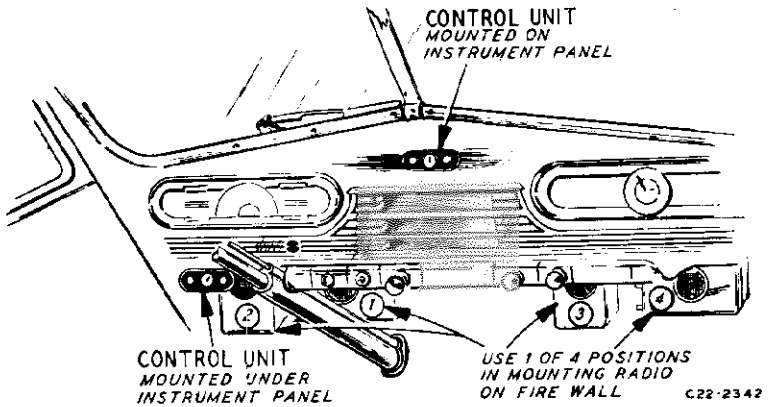


Fig. 1—Control Unit and Chassis Mountings

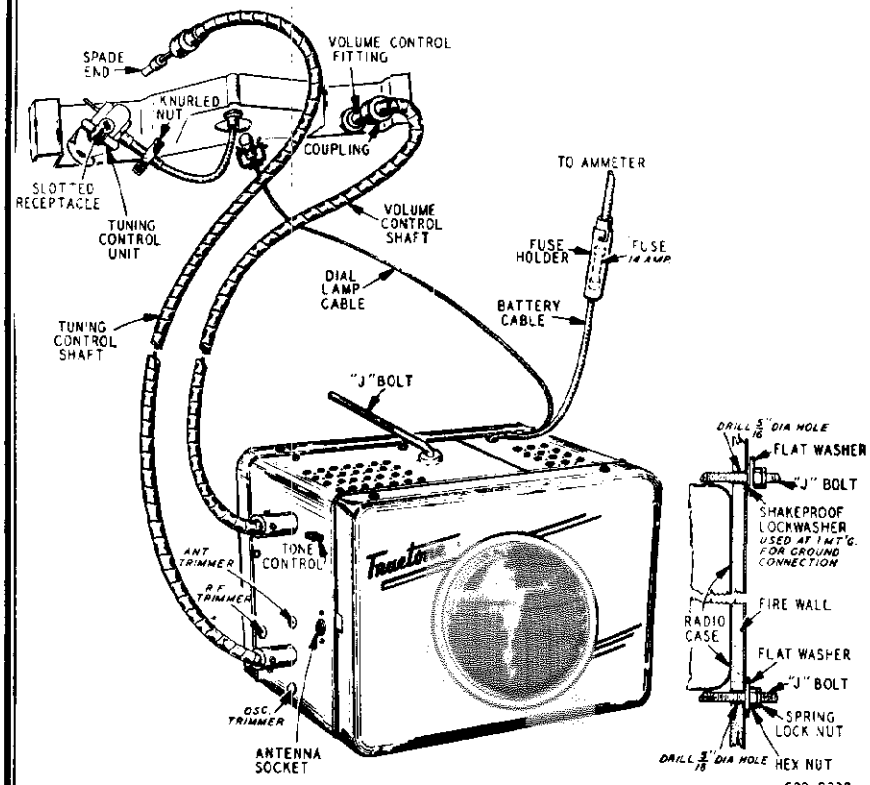

Fig. 2—General Installation View

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.
The following equipment is required for aligning:

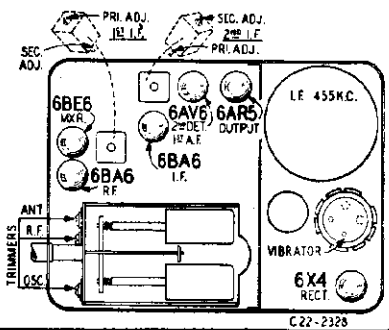
A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antenna—.05 mf., See Note A.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	IRON CORE SETTING	ADJUST TUNING SLUGS (IF) AND TRIMMERS TO MAXIMUM (See Fig. 3)
I.F.	Control Grid (prong No. 7)		Extreme Position	1st I.F. PRI. & SEC. ADJ
455 KC	6BE6 Mixer Tube	.05 mf.	out of Coil	2nd I.F. PRI. & SEC. ADJ
OSCILLATOR				
1600 KC	Antenna Cable See Note A	See Note A	Extreme Position out of Coil	Oscillator (C1C)
1400 KC ADJUSTMENT				
1400 KC	Antenna Cable	See Note A	Tune to Max. Output with Tuning Knob	R.F. (C1B) Ant. (C1A)

Reassemble Radio—Install in Car—Connect Car Antenna to Radio.

Car Antenna Readjustment—Tune in weak signal near 1400 KC—Readjust Antenna Trimmer C1A for maximum output.

Fig. 3—Location of Tubes and Vibrator



Calibrating the Radio

To calibrate the radio, tune in a station of known frequency, loosen the knurled nut at the tuning control clamp fitting and turn the flexible shaft with the fingers until the dial pointer indicates the frequency of the station being received.

Slide the flexible shaft in or out of the tuning control clamp fitting until a smooth action with a minimum of backlash is obtained.

The knurled nut should then be tightened with the fingers.

SUPPRESSION OF MOTOR NOISE

The following procedure has been found to be effective in reducing motor noise to a satisfactory level in most cars. Follow the steps in the order given. Additional procedure, which may be required in exceptional cases of motor noise, is not covered here and will be found by referring to current literature on this subject.

GENERATOR CONDENSER — A generator condenser is required in all cases. Connect the condenser lead to the battery terminal of the generator. The case and mounting strap connect the other side of the condenser to ground. This unit must, therefore, be well grounded at its mounting.

CAUTION—In cars with automatic regulators, it is important not to connect the condenser across the field terminal. Most manufacturers at the present time have a recommendation for the proper post at which to connect the condenser.

DISTRIBUTOR SUPPRESSOR—A distributor suppressor will be required in most cases. Remove the high tension lead to the distributor. Insert a distributor suppressor and connect the wire to the other end of the suppressor (See Fig. 4). If this is not practical, cut the high tension lead close to the distributor and use a wood screw end type distributor suppressor in this line.

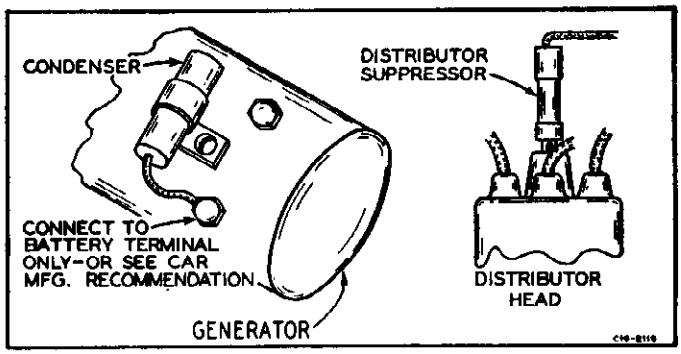


Fig. 4—Generator Condenser and Distributor Suppressor

Withdraw Antenna Cable Plug

Turn on the radio and start the motor.

If motor noise is heard, proceed as follows:

BONDING CABLES, STEERING COLUMN, ETC.—Try grounding to the fire wall all cables and tubing which pass through it such as oil lines, gas lines, etc. It is also possible for the steering column, foot pedals, and brake lever to carry interference to the back of the fire wall at which point it may effect the radio. By means of a file, contact can be established between any of these parts and the fire wall or frame in order to determine whether such a ground will reduce the noise. To bond the parts to the fire wall or frame, clean the point of contact, wrap a length of one inch braided shielding around the part, and solder the connection. Then solder the end of the shielding to the fire wall or frame or ground it under a screw head if one is convenient.

Sufficient play should be left in the bonding shielding so that movement of the parts will not loosen this shielding.

Then Re-insert Antenna Cable Plug

If motor noise is heard when the antenna cable is reconnected, proceed as follows until the noise is satisfactorily reduced:

BYPASS CONDENSERS — Try a .5 mfd. bypass condenser from the ammeter to ground and see if interference is reduced, Install this condenser permanently if there is an improvement.

In like manner, try a .5 mfd. condenser from car fuse to ground, switch to ground, tail light and stop light connections to ground, windshield wiper and various other 6 volt connections to ground, noting what effect these condensers have on the noise pickup.

Try a .5 mfd. condenser between the point at which the dome light lead leaves the pillar post and ground.

Try a .5 mfd. condenser from the "Hot" side of the coil primary to ground.

The electric gauges used for oil, water, and gas are often a source of interference and bypass condensers should be tried. The condenser should usually be connected to the end of the line nearest the measuring device rather than at the instrument panel.

HIGH AND LOW TENSION LEADS—In some cases, the high and low tension leads between the coil and distributor are run close together. In some cars, they are in the same conduit. If this is the case, remove the low tension lead from this conduit. In any event, keep the high and low tension leads as far apart from each other as possible. If separating the two leads is not sufficient, shield and ground the shield of the low tension lead.

GROUNDING MOTOR AND OTHER PARTS—The motor must, in every case, be well grounded to the frame of the car. If it is not, use a very heavy braided lead for this purpose, similar to a storage battery ground lead. In like manner, it may be necessary to check the grounding of the metal fire wall, instrument panel, transmission, radiator, hood, and muffler to the frame of the automobile. To obtain a good electrical connection, scrape off the paint, if necessary, at the point where ground contact is made.

PEENING ROTOR ARM — In extreme cases of motor noise, it is advisable to peen the distributor rotor arm, that is, increase the length of the arm by using a small machinist's hammer. This will lessen the gap between the rotor arm and the stationary contacts thus reducing the spark. Be sure, after peening the arm, that it does not strike the stationary contacts.

SPARK PLUG SUPPRESSORS—If motor noise persists, spark plug suppressors must be installed. One suppressor is put on each plug. These are not regularly supplied with the radio and must be purchased extra. Ninety-five percent of all cars will not require spark plug suppressors.

Care should be taken that a good mechanical and electrical connection is made between the spark plugs, suppressors, and plug wires.

WHEEL OR BRAKE STATIC—To determine if noise is being caused from this source, set the car in motion; then with the motor shut off and the clutch disengaged, apply the brakes. *If the noise* stops, the source of the static is in the wheels. The use of a front or rear wheel static eliminator will generally end the trouble.

MODELS D4832A, D4832B WESTERN AUTO SUPPLY CO.

REPLACEMENT PARTS LIST

1	6SA7	Converter
1	6SK7	I-F Amplifier
1	6SQ7	Det., A.V.C., A-F Amp.
1	6SQ7	Phase Inverter
2	6V6GT/G	Power Output Amp.
1	6U5	Tuning Eye
1	5Z4	Rectifier

PILOT LAMPS:

2 Westinghouse No. 44 ..... 6.3 v., 0.25 amp.

POWER OUTPUT:

Undistorted	8 watts
Maximum	11 watts

LOUDSPEAKER:

Type	P.M. dynamic
Voice Coil Impedance at 400 cycles	3.2 ohms
Size (H-142)	8 inches
Size (H-163, H-172, H-175)	12 inches

OPERATING VOLTAGES (40-60 cycles A-C):

100 to 120 volts—Insert line voltage plug beside power transformer in 110 v position.

120 to 140 volts—Insert adapter V-7046 in place of line voltage plug.

140 to 160 volts—Insert adapter V-7047 in place of line voltage plug.

200 to 240 volts—Insert line voltage plug beside power transformer in 220 v. position.

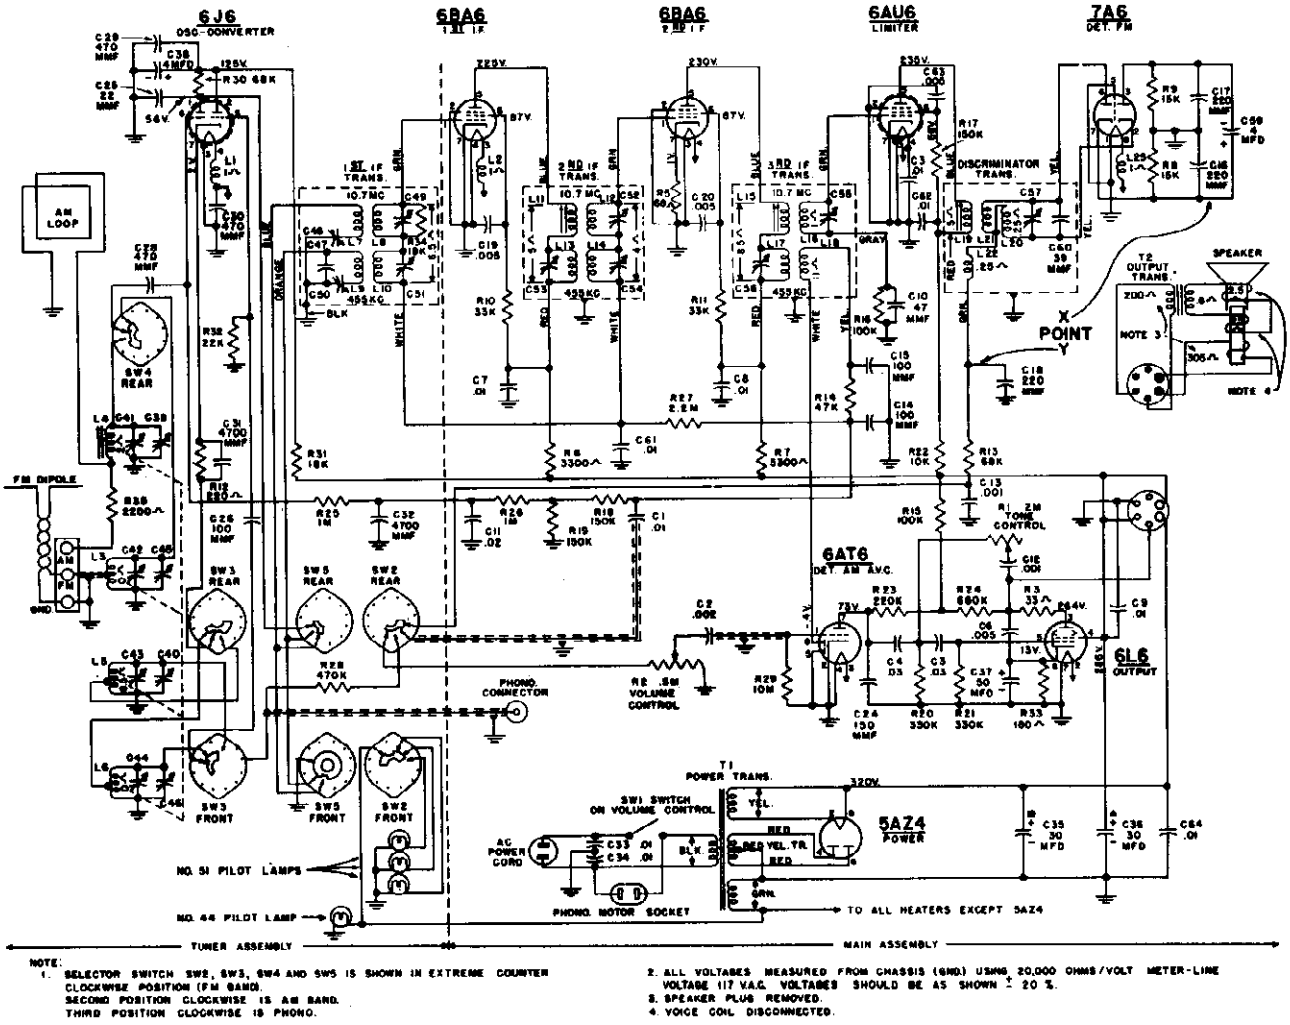
POWER CONSUMPTION (at 110 volts, 60 cycles): 100 watts

SPECIAL PROVISION (H-163 and H-172):

110 volts A-C is supplied to the phono motor socket on rear of chassis, regardless of line voltage.

MODELS H-161, H-168, H-168A, H-168B Revised

WESTINGHOUSE ELECTRIC CORP.



NOTE:
1. SELECTOR SWITCH SW2, SW3, SW4 AND SW5 IS SHOWN IN EXTREME COUNTER CLOCKWISE POSITION (FM BAND). SECOND POSITION CLOCKWISE IS AM BAND. THIRD POSITION CLOCKWISE IS PHONO.
2. ALL VOLTAGES MEASURED FROM CHASSIS (GND.) USING 20,000 OHMS/VOLT METER-LINE VOLTAGE 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 %.
3. SPEAKER PLUG REMOVED.
4. VOICE COIL DISCONNECTED.

CHANGES IN V-2118 CHASSIS

Improved performance was obtained in later production of the V-2118 chassis by incorporating the changes listed below. A schematic diagram of the revised chassis is shown on the back of this sheet, and parts list additions appear below.

1. The connection between the antenna loading coil (L4) and the bandswitch (SW4) was moved to the top of the coil.
2. A resistor (R35) was inserted in place of C27 in the AM antenna circuit.
3. Capacitor (C58) in the AM antenna circuit was deleted.
4. R32 now connects between the 6J6 oscillator grid and ground instead of between the 6J6 oscillator grid and cathode.
5. Filament choke (L25) was added to the 7A6 heater circuit.
6. C64 was added across the power supply filter circuit.
7. C6 now connects between resistor (R3) and 6L6 cathode instead of between 6L6 plate and cathode.
8. A phono motor power socket was mounted on the rear of the chassis.

These parts should be added to the parts list in the original service notes. The list will then apply to both the original and the revised chassis.

ALIGNMENT

BROADCAST BAND—AMPLITUDE MODULATION

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set on treble, and the signal generator output attenuated to avoid AVC action.

Step	*Connect Signal Generator to—*	*Signal Gen. Freq.*	*Radio Dial*	*Adjust for Maximum Output*
1.	Set Phono-Band Switch to "AM"			
2.	6bA6, 2nd I-F, control grid through a 0.1 mfd capacitor	455 kc	540 kc	455 kc primary trimmer of 3rd I-F transformer.
3.	6BA6, 1st I-F, control grid through a 0.1 mfd capacitor	455 kc	540 kc	455 kc primary and secondary trimmers of 2nd I-F trans.
4.	6J6, converter, control grid through a 0.1 mfd capacitor	455 kc	540 kc	455 kc primary and secondary trimmers of 1st I-F trans.
5.	6J6, converter, control grid through a 0.1 mfd capacitor	455 kc	540 kc	Peak all 455 kc I-F transformer trimmers.
6.	Radiated signal (no actual connection)	1600 kc	1600 kc	AM oscillator trimmer.
7.	Radiated signal	600 kc	600 kc	AM antenna padder.
8.	Radiated signal	1400 kc	1400 kc	AM antenna trimmer.
9.	Recheck steps 7 and 8 in order given. "Rock" tuning capacitor while adjusting AM antenna trimmer.			

FM BAND—FREQUENCY MODULATION

Do not align the 10.7 mc I-F circuits until all 455 kc I-F adjustments have been completed.

Step	*Connect Signal Generator to—*	*Signal Gen. Freq.*	*Radio Dial*	*Adjust—*
1.	Set Phono-Band switch to "FM."			
2.	Connect a vacuum tube voltmeter between point X (see Figs. 3 and 4) and ground (chassis).			
3.	6BA6, 2nd I-F, control grid through a .001 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	10.7 mc primary and secondary of 3rd I-F trans. and primary of discriminator trans. for max. voltage.
4.	6BA6, 1st I-F, control grid through a .001 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	10.7 mc primary and secondary of 2nd I-F trans. for max. voltage.
5.	Stator of FM tuning capacitor (C42) through a .01 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	10.7 mc primary and secondary of 1st I-F trans. for max. voltage.
6.	Connect the vacuum tube voltmeter between point Y (Figs. 3 and 4) and chassis.			
7.	Stator of FM tuning capacitor (C42) through a .01 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	Secondary of discriminator trans. for zero voltage. The voltage will change polarity as the trimmer is tuned through resonance. Tune carefully for zero voltage.
8.	Connect the vacuum tube voltmeter between point X and chassis.			
9.	Stator of FM tuning capacitor (C42) through a .01 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	Primary of discriminator trans. for max. voltage.
10.	FM antenna terminal through a 72 ohm non-inductive resistor	Unmodulated 105 mc	105 mc	FM oscillator trimmer for max. voltage.*
11.	FM antenna terminal through a 72 ohm non-inductive resistor	Unmodulated 105 mc	105 mc	FM antenna trimmer for max. voltage *— "rock" tuning capacitor while adjusting.
12.	Check dial calibration and tracking at 90 mc.**			

* The FM oscillator and antenna trimmers can be adjusted by using the thumb and forefinger to rotate the outside drum of the capacitor. Hand capacity effects may be reduced by holding the heel of the hand against the 1st I-F trans. can.

** After the radio has been aligned at 105 mc., check calibration by tuning to a 90 mc. signal from the generator. If the dial pointer indicates 90 mc., no further adjustments are necessary. If the pointer is on the high frequency side of 90 mc., slightly *expand* the length of oscillator coil (L6) and repeat steps 10, 11, and 12 above until dial calibration is correct. If the pointer is on the low frequency side of 90 mc., slightly *compress* length of oscillator coil (L6) and repeat steps 10, 11, and 12 until dial calibration is correct.

After calibration has been checked and the antenna circuit has been "peaked" at 105 mc., check the antenna circuit tracking by tuning to a 90 mc. signal and rotating the FM antenna trimmer. If the "peak" setting is the same at 90 mc. as it was at 105 mc., no further adjustments are necessary. If the trimmer capacitance must be increased to obtain maximum output at 90 mc., slightly compress the length of antenna coil (L3) and repeat steps 11 and 12 until correct tracking is obtained. If the trimmer capacitance must be decreased to obtain maximum output at 90 mc., slightly expand the length of antenna coil (L3) and repeat steps 11 and 12 until correct tracking is obtained.

RCP10M6S02A	Capacitor, .005 mfd 600 v. (C6)
V-5040-15	Capacitor, .01 mfd 600 v. (C7, C8, C9)
RCM20A470M	Capacitor, 47 mmf mica (C10)
RCP10W4203A	Capacitor, .02 mfd 400 v. (C11)
RCP10W6102A	Capacitor, .001 mfd 600 v. (C12, C13)
RCM20A101M	Capacitor, 100 mmf mica (C14, C15)
RCM20A221K	Capacitor, 220 mmf mica (C16, C17, C18)
V-5040-11	Capacitor, .005 mfd 600 v. (C19, C20)
RCM30A472M	Capacitor, 4700 mmf mica (C21)
RCM30A103M	Capacitor, .01 mfd mica (C22, C23)
RCM20A151M	Capacitor, 150 mmf mica (C24)
RCM20B220K	Capacitor, 22 mmf mica (C25)
R3CC32CG101K	Capacitor, 100 mmf ceramic (C26)
R3CC26SL101M	Capacitor, 100 mmf ceramic (C27)
RCM20A471M	Capacitor, 470 mmf mica (C28)
R5CC20ZY471M	Capacitor, 470 mmf ceramic (C29 C30)
R5CC36ZY472M	Capacitor, 4700 mmf ceramic (C31, C32)
V-4634	Capacitor, dual line filter .01-.01 mfd 600 v. (C33, C34)
V-4635	Capacitor, dual filter, electrolytic 30-30 mfd 450 v. (C35, C36)
V-4636	Capacitor, electrolytic 50 mfd 25 v. C37
V-4885	Capacitor, electrolytic 4 mfd 450 v. (C38, C59)
V-4671	Capacitor, AM antenna trimmer (C39)
V-4672	Capacitor, AM oscillator trimmer (C40)
V-4673	Capacitor, variable 2 gang (C41, C42, C43, C44, C45, C46)
R3CC25CG270J	Capacitor, 27 mmf ceramic (C58)
V-5307-1	Cardboard & Grille Cloth Assy., L.H. side (H-168, H-168A Mahogany)
V-5307-2	Cardboard & Grille Cloth Assy., L.H. side (H-168 Blonde)
V-4898	Catch, bullet
V-5071	Channel, rubber (H-168, H-168A)
V-4638	Choke, filament, 1.1 microhenries (L1, L2)
V-4877	Clamp, power cord, closed
V-3337S	Clamp, power cord, open

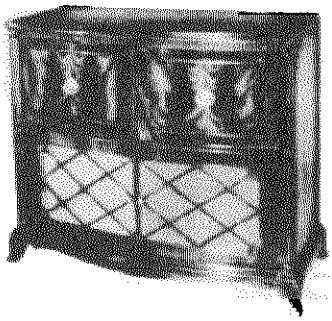
PARTS LIST FOR MODELS H-161, H-168 AND H-168A

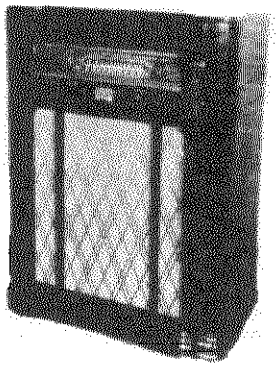
Part No.	Description
RC30AE103K	Resistor, 10,000 ohms 1 w. (R22)
RC10AE224K	Resistor, 220,000 ohms ¼ w. (R23)
RC10AE684K	Resistor, 680,000 ohms ¼ w. (R24)
RC10AE105M	Resistor, 1 megohm ¼ w. (R25, R26)
RC10AE225M	Resistor, 2.2 megohms ¼ w. (R27)
RC10AE474M	Resistor, 470,000 ohms ¼ w. (R28)
RC10AE106M	Resistor, 10 megohms ¼ w. (R29)
RC20AE683K	Resistor, 68,000 ohms ½ w. (R30)
RC30AE183K	Resistor, 18,000 ohms 1 w. (R31)
RC10AE223K	Resistor, 22,000 ohms ¼ w. (R32)
V-4648	Resistor, cathode 180 ohms 2 w. (R33)
V-3755S-11	Screw, chassis mounting (H-161)
V-3570S-5	Screw, tuner assembly mounting
V-3570S-11	Screw, Hex head, chassis mtg. (H-168 and H-168A)
V-3755S-9	Screw, Phillips head, chassis mtg. (H-168 and H-168A)
V-4678	Shaft, tuning
V-4649-3	Shield, spiral (2¾ inches long)
V-4649-2	Shield, spiral (7½ inches long)
V-4884	Shield, loktal tube
V-4861	Shield, flat steel (under chassis)
V-4169-2	Shield, miniature tube
V-3344S-2	Sleeve, spacer, tuner assy. mounting
V-3288S	Socket, speaker
V-3870-1	Socket, lock-in tube
V-3275S	Socket, molded octal tube
V-4292S-1	Socket, miniature molded
V-4679	Socket, dial light
**V-4702	Speaker, 8" Electro Dynamic for H-161
**V-4945	Speaker, 10" Electro Dynamic for H-168 and H-168A
V-4650	Spring, pointer
V-4057	Spring, dial drive
V-3258S	Spring, knob
V-4900	Strike, bullet catch
V-4651	Stud, trimount, plastic dial mounting
V-5295-1	Support, lid, L.H. (Mahogany)
V-5295-2	Support, lid, L.H. (Blonde)
V-5295-3	Support, lid, R.H. (Mahogany)
V-5295-4	Support, lid, R.H. (Blonde)
V-4682	Switch, selector (SW2, SW3, SW4, SW5)
V-4704	Tab, AM
V-4705	Tab, FM
V-3643	Teenut, record changer mounting
V-4684	Terminal Board, ANT-GND
V-4667	Terminal Board, 1 lug
V-4664	Terminal Board, 2 lugs
V-3486	Terminal Board, 3 lugs
V-4665	Terminal Board, 9 lugs
V-4627	Transformer, 1st I-F (L7, L8, L9, L10, R34, C47, C48, C49, C50, C51)
V-4628	Transformer, 2nd I-F (L11, L12, L13, L14, C52, C53, C54)
V-4629	Transformer, 3rd I-F (L15, L16, L17, L18, C55, C56)
V-4630	Transformer, discriminator (L19, L20, L21, L22, C57, C60)
V-4653	Transformer, power (T1)
V-4945-1	Transformer, output for V-4945 speaker stamped 285
V-4945-3	Transformer, output for V-4945 speaker stamped 191
V-4702-1	Transformer, output for V-4702 speaker stamped 285
V-3267S-1	Washer, chassis mounting, small
V-3267S-6	Washer, chassis mounting, large
V-3267S-10	Washer, record changer mounting
V-3668S	Washer, felt
V-4904-1	Washer, finishing (H-168 and H-168A Mahogany)
V-4904-2	Washer, finishing (H-168 Blonde)

Part No.	Description
V-4685	Clamp, spring, filter capacitor mtg.
V-5296	Clip, front glass plate mtg.
V-4883	Coil, FM antenna (L3)
V-4675	Coil, antenna loading (L4)
V-4676	Coil, AM oscillator (L5)
V-4882	Coil, FM oscillator (L6)
V-4945-2	Cone & Voice Coil Assy. for V-4945 speaker stamped 285
V-4945-4	Cone & Voice Coil Assy. for V-4945 speaker stamped 191
V-4702-2	Cone & Voice Coil Assy. for V-4702 speaker stamped 285
V-3254S	Connector, phono
V-4639	Control, tone, 2 megohms (R1)
V-4640	Control, volume, .5 megohms (R2) and switch (SW1)
V-4349-2	Cord, Power A-C
V-4304S-7	Cord Assembly, dial drive
V-4958	Cord, A-C power assy. (H-168 and H-168A)
V-4525-3	Cushion, chassis (H-168 and H-168A)
V-3885	Cushion, lid (H-168 and H-168A)
V-4690	Decal, band
V-4691	Decal, tone
V-4692	Decal, tuning
V-4693	Decal, volume
V-4642	Dial, plastic
V-4643	Eyelet, chassis mtg. (H-161)
V-3371	Foot, recessed (H-161)
V-4902	Glide, furniture (H-168 and H-168A)
V-4948-1	Grille Cloth, R.H. side (H-168 and H-168A)
V-3345S-4	Grommet, tuner assembly mounting
V-4644	Grommet, plain, chassis mounting
V-4852	Grommet, chassis mounting (T shaped)
V-4903-1	Hinge, door (H-168 and H-168A Mahogany)
V-4903-2	Hinge, door (H-168 Blonde)
V-3510	Hinge, lid (H-168 and H-168A Mahogany)
V-4321	Hinge, lid (H-168 Blonde)
V-4697S-1	Knob, volume, tuning and tone (Mahogany)
V-4697S-3	Knob, volume, tuning and tone (Blonde)
V-4697S-2	Knob, band (Mahogany)
V-4697S-4	Knob, band (Blonde)
No. 44	Lamp, pilot, background
No. 51	Lamp, pilot, AM, FM, edge
V-4645	Link, pointer connector
V-4660	Link Assembly, pointer actuator
V-4696	Nameplate, Westinghouse FM
V-5303	Needle, phono, sapphire tip
V-3926	Nut, speed, ⅛ inch, nameplate mtg.
V-4701	Plate, front glass (H-161)
V-5297	Plate, front glass (H-168 and H-168A)
V-4647	Pointer Assembly
V-5294	Pull, door (H-168 and H-168A)
RC10AE330K	Resistor, 33 ohms ¼ w. (R3)
RC10AE680K	Resistor, 68 ohms ¼ w. (R5)
RC30AE332K	Resistor, 3300 ohms 1 w. (R6, R7)
RC10AE153J	Resistor, 15,000 ohms ¼ w. (R8, R9)
RC30AE333K	Resistor, 33,000 ohms 1 w. (R10, R11)
RC10AE221K	Resistor, 220 ohms ¼ w. (R12)
RC10AE683M	Resistor, 68,000 ohms ¼ w. (R13)
RC10AE473M	Resistor, 47,000 ohms ¼ w. (R14)
RC10AE104K	Resistor, 100,000 ohms ¼ w. (R15, R16)
RC20AE154K	Resistor, 150,000 ohms ½ w. (R17)
RC10AE154M	Resistor, 150,000 ohms ¼ w. (R18, R19)
RC10AE334K	Resistor, 330,000 ohms ¼ w. (R20, R21)

MODELS H-164, H-166, H-167, H-166A WESTINGHOUSE ELECTRIC CORP.



H-166 & H-166A



H-164

H-167

For H-166 and H-167 record changer information, refer to V-4914 Automatic Record Changer Service Notes.

For information on the V-5699 record changer used in the Model H-166A, refer to V-4944 Automatic Record Changer Service Notes. The V-5699 and V-4944 record changers are similar except that the pickup arms, pickup cartridges, and power cords are different.

SPECIFICATIONS

FREQUENCY RANGES:
- Standard Broadcast ..... 540 to 1600 kc.
- Frequency Modulation ..... 88 to 108 mc.

INTERMEDIATE FREQUENCIES:
- Amplitude Modulation ..... 455 kc.
- Frequency Modulation ..... 10.7 mc.

TUBE COMPLEMENT:
- 1 7F8 ..... R-F Amp. (FM)
- 1 7F8 ..... Osc.-converter
- 2 6BA6 ..... 1st and 2nd I-F Amp.
- 1 6AU6 ..... Limiter (FM)
- 1 6H6GT ..... Ratio Det. (FM)
- 1 6AT6 ... Det. (AM), AVC and 1st A-F Amp.
- 1 6AT6 ..... Phase Inverter
- 2 6Y6G ..... Output Amp.
- 1 5U4G ..... Rectifier
- 1 6SC7 Phono. Pre-Amp. (H-166, H-166A and (H-167)

PILOT LAMPS:
- 2 Westinghouse No. 44 .... 6.3 v., 0.25 amp.

POWER OUTPUT:
- Undistorted ..... 15 watts
- Maximum ..... 18 watts

LOUDSPEAKER: ..... 12" Electro-dynamic

OPERATING VOLTAGE: 105 to 120 volts, 50-60 cycles A-C

POWER CONSUMPTION(radio section): 150 watts

MODELS H-164, H-166, H-167, H-166A

WESTINGHOUSE ELECTRIC CORP.

ALIGNMENT

BROADCAST BAND — AMPLITUDE MODULATION

Connect an output meter across the speaker voice coil

While making the following adjustments, keep the volume control set for maximum output, the tone control set on treble, and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output
1.	Set PHONO-BAND switch to "AM"			
2.	Pin No. 1 of 6BA6, 2nd I-F, through a 0.1 mfd capacitor	455 kc	550 kc	455 kc primary trimmer of 3rd I-F trans.
3.	Pin No. 1 of 6BA6, 1st I-F, through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 2nd I-F trans.
4.	Pin No. 1 of 7F8, converter, through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 1st I-F trans.
5.	Radiated signal (no actual connection)	1500 kc	1500 kc	BC osc. trimmer (C61) (make certain that loop antenna is connected to "L" terminals)
6.	Radiated signal (no actual connection)	1400 kc	1400 kc	BC converter (C56) and BC antenna (C55) trimmers
7.	Radiated signal (no actual connection)	600 kc	600 kc	BC oscillator padder (C60) ("rock-in" adjustment)
8.	Repeat steps 5, 6, and 7			

FM BAND — FREQUENCY MODULATION

Do not align the 10.7 mc. I-F circuits until all 455 kc I-F adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust
1.	Set PHONO-BAND switch to "FM"			
2.	Connect a vacuum tube voltmeter between point "X" (See Figs. 1 and 2) and ground (chassis).			
3.	Place a temporary short between rotor and stator of FM osc. section of tuning capacitor (C54).			
4.	*Detune* 10.7 mc. secondary trimmers of 1st, 2nd, and 3rd I-F transformers and secondary trimmer of discriminator transformer by turning screws ½ turn toward tight position.			

FM BAND — FREQUENCY MODULATION — CONTINUED

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust
5.	Stator of FM converter tuning capacitor (C53) through a .001 mfd mica capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc primary trimmers of discriminator, 3rd I-F, 2nd I-F, and 1st I-F transformers (in order given) for maximum voltage
6.	Stator of FM converter tuning capacitor (C53) through a .001 mfd mica capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc secondary trimmers of 1st, 2nd, and 3rd I-F transformers (in order given for maximum voltage. NOTE: *Do not* re-peak the primary trimmers.
7.	Connect the vacuum tube voltmeter between point "Y" (Figs. 1 and 2) and chassis.			
8.	Stator of FM converter tuning capacitor (C53) through a .001 mfd mica capacitor	UNMODULATED 10.7 mc	88 mc	Secondary of discriminator trans. for zero voltage. The voltage will change polarity as the trimmer is tuned through resonance. Tune carefully for zero voltage.
9.	Connect the vacuum tube voltmeter between point "X" and chassis.			
10.	Remove the short from the FM oscillator tuning capacitor.			
11.	FM antenna terminal through a 72 ohm resistor	UNMODULATED 105 mc	105 mc	FM oscillator trimmer (C59) for max. voltage*
12.	FM antenna terminal through a 72 ohm resistor	UNMODULATED 98 mc	98 mc	FM converter (C58) and FM R-F (C57) trimmers for max. voltage**

* After adjusting the oscillator trimmer at 105 mc., check dial calibration by tuning the receiver to a 90 mc. signal from the generator. If the dial pointer indicates 90 mc., no further oscillator adjustments are necessary. If the pointer is on the high frequency side of 90 mc., slightly expand the length of the oscillator coil (L9); if the pointer is on the low frequency side of 90 mc., slightly compress the oscillator coil. Re-adjust the oscillator trimmer (C59) at 105 mc., and again check the calibration. Repeat this process until calibration is correct.

** After adjusting the trimmers at 98 mc., check tracking by tuning the receiver to a 90 mc. signal from the generator and re-adjusting the trimmers for max. voltage. If the "peak" setting is the same at 90 mc. as it was at 98 mc., no further adjustments are necessary. If the capacitance of either trimmer must be increased to obtain maximum output at 90 mc., slightly compress the coil across that trimmer (either L7 or L8); if the capacitance of either trimmer must be decreased to obtain maximum output at 90 mc., slightly expand the coil across that trimmer. Re-adjust the converter and R-F trimmers (C57 and C58) at 98 mc., and again check the tracking. Repeat this process until tracking is correct.

MODELS H-164, H-166, H-167, H-166A

WESTINGHOUSE ELECTRIC CORP.

PRE-AMPLIFIERS

A phonograph pre-amplifier is used in Models H-166, H-166A and H-167. Either of the pre-amplifier chassis shown below may be used. The chassis number is stamped on the chassis of all pre-amplifiers for identification.

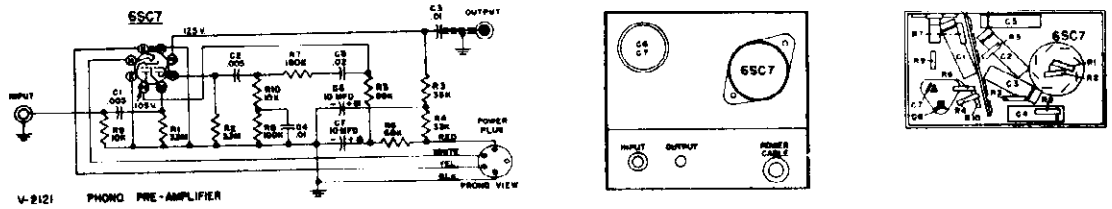

Fig. 6 - V-2121 PHONOGRAPH PRE-AMPLIFIER

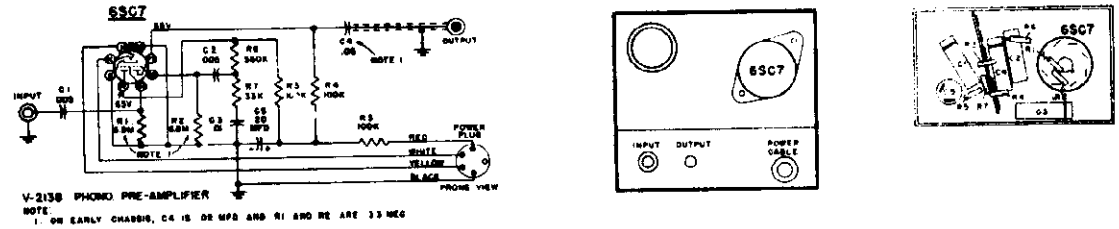

Fig. 7 - V-2138 PHONOGRAPH PRE-AMPLIFIER

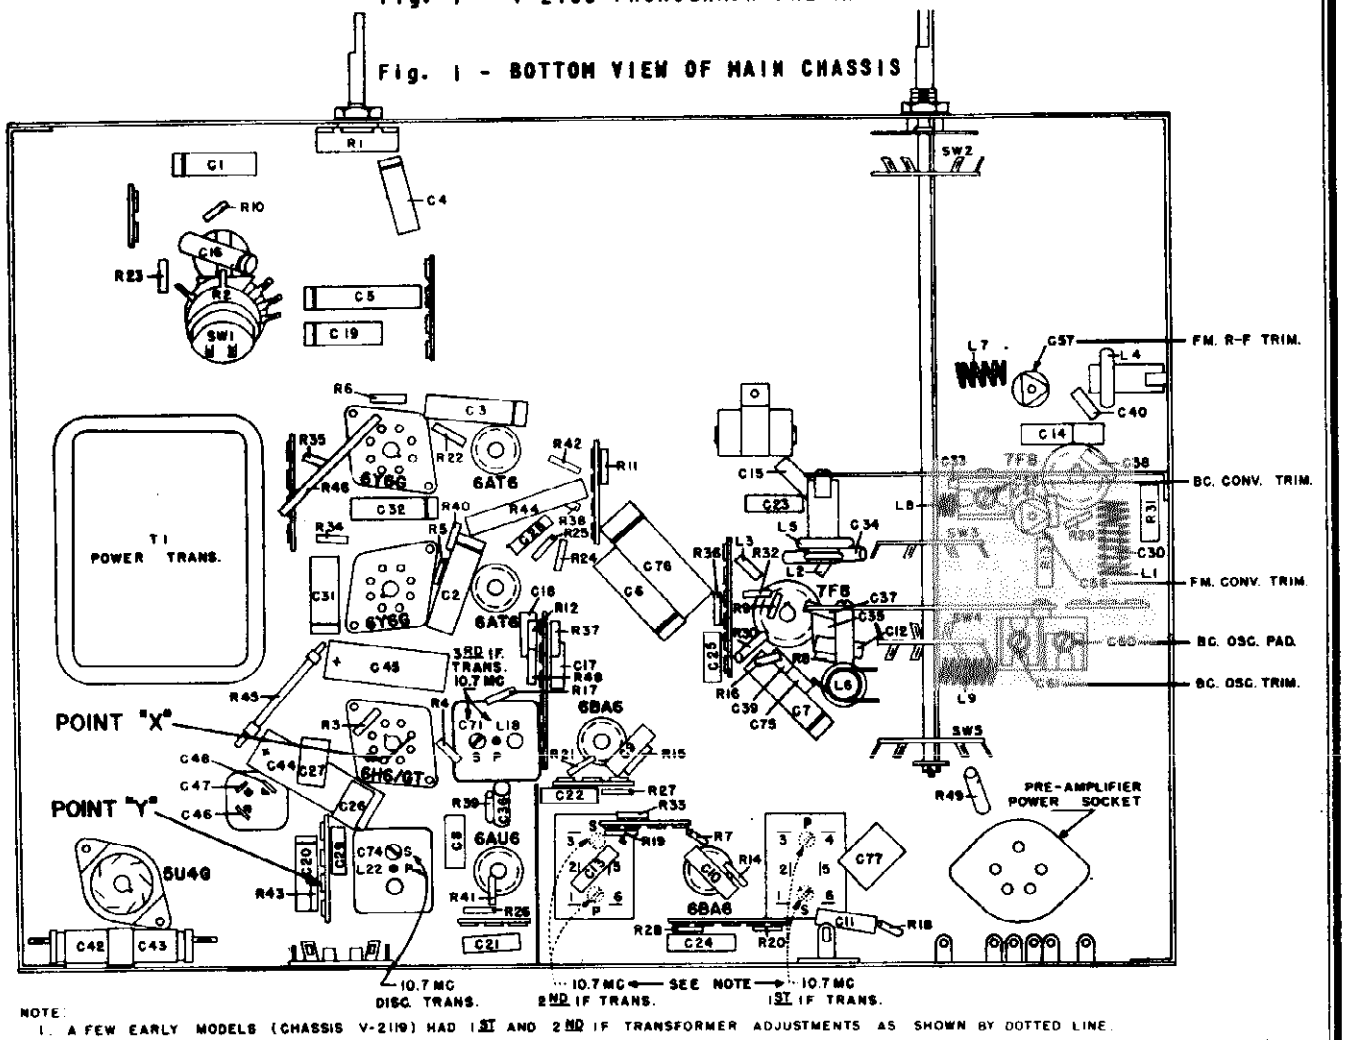
Fig. 1 - BOTTOM VIEW OF MAIN CHASSIS



NOTE:
1. A FEW EARLY MODELS (CHASSIS V-2119) HAD 1ST AND 2ND IF TRANSFORMER ADJUSTMENTS AS SHOWN BY DOTTED LINE.

MAIN CHASSIS AND CABINET PARTS LIST

Part No.	Description of Part
RC20AE471K	Resistor, 470 ohms ½ w. (R8)
RC20AE223K	Resistor, 22,000 ohms ½ w. (R9)
RC20AE273K	Resistor, 27,000 ohms ½ w. (R10)
RC20AE224M	Resistor, 220,000 ohms ½ w. (R11, R12)
RC30AE682K	Resistor, 6800 ohms 1 w. (R13, R31)
RC20AE680K	Resistor, 68 ohms ½ w. (R14, R21)
RC20AE333K	Resistor, 33,000 ohms ½ w. (R15, R16)
RC20AE474M	Resistor, 470,000 ohms ½ w. (R17, R18, R19, R20, R48)
RC20AE274K	Resistor, 270,000 ohms ½ w. (R22, R23)
RC20AE105M	Resistor, 1.0 megohms ½ w. (R24)
RC20AE156M	Resistor, 15 megohms ½ w. (R25)
RC20AE332M	Resistor, 3300 ohms ½ w. (R26, R27, R28)
RC20AE121K	Resistor, 120 ohms ½ w. (R29)
RC30AE103M	Resistor, 10,000 ohms 1 w. (R30)
RC20AE225M	Resistor, 2.2 megohms ½ w. (R32, R33)
RC20AE330M	Resistor, 33 ohms ½ w. (R34, R35, R49)
RC20AE475M	Resistor, 4.7 megohms ½ w. (R36)
RC20AE473M	Resistor, 47,000 ohms ½ w. (R37)
RC20AE104K	Resistor, 100,000 ohms ½ w. (R38, R39)
RC20AE224K	Resistor, 220,000 ohms ½ w. (R40, R41)
RC20AE154M	Resistor, 150,000 ohms ½ w. (R42)
RC20AE683M	Resistor, 68,000 ohms ½ w. (R43)
RC41AE272K	Resistor, 2700 ohms 2 w. (R44)
V-4758	Resistor, 110 ohms 3 w. (R45)
V-4759	Resistor, 7500 ohms 5 w. (R46)
V-3429S-9	Screw, #10-32 chassis mounting
V-3806S-5	Screw, speaker mounting
V-3164	Shaft, tuning
V-5595	Shield, plate
V-4168	Shield, tube socket
V-3344S-2	Sleeve, spacer, variable capacitor mounting
V-3353-3	Slide mechanism, left hand
V-3353-4	Slide mechanism, right hand
V-3252-2	Socket, pilot light (10-3/4" lead)
V-3252-4	Socket, pilot light (8½" lead)
V-3162S	Socket, 5 contact
V-3288S	Socket, 6 contact
V-4832-1	Socket, lock-in tube
V-4292S-1	Socket, miniature molded
V-3275S	Socket, molded octal tube
V-3246S	Socket, octal tube
V-3393-2	Socket, phono, A-C power
V-4784	Speaker, 12" Electro-dynamic
V-3258S	Spring, knobs
V-3248S	Spring, dial drive
V-3740S-1	Strap, ground flexible
V-4900	Strike, bullet catch, mahogany (H-166) and blonde and silver walnut (H-167)
V-5065-1	Strike, bullet catch, cordovan (H-167)
V-3167S-1	Stud, pulley, threaded
V-3430	Support, volume control shaft
V-4760	Switch, selector (SW2, SW3, SW4, SW5)
V-4771	Terminal board, ANT.-GND.
V-3417	Terminal board, FM antenna
V-4784-1	Transformer, output for V-4784 speaker stamped 252
V-4784-3	Transformer, output for V-4784 speaker stamped 189
V-4784-5	Transformer, output for V-4784 speaker stamped 285
V-5367	Transformer, 1st I-F (V-2119-1 chassis only) (C62, C63, C64 C65, C66, L10, L11, L12, L13, R47)
V-4621	Transformer, 1st I-F (V-2119 chassis only) (C62, C63, C64, C65, C66, L10, L11, L12, L13, R47
V-5368	Transformer, 2nd I-F (V-2119-1 chassis only) (C67, C68, C69, C70, L14, L15, L16, L17)
V-4622	Transformer, 2nd I-F (V-2119 chassis only (C67, C68, C69, C70, L14, L15, L16, L17)
V-4623	Transformer, 3rd I-F (C71, C72, L18, L19, L20, L21)
V-4624	Transformer, discriminator (C73, C74, L22, L23, L24)
V-4761	Transformer, power (T1)
V-3295	Transformer, power (T1) (used on *some* V-2119 chassis)
V-3274S	Tube holder
V-3506S-1	Washer, chassis mounting, Neoprene
V-5055	Washer, capacitor trimmer, Phenolic
V-3668S	Washer, felt (knobs)
V-3267S-3	Washer, flat, chassis mounting
V-3267S-10	Washer, flat, 1" dia.
V-3267S-1	Washer, front glass plate mounting

PARTS FOR V-5699 RECORD CHANGER

(Used in Model H-166A —

When ordering replacement parts for the V-5699 record changer, order these parts rather than the parts shown under these Loc. numbers in the V-4944 Record Changer Service Notes.

Loc.	Part No.	Description
9	V-7342	Cable, pickup
10	V-7341	Pickup arm assembly Pickup, magnetic (13) Cable, pickup (9) Arm, pickup (10) Strengthener, pickup arm (3) Screws
10	V-4976	Arm, pickup
13	V-7017	Pickup, magnetic (with mtg. screws)

PARTS LIST FOR MODELS H-164, H-166, H-166A AND H-167

When ordering parts, specify model number of set in addition to part number and description of part.

V-2121 PHONO PRE-AMPLIFIER PARTS LIST

Part No.	Description of Part
V-4931	Cable, output
V-4930	Cable, power
RCP10W6502A	Capacitor, .005 mfd 600 v. (C1, C2)
RCP10W4103A	Capacitor, .01 mfd 400 v. (C3, C4)
RCP10W4203A	Capacitor, .02 mfd 400 v. (C5)
V-4928	Capacitor, dry electrolytic, dual 10 mfd 450 v. (C6, C7)
V-3254S	Connector, phono
V-3345S-5	Grommet, power cord
V-3345S-10	Grommet, socket mounting
RC20AE335M	Resistor, 3.3 megohms ½ w. (R1, R2)
RC20AE333K	Resistor, 33,000 ohms ½ w. (R3, R4)
RC20AE683K	Resistor, 68,000 ohms ½ w. (R5, R6)
RC20AE184K	Resistor, 180,000 ohms ½ w. (R7)
RC20AE104K	Resistor, 100,000 ohms ½ w. (R8)
RC20AE103M	Resistor, 10,000 ohms ½ w. (R9)
RC20AE103K	Resistor, 10,000 ohms ½ w. (R10)
V-4933	Socket, molded octal

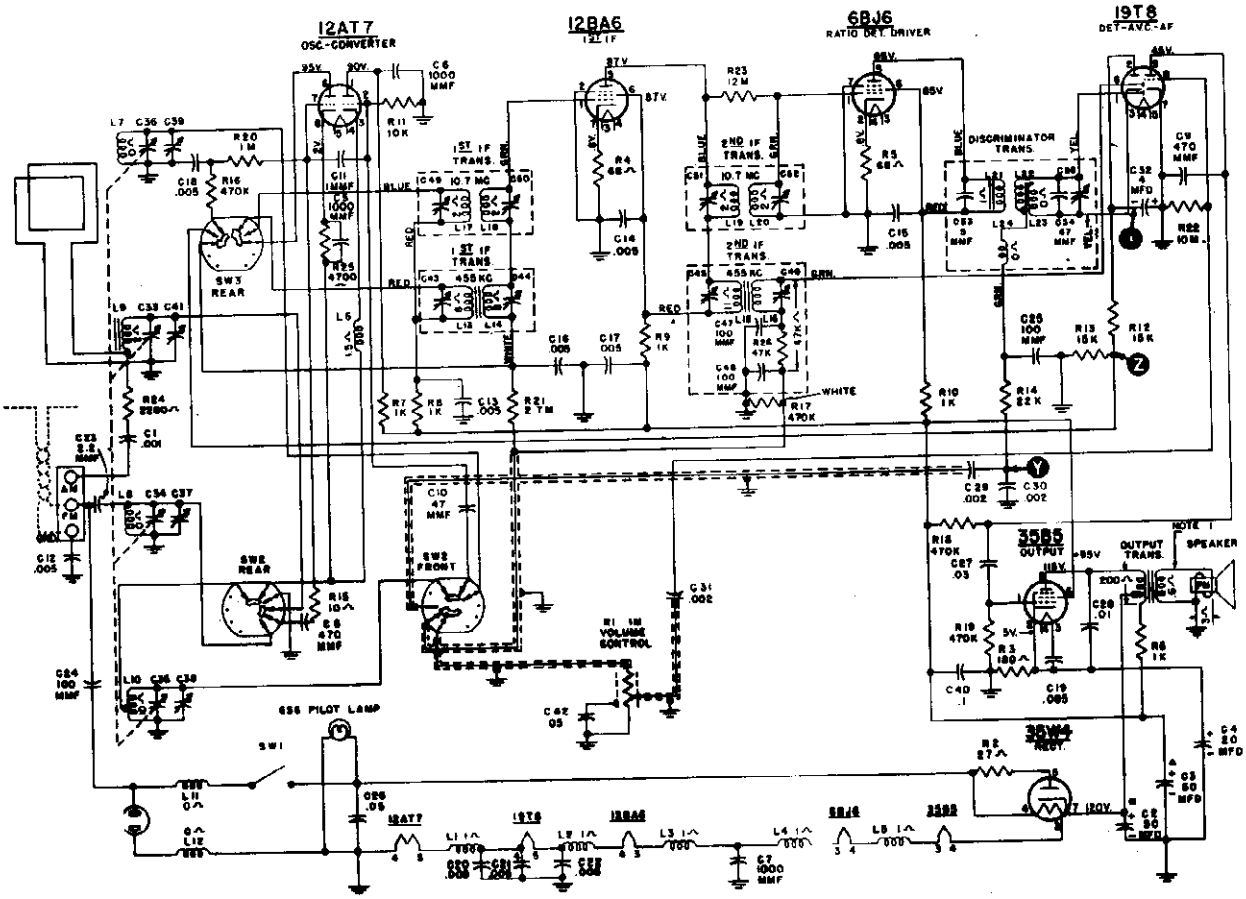
V-2138 PHONO PRE-AMPLIFIER PARTS LIST

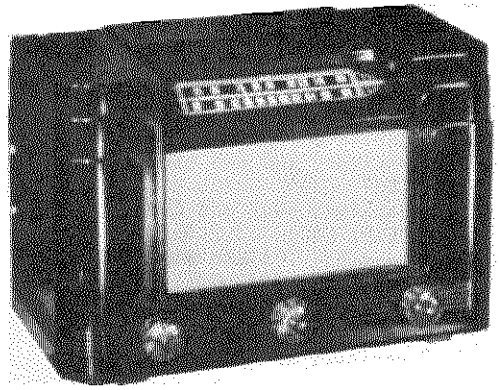
Part No.	Description of Part
V-4931	Cable, output
V-4930	Cable, power
RCP10W6502A	Capacitor, .005 mfd 600 v. (C1, C2)
RCP10W4103A	Capacitor, .01 mfd 400 v. (C3)
RCP10W4503A	Capacitor, .05 mfd 400 v. (C4)
V-5765	Capacitor, dry electrolytic, 20 mfd 300 v. (C5)
V-3254S	Connector, phono
V-3345S-5	Grommet, power cord
V-3345S-10	Grommet, socket mounting
RC20AE685M	Resistor, 6.8 megohms ½ w. (R1, R2)
RC20AE104M	Resistor, 100,000 ohms ½ w. (R3, R4, R5)
RC20AE564K	Resistor, 560,000 ohms ½ w. (R6)
RC20AE333M	Resistor, 33,000 ohms ½ w. (R7)
V-4933	Socket, molded octal

MAIN CHASSIS AND CABINET PARTS LIST

V-4777-2	Antenna Assembly, FM dipole (H-166, H-167)
V-4777-1	Antenna Assembly, FM dipole (built-in H-164)
V-4762	Background, felt
V-4745	Bracket Assembly, dial background
V-3409	Bracket and Stud Assembly, dial background
V-3415	Bracket and Tuning Shaft Assembly
V-3672	Bracket, capacitor mounting (front)
V-3671	Bracket, capacitor mounting (rear)
V-3185	Bracket, dial light
V-3357	Bracket, dial light (large)
V-3374	Bracket, volume control mounting
V-4965-1	Cable, record changer to pre-amp., phono (H-166, H-167)
RCP10W4103A	Capacitor, .01 mfd 400 v. (C1)
RCP10M4103A	Capacitor, .01 mfd 400 v. (C2, C3)
RCP10W6502A	Capacitor, .005 mfd 600 v. (C4)
RCP10W4503A	Capacitor, .05 mfd 400 v. (C5, C6, C7)
RCM30B512M	Capacitor, .005 mfd mica (C8, C9, C10, C11, C12, C13)
RCM30C272G	Capacitor, 2700 mmf mica (C14, C15)
RCP10W6202M	Capacitor, .002 mfd 600 v. (C16)
RCM20B101M	Capacitor, 100 mmf mica (C17, C18)
RCP10W6102K	Capacitor, .001 mfd 600 v. (C19, C20)
RCM30B103M	Capacitor, .01 mfd mica (C21, C22, C23, C24, C25)
RCM20B271J	Capacitor, 270 mmf mica (C26, C27)
RCM20B221M	Capacitor, 220 mmf mica (C28, C29)
RCP10M6202M	Capacitor, .002 mfd 600 v. (C31, C32)
R2CC21CH050D	Capacitor, fixed ceramic 5 mmf (C33)
R2CC36SL221M	Capacitor, fixed ceramic 220 mmf (C34)
R2CC21PJ220K	Capacitor, fixed ceramic 22 mmf (C35)
R2CC26PJ470K	Capacitor, fixed ceramic 47 mmf (C36, C37, C38)
R5CC21ZY471M	Capacitor, fixed ceramic 470 mmf (C39, C40, C41)
V-3241	Capacitor, dual line filter .05-.05 mfd 600 v. (C42, C43)
V-4880	Capacitor, electrolytic 2.0 mfd 50 v. (C44)
V-3236	Capacitor, electrolytic cartridge, 20 mfd 25 v. (C45)
V-3302	Capacitor, electrolytic 40 mfd 450 v. (C46)

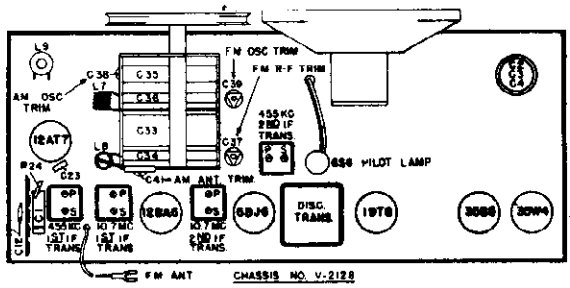
MODEL H-182 WESTINGHOUSE ELECTRIC CORP.



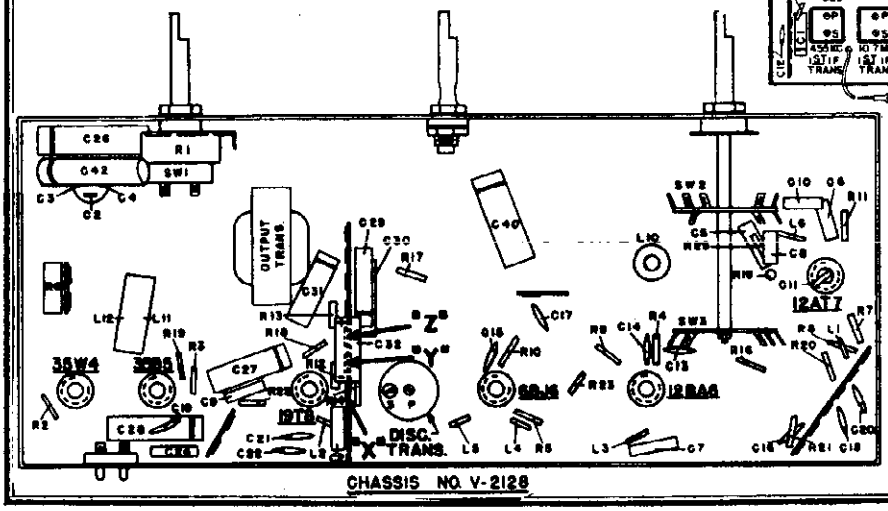


NOTE
1. VOICE COIL DISCONNECTED.
2. SELECTOR SWITCH SW2 AND SW3 IS SHOWN IN EXTREME COUNTER-CLOCKWISE POSITION OR AM BAND. SECOND POSITION CLOCKWISE IS FM BAND.
3. ALL VOLTAGES MEASURED FROM CHASSIS BAND USING 20,000 OHMS/VOLT METER—LINE VOLTAGE 117 VAC. READINGS SHOULD BE AS SHOWN ± 20%.
4. THE RATINGS OF SOME COMPONENTS USED IN PRODUCTION MAY VARY SLIGHTLY FROM THOSE SHOWN ABOVE.

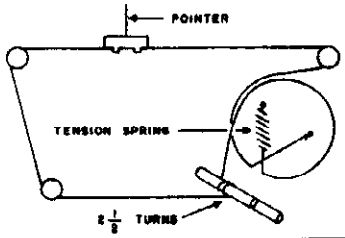
CHASSIS NO V-2128



CHASSIS NO. V-2128



CHASSIS NO. V-2128



WESTINGHOUSE ELECTRIC CORP. MODEL H-182

ALIGNMENT

BROADCAST BAND

Connect an output meter across the speaker voice coil

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1.	Set Band Switch to AM			
2.	Pin #1 of 12BA6 tube through a 0.1 mfd capacitor	455 kc	1615 kc	Pri. and sec. of 455 kc 2nd I-F trans. for max. output
3.	Stator of tuning capacitor (C33) through a 0.1 mfd capacitor	455 kc	1615 kc	Pri. and sec. of 455 kc 1st I-F trans. for max. output
4.	Radiated signal (no actual connection)	1400 kc	1400 kc	AM osc. trimmer for max. output
5.	Radiated signal (no actual connection)	1400 kc	1400 kc	AM ant. trimmer for max. output (rock in adjustment)
6.	Recheck steps 4 and 5			

FM BAND

Do not align 10.7 mc I-F circuits until all 455 kc I-F adjustments have been completed.

1.	Set Band Switch to FM			
2.	Connect a VTVM between point "X" and ground. (See Figs. 1 and 3.)			
3.	Pin #1 of 12BA6 tube through a .002 mfd mica capacitor	UNMODULATED 10.7 mc	108 mc	Discriminator trans. primary and 10.7 mc. 2nd I-F trans. pri. and sec. for max. voltage.
4.	Reconnect VTVM between points "Y" and "Z". (See Figs. 1 and 3.)			
5.	Pin #1 of 12BA6 tube through a .002 mfd mica capacitor	UNMODULATED 10.7 mc	108 mc	Discriminator trans. secondary for *zero* voltage. The voltage will change polarity as the trimmer is tuned through resonance — tune carefully for zero.
6.	Reconnect VTVM between point "X" and ground.			
7.	Pin #1 of 12BA6 tube through a .002 mfd mica capacitor	UNMODULATED 10.7 mc	108 mc	Discriminator trans. primary and 10.7 mc. 2nd I-F trans. pri. and sec. for max. voltage.
8.	Place a temporary short across C34 (FM R-F tuning capacitor).			
9.	Pin #7 of 12AT7 tube through a .002 mfd mica capacitor	UNMODULATED 10.7 mc	108 mc	Pri. and sec. of 10.7 mc 1st I-F trans. for max. output
10.	Remove short from C34.			
11.	FM ant. terminals through a 300 ohm non-inductive resistor	UNMODULATED 108 mc	108 mc	FM osc. trimmer for max. output
12.	FM ant. terminals through a 300 ohm non-inductive resistor	UNMODULATED 98 mc	98 mc	FM R-F trimmer for max. output (rock in adjustment).
13.	Place a dab of thermal cement on the FM osc. and R-F trimmers to lock adjustment.			

TUBE COMPLEMENT:

1 12AT7 ..... Osc.-Converter
1 12BA6 ..... I-F Amp.
1 6BJ6 ..... Ratio Det. Driver (FM)
1 19T8 ..... Det., AVC, A-F Amp.
1 35B5 ..... Output Amp.
1 35W4 ..... Rectifier

OPERATING VOLTAGE:

105 to 120 volts 50-60 cycles A-C or 105 to 120 volts D-C.

POWER CONSUMPTION: ..... 30 watts

V-5526	Washer, insulator, for controls

CAUTION: One side of the power line is connected directly to the chassis in this model. Care must be exercised to avoid contacting the radio chassis and ground at the same time — ***serious shock may result.*** When making repairs or adjustments to the radio, it is recommended that the chassis be isolated from the power line by means of an isolation transformer.

WESTINGHOUSE ELECTRIC CORP. MODELS H-185, H-195

H-195

SPECIFICATIONS

FREQUENCY RANGE: ..... 540 to 1600 kc.

INTERMEDIATE FREQUENCY: ..... 455 kc.

TUBE COMPLEMENT:

1	1R5	Converter
1	1T4	I-F Amp.
1	1U5	Det., AVC and 1st A-F Amp.
1	3S4	Power Output Amp.

POWER OUTPUT:

Maximum (line):	.175 watt
Maximum (battery):	.15 watt
Undistorted (line):	.08 watt
Undistorted (battery):	.02 watt

LOUDSPEAKER: ..... 4" P.M.

POWER SUPPLY:

Battery Operation:
1 Westinghouse V-5009 "B" battery (67½ v.)
5 Westinghouse V-5696-1 "A" batteries (1½ v. each)

LINE OPERATION:

105 to 120 volts, 50 — 60 cycles A-C, or D-C

CURRENT CONSUMPTION (Battery Operation):

"A" Batteries	.05 amp.
"B" Battery	.01 amp.

POWER CONSUMPTION (Line Operation): 17 watts

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Make certain that the dial pointer is correctly orientated with respect to the dial scale.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to -	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output
1	Stator of R-F tuning capacitor (C5) through a 200 mmf capacitor	455 kc	455 kc	Pri. and Sec. of 2nd I-F trans.
2	Stator of R-F tuning capacitor (C5) through a 200 mmf capacitor	455 kc	455 kc	Pri. and Sec. of 1st I-F trans.
3	Recheck steps 1 and 2			
4	Radiated Signal	1615 kc	1615 kc	Oscillator Trimmer (C8)
5	Radiated Signal	1400 kc	1400 kc	R-F Trimmer (C6)

ALIGNMENT

BROADCAST BAND—AMPLITUDE MODULATION

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set on treble, and the signal generator output attenuated to avoid AVC action.

Step	*Connect Signal Generator to—*	*Signal Generator Frequency*	*Radio Dial Setting*	*Adjust for maximum output*
1	Set PHONO-BAND switch to "AM".			
2	Pin No. 1 of 6BA6, 2nd I-F, through a 0.1 mfd capacitor	455 kc	550 kc	455 kc primary trimmer of 3rd I-F trans.
3	Pin No. 1 of 6BA6, 1st I-F, through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 2nd I-F trans.
4	Pin No. 1 of 7F8, converter, through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 1st I-F trans.
5	Radiated signal (no actual connection)	1500 kc	1500 kc	Bc osc. trimmer (C67) (make certain that loop antenna is connected to "L" terminals).
6	Radiated signal (no actual connection)	1400 kc	1400 kc	Bc converter (C62) and BC antenna (C61) trimmers.
7	Radiated signal (no actual connection)	600 kc	600 kc	BC oscillator padder (C66) ("rock-in" adjustment).
8	Repeat Steps 5, 6 and 7			

MODELS H-186, H-187 WESTINGHOUSE ELECTRIC CORP.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set PHONO-BAND switch to "FM".			
2	Connect a vacuum tube voltmeter between point "X" (see Figs. 2 and 3) and ground (chassis).			
3	Place a temporary short between rotor and stator of FM osc. section of tuning capacitor (C60).			
4	*Detune* 10.7 mc. secondary trimmers of 1st, 2nd, and 3rd I-F transformers and secondary trimmer of discriminator transformer by turning screws ¼ turn toward tight position.			
5	Stator of FM convertor tuning capacitor (C59) through a .001 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	10.7 mc primary trimmers of discriminator, 3rd I-F, 2nd I-F, and 1st I-F transformers (in order given) for maximum voltage.
6	Stator of FM converter tuning capacitor (C59) through a .001 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	10.7 mc secondary trimmers of 1st, 2nd, and 3rd I-F transformers for maximum voltage. NOTE: *Do not* re-peak the primary trimmers.
7	Connect the vacuum tube voltmeter between "Y" (Figs. 2 and 3) and chassis.			
8	Stator of FM converter tuning capacitor (C59) through a .001 mfd mica capacitor	Unmodulated 10.7 mc	88 mc	Secondary of discriminator trans. for zero voltage. The voltage will change polarity as the trimmer is tuned through resonance. Tune carefully for zero voltage.
9	Connect the vacuum tube voltmeter between point "X" and chassis.			
10	Remove the short from the FM oscillator tuning capacitor.			
11	FM. antenna terminal through a 72 ohm resistor	Unmodulated 105 mc	105 mc	FM oscillator trimmer (C65) for max. voltage.*
12	FM antenna terminal through a 72 ohm resistor	Unmodulated 98 mc	98 mc	FM converter (C64) and FM R-F (C63) trimmers for max. voltage.**

*After adjusting the oscillator trimmer at 105 mc., check dial calibration by tuning the receiver to a 90 mc. signal from the generator. If the dial pointer indicates 90 mc., no further oscillator adjustments are necessary. If the pointer is on the high frequency side of 90 mc., slightly expand the length of the oscillator coil (L9); if the pointer is on the low frequency side of 90 mc., slightly compress the oscillator coil. Re-adjust the oscillator trimmer (C65) at 105 mc., and again check the calibration. Repeat this process until calibration is correct.

**After adjusting the trimmers at 98 mc., check tracking by tuning the receiver to a 90 mc. signal from the generator and re-adjusting the trimmers for max. voltage. If the "peak" setting is the same at 90 mc. as it was at 98 mc., no further adjustments are necessary. If the capacitance of either trimmer must be increased to obtain maximum output at 90 mc., slightly compress the coil across that trimmer (either L7 or L8); if the capacitance of either trimmer must be decreased to obtain maximum output at 90 mc., slightly expand the coil across that trimmer. Re-adjust the converter and R-F trimmers (C63 and C64) at 98 mc., and again check the tracking. Repeat this process until tracking is correct.

66-3020	Wafer Switch — (S1)

An OUTPUT METER, connected to the speaker voice coil terminals, should be used for accuracy in making ganging adjustments.

The voice coil terminals, as well as the I.F. trimmers, may be made accessible by removing the screws by which the motor panel is mounted in the cabinet. Before lifting off the phono-recorder unit, MOVE THE PHONO. ARM TO THE CENTER OF THE TURNTABLE, and permit the arm to maintain this position until after the unit has been restored to the cabinet. In this way, the follower arm which engages the lateral feed screw will be protected against damage.

The R.F. trimmers and loop loading coil may be reached by raising front edge of panel.

Connect signal generator to control grid of 6BE6 tube.*

SIGNAL GENERATOR FREQUENCY	DIAL POSITION	TRIMMER
456 K.C.	1400 K.C.	T2-S** (Top Screw)

TUBE, TRIMMER LOCATION, DIAL CABLE DRAWING AND DETAILED VIEW OF I. F. TRANSFORMERS.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I. F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I. F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

TUBE, TRIMMER LOCATION, DIAL CABLE DRAWING AND DETAILED VIEW OF I. F. TRANSFORMERS.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I. F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I. F. transformers the tuning wrench 68-7 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

ALIGNMENT PROCEDURE

OPERATION	CONNECT OSCILLATOR TO	DUMMY ANTENNA	INPUT SIG. FREQUENCY	SET DIAL AT	TRIMMERS	PURPOSE
1	Convertor Grid	.5 Mfd.	455 Kc.	600 Kc.	Adjust Primary & Secondary Slugs	For I.F. Alignment
2	Single Turn Loosely Coupled to Wave Magnet	--	1600 Kc.	1600 Kc.	C-4	Set Oscillator to Dial Scale.
3		--	1400 Kc.	1400 Kc.	C-3	Detector Alignment
4		--	1400 Kc.	1400 Kc.	C-2	Antenna Alignment

The 6E40 chassis is an AC, DC or battery operated superheterodyne circuit with a stage of RF amplification. The chassis is isolated from the DC circuit, and all measurements must be made from a common negative point. The most convenient place to reach this negative point is the terminal strip to which C5 is connected. The DC resistance from chassis to any circuit must be almost infinite. If any circuit becomes grounded a hum will appear. Microphonic tubes will cause audio howl. Check 1LA6.

The wavemagnet is connected to the chassis with a two wire cable. If the R.F. becomes weak or dead, check the D.C. resistance of the wavemagnet and connecting cable. This D.C. resistance should be approximately 1.75 ohms. If it is open check the cable and wavemagnet.

IF Alignment: Remove the chassis from the cabinet and arrange the units so that the wavemagnet can be plugged in. All the connections and adjustments can be made from the top of the chassis. Connect a signal generator, through a .1 mfd. dummy antenna, to the lug on top of the center section of the gang condenser (converter grid) and condenser gang frame. Connect an output meter across the voice coil of the speaker (two lugs provided). Set the signal generator to 455 Kc. and adjust C10, C11, C12 and C13 for maximum indication on the output meter. Always keep the signal output from the generator just high enough to get an indication, otherwise excessive loading may result. Remove the signal generator leads from the gang.

RF Alignment: Connect a two turn loop across the leads of the signal generator, loosely couple this loop to the wavemagnet. Set the signal generator and the dial pointer of the receiver to 1600 Kc. and adjust oscillator trimmer to resonance. Set the signal generator and dial pointer to 1400 and adjust detector trimmer and antenna trimmer to resonance. These trimmers are on the top of gang condenser. Check operation and re-install set in cabinet. Tune in a weak station near 1400 Kc. or use background noise and readjust antenna trimmer for maximum sensitivity.

TUNING RANGE 540KC. TO 1600 KC.

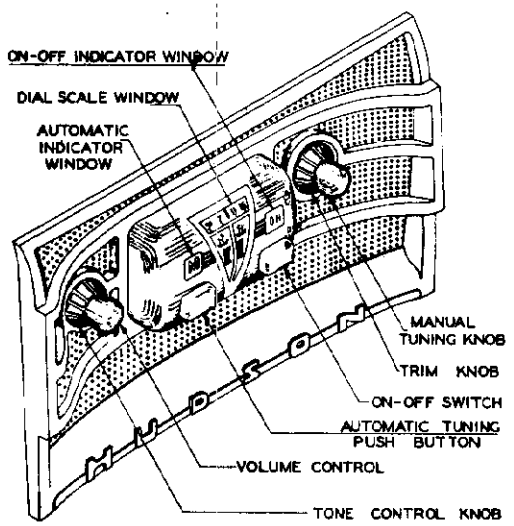
Automatic Tuning

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted proceed as follows:

1. Press the automatic tuning push button (on the left side) until Number 1 appears in the automatic indicator window.
2. Pull the manual tuning knob OUTWARD to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.

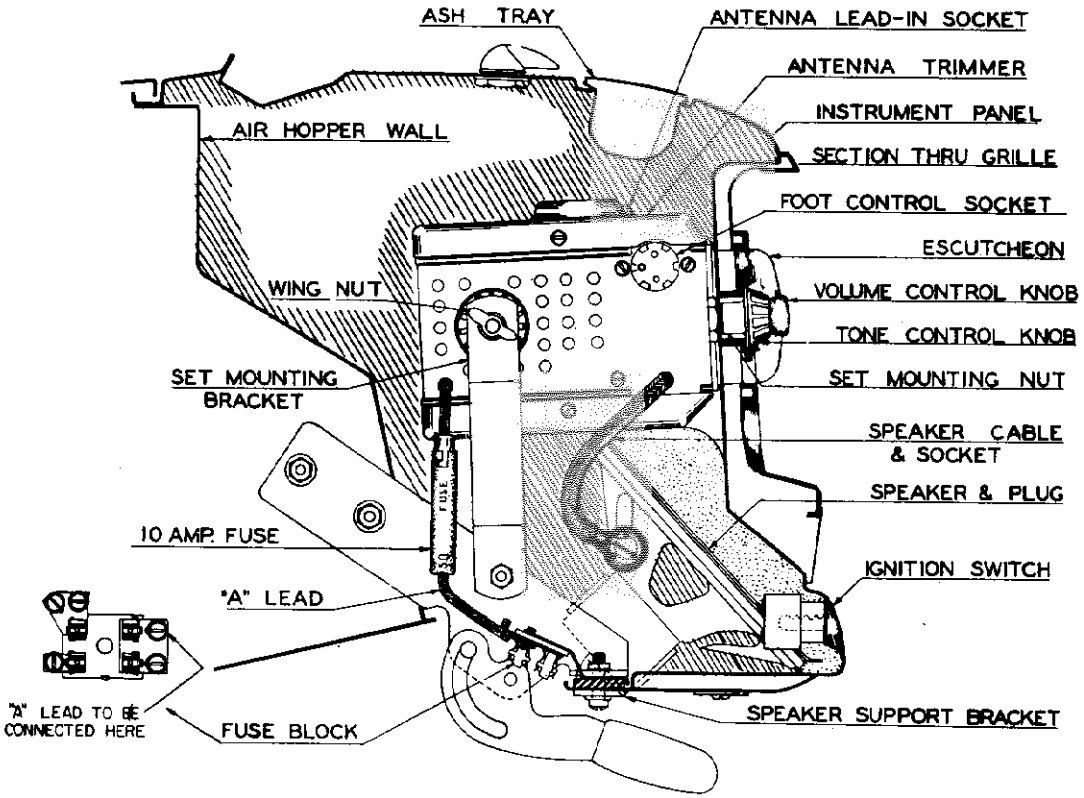
   CAUTION: DO NOT ATTEMPT TO FORCE THE KNOB IN. The knob will automatically return to the "IN" position when the automatic tuning push button or the foot switch is operated.
4. Press the automatic tuning push button, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use the same procedure for positions No. 3, 4 and 5.

When the five automatic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the AUTOMATIC button to return to MANUAL tuning, or to any one of the stations selected on the Automatic.

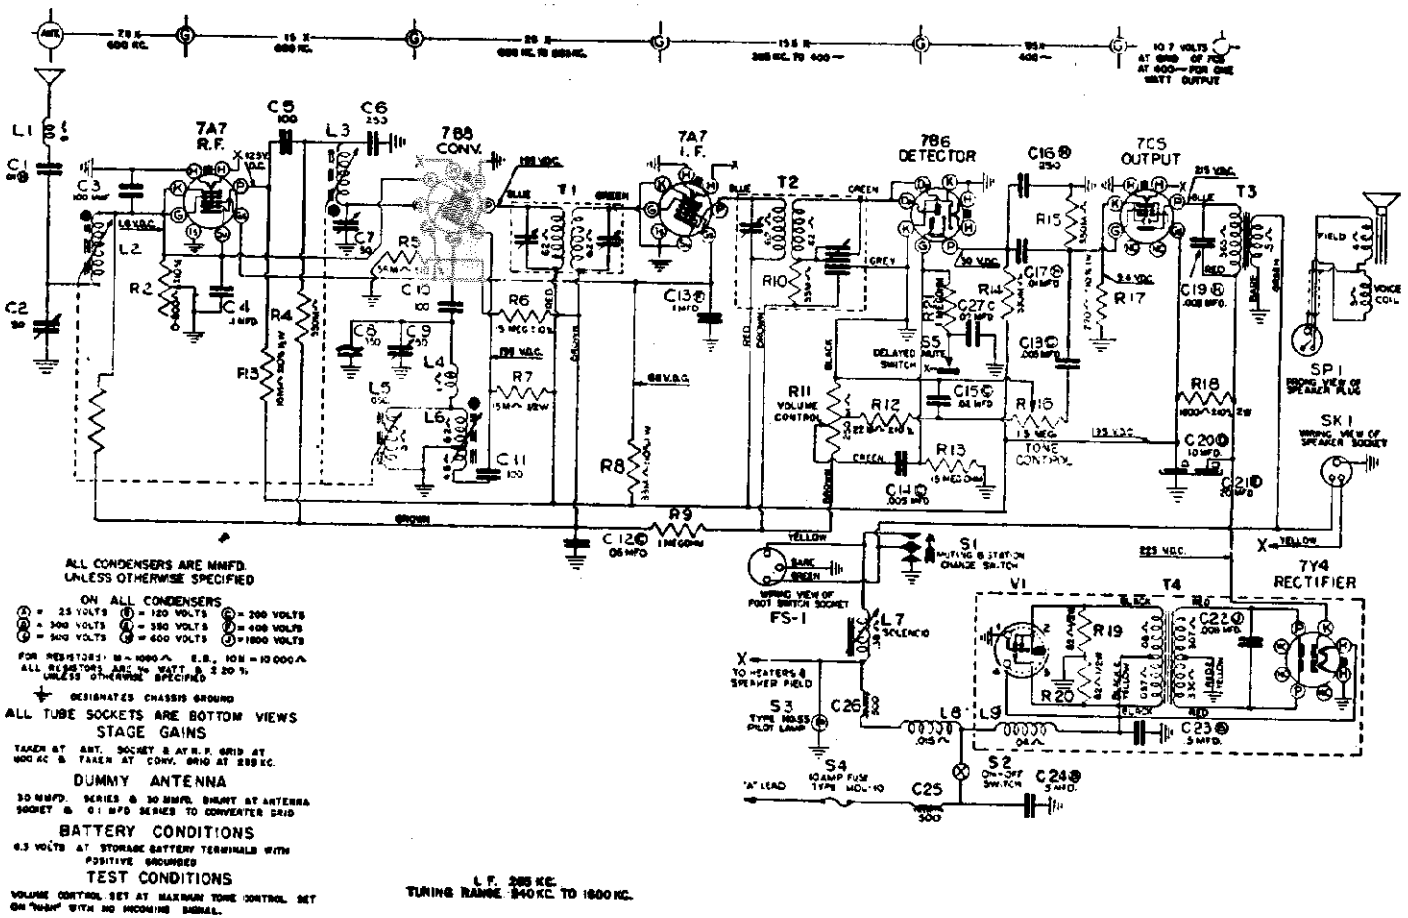


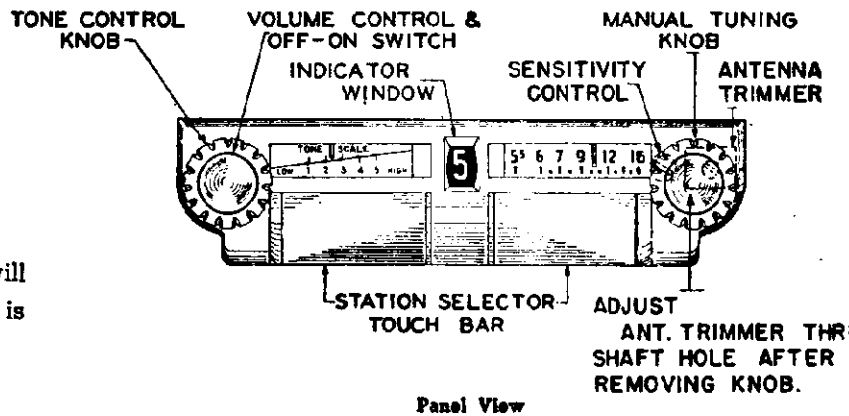
Operating Controls.

INSTALLATION INSTRUCTIONS



Mounting Details and Connections





Panel View

CAUTION: Do not attempt to force the tuning knob in. The knob will return to the "in" position when the station selector touch bar is depressed.

Setting The Adjust-O-Matic Tuning

Pressing the station selector touch-bar six times will cause the tuning mechanism to change through a cycle of six positions. Five of these Adjust-O-Matic positions, at which numbers appear in the station indicator window, may be set for five favorite local stations while the sixth position, at which the letter M appears in the station indicator window, may be used for selecting stations manually.

The five positions, at which numbers appear in the station indicator window, may be adjusted in succession to any desired dial settings. However, in order to simplify the identification of the stations, it is advisable to set the Adjust-O-Matic mechanism in sequence according to frequencies of the stations, beginning with the station broadcasting on the lowest frequency, and progressing to the station broadcasting on the highest frequency.

Turn the receiver on and allow it to operate for at least fifteen minutes in order for each part to reach normal operating temperature before making the following Adjust-O-Matic settings:

1—Press the station selector touch bar repeatedly until No. 1 appears in the station indicator window.

2—Pull the manual tuning knob outward engaging the Adjust-O-Matic mechanism with the dial. (Fig. 1.)

3—Select the station desired and tune it in by turning the tuning knob in the same manner as when tuning the radio manually. Tune very carefully for clearest reception.

CAUTION: Do not attempt to force the tuning knob in. The knob will return to the "in" position when the station selector touch bar is again depressed.

4—Press the station selector touch bar, pull the manual tuning knob outward, and tune in the station desired for No. 2 position. Use the same procedure for adjusting positions Nos. 3, 4, and 5.

When the five positions have been adjusted to the five desired stations, it is only necessary to press the station selector touch bar to return to manual tuning or to any one of the stations on the Adjust-O-Matic.

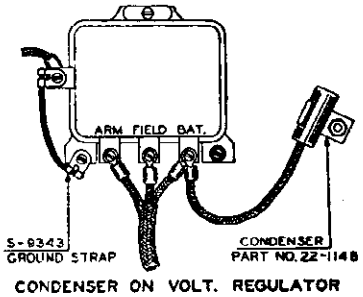
NOTE: When the letter M appears in the station indicator window, the manual tuning knob must be pulled outward and turned in order to select stations manually.

Interference Elimination

Important

Use the utmost care in the following operations to insure freedom from interference. Clean away paint and dirt to make good contacts between condensers and the car. Tighten all bolts and nuts securely.

1—Install a condenser, Part No. 22-1148, and a ground strap, Part No. S-9343, on the voltage regulator (Fig. 4.)



CONDENSER ON VOLT. REGULATOR

Fig. 4

2—Mount a condenser, Part No. 22-1326, on the ignition coil and connect the lead to the battery terminal (Fig. 5.)

3—Cut the high tension wire, that runs from the ignition coil to the distributor, three quarters of an inch from the point where it enters the soft rubber high tension wire housing. Shorten the wire one inch. Remove the wire from the coil, and screw the suppressor into the wire ends (Fig. 6). Replace the wire in the coil.

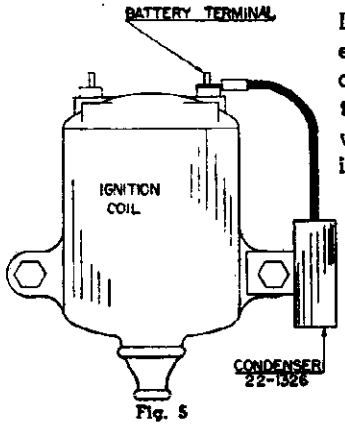


Fig. 5

If ignition interference is still present, check to make sure that the inside center windshield trim strip is grounded to the car body, and does not touch the antenna roof tube nut. Be certain the antenna wing nut and all the instrument panel bolts are tight.

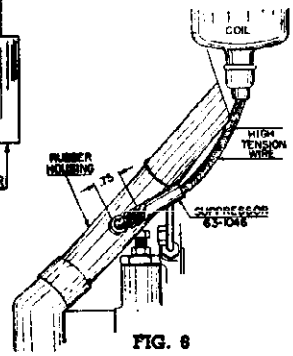

FIG. 6

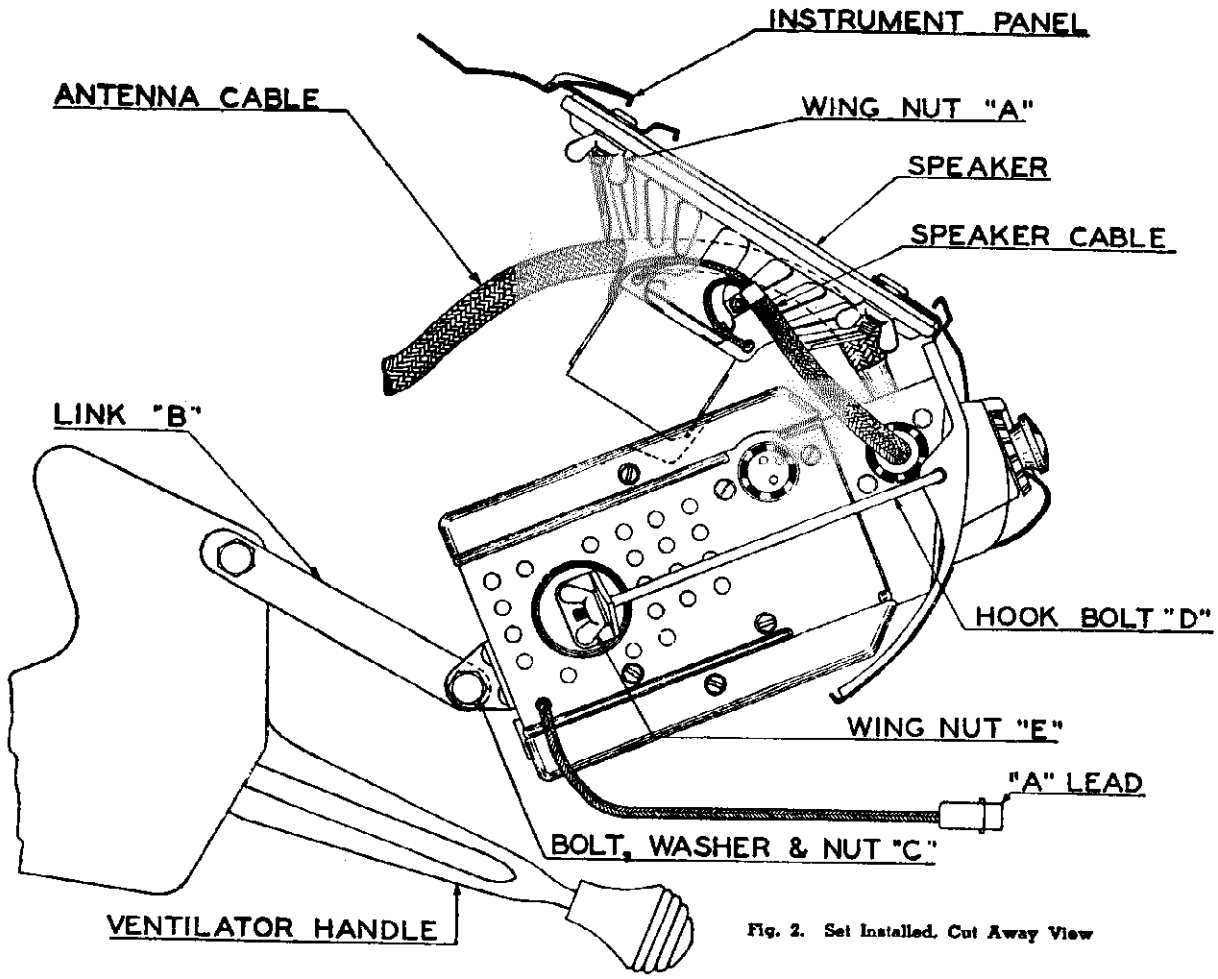

Fig. 2. Set Installed. Cut Away View

1—Install the antenna and antenna cable. Complete installation instructions are packed with each antenna kit.

2—Remove the radio opening cover plate from the instrument panel.

3—Place the speaker over the studs on the rear of the instrument panel, with the cable to the left. Fasten securely with the four wing nuts No. 54-189, furnished in the installation kit.

4—Start the wing nuts "E" on the hook bolts "D" (Fig. 2). Place the receiver in position. Slip the end of the hook bolts through the receiver brackets with the hooks turned toward the center. Hook the bolts in the holes provided on the instrument panel. Tighten the wing nuts sufficiently to hold the receiver in place while the supporting link "B" is connected between the rear hanger bracket of the receiver and the ventilator bracket of the car, with bolts, lock-washers and nuts ("C." Fig. 2.)

5—Tighten all nuts and bolts to hold the receiver firmly in place.

6—Connect "A" lead to circuit breaker. (Fig. 3.)

7—Connect the speaker cable and antenna lead to the receiver.

8—IMPORTANT: Turn the receiver on and allow it to operate for approximately fifteen minutes in order for each part to reach normal operating temperature. Tune in a weak station near 1200 Kc. With a small screwdriver adjust the antenna trimmer (Fig. 1), for maximum volume.

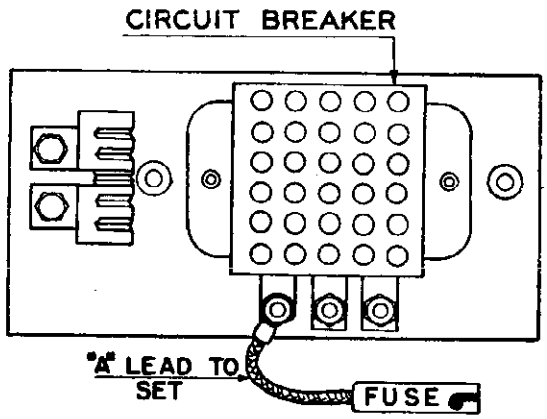

Fig. 3

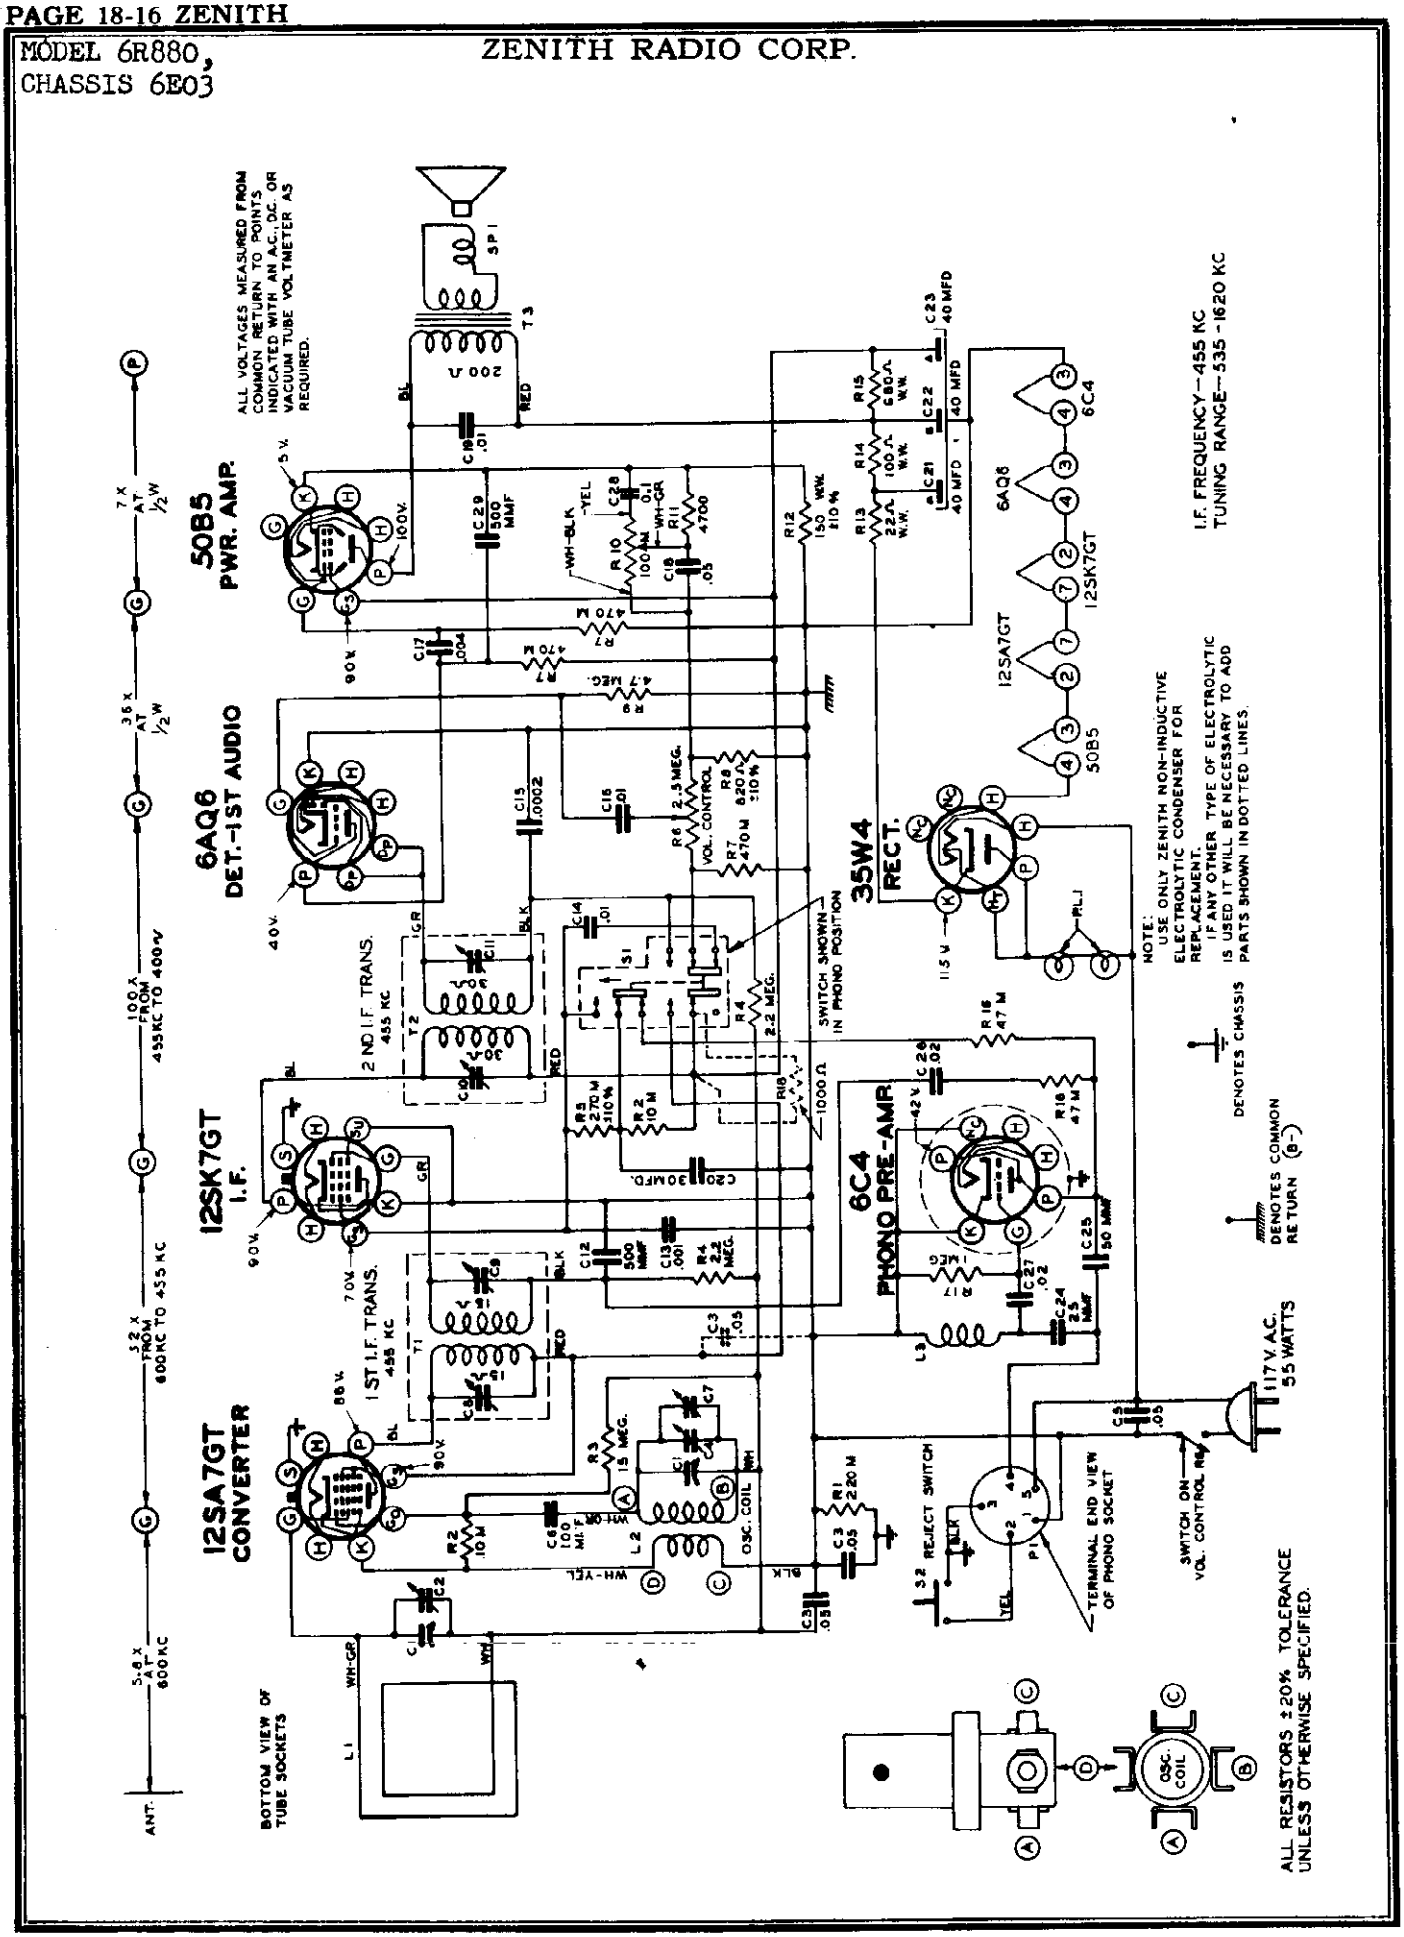
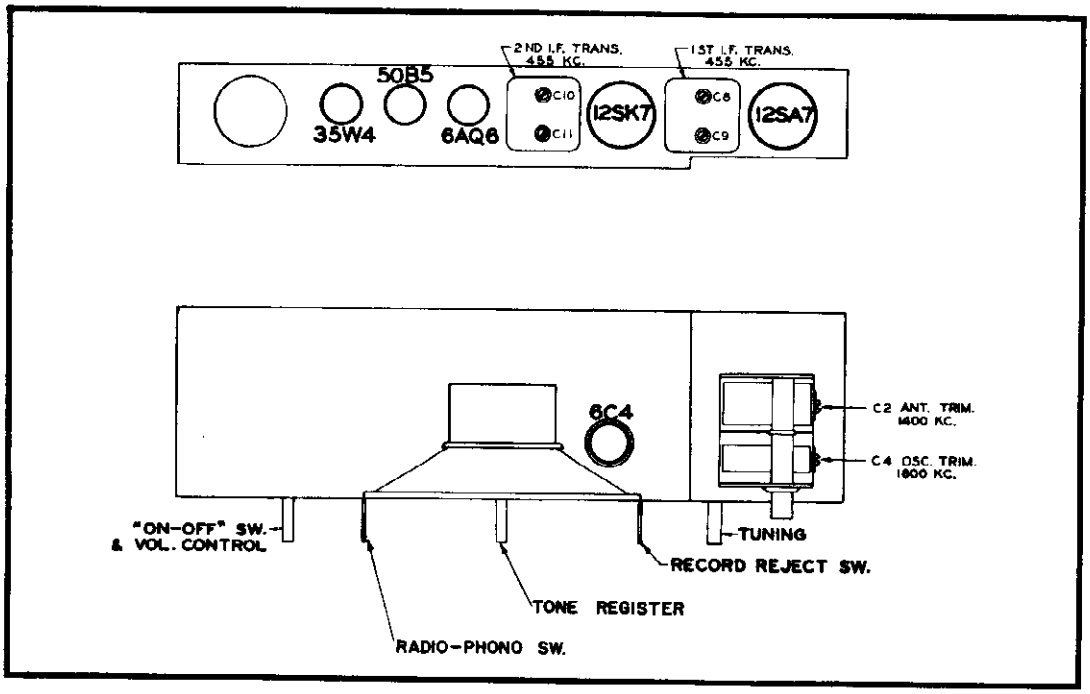
MODEL 6R880,
CHASSIS 6E03

ZENITH RADIO CORP.





TUBE AND TRIMMER LOCATION

The alignment of chassis 6E03 is conventional, however the adjustments interlock to some degree, therefore, the procedure must be followed exactly. Since this chassis is of the AC/DC type, care must be exercised when making measurements. Chassis 6E03 has a phono-radio push button switch of the double acting type. When in the "In" position this connects the radio for playing records. Socket P1 is used to connect the changer to the receiver chassis.

TUBE AND TRIMMER LOCATION

TO THE SERVICEMAN:

Chassis 6E02 has a Record Reject push button switch on the receiver control panel to reject records.

The socket P1 is used to connect the automatic record changer to the receiver. The record player is connected to the receiver by a shielded cable and socket arrangement.

The Phono-Radio switch is a two position double acting push-button switch and when in the "in" position connects the changer for playing records.

ALIGNMENT PROCEDURE

OPERATION	CONNECT OSCILLATOR TO	DUMMY ANTENNA	INPUT SIG. FREQUENCY	SET DIAL AT	TRIMMERS	PURPOSE
1	Converter Grid	.5 MFD	455 Kc.	1600 Kc.	C8, C9, C10, C11	Align I.F.
2	Single Turn Loop Loosely Coupled to Wavemagnet	------	1600 Kc.	1600 Kc.	C4	Set Oscillator to Dial Scale.
3		------	1400 Kc.	1400 Kc.	C2	Align Antenna.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 12BE6 Converter	.05 Mfd.	455 KC. Modulated	BC	600 Kc.	L8, 9, 12, 13	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C6	Set oscillator to dial scale.
3	2 turns loosely cpld. to wavemagnet		1400 Kc. Modulated	BC	1400 Kc.	C5	Align antenna stage.
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L15 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L16 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L14 Prim. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L10 and L11 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 12BE6 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L6 and L7 Prim. and Sec. of 1st IF transformer.	Align 1st IF transformer for maximum reading.
9 (c)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

TO THE SERVICE MAN:

The 7E02 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on all bands.

When adjustments are made on the 7E02 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

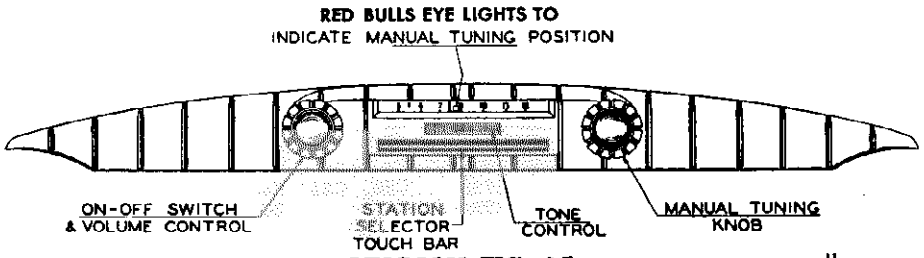
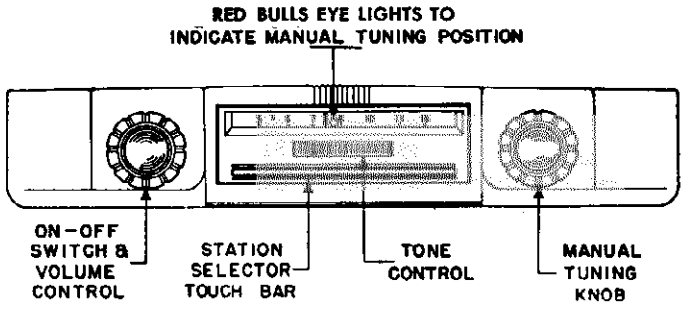
MODEL 7ML780, Lincoln; ZENITH RADIO CORP.
7ML781 Lincoln Continental

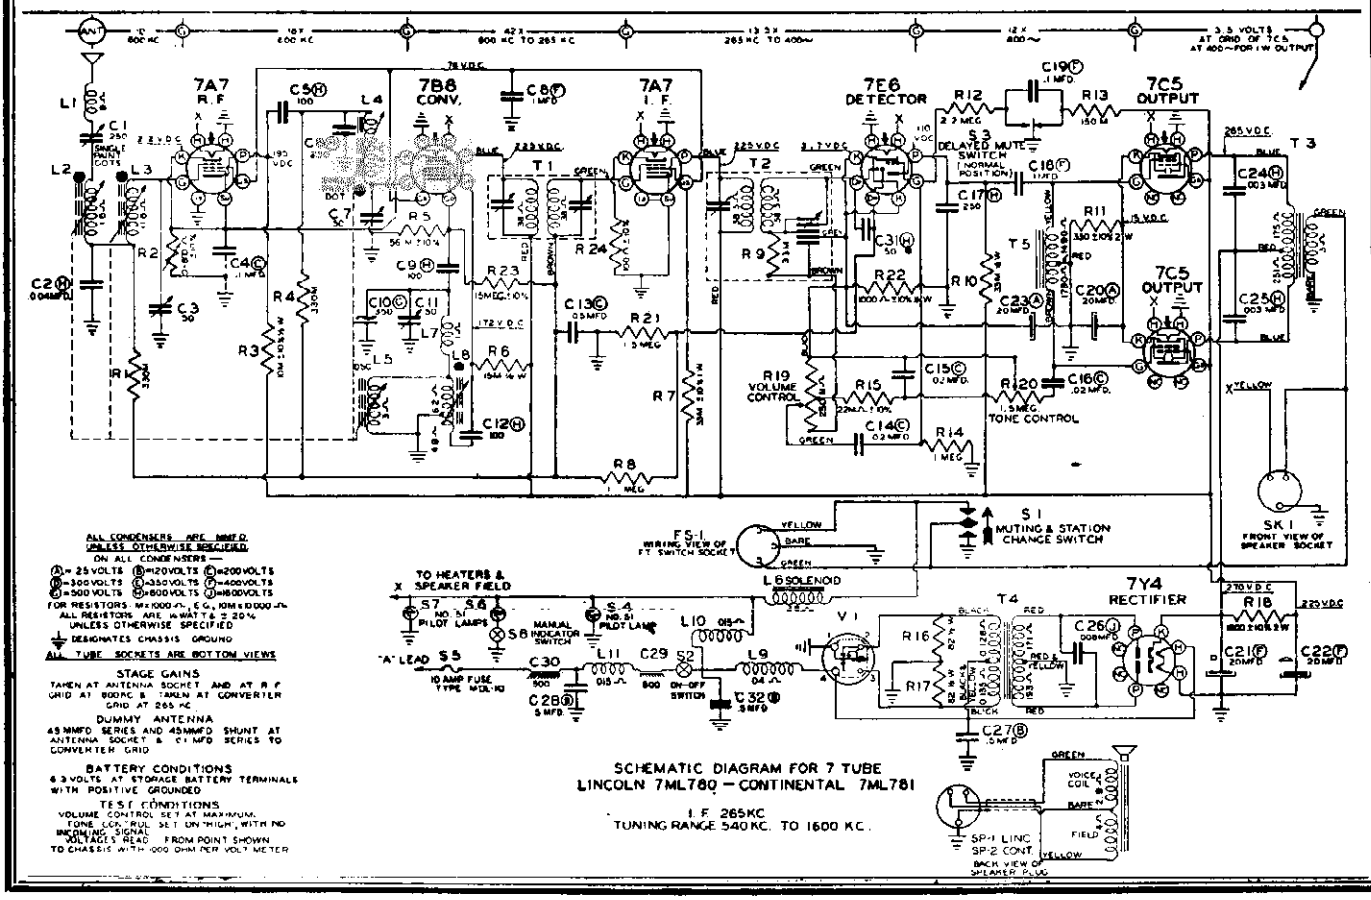
OPERATING INSTRUCTIONS



LINCOLN FIG. 1A



LINCOLN CONTINENTAL FIG. 1B



ZENITH RADIO CORP. MODEL 7ML780, Lincoln; 7ML781 Lincoln Continental

INSTALLATION INSTRUCTIONS

ANTENNA. The new Lincoln antenna is especially designed to work satisfactorily with this receiver. The installation instructions are included with the antenna.

IMPORTANT: 1200 K.C. ANTENNA ADJUSTMENT. After the receiver has operated for approximately 15 minutes, tune in a weak station near 1200 Kc. Adjust the antenna trimmer (C1, Fig. 2) for maximum signal.

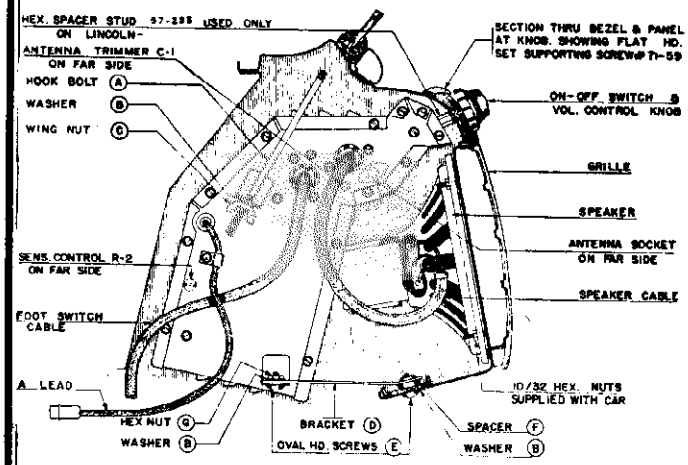


FIG. 2

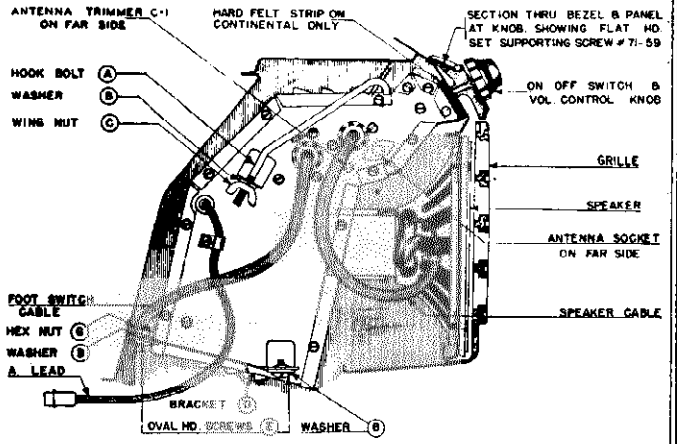

FIG. 2A

Lincoln Receiver Installation

1—Remove the cardboard cover from the speaker hole in the center of the instrument panel. Do not discard the nuts. Remove the bezel from the instrument panel by loosening the nuts on the underside.

2—Remove the protective cover from the speaker. Install the speaker on the rear of the grille so the cable is toward the left. Use the nuts that held the instrument panel hole cover in place.

3—Hang the hook bolts "A" in the holes provided for them in the dash so that the hooks are turned away from the receiver.

4—Place the receiver in position and slip the threaded end of the hook bolts through the upper hanger brackets.

5—Apply lock washers "B" and wing nuts "C" to the hook bolts and tighten them sufficiently to hold the receiver in place while installing the lower support brackets "D." Fasten the tapped end of the brackets to the instrument panel, using spacer washers "F," lock washers "B", and oval head screws "E." Fasten the other end of the bracket to the lower angle bracket of the receiver. Tighten all screws and nuts so that the receiver is held firmly in place (Fig. 2).

6—Connect the "A" lead to the battery terminal of the circuit breaker on the firewall. (Fig. 3.)

7—Connect the speaker cable and the antenna lead-in cable to the receiver and turn the power on.

8—Place the escutcheon plate, furnished with the receiver, over the tuning and volume control shafts and fasten it in place with the two 8/32" flat head screws furnished in the installation kit.

9—Fit tuning and volume control knobs to their respective shafts.

NOTE: Tuning control knob is fastened to the shaft with a set screw. Shaft has a milled recess for the screw.

Lincoln Continental Receiver Installation

The Continental Radio installation is similar to the Lincoln installation with the exception of the speaker.

To install the Continental speaker, remove the speaker grille which is held in place by four nuts on the back of the instrument panel. Place the speaker in position through the front of instrument panel so the cable is to the left. Fasten securely with the four No. 10/32 machine screws and lock washers. Replace the grille and proceed with the installation of the receiver as instructed under Lincoln Receiver installation. Note position of bracket D in figure 2A.

Foot Control Switch Installation

1—Remove the floor mat around the clutch and brake pedals.

2—Drill a hole in each of the three extrusions in the floor, between the clutch and brake pedals, with a No. 27 drill. (Fig. 3.)

3—Fasten the foot control switch in place with the sheet metal screws furnished. Dress the cable so that the plug can be inserted into the foot switch cable receptacle at the left side of the receiver as shown in figure 2.

4—Cut a hole in the floor mat for the foot switch button. Install the foot switch eyelet (furnished in the installation kit) in the hole. Replace the floor mat. A piece of 1⅛" pipe that has been sharpened on the inside of one end may be used to cut the hole.

ZENITH RADIO CORP.

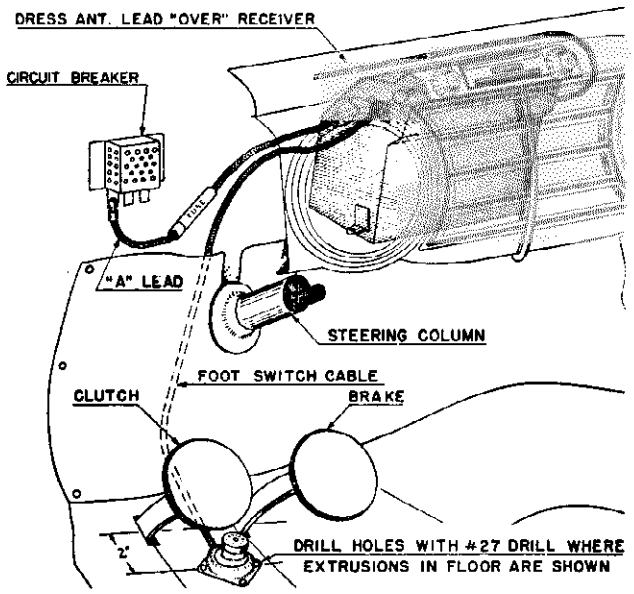

FIG. 3

Setting the Touch-Bar Tuning

Pressing the station selector touch-bar six times will cause the tuning mechanism to change through a cycle of six positions. Five of the Adjust-O-Matic positions may be set for favorite local stations. A red dot will appear in the tuning scale background when the Adjust-O-Matic is in the sixth position. This position may be used for selecting stations manually.

Using the manual (DIAL) position as a reference point, the remaining five positions may be adjusted in succession to any desired dial settings. Setting the stations in sequence according to their frequencies, beginning at the low frequency and progressing through to the high frequency end of the dial, is the recommended practice for simplifying the identification of each Adjust-O-Matic station.

Turn the receiver on and allow it to operate for at least fifteen minutes to bring the temperature up to normal before making the following Adjust-O-Matic settings.

1—Press station selector touch-bar (Figs. 1A and 1B) until red dot appears in dial scale background. Press the touch-bar once more to advance Adjust-O-Matic mechanism to No. 1 position.

2—Pull manual tuning knob outward to engage the Adjust-O-Matic mechanism.

3—Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.

CAUTION: DO NOT ATTEMPT TO FORCE THE KNOB IN. The knob will automatically return to the "IN" position when the station selector touch bar or the foot switch is operated.

4—Press station selector bar, pull tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5. Note: When the green dot appears in the tuning scale background, the manual tuning knob must be pulled outward and rotated to select the stations manually.

Interference Elimination

IMPORTANT: Use the utmost care in the following operations to insure freedom from interference. Be sure that clean contacts are made when connecting condensers in the car. If necessary, clean away paint or dirt with emery paper to make good ground. Tighten all bolts and nuts securely.

1. Mount the voltage regulator condenser No. 22-1192 and the ground strap No. S-9343 on "ground" terminal of the voltage regulator. (Fig. 4.) Connect the lead of the condenser to the ARM. terminal of the voltage regulator. Connect the end of the ground strap to the lower, left hand voltage regulator mounting screw. (Fig. 4.)

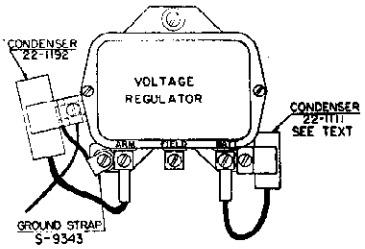

FIG. 4

2. Mount condenser No. 22-1111 under the lower right hand voltage regulator mounting bolt, and connect the lead to the BATT. terminal of the voltage regulator. (Fig. 4).

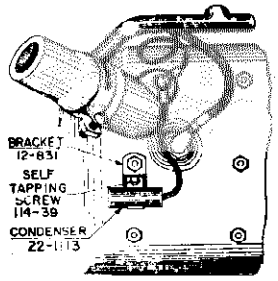

FIG. 5

3. Install the water temperature gauge condenser No. 22-1113 with its separate bracket (which fastens under one of the cylinder head nuts.) (Fig. 5.)

4. Install the condenser No. 22-1113 on the oil gauge unit. (Fig. 6.)

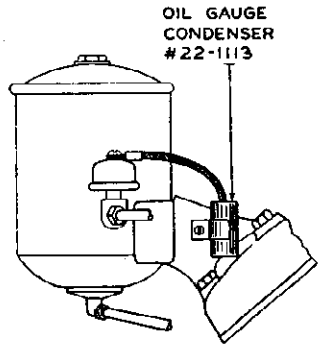

FIG. 6

5. Install the motor hood grounding spring. (Fig. 7.)

202-450		Instruction Book
S12734	W1	Phono Cable Assembly
S12740	L1	Wavemagnet Assem. - Type 29C
S13200		Non-Intermixer Record Changer
S13270		Handle & Name Strip Assem.

The alignment of chassis 6C06 is conventional. None of the adjustments interlock, however, the most accurate alignment will be accomplished if the procedure is followed exactly. The IF frequency is 455 KC and all measurements, voltage, and resistance have been taken with an electronic voltohm meter.

Stage by stage gain measurements are for reference purposes only. Gain measurements can seldom be duplicated, and are used only for comparison purposes.

ENOTES CHASSIS

I.F. FREQUENCY 455K.C.

TUNING RANGE 535 — 1620K.C.

A feature of chassis 7E22 is a high gain tuned R.F. stage ahead of the conventional superheterodyne circuit.

When making repairs or adjustments on the chassis be sure to have the Phono-Radio switch in Radio position (button out).

The Radiogran tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

The 6SK7 1st IF tube is also the phono preamplifier. The output from the phono oscillator is fed to the grid of the 6SK7 through R13 and C25. The amplified output is taken from the screen grid and fed back through U1 and C14 into the volume control circuit and the grid of the 6SQ7GT 1st audio amplifier.

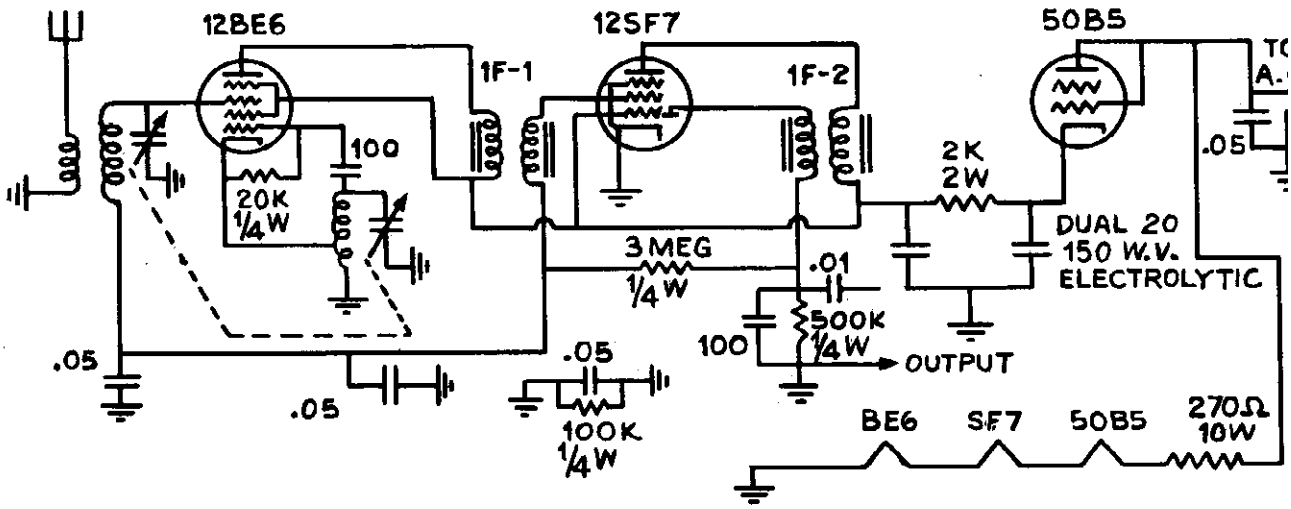
ADAPTOL COMPANY MODEL C



Adaptol CT-1 Miniature Superheterodyne Data

The following data will enable you to understand your tuner, and service with a minimum of test equipment.

The circuit is a straightforward superheterodyne of high efficiency, due to the employment of modern, best quality components and tubes. The 12BE is a dual purpose oscillator and mixer. The 12SF7 is used as a high gain I.F. stage, diode detector, and A.V.C. tube. The 50B5 is used as a rectifier because it does not open as readily as a conventional rectifier under overloads, and it permits a smaller value of dropping resistor, with lower dissipation below chassis.

The following voltages should appear under normal operation, with a strong Broadcast signal tuned in ...

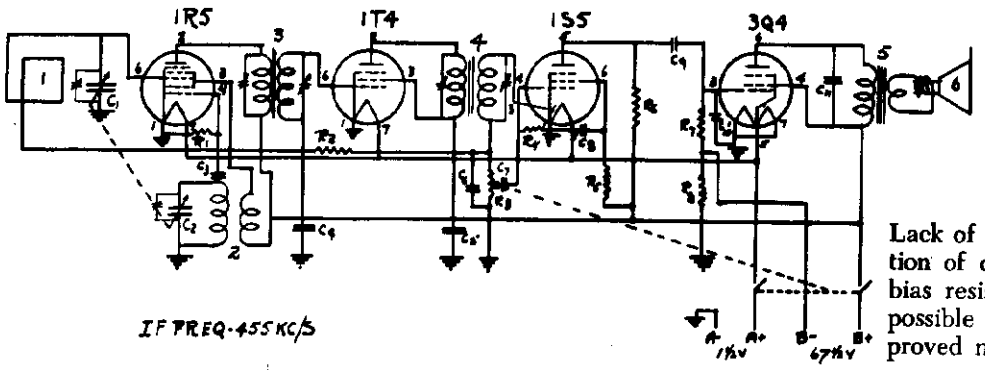
A.V.C. 3-6 volts
Plate at output of filter 100-120 volts
Total current 20-25 milliamperes
Oscillator grid bias 9-11 volts
Power consumption 20 watts 110 volts D.C. 60 cycle A.C.
All voltages measured with a VTVM with respect to B- (not chassis)

I.F. is 455 k.c. I.F.'s are permeability tuned, drift free units.

The following gain checks are approximate, depending on the equipment us line voltage, etc. Tuner set for 1000 kc.

Antenna to converter grid 4 to 5
Converter grid to IF grid 30
IF grid to diode 60
Audio Output on strong signal on five foot antenna .5 volt RMS
Selectivity 10 times down 8 kilocycles off resonance at 1000 k.c.

Note: Floating ground is used
⏚ Signifies B minus
⏚ Signifies chassis
Rotating tuning condenser to extreme counterclockwise position silences tuner for "standby", permits instant operation, thus eliminatin necessity for extra switch on amplifier.



TYPE - Four tube battery operated superheterodyne.
BATTERIES USED: "A" battery standard flashlight cell.
Eveready 950, Burgess 2R or equivalent.
"B" battery 67½ volt - Eveready 467, Burgess.
XX45 or equivalent.
TUNING RANGE: 540 to 1700 KCS.
TUBES USED: 1R5 - 1T4 - 1S5 - 3Q4
WARRANTY: This receiver carries the standard RMA guarantee.

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until other possible sources of trouble have been thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA: The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 1400, 1700 KCS and an output meter to be connected across the primary or secondary of the output transformer. If possible all alignments should be made with the volume control on maximum and the test oscillator output as low as possible. For more accuracy a vacuum tube voltmeter should be used.

1. Couple signal generator to loop loosely using one or two turns of wire connected to signal generator output.
2. Set signal generator of 455 KC and adjust the 4 I.F. trimmers on top of I.F. cans. An output meter may be connected across voice coil but we suggest for more accurate alignment that a vacuum tube voltmeter be connected between ground and tie lug connecting return lead of loop.
3. The oscillator trimmer should next be set so that a 1700 KC signal comes in at minimum setting of condenser. (Plates all out.)
4. The R.F. trimmer should be set at 1400 KC. It is suggested that it be adjusted with both batteries in case and chassis as near in the case as possible, and still adjust trimmer; as the chassis affects inductance of loop.

SERVICE NOTES

Rating: 105-125 volts 60 cycles AC

Tuning frequency range: 540-1720 Kilocycles

Intermediate frequency: 455 KC

Loudspeaker: Alnico V Magnet Dynamic
Outside cone diameter 5-1/4 inch diameter
Voice coil impedance (400 Cycles) 3.2 Ohms

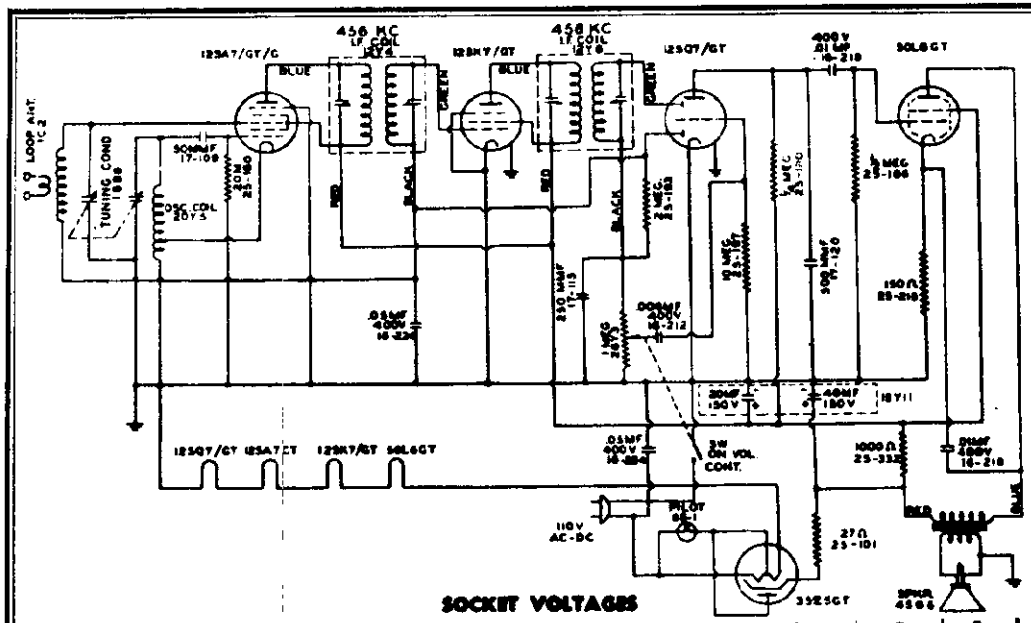
Tubes:
Converter and oscillator	12SA7
I.F. Amplifier	12SK7
Det., Audio, A.V.C.	12SQ7
Power Output	50L6GT
Rectifier	35Z5GT/G
Pilot Lamp	G.E. 47

ALIGNMENT PROCEDURE

I.F. Alignment: Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC. and keep the oscillator output as low as a readable meter reading will permit. Apply signal to the converter grid through a .05 mfd. capacitor and align progressively the trimmers in the second and first IF transformer cans.

R.F. Alignemt : Apply the R.F. alignment signals through a standard I.R.E. dummy Ant. to the receiver antenna post. With the gang condenser wide open, align the oscillator trimmer on front section of gang to 1720 KC. Change the signal generator to 1500 KC., tune the receiver to the signal and peak the antenna trimmer on rear section of gang for maximum output on output meter.

Precaution: If the signal generator is AC operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as A-C through the capacitor will introduce hum modulation and/or create the possibility of a burned out signal generator attenuator.



SOCKET VOLTAGES

TUBE	POSITION	1	2	3	4	5	6	7	8

NOTE: All DC voltages measured with a 1000 ohm per volt meter from ON-OFF switch (—B) to socket contact indicated. All AC voltages are measured from ON-OFF switch (—B) to socket contact indicated.
All voltages are positive DC unless otherwise marked.
Volume control full on.
Line voltage 117 volts AC.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd., — 10 mmf.

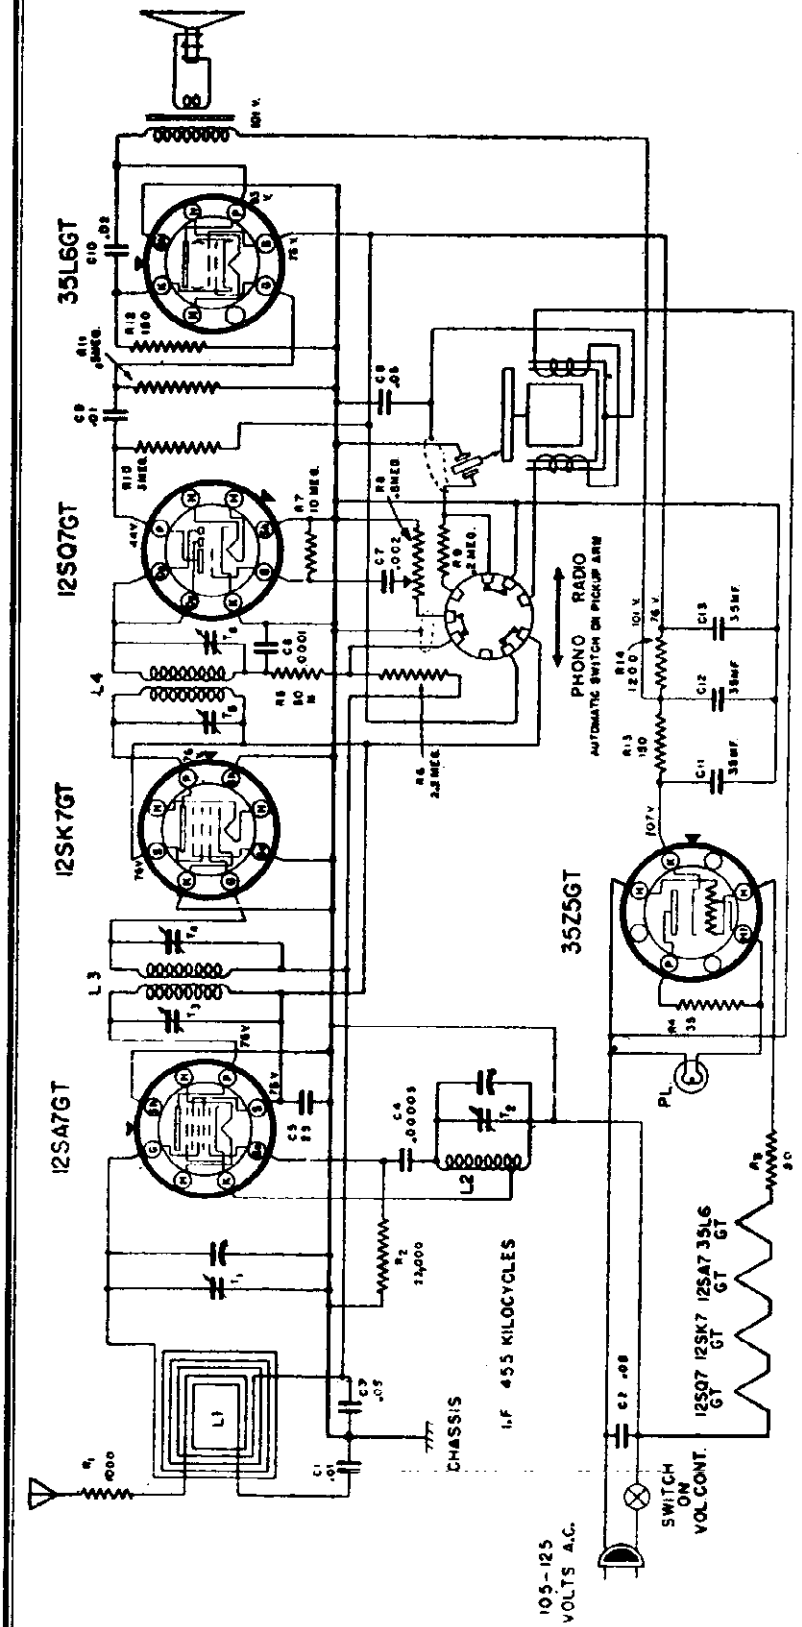
MODEL 68F

INTERSTATE HOME EQUIPMENT CO.



Alignment Frequencies:

I. F. ..... 455 K.C.
R. F. ..... 1500 K.C.

I. F. Alignment

Connect an output meter across the voice coil. Rotate the volume to maximum. Set test oscillator to 455 K.C. and apply signal to lug on stator of gang condenser to which loop is connected through a .05 Mfd. capacitor. Align the second I. F. transformer trimmers, next adjust the first I. F. transformer trimmers. Keep test oscillator output as low as a readable meter reading will permit.

R. F. Alignment

Set the dial pointer and generator at 1500 K.C. Run wire from the output terminal of the generator, having it come near the receiver. However, no metallic connection is made between the signal generator and the receiver.

Peak the oscillator trimmer for maximum output and then the antenna trimmer.

If the variable condenser plates have become bent or damaged, it may be necessary to adjust them for tracking, at 600 K.C. The oscillator plates are adjusted first, then the antenna plates are adjusted for maximum output at 600 K.C.

This radio is a compact, table model phono-radio superheterodyne receiver using six tubes and operates from an A.C. source of power. This receiver tunes the broadcast band of frequencies, covering the range of 540-1720 kilocycles.

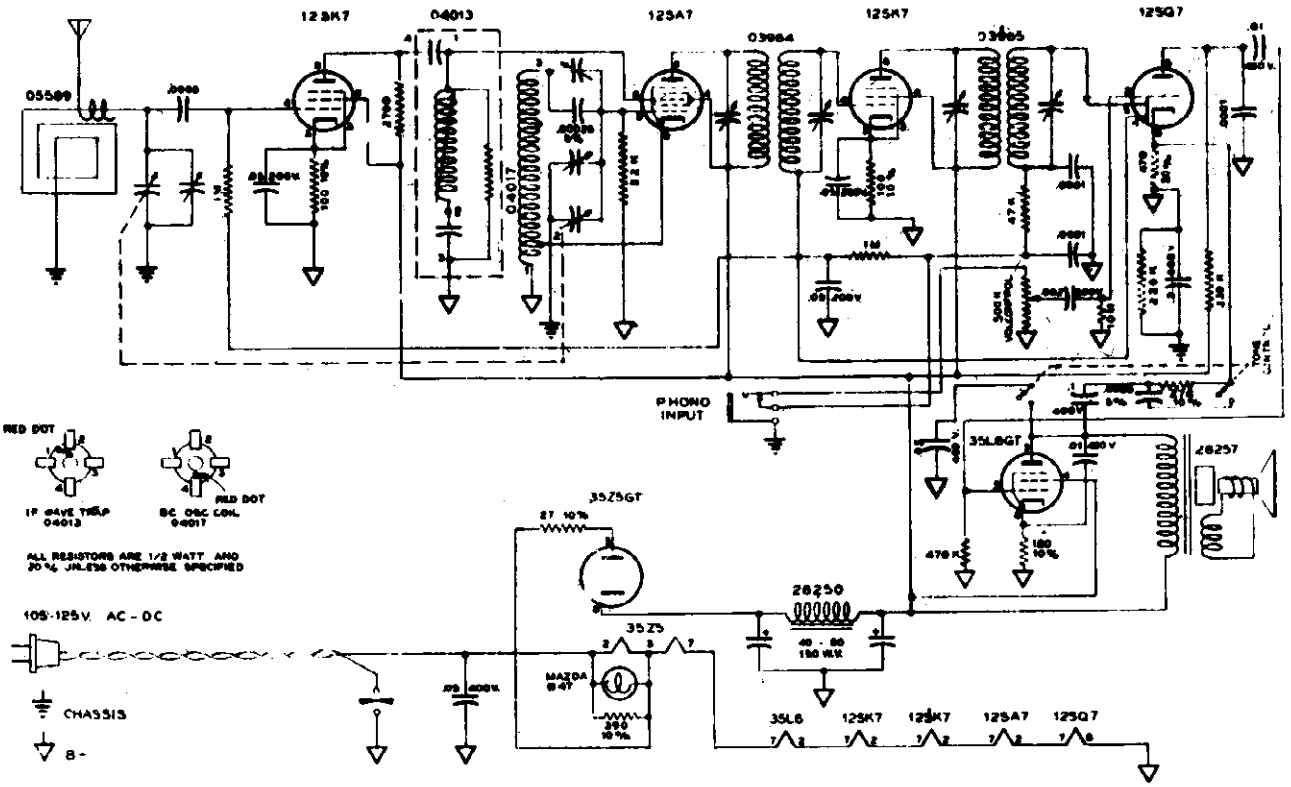
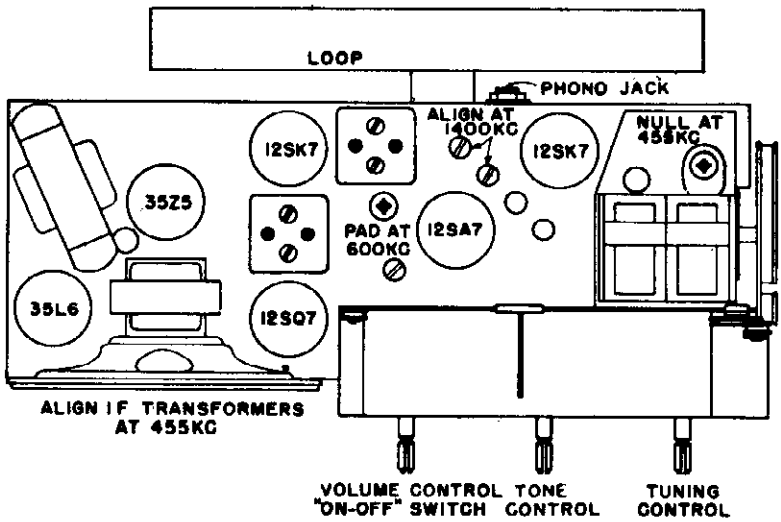
MODEL 6K

MAGUIRE INDUSTRIES, INC.





TUBE LAYOUT

This is a 6-tube superheterodyne radio receiver, with provision for phonograph input, for operation on 105-125 volt AC or DC power supply. The tubes used are a 12SK7 as an R.F. amplifier, a 12SA7 as an oscillator-converter, a 12SK7 as an I.F. amplifier, a 12SQ7 as an AVC, detector, and 1st audio amplifier, a 35L6 as an output, and a 35Z5 as a power rectifier.

The broadcast band covers a frequency range from 535 to 1620 kilocycles. The dial is calibrated in kilocycles (KC) (less the final zero).

When using D.C. power supply, and after allowing sufficient time for tubes to warm up, if the receiver does not operate, remove the line cord plug from the socket and reverse. Replace the plug in the reverse position and allow tubes to warm up, at which time the receiver will operate.

When using A.C. power supply, it will be found that there will be less hum when the line cord is in the best position. Try both positions, leaving the plug in the position that produces the least hum.

For reception of local stations no antenna is necessary, the built-in loop providing sufficient volume. If it is desired to listen to more distant stations, an antenna 50 to 100 feet long should be connected to the flexible lead protruding from the rear of the cabinet. **Do not use a ground with this receiver.**

This receiver is designed to operate over the standard broadcas band which extends from 535 to 1620 Kilocycles (KC) (185 to 56 Meters.)

ALIGNMENT PROCEDURE

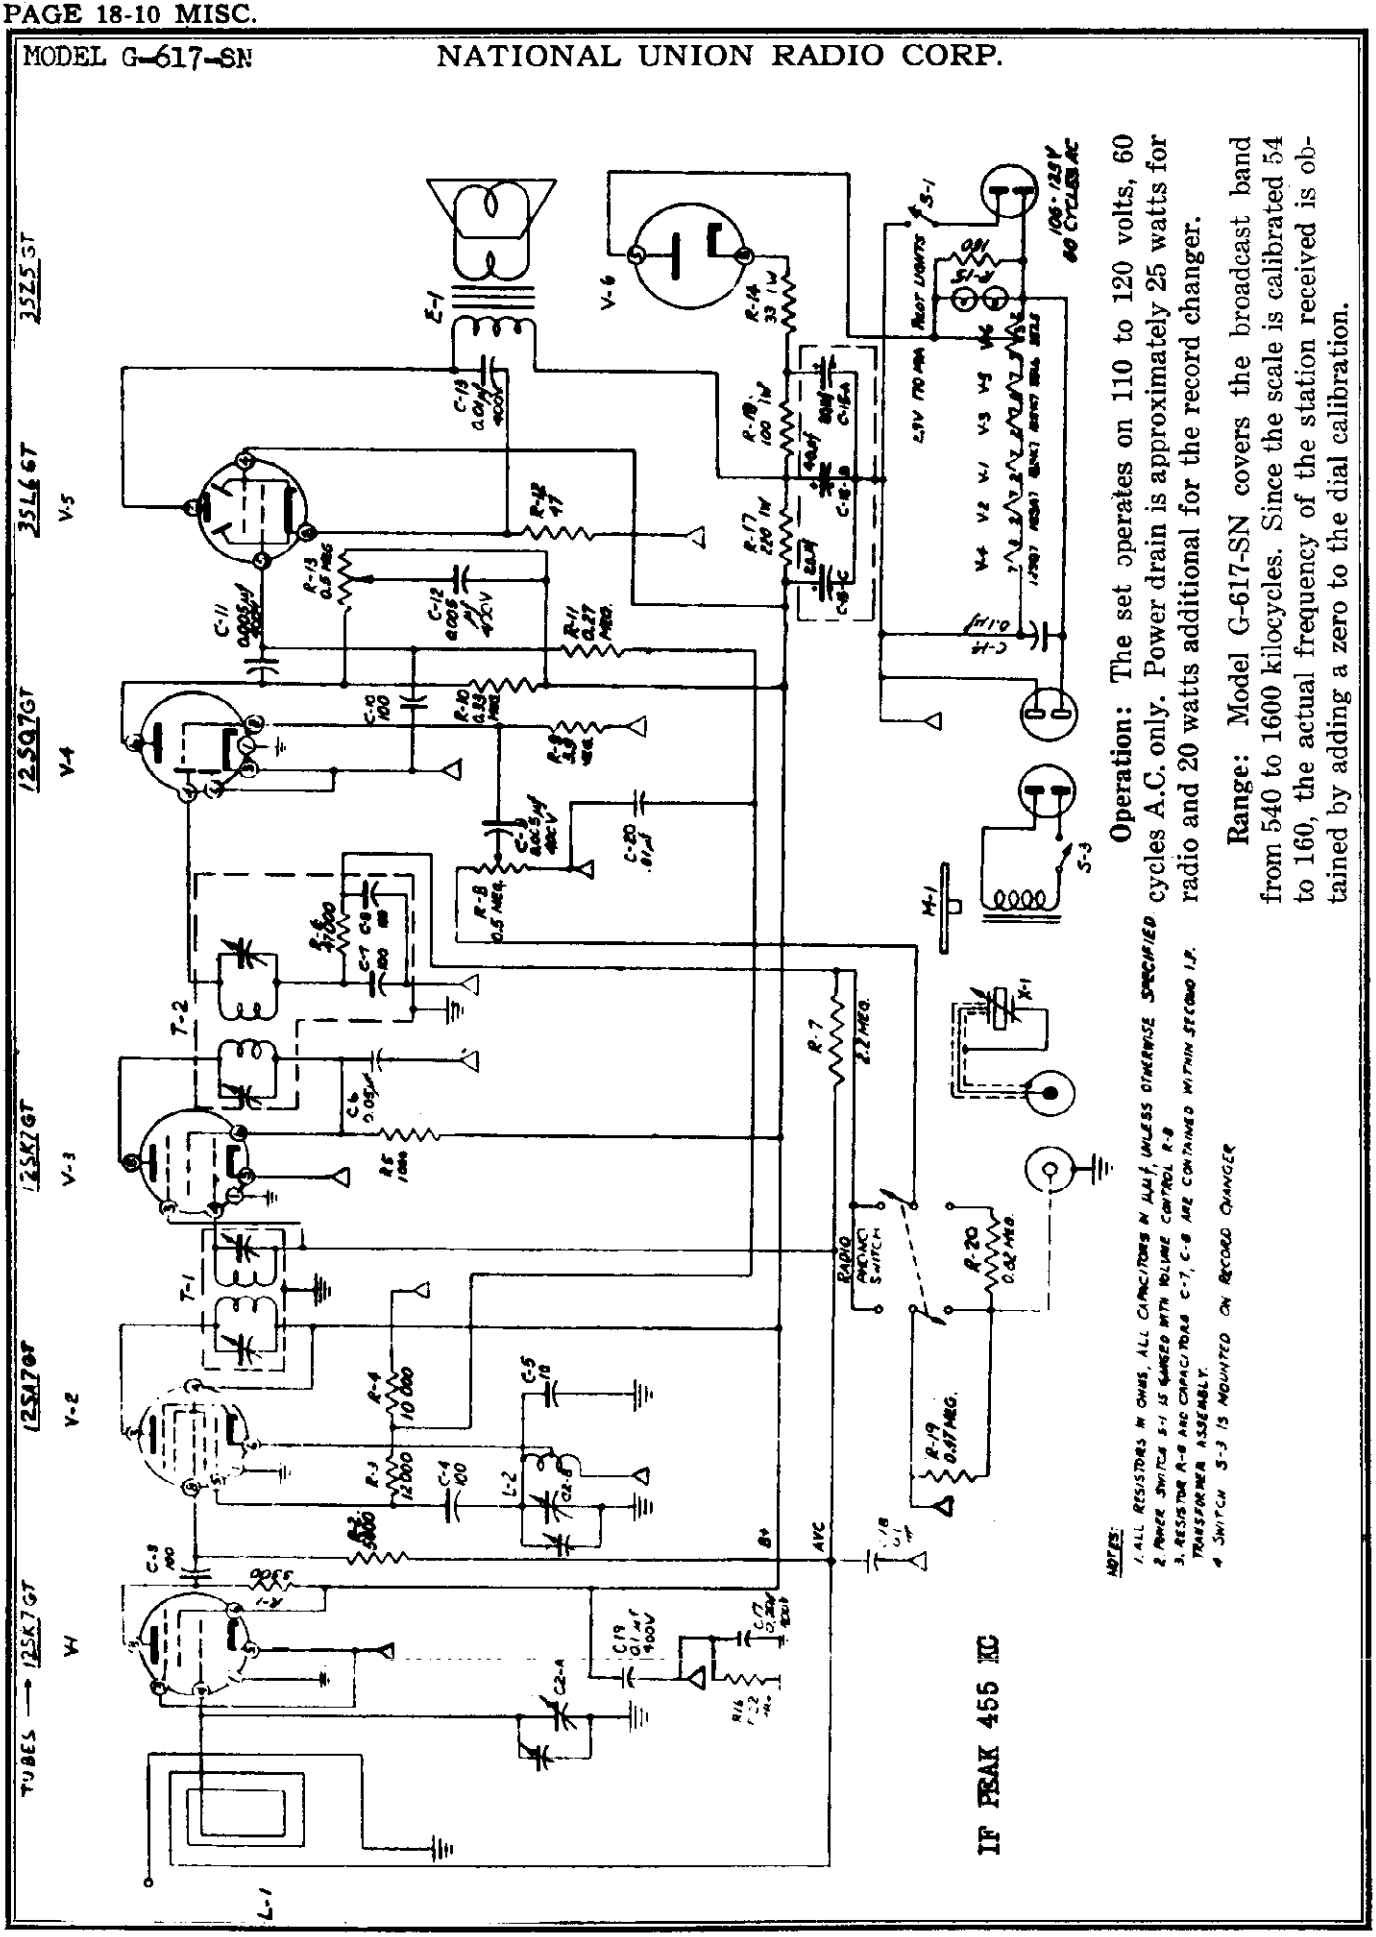
GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cobinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With t gang condenser set at minimum, adjust the test oscillator to 4 KC and connect the output to the grid of the converter tube (12SA through a .05 or .1 mfd. condenser. The ground on the test oscilla should be connected to the ground buss, indicated on the circ diagram. Align all three I.F. trimmers to peak or maximum readi on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to a dummy l which can be made by coiling 2 turns of hookup wire about 6" in diame Place this dummy loop about a foot from the loop on the receiver and in same plane as the receiver loop. With the gang condenser set at minim capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 trimmer) on the gang condenser. Next—set the test oscillator at 1400 KC, tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, tune in signal on condenser to check alignment of coils.

MODEL G-617-SN NATIONAL UNION RADIO CORP.



Operation: The set operates on 110 to 120 volts, 60 cycles A.C. only. Power drain is approximately 25 watts for radio and 20 watts additional for the record changer.

Range: Model G-617-SN covers the broadcast band from 540 to 1600 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metalic screwdriver.
4. Dummy antenna: — .1 mfd., — 10 mmf.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS
IF 455 kc.	12BE6 Grid	.1 mfd.	HF end	IF Trimmers C D E F	Tune to max.
535 kc.	12BE6 Grid	10 mmf.	LF end	Osc. Trimmer B	Set limit of band
1400 kc.	12BE6 Grid	10 mmf.	1400 kc.	Ant. Trimmer A	Tune to max.

Frequency Range.....540-1700 kc.
Intermediate Frequency.....455 kc.
Power Supply.....105-125 volts AC-DC
Loudspeaker.....4 inch Dynamic
V.C. Impedance....3.5 ohms at 400 cycles

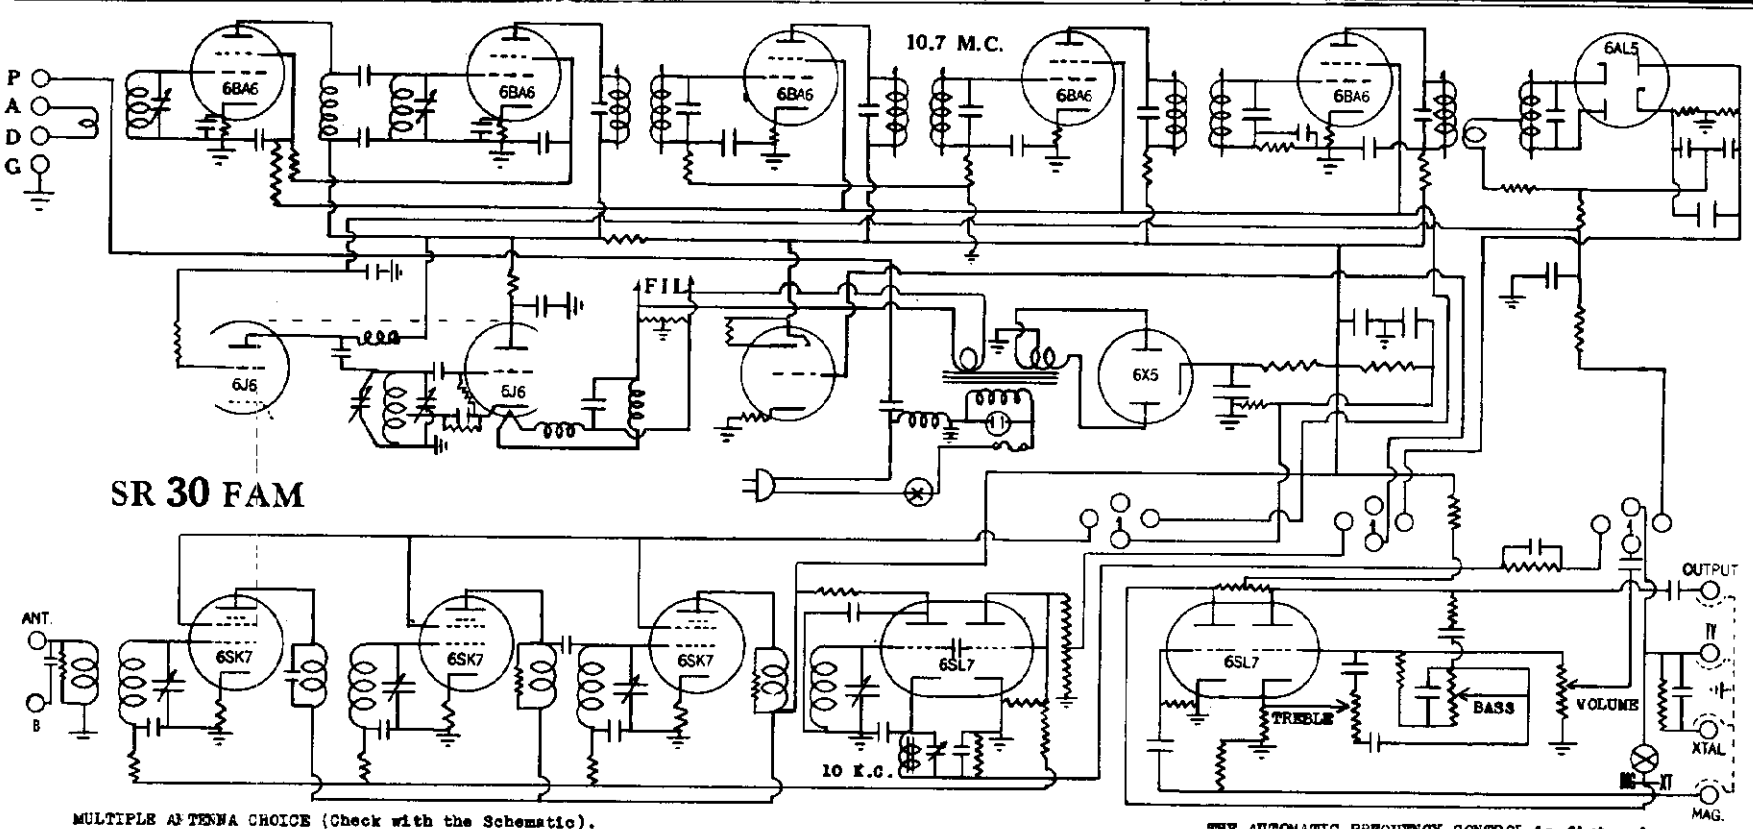
Power Output (Undistorted).....75 watts
Power Output (Maximum).....1.5 watts
Tuning Drive Ratio.....1 to 1
Rated Power Input.....32 watts

TUBE COMPLEMENT

1—12BE6 Oscillator and Mixer tube.
1—12BA6 IF Amplifer tube.
1—50B5 Power Output tube.
1—35W4 Rectifer tube.
1—12AT6 Second Detector and First Audio tube.

PARTS LIST

Part No.	Description	Part No.	Description
LL-21	Loop antenna assembly	EC-12	Two section electrolytic cond.
GC-9	Tuning gang condenser	VC-9	Vol. cont. & switch 1 megohm
LI-6	1st I.F. transformer 456 kc.	LO-14	Oscillator coil



MULTIPLE ANTENNA CHOICE (Check with the Schematic).
For best F.M. results a 100 M.C.Dipole should be installed well above surrounding obstructions. The twisted 300 ohm line from the dipole should be connected to antenna terminals "A" and "D".

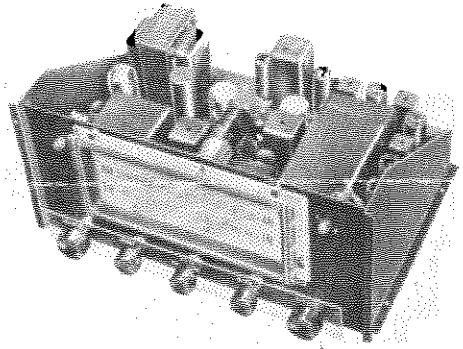
If only a single wire antenna is possible it should be connected to "A" with terminal "D" shorted to "G", which indicates "GROUND".

If suitable antenna is not available the power line may be used as a substitute antenna by connecting terminal "P" to terminal "A" and terminal "D" to "G". No other connections are necessary, just be sure that the line-cord is not skeined or coiled. Results will depend greatly on location.

THE ANTENNA FOR THE A.M. Section of SR30FAM must be connected to Ant. or Ant."B". Ant."B" inserts a 10 MMF capacitor in series with the Ant. connection and is to be used when an outside antenna is made necessary by the shielding construction of a building. Keep AM and FM leads apart.

PROVISION IS MADE FOR AURAL TELEVISION - when AM-PHONO-FM Switch is in PHONO position.

MG-XL. The switch so marked and located near the center rear of the chassis re-arranges the Phono input circuit for Variable Reluctance (magnetic) or crystal pickup.



THE AUTOMATIC FREQUENCY CONTROL is fixt and requires no adjustment.

ALL INPUTS go thru the SR "Tone Gate" tube and are therefore effected by all controls. This allows for a pre-set amplifier.

OUTPUT. The audio output jack should be connected by plug and shielded wire to the high impedence input circuit of a high quality amplifier. Choose a speaker capable of wide range reproduction.

A.C.POWER. SR30FAM is completely powerized for 110-125 volts 50-60 cycles. The power switch (on the Volume Control) also controls the A.C. receptacle on the back of the chassis for convenience in amplifier installation.

No component values have been listed as each unit is clearly marked in accordance with RMA code and approximate values are obvious to the skilled technician.

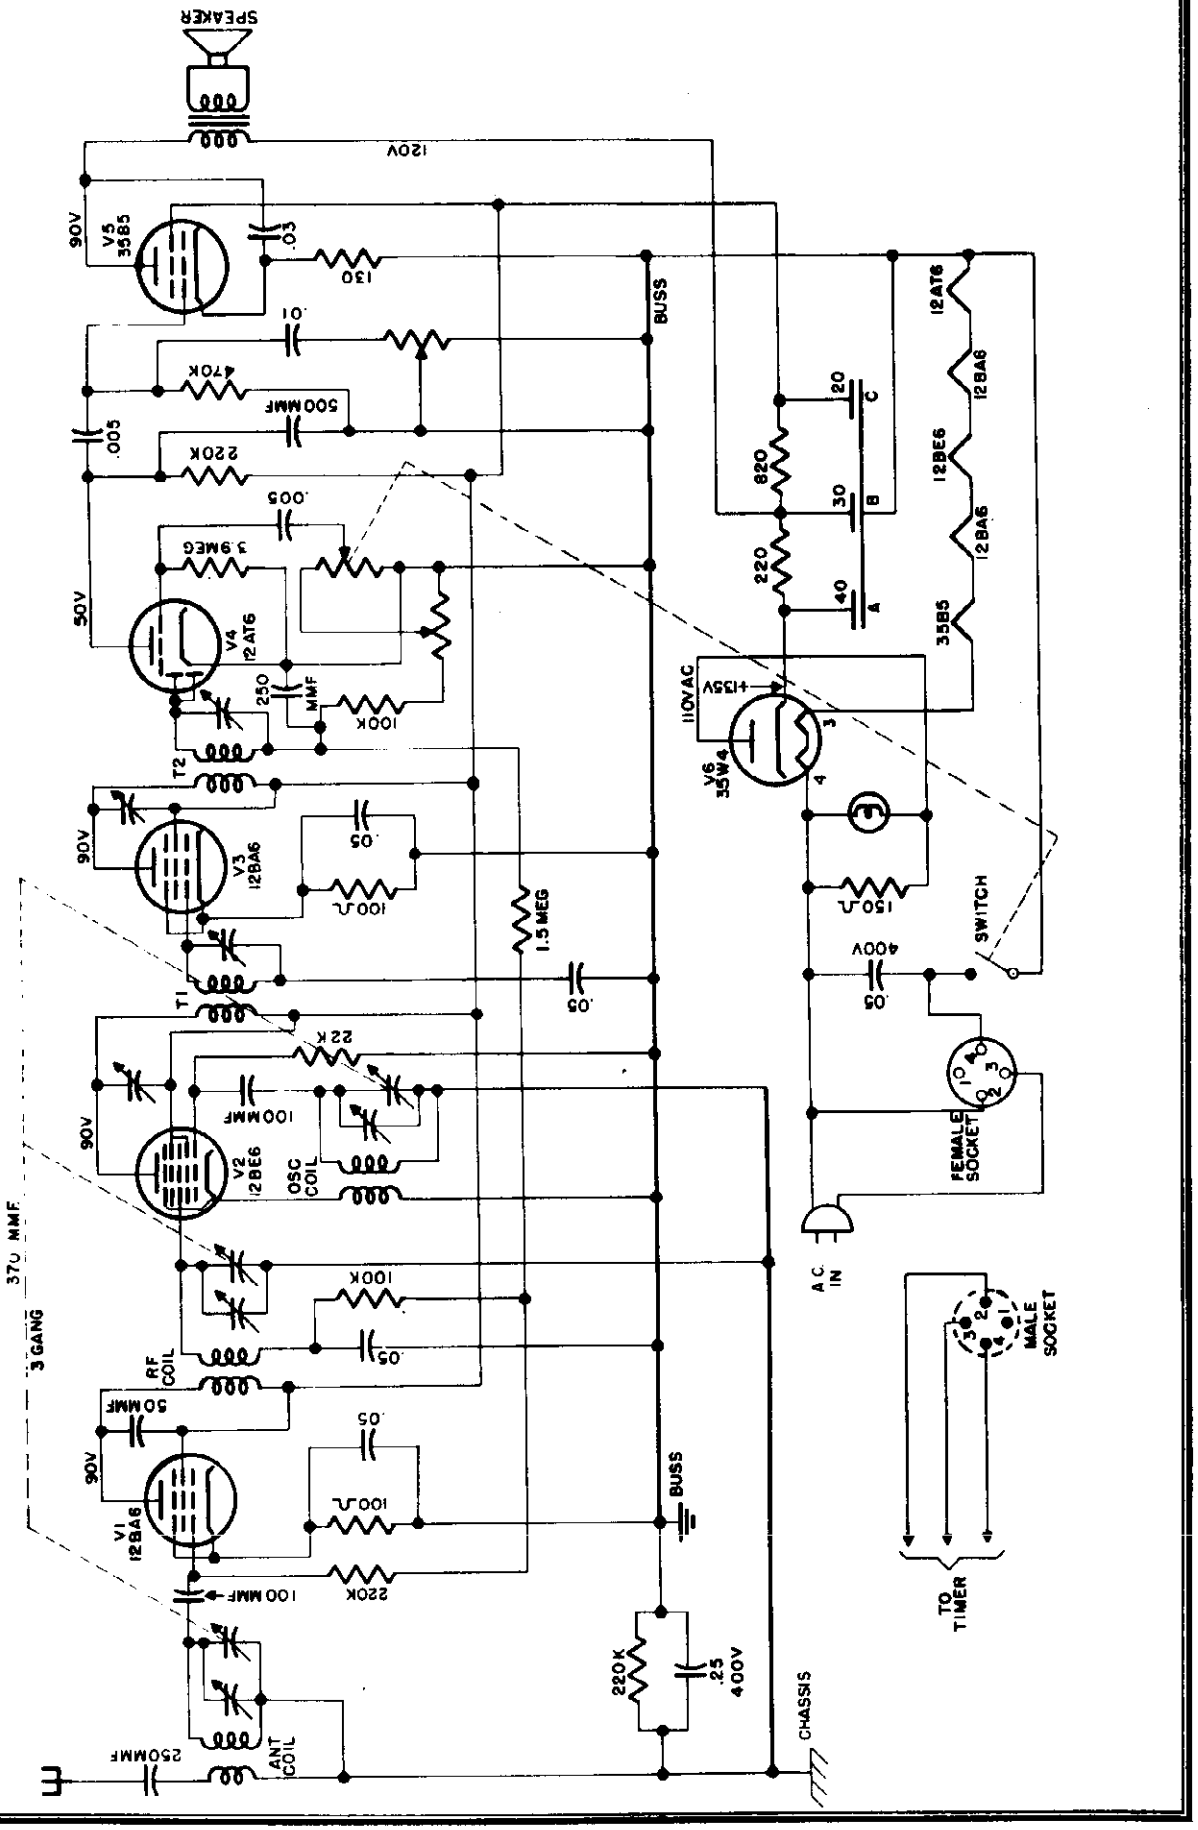
MODEL TF6

TRADIO



Admiral 7C65

The voltage data and parts list of model 7C65, chassis 7E1 were omitted from *page 17-3 of Rider's Volume XVII* and are here reproduced for inclusion in that Manual. The record changer for this receiver is the Admiral model RC170 or RC170A, the data for which will be found on *RCD.CH. page 16-1 of Rider's Volume XVI.*

VOLTAGE DATA — "Radiophone" switch in "Radio" position. Readings made between point indicated and chassis. Measured on 117-volt a-c line. Dial turned to low-frequency end, no signal. Voltages measured with a vacuum-tube voltmeter. If voltage readings are taken with "Radio-Phono" switch in "Phono" position, readings will be zero or practically zero.

Admiral Models 7RT41, 7RT42, 7RT43

These models are shown on *pages 16-11 and 16-2 of Rider's Volume XVI.* An error has been found in the part number of the SW2 radio-phono switch in the service information on these models. The part number of this switch should be 77A16-1 instead of 77A16-2.

Admiral Chassis 9A1

This chassis is shown on *pages 16-6 to 16-8 of Rider's Volume XVI.* It has been found that the dial windows of these chassis build up a small electrostatic charge, thus causing the plastic to attract fine dust particles. These are so fine that the dial windows appear milky or foggy.

Treating the windows with a solution called Hexco Dust-Ded reduces the amount of fine dust that collects on them. The dial window should be removed from the cabinet to apply the solution properly. Remove the knobs and the screws holding the escutcheon to the cabinet. Clean the window by wiping off the dust thoroughly on both sides with a damp (not wet) cloth or chamois skin. Apply the Hexco Dust-Ded according to the directions on the bottle.

Part No.	*Description*
98A11-2	Hexco Dust-Ded

Allied Radio 6A-127 Revised, 6B-127, 6C-127

This model is the same as Model 6A-127 appearing on *pages* 15-4 *and* 15-5 *of Rider's Volume XV,* except for the following changes. Part 36 has been changed in value from one megohm to 220,000 ohms and the bottom side of this resistor has been moved from the negative filament line (junction of parts 34 and 17 and 47) to the avc bus (junction of parts 33, 34, 14, and 35). Part 40 has been changed in value from 220,000 ohms to 100,000 ohms. Part 13 is now connected from the junction of resistor 39 and the secondary of the first i-f transformer to the positive side of the filament of the IN5GT tube instead of from the junction to the common negative as previously.

Part 28 is now connected from the negative side of the filament of the 1H5GT tube to the grid of that tube instead of from the center arm of the volume control to the common negative. The bottom side of part 19 is now connected to the junction of part 48 and the center tap of the filament of the 3Q5GT tube, and thence to the left-hand side as shown on the schematic) of capacitor 10. This part was formerly connected directly to the right-hand side of the same capacitor. The connection from the negative side of the filament of the IN5GT tube to the left-hand side of capacitor 10 has been removed. A 68-ohm resistor has been inserted in the high side of the 45-volt battery lead.

The following changes have been made in the parts list.

Illus. No.	*Part No.*	*Description*
36	27E224	Carbon, 220,000 Ohm, ½ W.
40	27E104	Carbon, 100,000 Ohm, ½ W.

Allied 6C-122

This model is the same as Model 6B-122 appearing on *pages 16-3 and 16-4 of Rider's Volume XVI.*

Automatic Tom Thumb

Please change the listing in your Rider's Volume XVII Index for Automatic page 17-8 from Models 660, 662, 666 to Model Tom Thumb.

Automatic 127

This model is the same as Model 120, appearing on *page 12-7 of Rider's Volume XII.*

Automatic 640, Series B

The schematic of this model is the same as the 640 shown on *page* 15-7 *of Rider's Volume XV* except for the change from octal type to loctal type tubes.

This model uses the 14Q7, 14A7, 14B6, 50A5, and 35Y4 in place of the 12SA7GT, 12SK7GT, 12SQ7GT, 50L6GT, and 35Z5GT tubes.

Automatic 650

This model is similar to the 650 shown on *pages 15-4 and 15-7 of Rider's Volume XV* except for the following change: The 20,000 resistor in the oscillator grid circuit of the 12SA7GT now is connected directly to ground instead of to the cathode of that tube.

Belmont 6D127

This model is the same as Model 5D128 appearing on *pages 15-4 and 15-5 of Rider's Volume XV.*

Belmont 8A510

This model is the same as the 8A59 shown on *pages 15-8 to 15-12 of Rider's Volume XV,* except for the addition of four parts.

The two miscellaneous parts of the removable tuner assembly are:

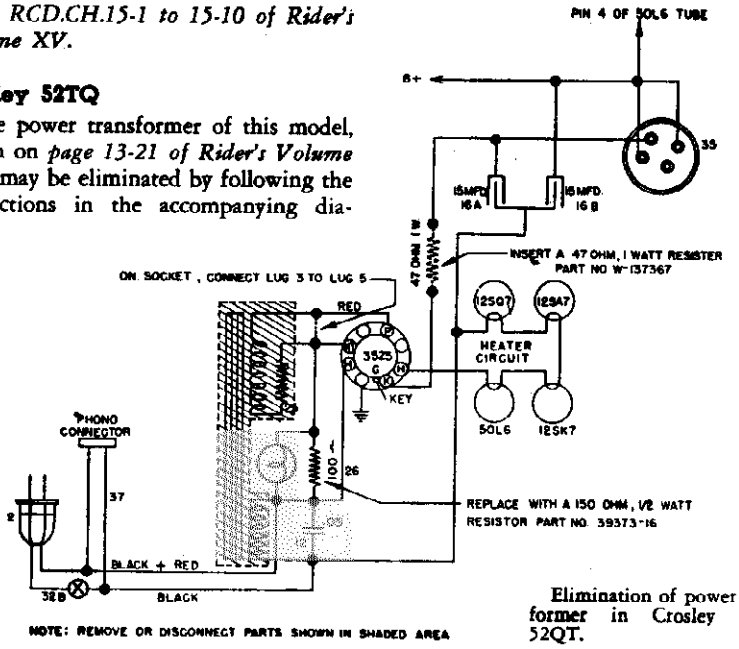
1. Part No. A-2J-7176—cam locking spring.
2. Part No. A-2J-7627-1—retainer spring.

The miscellaneous part added to the main chassis is part A-19A-11539 which is a plug on the speaker leads.

The final addition is an alternate record changer which can be used with this model. Part C-201-12545-1 is a Detrola changer model 550, which is shown on *pages RCD.CH.15-1 to 15-10 of Rider's Volume XV.*

Crosley 52TQ

The power transformer of this model, shown on *page 13-21 of Rider's Volume XIII,* may be eliminated by following the instructions in the accompanying diagram.



Elimination of power transformer in Crosley model 52QT.

Crosley 56PA, 56PB

These models appear on *pages* 15-29 to 15-31 *of Rider's Volume XV.* It has been found that the 3S4 tube used in these models has a tendency to burn out. The following change should be made to prevent this. Remove the wire that connects the plate lug 3 to the cathode lug 8 of the 117Z6 tube socket. In its place solder one end of a 47-ohm, 1-watt resistor (part number 39373-119) to the plate lug. The 1S5 Det.—AVC—1st A-F Amplifier tube has been changed to a 1U5 tube. The characteristics of the tubes are the same but the socket connections are different.

The accompanying socket voltage chart includes both changes.

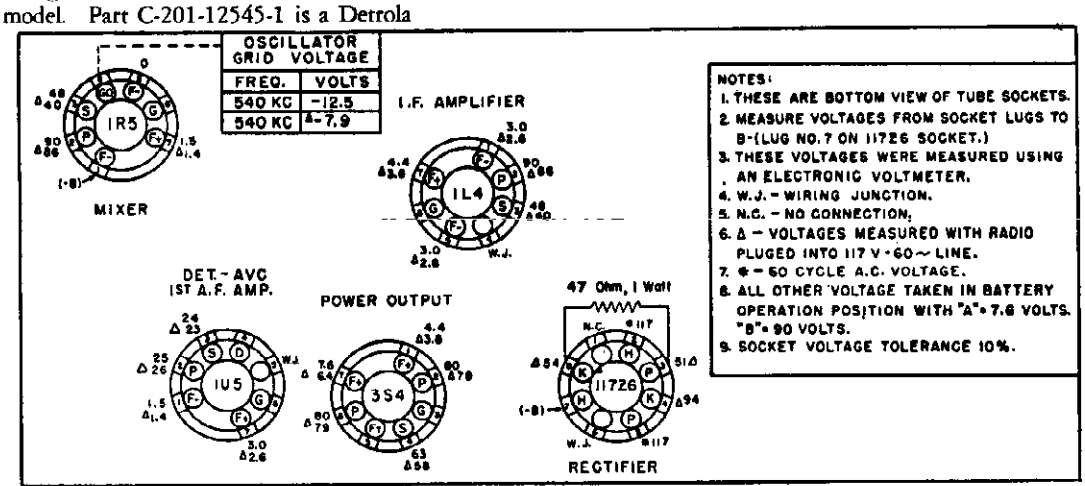
Crosley Model 66CS(0)

This model is the same as Model 66CS (s) appearing on *pages 16-16 to 16-19 of Rider's Volume XVI,* except for the cabinet and the following changes:

Item	*Part No.*	*Description*
44*	39368-10	Control, Tone
45*	39368-18	Control, Volume
	39369-1	Switch, Power
	39370-1	Shaft, Plug In
	R-139206	Cabinet
	D-137057	Record Changer
	AC-137885	Lid Support, Cabinet
	W-138330	Hinge, Cabinet Lid

* These parts replace the original equipment parts.

The record changer (Part No. D-137057) is Oak Model 6666 shown on *RCD.CH. pages 15-1 to 15-7 of Rider's Volume XV.*



Socket voltage chart for Crosley models 56PA and 56PB showing new socket connections.

DeWald 418

This model is the same as model 414 appearing on *page 11-2 of Rider's Volume XI.*

Electronic Laboratories 2811

This model, shown on *page 16-8 of Rider's Volume XVI,* uses the Webster model 56 record changer, which is shown on *page RCD.CH.15-10 of Rider's Volume XV.*

Emerson BF-169, BF-204, And BF-207

These models are the same as Model BF-191 appearing on *pages 9-1 and 9-2 of Rider's Volume IX.*

Emerson 567, Chassis 120016

This model is the same as Model 560, Chassis 120016, appearing on *pages 17-30 to 17-32 of Rider's Volume XVII.*

FM Specialties Model Fidelotuner

This model is shown on *pages 17-1 to 17-4 of Rider's Volume XVII.* Three terminals are shown in Fig. 5, page 17-4; the first labelled 3, and the third terminal (not labelled in this figure) should be labelled 4. The ground from the phonograph connection to the receiver should be made to this third terminal (terminal 4).

Farnsworth AC-55, Chassis C2-3

This model is the same as model ACL-55, Chassis C 2-3, shown on *pages 11-7 and 11-10 in Rider's Volume XI.*

Farnsworth ACL 55, ACL56, AKL58, AKL 59

These models shown on *pages 11-7 and 11-10 of Rider's Volume XI* are erroneously listed as ATL.

Farnsworth GK-140

Slippage of the dial-drive cable on the early production sets can be corrected by replacing the cable with part number 05096. This cord is softer and smaller than the one used previously.

If the push buttons bind on the front panel of the cabinet, the ganged capacitor may not be properly positioned. This may be corrected by installing a flat metal washer under each of the mounting grommets. This may be done without removing the gang from the chassis.

Oscillation or low sensitivity on f.m. may be due to poor ground connections from the gang to the r-f shelf. When aligning the f-m band, oscillation may occur with certain signal generators. Changing the value of the resistor in series between the generator and the chassis will prevent oscillation. With some generators more than 400 ohms are required, with others less.

In some preliminary sets a 200-$\mu\mu$f capacitor was placed in series with the short-wave converter-trimmer. If for any reason this trimmer requires replacement, removal of the capacitor is suggested. This capacitor is not shown on the schematic.

In some of the preliminary 14-tube sets, Belden braid was used to ground the ganged capacitor to the r-f shelf. In certain instances too much solder flowed into the braid and as a result some joints break loose or the set becomes microphonic. This braid should be replaced with soft copper strips.

General Electric A51, A56

These models are the same as model A54 shown on *pages 7-4 to 7-6 of Rider's Volume VII.*

General Electric H639AC-DC

The r-f alignment instructions of these models found on *page 11-80 of Rider's Volume XI,* should read as follows: With gang condenser plates completely meshed, set dial to the first mark at the left end of scale. Then set dial to 1500 kc. Apply a 1500-kc signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align C2 and C1 at 1500 kc for maximum output. Set dial to 580 kc and peak C3 on 580 kc while rocking the gang condenser. Retrim at 1500 kc.

GE YRB 60-12

This receiver is the same electrically as the YRB 60-2 appearing on *page 15-5 of Rider's Volume XV* but the cabinet is different.

GE YRB 92-2 and 81-3

These models are the same electrically as the YRB 82-1 appearing on *pages 15-53 to 15-54 of Rider's Volume XV,* but they have different cabinets.

General Electric L604

This model is the same as Model L600 appearing on *page 13-40 of Rider's Volume XIII.*

General Electric 202

This receiver is the same electrically as the model 200 as shown on *pages 15-54 to 15-56 in Rider's Volume XV,* except that it has a different cabinet.

General Electric 219, 220, 221

A few cases of hum which cannot be reduced in the normal manner from these models shown on *pages 15-28 to 15-31 of Rider's Volume XV,* may be corrected by cathode degeneration in the output tube, 35L6GT/G, cathode circuit. Remove R17 and C29-C from the circuit. This can be done by disconnecting one end of R17.

General Electric 260

This model appears on *pages 16-7 to 16-12 of Rider's Volume XVI.* It has been found that late production 1LC6 tubes, coded H7E, will oscillate at another frequency in addition to the desired frequency, causing unsatisfactory operation. To remedy this condition, the oscillator grid capacitor, C17, should be changed from 100$\mu\mu$f to 56$\mu\mu$f.

GE 254

This model is illustrated on *pages 16-to 16-5 of Rider's Volume XVI.* Th suffix letters after 254 indicate only th cabinet styling. All versions are elec trically identical.

Firestone 7402-4

This model is the same as model S7426-6 shown on *page 10-5 of Rider's Volume X.*

Firestone 7423-5

This model is the same as model S7402-5 shown on *page 13-38 of Rider's Volume XIII.*

Goodrich R655W

This model uses the Admiral record changer model RC161 or RC161A, whic are to be found on Admiral RCD. CH pages 17-1 to 17-7 of Volume XVII.

Hallicrafters S-40A

This model is the same as Model S-40 second revision, on *pages 16-67 to 16-8 of Rider's Volume XV,* except for the fol lowing changes. C18 has been changed in value from 100$\mu\mu$f to 68$\mu\mu$f. A 10-ohm re sistor (R30) has been connected betwee the center tap of oscillator coil T10 and terminal C. R30 has been removed from its previous position between C16 and the junction of C26, C6C, C7C, and switch S1F. C55 has been changed in value from 100$\mu\mu$f to 47$\mu\mu$f, and is now connected to the top of the 470-$\mu\mu$f capacitor (C54). The coil T17 is connected directly across C54, with one end going to ground. The center tap of this coil is connected to the cathode of the 6J8 tube. The 0.01-μf capacitor (C53) is connected from the plate of the 6J8 tube directly to ground.

The parts list should be changed to read as follows:

Ref. No.	*Description*	*Hallicrafter's Part No.*
C18	68$\mu\mu$f, ±10%, 500 vdcw; neg. temp. coeff. 0.0075$\mu\mu$f/$\mu\mu$f/deg.C; ceramic	CC25UK680K
C55	47$\mu\mu$f, ±20%, 500VDC, Mica	CM20A470M
T17	BFO coil; 455 kc; shielded	54B033-2

Hallicrafters SP-44 AND SX-42

These models appear on *pages* 17-1 *to* 17-5 *and* 17-6 *to* 17-16 *respectively of Rider's Volume XVII.* When the SX-42 is used with the SP-44 Panadaptor on the low-frequency band, it appears to motor boat. To correct this condition, do the following.

The connecting cable between the SP-44 and the SX-42 is shielded and the shield is connected to the SX-42 ground. Disconnect the shield from the SX-42 ground and place a 50-$\mu\mu$f capacitor between the shield and the SX-42 chassis. Be sure that the SX-42 chassis is well grounded. A shielded antenna lead, or a balanced antenna, on the SX-42 may also help.

The following modifications should be made on the SP-44 unit. A strip of bonding braid, 5/8 inch wide, may

be connected to the No. 1 grounded pin of the 6AC7 tube, going around the choke coil and connecting to the right side of the chassis. The braid should be insulated with a piece of spaghetti and should lie parallel to the front panel. Two pieces of braid ¼ inch wide, or a copper strap may also be used.

A piece of copper or steel sheet about 2½ inches wide may be screwed or soldered across the bottom so that it is attached to both edges of the chassis. This plate should be centered over the bottom of the 6AC7 tube.

Hallicrafters SX-42

This model appears on *pages 17-6 to 17-16 of Rider's Volume XVII*. It has been found that there is unsatisfactory image ratio on the 10-meter band. This can be corrected in two ways, one of which provides for the change or replacement of four parts and the other provides for no change in the oscillator coil.

The first method is as follows:

1. The band 4 oscillator coil should be removed and replaced with a new coil, part number 50-837D.
2. Resistor R24, now 56 ohms, should be removed and replaced with a 22-ohm resistor, part number RC20AE220M.
3. Remove the main tuning dial scale, part number 83C265, and replace with new scale, part number 83C325.
4. Remove antenna coil, part number 51B827-C, and replace it with antenna coil, part number 51B827-D.
5. Align the receiver in the normal manner, making certain that the image falls on the high-frequency side of the signal frequency.

The second method is as follows:

1. Remove the oscillator trimmer capacitor C-42.
2. Calibrate the main tuning dial at 28 megacycles, with slug S-33, making certain that the image falls on the high-frequency side of the fundamental.
3. Calibrate the bandspread as outlined on *page 17-15 of Rider's Volume 17*, except that slug S-33 should be used instead of trimmer C-42.

It will be noticed that in this method the calibration of the low-frequency end of the number 4 band has been neglected entirely, since this cannot be accomplished without the use of trimmer C-42. The oscillator coil would have to be replaced to allow the use of this trimmer.

International Detrola 339, 340, 340-1

These models appear on *page 12-4 of Rider's Volume XII*. The 30-ohm resistor used in these models is the resistor with 5% tolerance, part number 8158.

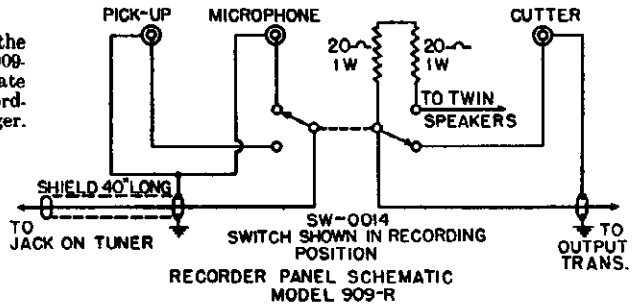
International Detrola 2744

This model is the same as Model 274 appearing on *page* 10-9 *of Rider's Volume X*.

Howard 909MR

This model is similar to Model 909M appearing on *pages 17-54 to 17-57 of Rider's Volume XVII*, except that recording units were added. The General Industries Model GI-RC130 recorder and record changer combination was used to make this change. The recorder unit was added without disturbing the wiring of the radio chassis. The wiring necessary for the addition is shown in the accompanying diagram.

The wiring in the Howard Model 909-MR to accomodate the GI-RC130 recorder and record changer.



Majestic 8FM783, Chassis 8BO7D

This model is the same as Model 8FM776, Chassis 8B07D, appearing on *pages 17-17 to 17-22 of Rider's Volume XVII*, except that "solid doors" are used instead of metal grilled frame doors. The parts list should be changed to read as follows:

Part No.	*Description*
115-48	Cabinet, console combination, mahogany or walnut (state color)

Montgomery Ward 04BR-420B

This model is the same as Model 93BR-420A appearing on *pages 11-25 and 11-26 of Rider's Volume XI*.

Montgomery Ward 14WG-635B

This model is the same as Model 14WG-624A appearing on *pages* 13-53 *and* 13-54 *of Rider's Volume XIII*.

Montgomery Ward 64WG-1050D, 74WG-1050B

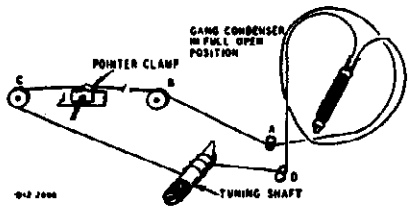
These models are similar to the 64WG-1050A shown on *pages 15-75 to 15-77 of Rider's Volume XV* with the following changes. The 0.1-μf capacitor (C-11) is connected to B— from pin 1 of the 1R5 socket instead of to chassis ground. A 1000-ohm resistor (R-13) is connected from pin 7 of the 3S4 output tube to B—.

Montgomery Ward 64WG-1804B, 74WG-1804B

These two models are similar to Model 64WG-1804A shown on *pages* 15-88 *to* 15-90 *of Rider's Volume XV*, except for the following changes.

The frequency range has been slightly contracted to 540-1600 kc. A 47-ohm dropping resistor (R-20) has been inserted between B+ and the junction of the primary winding of the first i-f transformer (T-3), the screen grids of the 12SA7 mixer, the screen-grid of the 12SK7 r-f amplifier, and resistor R-1. A 0.05-μf bypass capacitor is connected from this junction to the point marked "X" in the filament line of the schematic shown on *page* 15-88 *of Rider's Volume XV*.

The drive cord length has been increased for these models and the following drive cord replacement instructions should be observed. Turn the gang capacitor to the fully open position. Use a new drive cord 42 inches long and tie one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley rim and continue around pulley ½ turn counterclockwise. Pass cord around stud D and wind three turns clockwise (from front of chassis) around the turning shaft. Turns must progress away from chassis. Pass cord around pulleys C and B and stud A. Pass cord under drive pulley and wind 1½ turns counterclockwise around drive pulley. Stretch tension spring and tie free end of cord to spring. Cut off any excess string. Attach the dial pointer to the cord and position as instructed on *page* 15-89 *of Rider's Volume XV*.



Winding for the new longer drive cord for Models 64WG-1804B and 74WG-1804B.

The components used in the Models 64WG-1804B and 74WG-1804B are the same as those enumerated on *page* 15-90 *of Rider's Volume XV*, except for the following.

Ref. No.	*Part No.*	*Description*
C-1	D67102	0.001μf, 400 v. tubular
C-14	B67403	0.04μf, 200 v. tubular
C-15	B67602	0.006μf, 200 v. tubular
C-19	B67253	0.025μf, 200 v. tubular
C-22	B67204	0.2μf, 200 v. tubular
C-24	17A123	1.5—12μμf, trimmer
C-28	B67503	0.05μf, 200 v. tubular
R-14	B84274	270,000Ω, 0.5 watt, carbon
R-20	B85471	470Ω, 0.5 watt, carbon
	20X329	Capacitor cushion stud in gang capacitor mounting
	28X95	Drive cord tension spring

Montgomery Ward 64WG-1807B, 74WG-1807B

These models are the same as model 64WG-1807A, shown on *pages 15-91 to 15-94 in Rider's Volume XV*, except for the following changes. A 0.2-μf bypass capacitor (C-35) has been connected between ground and the screen grid of the 6V6GT output tube, resistor R-14, resistor R-12, the red lead of the second i-f transformer (T-3), resistor R-5, resistor R-4, the red lead of the first i-f transformer (T-2), and resistor R-2. The 0.004-μf capacitor (C-31) is now connected from the plate lead of the 6V6GT output tube to the cathode of this tube. No counterpoise foil antenna is used.

Montgomery Ward 64WG-2500B, 74WG-2500B

These models are similar to the 64WG-2500A, shown on *pages 15-1 and 15-31 to 15-35 of Rider's Volume XV*, except for the following changes: The 64WG-2500B has a 10" electrodynamic speaker in place of an 8" electrodynamic speaker used in the issue A models. The part number and description of the new speaker is as follows:

Part No.	*Description*
12A399	10" Electrodynamic Speaker

Two types of speaker assemblies are used in the 74WG-2500B receiver. These are listed below and are directly interchangeable, both electrically and mechanically.

Part No.	*Description*
12A399	10" Electrodynamic Speaker
or	
12A455	10" Electrodynamic Speaker

Montgomery Ward 64WG-2700B

This model is similar to the 54WG-2500A, shown on *pages 15-1 and 15-32 to 15-35 of Rider's Volume XV*, except for the following change: This receiver has a 10" electrodynamic speaker in place of the 8" electrodynamic speaker used in the issue A models. The part number and description of the new speaker is as follows:

Part No.	*Description*
12A455	10" Electrodynamic Speaker

Montgomery Ward 74BR-1812B

This model is the same as Model 74BR-1812A appearing on *pages 16-17 through 16-21 of Rider's Volume XVI.*

Montgomery Ward 62-690

This model is the same as Model 14WG-690A appearing on *pages 15-61 and 15-62 of Rider's Volume XIII.*

Montgomery Ward 74WG-2711

This model is similar to model 74WG-2705B described in SUCCESSFUL SERVICING for September-October 1947, except for the addition of twin doors on the cabinet covering the dial panel.

Montgomery Ward 74BR-2003C

This model is the same as Model 74BR-2003B appearing on *pages 17-29 to 17-31 of Rider's Volume XVII*, except for the following changes. The 100-μμf capacitor in the external antenna lead CI has been changed to 820-μμf capacitor, C22. The 820-μμf capacitor, C2, which was connected from terminal 2 of the antenna socket to ground, has been removed. The 220,000-ohm resistor, R1, that was connected from terminal 2 of the antenna socket to the low side of capacitor C6 has been removed. A 1000-ohm resistor, R17, has been inserted between terminal 2 of the antenna socket and C22. On some sets a 100,000-ohm resistor has been added in series with the high side of the volume control. The loop has been changed and the loops of series B and series C are not interchangeable.

Ref. No.	Part No.	Description
	C-13E-15103	Loop antenna assembly
R17	C-9B1-62	1000 ohms, ½ watt

Montgomery Ward 74WG-1801C

This model is similar to 64WG-1801C shown on *pages 15-27 to 15-29 in Rider's Volume XV*, except for the following changes. The frequency range has been slightly contracted to 540 to 1600 kc. The dial cord length has been increased, and the following dial cord replacement data should be used.

Turn the gang capacitor to the fully closed position. Use a new drive cord 18 inches in length and tie one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive-pulley rim and continue around pulley one-half turn, counterclockwise. Wind 3½ turns counterclockwise (from front of chassis) around tuning shaft. Turns should progress toward rear of chassis. See accompanying illustration.

Wind cord counterclockwise around drive pulley in back of previous ½ turn. Pass cord through the slot in the pulley rim. Stretch tension spring and tie free end of cord to the spring. Cut off any excess string.

New dial cord stringing for Montgomery Ward model 74WG-1801C.

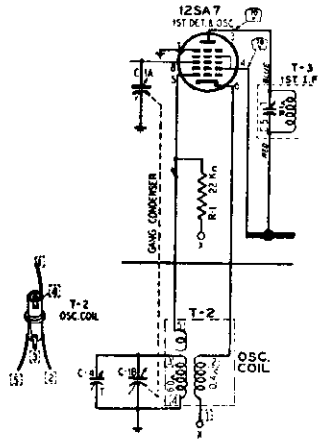
The components used in the 74WG-1801C are the same as those listed for the 64WG-1801A on *page 15-29 of Rider's Volume XV*, except as noted below.

Ref. No.	*Part No.*	*Description*
C-15	B67204	0.20 μf 200 V tubular
C-16	D67104	0.10 μf 400 V tubular
C-18	D67102	0.001 μf 400 V tubul
C-19	17A123	1.5-12 μμf trimmer
T-1	26A467	"B" band loop anten assembly
T-3	9A1775	1st i-f transformer a can assembly

Montgomery Ward 74WG-1801D

This model is similar to the 64WG 1801C shown on *pages 15-27 to 15-29 Rider's Volume XV*, except for t changes listed below. This model i corporates all the changes previous listed for the 74WG-1801C.

The grid resistor (R-1) of the 12SA det. and osc. tube has been changed 22,000 ohms. The oscillator coil h been changed and capacitance couplin to the tube is now obtained throug



First detector and oscillator circuits of th Montgomery Ward model 74WG-1801D.

the use of a "gimmick," as shown in th accompanying drawing. The component used in the 74WG-1801D are the sam as those listed for the 64WG-1801C or *page 15-29* except for the changes pre viously noted for the 74WG-1801C an those below.

Ref. No.	*Part No.*	*Description*
R-1	B84223	22,000 ohms 0.5 wat carbon
R-4	36X368	0.5 megohm volum contro and switch
R-8	B84151	150 ohms 0.5 wat carbon
T-2	9a1911	Oscillator coil assembly
	13X546	Line cord and plug as sembly
	10X45	Drive cord assembly

To replace the dial cord, use either a new 10 x 45 drive-cord assembly or a piece of cord 18 inches long. See replacement instructions under Model 74WG-1801C.

Motorola 402

This model is the same as the Motorola shown on *pages* 12-62 *and* 12-65 *of Rider's Volume XII.*

National Union Presentation

This model is the same as Model G-619 appearing on *pages 16-1 and 16-2 of Rider's Volume XV*. This company's Presentation Deluxe is the same as Model G-613 appearing on *pages 16-1 and 16-2 of Rider's Volume XVI.*

Montgomery Ward 74WG-1054A and 74WG-1054B

These models are similar to 64WG-1054A shown on *pages 15-82 to 15-84 of Rider's Volume XV*, except for the following changes. The terminals of the oscillator coil are reversed. The high side of the 2.2-ohm winding goes to the first grid of the 1R5 mixer tube and the high side of the 6.4-ohm winding goes to grids 2 and 4 of the same tube. The low side of the 2.2-ohm winding is grounded and the low side of the 6.4-ohm winding is connected to R-7. These models also incorporate the changes noted on page 6 of the May 1947 issue of SUCCESSFUL SERVICING.

It has been called to our attention that misinterpretations are possible of the statements made in the May 1947 issue about wiring changes. The wiring of the set does not change, as no components are changed; but the wiring of the *socket* of the output tube changes as indicated in the afore-mentioned issue.

In model 74WG-1054B, in addition to the changes listed above, a 2.2-megohm resistor (R24) in parallel with a 100-$\mu\mu$f capacitor (C24) is connected from the antenna to grid 3 of the 1R5 mixer tube.

Arvin 140P, Chassis RE-209

This model appears on *pages 17-1 through 17-4 of Rider's Volume XVII*. The volume control mounting has been revised to prevent the dial-indicator eccentric mounted on the volume-control shaft from binding in its bracket. The mounting bushing on the control is slotted instead of threaded, and the control is mounted with a C20227 Speed Clip, instead of a 3/8-inch nut.

The following changes have been made in the oscillator circuit to increase the sensitivity. The 0.05-μf capacitor (C5) formerly located between the bottom of the oscillator tickler coil (L3) and floating ground, has been connected from the second grid of the 1R5 converter tube (pin 3) to the junction of the top of the tickler coil to the bottom of the primary of T1. The 22,000-ohm resistor (R3) is now connected in parallel with C5 instead of from the bottom of the tickler coil to the bottom of the primary of T1. The top of the tickler coil is connected to the bottom of the primary of T1 instead of to the second grid of the 1R5 converter tube. The 1R5 plate current as well as the screen current thus passes through the tickler coil.

To prevent audio oscillation, a 0.00025-μf bypass capacitor (C10) has been added from the plate to the positive filament of the 1S5 tube. The plate load of the 1S5 tube (R9) has been changed from 330,000 to 470,000 ohms. The value of R21 has been changed from 6.8 to 15 megohms. The value of C13 has been changed from 0.05μf to 0.02μf. The 0.05-μf capacitor (C19) has been changed from the input side to the plate side of L4 to reduce hash.

Since the clinch nuts in the top of the loop shield, which hold the screw in the top of the cabinet, have at times come loose, a brass extruded nut, part number A21681, has been made available for replacing these clinch nuts when they come loose.

In the note under the resistance chart on *page 17-4 of Rider's Volume XVII*, K was shown as equalling 100 ohms. This note should read K equals 1000 ohms. The parts numbers given in the parts list on *page 17-2* for the miniature tube sockets were A21032-1 and A21032-2. These should have been A20132-1 and A20132-2.

A slide switch, part number A21051, has been added to the parts list.

Arvin 150TC, 151TC, Chassis RE-228-1

These models are the same as Model 150TC appearing on pages *17-5 to 17-8 of Rider's Volume XVII*, except for the following changes. The 35W4 rectifier tube has been replaced with a 100-ma selenium rectifier. The 35B5 output tube has been replaced with a 50L6 output tube. A negative temperature coefficient resistor has been added in the filament line. The filter choke has been replaced by a 1200-ohm resister and a tap on the output transformer. The 0.005-μf tone capacitor has been replaced with an 0.003-μf capacitor.

Arvin 544 and 544R (Noblitt-Sparks)

The following changes have been made in the circuit appearing on *pages 15-3 to 15-5 of Rider's Volume XV* to reduce low level hum and hum modulation.

1. The capacity of the electrolytic capacitor A19136 (C7) is changed from 40-20$\mu\mu$f, 150v, 20$\mu\mu$f, 25v, to 50-20$\mu\mu$f, 150C, 20$\mu\mu$f, 25c.
2. The rotor of the variable capacitor is now connected to AVC instead of to chassis. (This is the same circuit that was used in sets built previous to March 1946.)
3. C11 0.1μf, 400v, capacitor from AVC to chassis is deleted.
4. The bypass capacitor from B+ to chassis is changed from C9, 0.05μf, 400v, to C11, 0.1μf, 400v, to prevent oscillation.
5. A fiber washer part 20198 ¼ inch ID, ½ inch OD, ⅛ inch thick, is added under the pointer to prevent the pointer from touching the dial and shorting AVC to the chassis.
6. The floating ground wiring is changed; the jumper from the oscillator coil to the #3 lug on the 12SK7 socket is removed and replaced by a jumper from the ground side of the volume control to the a-c switch lug.
7. The top of the dial scale backing plate has been cut off even with the top of the dial, to allow the dial to set in a more vertical position. The part number remains the same, and the old and new plates are interchangeable.

The parts list for these models remains the same as that enumerated on *page 15-5 of Rider's Volume XV* except for the changes noted.

Part No.	*Description*
A19136	Capacitor, electrolytic 50-30$\mu\mu$f, 150v. 20$\mu\mu$f, 25v.
A20198	Washer, fiber

Noblitt-Sparks 664 and 664A

These models are the same as Model 6640, Chassis RE-206-1, appearing on *pages 17-16 to 17-18 of Rider's Volume XVII*, except that the loop assembly has been changed. The part number is AC18579-1.

Arvin 664 and 664A, Chassis RE-206-1

These models appearing on *pages 15-10 and 15-5 and 15-6 of Rider's Volume XV*, have been changed as follows to reduce the a-c hum. The 0.1-μf capacitor (C12) connected from B+ to the cathode of the 35L6 tube has been changed to 0.03μf. The resistance of R12 connected from B+ to the cathode of the 35L6 tube has been changed from 12,000 to 15,000 ohms .Making this change will reduce the a-c hum of many of the sets with the previous circuit.

The parts list should be changed as follows:

Delete:

Ref.No.	*Part No.*	*Description*
R12	C20070-123	Resistor 12,000 ohms, 1 watt
C12	C20068-104	Capacitor, 0.1μf, 400 v. p. t.

Add:

Ref.No.	*Part No.*	*Description*
R12	C20070-153	Resistor, 15,000 ohms, 1 watt
C12	C20068-303	Capacitor, 0.03μf, 400 v. p. t.

Phillips Petroleum 3-62A

This is the same as Model 3-61A, appearing on *pages 17-9 to 17-12 of Rider's Volume XVII*

Radio & Television (Brunswick) 4000, 4000½, 6000, 6000½, 6876

These models are the same as Model SF-6810 on *pages 16-1 to 16-5 of Rider's Volume XVI*.

Olympic Radio 6A-501W-U, 6A-501V-U, 6A-502-U

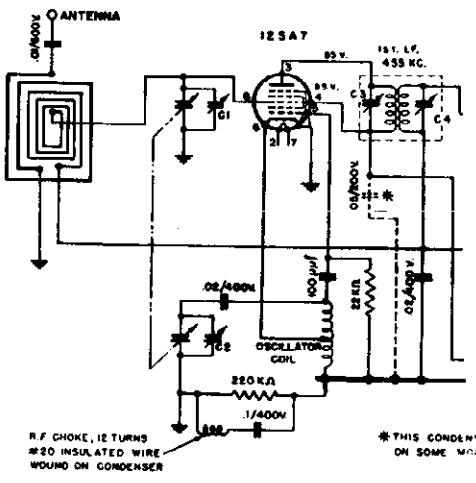
These models are the same as Model 6-501W-U on *page 15-2 of Rider's Volume XV*, except for the following changes. The tube lineup may be 12BE6, 12BA6, 12AT6, 50B5, and 35W4, instead of the lineup shown on page 15-2. The 330-$\mu\mu$f capacitor in the oscillator feed-in line has been changed to 100$\mu\mu$f. The 8200-ohm resistor connected from the top of this capacitor to B minus is now 22,000. A 220,000-ohm resistor is connected from B minus to the ground side of C2 and the trimmer capacitor across it. A 0.1-μf capacitor and an r-f choke are connected in series across the 220,000-ohm resistor. The choke consists of 12 turns of #20 insulated wire wound on the capacitor. In some models, a 0.05-μf capacitor is connected from the primary of the first i-f transformer to B minus.

A 47,000-ohm resistor has been placed inside the can of the second i-f transformer and two 100-$\mu\mu$f capacitors are connected across it. The resistor is connected between the secondary of the i-f transformer and the avc line. There is a connection from the cathode of the 12SQ7 (or 12AT6) tube to the junction of the capacitors.

The parts list has been changed as follows:

Part No.	*Description*
CA-327W	Cabinet—walnut bakelite cabinet
CA-327V	Cabinet—ivory bakelite cabinet
CL-575	Coil—oscillator coil
REB223M	Resistor—22,000 ohms, ±20%, 1/2 watt
ST-255-1	Back—cardboard back (for 6A-501U only)
TR-707	Transformer—first i-f transformer (shielded)
TR-708	Transformer—second i-f transformer with built in diode filter (shielded)

Changes in the mixer-oscillator circuit of the Olympic models 6A-501-W-U, 6A-501V-U, and 6A-502-U.



RCA QU61

The following circuit modifications have been made in RCA Model QU61, the schematic of which appears in *Rider's Volume XV on page 15-55:*

1. In some sets, a modification has been made in the "Radio-Phono Switch and Tone Control Strip," the diagram of which appears on *page 15-58.* The modified diagram appears in Fig. 1. In these sets, R9 (Stock No. 30648) has been omitted and C57, 120 $\mu\mu$f (Stock No. 39630) has been changed to 47$\mu\mu$f (Stock No. 35644). A 220,000-ohm resistor (R33, Stock No. 14583) has been added from terminal 12 of S7 to the ground terminal of R11.

2. In some sets, a modification has been made in the bias supply to the output tubes. The schematic for the unmodified diagram appears on *page 15-55 of Rider's Volume XV*, and the modified diagram is shown in Fig. 2. A 120,000-ohm resistor (R25, Stock No. 30180) has been added in series with the supply and a 0.05 μf capacitor (C56, Stock No. 70615) has been added from the output tube side of the 120,000-ohm resistor to ground.

3. Should interference from a powerful near-by station require the use of a wave trap, install RCA Stock No. 32553 trap as illustrated in Fig. 3. The complete chassis view is found on *page 15-58 of Rider's Volume XV.* Connect the coil lug to the receiver antenna connection; ground connection is made to the chassis through coil mounting foot. Adjust the capacitor mounted on top of the coil for minimum signal from the interfering station.

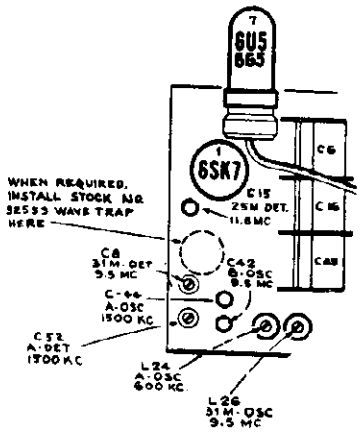


Fig. 3. In case of interference, a wave trap can be installed as shown in the RCA model QU61.

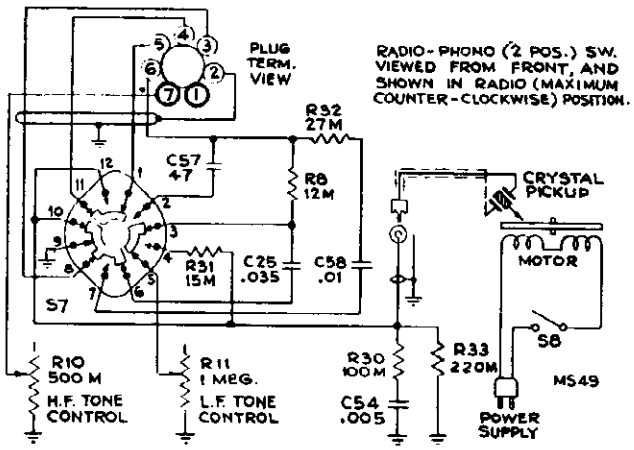

Fig. 1, above. Modified schematic of phono switch and tone control strip in RCA model QU61.

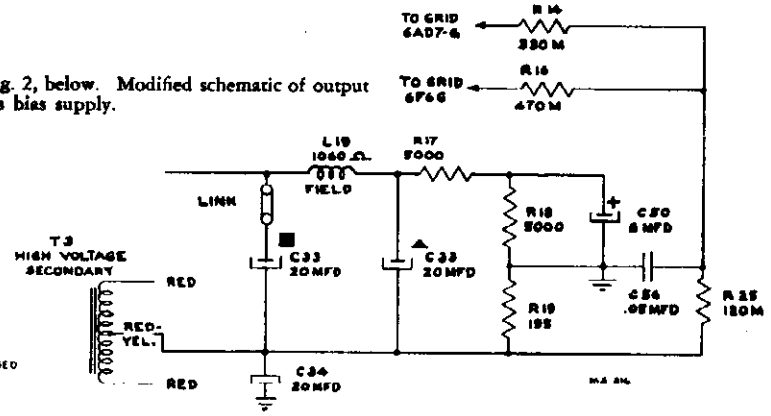
Fig. 2, below. Modified schematic of output tubes bias supply.



RCA QB55, Chassis RC-563A

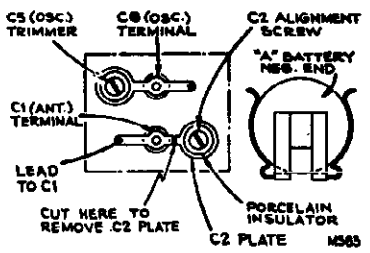
The following changes pertain to RCA QB55, chassis RC-563A appearing on *pages 15-27 to 15-28 of Rider's Volume XV*. In some chassis the 12-$\mu\mu$f section (C20) of the electrolytic capacitor has been changed to 20-$\mu\mu$f and the 20-$\mu\mu$f section (C22) has been changed to 30-$\mu\mu$f. C12 has been changed to 0.03μf and C18 to 0.003-μf.

RCA 54B Series

These receivers have been produced with loops of two types of construction: "taped," in which the coil is fastened to the loop cover with Scotch tape; and "cemented," wherein the coil is fastened to the loop cover with coil cement. Receivers using "cemented" loop have been produced with and without the antenna trimmer capacitor, C2. Receivers using the "taped" loop have only been produced with antenna trimmer C2, and they are to be aligned according to the instructions on *page* 15-22 *of Rider's Volume XV*. In the case of those receivers using the "cemented" loop which has the trimmer C2, this capacitor is removed before alignment. Trimmer C2 is removed by removing the C2 alignment screw and cutting off the C2 capacitor plate as shown in the accompanying illustration.

Removal of the trimmer necessitates changes in the alignment for sets using the "cemented" loop. Refer to the alignment instructions on *page* 15-22. Steps 1 and 2; connect the high side of the test oscillator to the connection lug of C1 located on rear of gang in series with 0.01-μf capacitor. Step 3: test oscillator tuned to 1500 kc; the gang capacitor is rocked instead of being set to 1600 kc. Step 4: omitted. Step 5: the gang capacitor is rocked instead of being set to 600 kc. All other instructions are the same with the foregoing exceptions.

If there is distortion and low volume in the RCA 54B series, check



Before aligning the RCA model 54B with a "cemented" loop, C2 is removed, as indicated.

the coupling capacitor C19 (0.002 μf) for leakage. This capacitor couples the audio signal from the 1S5 tube to the 3S4 output tube. This capacitor has only a 150-volt rating and it should be replaced with one that has a 200-volt rating.

The following is a list of changes for the parts lists for these models:

1. Delete Stock No. 70454—Capacitor-Tubular, 0.002 μf, 150 volts (C14, C19)

2. Add Stock No. 72315—Capacitor-Tubular 0.002 μf, 200 volts (C14, C19).

3. Delete Stock No. 70453—Capacitor-Tubular, 0.02 μf, 100 volts (C10, C15).

4. Add Stock No. 71928—Capacitor-Tubular, 0.02 μf, 200 volts (C10, C15).

NOTE: C15 (Stock No. 71928) should be located adjacent to the output transformer instead of under the socket subpanel, since its physical size is slightly larger than C15 (Stock No. 70453).

RCA 54B1, 54B2, 54B3

These models appear on *pages 15-22 to 15-24 of Rider's Volume XV*. The position of the green and black leads of the second i-f transformer (stamped (922246-2) have been transposed to facilitate assembly. This change affects only the wiring, not the schematic.

RCA 56X, 56X2, 56X3, Chassis RC-1011, A, B

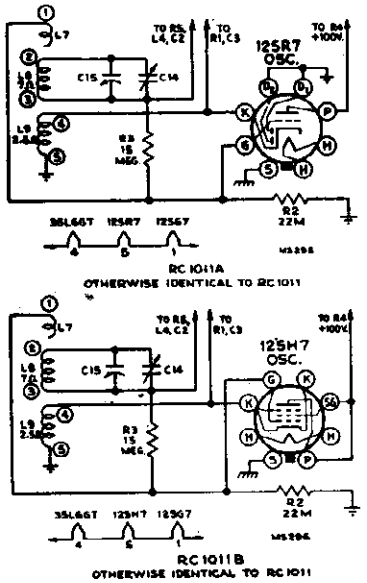
These models are the same as Model 56X on *pages 15-31 and 15-26 of Rider's Volume XV*, except for the following changes. Some sets have a 220,000-ohm resistor in shunt with the primary of the first i-f transformer. The replacement transformers may not need this resistor if the i-f amplifier seems stable.

Some sets have a 22-ohm, 1-watt resistor as a fuse in series with the electrolytic capacitor.

Some sets have a 56-$\mu\mu$f capacitor from terminal 1 of the oscillator coil to terminal 2. This is not necessary on replacement coils as they have a built-in capacity winding.

On some models the 500,000-ohm volume control is not furnished with a stop 50,000 ohms from the high end of the control. Controls having no stop can be identified by a dot of red lacquer on the left side of the control, viewing the shaft end with terminals up. In models using this completely covered with spaghetti tubing, is connected between the high end of the control and the yellow lead on the second i-f transformer.

Replacement controls equipped with a stop do not need this external 56,000-ohm resistor, so when replacing a volume control, check the resistance between the arm and the high end of the replacement control with the arm turned fully clockwise. A reading of 50,000 ohms will indicate that the control is equipped with a stop and that the 56,000-ohm resistor should be removed before installing the new control.

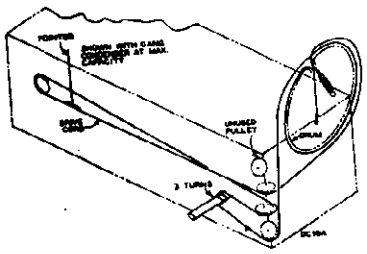


Changes in the oscillator circuit of RCA Chassis RC1011A, above, and Chassis RC1011B, below.

In chassis RC 1011A and chassis RC 1011B, the 12J5GT oscillator tube has been replaced with a 12SR7 in the former and a 12SH7 in the latter. The wiring changes in respect to these tube changes are shown in the accompanying partial schematics. Otherwise chassis RC 1011A and RC 1011B are identical to chassis RC 1011.

RCA 68R1, 68R2, 68R3, 68R4, Chassis RC-608

These models are the same as those illustrated on *pages 16-39 to 16-43 of Rider's Volume XVI*, except that the dial cord assembly has been redesigned. The revised design uses a simpler method, and the length of the dial cord has been reduced to approximately 67 inches



Revised method for dial cord stringing in RCA models 68R series.

rather than the original 80 inches. See accompanying illustration for method of restringing.

Radio Wire Television M72 and M73

These models are the same as Model M70A which appears on *pages 17-6 to 17-11 of Rider's Volume XVII*, with the following exceptions. The 22K resistor (R51) in the grid circuit of the first audio stage has been removed. The 0.02-μf capacitor (C19) which was connected from the top of R51 to one side of the tone control (R14) now is connected from the bottom of R13 to ground.

RCA 54B1, Chassis RC-589, 54B1-N, Chassis RC-589D, 54B2, Chassis RC-589A, 54B3, Chassis RC-589B, Second Production, Chassis RC-589U, RC-589UA, RC-589UB

These models are the same as Model 54B1, Chassis RC-589, appearing on *pages 15-22 through 15-24 of Rider's Volume XV*, except for the following changes. These models have been produced with loops of two types of construction: "taped"—the coil is fastened to the loop cover with scotch tape; and "cemented"—the coil is fastened to the loop cover with coil cement. The models with the "cemented" loops have been produced with and without the 2—15-$\mu\mu$f antenna trimmer capacitor C2. Receivers with the "taped" loop all have C2. The three combinations are listed below with the correct alignment procedure specified. CAUTION: A "taped" type loop should never be used as a replacement on those models which do not have antenna trimmer capacitor C2.

Loop Construction	*C2 Ant. Trimmer*	*Alignment Procedure*
Taped	With	As given on page 15-22
Cemented	With*	See following alignment table
Cemented	Without	See following alignment table

*Remove antenna trimmer capacitor C2 by removing C2 alignment screw and cut off C2 capacitor plate.

*Steps 3, 4, and 5 require a coupling loop from the signal generator to feed a signal into the receiver loop located in the lid. This loop should be approximately one turn of 6x3½ inches coupled to the signal generator through a 200-$\mu\mu$f capacitor, and loosely coupled to the receiver loop antenna at about 1¾ inches distances, so as not to disturb the receiver loop inductance. Ground test oscillator through 0.1-μf capacitor to receiver chassis.

Steps	Connect the high side of test osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	Connection lug of C1 located on rear of gang in series with .01 mf.	455 kc	Quiet point near 1,600 kc	C11, C12 2nd I-F trans.
2		455 kc	Quiet point near 1,600 kc	C9, C8 1st I-F trans.
3	*Antenna coupling loop thru 200 mmf. capacitor	1,500 kc	Rock gang	C5 (osc.)
4		600 kc	Rock gang	L2 (osc.)
5	Repeat steps 3 and 4 for final adjustments.			

The second production of these models use a type 1U5 tube in place of the type 1S5 (second detector, a-f, avc). They may be identified by the letter U in the chassis number which is stamped on the tuning capacitor or chassis. The accompanying diagrams show a partial schematic and a parts layout and wiring diagram for this tube. The replacement parts for these models are the same as those for the first production, with the exception of the following.

Stock No.	*Description*
72230	Support—tube support less tube sockets and transformers

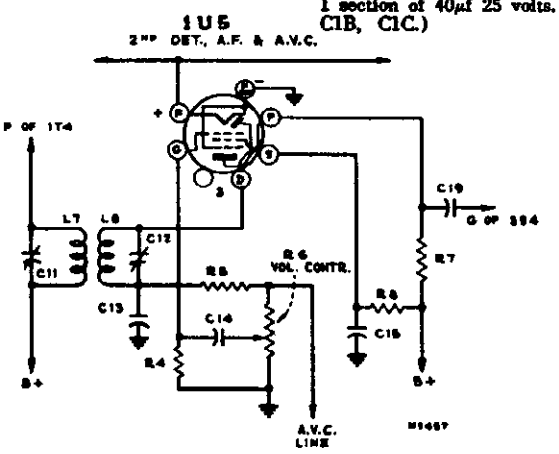
The following changes should be made in the parts list shown on *page 15-24 of Rider's Volume XV* to conform to all first production models.

Delete:

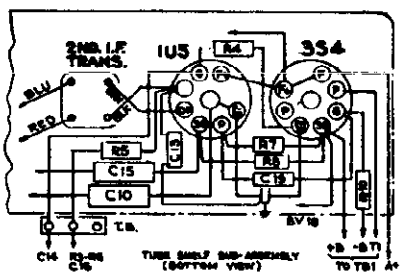
Stock No.	*Description*
60954	Capacitor—ceramic, 56$\mu\mu$f (C4)
65405	Capacitor—ceramic, 82$\mu\mu$f (C13)

Add:

Stock No.	*Description*
70448	Fastener—push fastener to hold loop (two required)
71563	Hinge—lid hinge—Model 54B3, —Red (two required)
71565	Lid—case lid complete with lid support less loop—Model 54B3—Red
71564	Loop—antenna loop complete with connectors less lid — Model 54B3—Red
71562	Plate—backing plate for mounting hinge on lid—Model 54B3—Red (two required)
71725	Screw—case cover mounting screw (one set)—Model 54B3
71567	Bottom—case bottom—Model 54B3—red
71566	Center—case center—Model 54B3—red
71568	Handle—carrying handle—Model 54B3—red
71569	Link—handle link—Model 54B3—red (two required)

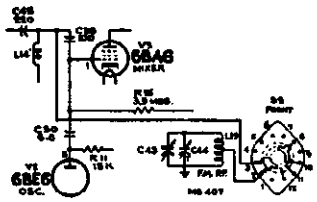


Alignment instructions for sets with cemented loop are shown in the table. The wiring changes for the type 1U5 tube used in the second production are shown on the right.



RCA 711V1, 711V2, 711V3, CHASSIS RK-117, RS-123

Models 711V1 and 711V3 are the same as Model 711V2 shown on *page 17-44 to 17-55 of Rider's Volume XVII* except for the cabinets. The following changes apply to all models. Resistor R6 is 1200 ohms instead of 680 ohms as indicated on the schematic of the RK-117 chassis. The



The revised V3 mixer circuit.

mixer (V3) input circuit of this chassis has been revised. C28 is omitted, the connections to terminals #2 and #3 of the range switch (S3 front) have been reversed, the plate circuit of the r-f amplifier (V1) is coupled to the grid circuit of the mixer (V3) through C38 instead of C28. Capacitor C1B on Chassis RS-123 has been changed from 15μf to 50μf. The following change should be made in the parts list for for this chassis. Stock number 36599 should be deleted, and number 72955 added.

Stock No.	*Description*
72955	Capacitor—Electrolytic, comprising 1 section of 30μf, 450 volts, 1 section of 50μf 400 volts, and 1 section of 40μf 25 volts. (C1A, C1B, C1C.)

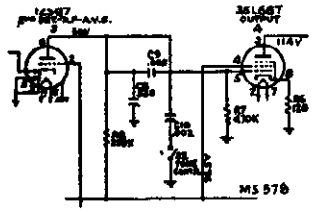
RCA 66X1, 66X2, RC-1038, 66X3, 66X4, 66X7, 66X8, 66X9, Chassis RC-1038A

These models are similar to Model 66X1, Chassis RC-1038, appearing on *pages 15-89 through 15-91 of Rider's Volume XV*. The following additions have been made to the parts list.

Stock No.	*Description*
72753	Plate—dial back plate complete with four (4) pulleys less dial for models 66X3, 66X4, 66X7, 66X8, 66X9
6134	Resistor—1200 ohms, 1 watt, (R11)
72514	Back—cabinet back for 66X7 and 66X9
72721	Back—cabinet back for 66X8
X1627	Baffle—baffle board and grill cloth for 66X7, 66X8, 66X9
Y1423	Cabinet—catalin (black) cabinet for 66X7
Y1408	Cabinet—catalin (red) cabinet for 66X8
Y1393	Cabinet—catalin (black and white) cabinet for 66X9
72822	Dial—glass dial scale for 66X3, 66X7, 66X8, 66X9
72678	Knob—control knob (black) for 66X7 and 66X9
71821	Knob—control knob (maroon) for 66X8
72295	Socket—phono

RCA 66X11, 66X12, 66X13, Chassis RC-1046C, RC-1046D, RC-1046E

These models are the same as Model 66X11, chassis RC-1046A, on *pages* 17-29 *and* 17-30 *of Rider's Volume XVII*, except for the following change. The capacitor C10 (tone-control circuit) which was connected



Capacitor C10 is here connected to the plate of the 12SQ7 a-f amplifier tube.

to the grid of the 35L6GT output tube, is now connected to the plate of the 12SQ7 a-f amplifier tube, as shown.

RCA 66X11, 66X12, 66X13, Chassis RC-1046C, RC-1046D, RC-1046E, Second Production

These models are similar to Model 66X11, chassis RC-1046A, on *pages 17-29 and 17-30 of Rider's Volume XVII*. They incorporate the changes listed in the June 1948 issue of SUCCESSFUL SERVICING, in addition to the following changes. The parts list should be amended as follows:

CHASSIS ASSEMBLIES

Change: 72896 Plate—to read
72896 Plate—dial back plate complete with drive cord pulleys for Model 66X11.

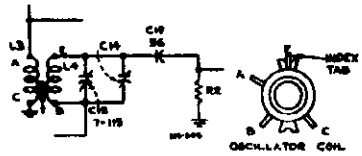
Add: 72601 Plate—dial back plate complete with drive cord pulleys for Model 66X12.

MISCELLANEOUS

Change: 73169 Back—to read
73169 Back—cabinet back for Model 66X13—walnut

Add: 73278 Back—cabinet back for Model 66X13 mahogany
71893 Decal—trade mark decal

The stock number of the dial cord should be 72953 instead of 72913. This cord is supplied in 250 foot reels. Approximately 56 inches are required for the first



Oscillator Circuit
RC-1046C, RC-1046E

Schematic otherwise identical to RC-1046-A,-B except ant. tuning cond. C12 is 10-398 mmfd., only one dial lamp used on RC-1046E.

production and approximately 49 inches for the second production.

The differences between these various chassis are as follows. Chassis RC-1046C uses oscillator coil without capacity winding, L5. Capacitor C19 is used and a tuning capacitor without C16 is used. Two dial lamps type number 1490 are used. Chassis RC-1046E is the same as RC-1046C, except that only one dial lamp, Type 47, is used. For oscillator circuit see accompanying diagram.

73172	Capacitor—ceramic, 56μμf (C19)
73163	Coil—Oscillator coil complete with adjustable core and stud (L3, L4)
73164	Capacitor—Variable tuning capacitor (C12, C13, C14, C15)

RCA 612V1, 612V3, AND 612V4

These models appear on *pages* 17-31 *to* 17-43 *of Rider's Volume XVII*. The alignment tabulation should be corrected to read as follows.

Step No. 12—Repeat steps 10 and 11 for exact calibration.

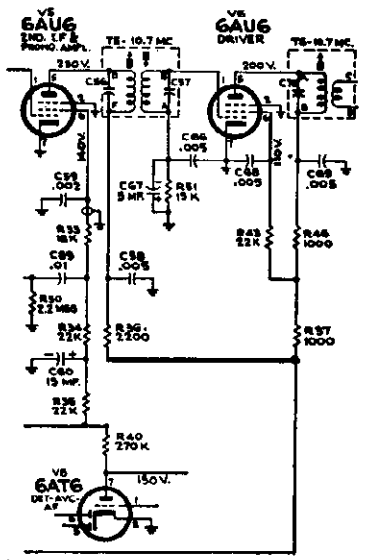
Step No. 18—Repeat steps 16 and 17 for maximum output.

On chassis RS-123, the electrolytic capacitor C1B has been changed from 15μf to 50μf.

RCA 612V1, 612V3, 612V4, Chassis RK-121

These models, appearing on *pages* 17-31 *to* 17-43 *of Rider's Volume XVII*, have been changed as follows. R36 is no longer connected to the junction of R35-R40-R22-R25. It is now connected to R37 and terminal #11 of S5. This change removes the plate voltage from V5 (6AU6) when the range switch is in the "Phono" position, and is illustrated here.

If the shielded lead of the power cable touches the speaker frame, noise will be caused. The power cable should be clamped in such a position to prevent contact with the speaker frame.



This new connection for R36 removes the plate voltage from V5 when the range switch is in the "Phono" position.

RCA Record Changer Model 960015

This model is shown on *RCD.CH. Page 15-11 of Rider's Volume XV*. If binding or freezing of turntable bearing occurs, the turntable shaft should be removed and polished with very fine emery cloth or crocus cloth. Clean off any bearing metal or foreign particles from the shaft, including the set-screw burr. Next, bevel the top edge of the top bearing slightly, with a knife or scraper. Clean the shaft and the bearing with carbon tetrachloride, removing oil and grease and being certain to clean out any chips which may have dropped into the bottom bearing. Lubricate all moving surfaces with a light coating of a very light-bodied grease.

If records do not separate properly and it is found necessary to adjust record slide actuating lever, proceed as follows:

1. Rotate separator shelf to 10" position.
2. Remove 10" landing adjustment bolt.
3. Press down on reject button and rotate turntable by hand in the normal direction until a "click" is heard (reject actuating slide latching).
4. Loosen set screws "G" and set record actuating lever ⅜ inch from bracket as indicated in Fig. 2 of service data.
5. Tighten set screws "G" and replace landing adjustment bolt.
6. Make necessary landing adjustment as described in service data.

NOTE: This method just described makes the set screw "G" more accessible and is therefore found more convenient. This method can be substituted for step No. 9 under Preliminary Adjustments.

RCA Record Changers 960001 Series

These changers are the same as Model 960001-1 on *RCD. CH. page 15-1 of Rider's Volume XV* except for the following changes:

960001-4 Uses L230270 Motor. Has additional pickup shorting switch that shorts out pickup arm when in the rest position.

960001-5 Uses pickup cable 72583 of different length.

960001-6 Same as 960001-5 except for color of knobs, arm, etc.

Regal Electronics 208

This model is the same as models 800 and 801 shown on *page* 16-1 *of Rider's Volume XVI.*

Remler Model 5100

This model appears on *Misc. page 16-9 in Rider's Volume XVI.* The external resistor connected from the suppressor grid (pin 3) to the cathode (pin 5) of the 6SK7 i-f amplifier has been changed from 100 ohms to 220 ohms. The 1-meg resistor connected from the plate (pin 3) of the 6V6GT audio amplifier to the junction of the 0.01-μf coupling capacitor and the 220,000-ohm plate load resistor of the 6SQ7 detector, has been removed. A 0.05-μf filter capacitor has been connected from each side of the a-c power line to ground.

Sears Roebuck 3351, 3451, 3551, Chassis 132.802-2C, -2D, -2E

These models are the same as Model 3351, Chassis 132.802 on *page 12-3½ of Rider's Volume XII,* except for the following changes. A pilot-light shield and snubber assembly has been added, replacing the dial-light shield which was assembled to the dial-pointer shaft bracket. The push-button caps are permanently cemented to the push buttons at the time the set is built.

Sears-Roebuck 4518, Chassis 101.393

This model is the same as model 4500, chassis 101.393 shown on *page 8-15 of Riders Volume VIII.*

Sears-Roebuck 6200A, Chassis 101.800-1; 6203, Chassis 101.800-A

These models are the same as Model 6200, chassis 101.800, shown on *pages* 15-13 *and* 15-2 *of Rider's Volume XV,* except for the following changes. A phono socket has been added to Model 6200A. An ivory cabinet, instead of a brown one, is used on Model 6203.

Part Number	Description
R61010	Cabinet, Ivory (101.800-A)
R44897	Socket, phono (101.800-1)

Sears-Roebuck 7025, Chassis 132.807-2

This model is the same as that shown on *page* 13-63 *of Rider's Volume XIII,* with the following exceptions. The electromagnetic speaker (Part No. N17258) has been replaced by a permanent magnet speaker (Part No. N16993.) The oscillator coil (Part No. 17233) has been rotated 180 degrees and the mounting lug soldered to the back of the chassis to provide a better mounting. This change does not involve any circuit changes.

Sears Roebuck 7056

This model appears on *pages 13-75 and 13-76 of Rider's Volume XIII.* The Astatic L-40A crystal cartridge should be used as a replacement cartridge for the phonograph pickup.

Sears-Roebuck 7080, Chassis 101.809; 7100, Chassis 101.811

These models, shown on *page 16-4 of Rider's Volume XVI,* use The General Instrument model 205 record changer which is shown on *page RCD.CH.15-5 of Rider's Volume XV.*

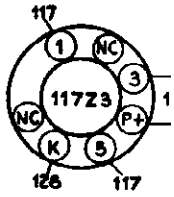
Sears Roebuck 8052, Chassis 101.808-1C, and 8053, Chassis 101.808-1D

These models are similar to Model 7054, Chassis 101.808, appearing on *pages 16-1 to 16-3 of Rider's Volume XVI,* except for the appearance of some of the parts and the addition of a variable tone control circuit. This circuit, consisting of a 0.001-μf capacitor (C23) in series with a 2-megohm variable resistor (R15), has been connected from the plate of the 7C6 tube to the B minus line. The location of these parts is shown in the accompanying illustration.

The dial stringing diagram for these models is shown in the accompanying diagram and is the same for both Models 8052 and 8053 except that part No. R62057 is part No. R62187 for Model 8053.

Sentinel Model 286P

In this model (*pages 16-14 to 16-16 Rider's Volume XVI*) all factory wiring connections were made to the 117Z3 tube socket at pin number 1. The 117Z3 tube as originally produced, had an internal connection to pins 1, 3, and 5. Therefore



When a new type 117Z3 is used in the Sentinel model 286P, pins 1, 3, and 5 must be externally connected. Voltages are here shown.

the foregoing connection was satisfactory and no jumper was provided.

The new production of 117Z3 tube provides no internal connection between the number 1 pin and the number 3 and 5 pins. Therefore, it is necessary to wire the 1, 3, and 5 socket connections together so that this receiver will operate when the original 117Z23 tube is replaced with a recent production tube.

Setchell Carlson 416

This model appears on *Misc. page* 15-19 *of Rider's Volume XV.* The i-f transformers were coated with a low melting point wax (yellow wax). If this wax runs, the trimmers will not stay adjusted. The only remedy is to replace the transformer.

Sonora RMR-219, RMR-220, RMR-245, 402A Mahogany and Prima Vera

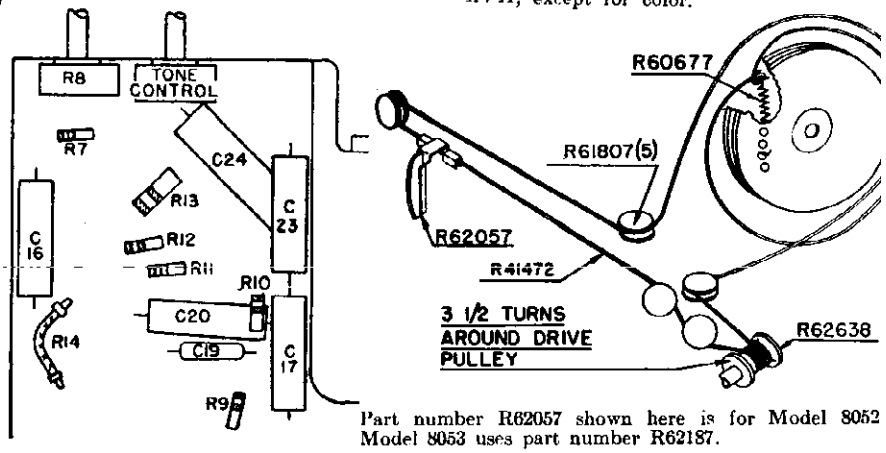
These models are the same as Model RMR appearing on *pages 17-6 to 17-8 of Rider's Volume XVII.*

Sonora KBU-168

This model is the same as Chassis KB, appearing on *page 12-6 of Rider's Volume XII.*

Stewart Warner VM-506261 Record Changer

This model is the same as Model VM-505339, appearing on *pages RCD.CH. 17-14 to RCD.CH. 17-19 of Rider's Volume XVII,* except for color.



Part number R62057 shown here is for Model 8052. Model 8053 uses part number R62187.

The variable tone control consisting of capacitor C23 and resistor R15 in Models 8052 and 8053.

Sentinel 1U286

This model is the same as Model 286PR on *pages 16-14 to 16-16 of Rider's Volume XVI*, except for the following changes.

A 0.1-μf capacitor (46) has been placed between pin number 6 of the 1R5 oscillator-modulator tube and the top side of the ganged tuning capacitor. A 470,000-ohm resistor (48) has been connected in the a.v.c. line between the top of the 0.05-μf capacitor (14) and the 4,700,000-ohm resistor (35). A 0.05-μf capacitor (47) has been connected from the junction of resistors 48 and 35 and ground. Two interlock plugs have been added in the power line. The i-f transformers (2 and 3) may either be the transformers listed in the parts list on page 16-16, or they may be part number 20E299.

The following parts should be deleted from the parts list shown on page 16-16.

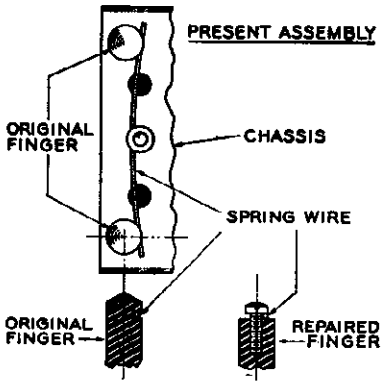
Illus. No.	Part No.	Description
8	23E2014-6	Capacitor, tubular, 0.01 μf, 150 V.
10	23E2014-6	Capacitor, tubular, 0.01 μf, 150 V.
11	23E2014-6	Capacitor, tubular, 0.01 μf, 150 V.
12	23E2014-6	Capacitor, tubular, 0.01 μf, 150 V.
13	23E2014-6	Capacitor, tubular, 0.01 μf, 150 V.
14	23E2014-8	Capacitor, tubular, 0.05 μf, 150 V.
16	23E2014-12	Capacitor, tubular, 0.002 μf, 150 V.
17	23E2014-9	Capacitor, tubular, 0.01 μf, 150 V.
46	23E2014-9	Capacitor, tubular, 0.1 μf, 150 V.
23	23E680-3	Resistor, carbon, 68 ohm, ½ W.
	20E128	"A" battery con. bracket assembly, with 4 No. 10E43 trimount studs
	20E130-1	Complete cabinet assembly, with lid and loop, handle, lid catch and pushbutton assembly and bottom assembly
	20E184	Top lid assembly with loop and hinges.
	20E185-1	Bottom assembly with locking slotted head stud
	30E25-1	Cabinet center section, less lid and bottom assemblies, with handle, speaker screen, lid catch and pushbutton
	20E136-1	Hinge and spring assembly with two No. 82E36-F10 No. 4-24 x ¼ mounting screws
	55E22-1	Handle, leather
	71E42-F10	Screw, No. 4-40 x 3/16 slot B.H.I.M.

The following parts should be added to the parts list.

Illus. No.	Part No.	Description
8	23E2004-5	Capacitor, tubular, 0.01 μf, 200 V.
10	23E2004-5	Capacitor, tubular, 0.01 μf, 200 V.
11	23E2004-5	Capacitor, tubular, 0.01 μf, 200 V.
12	23E2004-5	Capacitor, tubular, 0.01 μf, 200 V.
13	23E2004-5	Capacitor, tubular, 0.01 μf, 200 V.
14	23E2004-7	Capacitor, tubular, 0.05 μf, 200 V.
16	23E2004-2	Capacitor, tubular, 0.002 μf, 400 V.
17	23E2004-8	Capacitor, tubular, 0.01 μf, 200 V.
23	27E680-3	Resistor, carbon, 68 ohm, 1 W.
44	20E280-2	Switch, lid operated, mounted on "A" battery bracket assembly
45	20E284	Interlock, socket assembly
46	23E2014-9	Capacitor, tubular, 0.1 uf, 200 V.
47	23E2014-8	Capacitor, tubular, 0.05 μf, 200 V.
48	27E47-7	Resistor, carbon, 470,000 ohm, ¼ W.
48	20E284	Interlock, socket assembly
	20E130-3	Complete cabinet assembly with lid and loop, handle, lid catch and pushbutton assembly and bottom assembly
	20E184-3	Top lid assembly with loop and hinges
	30E25-3	Cabinet center section, less lid and bottom assemblies, but with handle, speaker screen, lid catch and pushbutton assembly.
	20E136-2	Hinge, right hinge and spring assembly with two No. 82E36-F10 No. 4-24 x ¼ mounting screws
	20E136-3	Left hinge and spring assembly with two No. 82E36-F10 No. 4-24 x ¼ mounting screws
	20E280-2	Complete "A" battery bracket assembly with lid operated switch assembly
	20E283	"A" battery contact plate assembly
	52E28	Plastic covered handle
	55E39	Handle strap, clock spring steel
	85E4-21	Screw, No. 4-40 x 3/16 Slot headless cup point for control knobs
	82E2004	Screw, for adjusting lid switch shaft

Setchell Carlson 427

This model appears on *page* 16-1 *of Rider's Volume XVI*. If the line voltage is extremely low, the 50L6 tube should be replaced with a 35L6 tube. The chassis is held in the cabinet by means of a spring wire caught in slots which are near the top of a finger built into the cabinet. If the head of this finger breaks off, repair can be made by drilling and tapping for an 8/32 machine screw. The accompanying illustration shows this method.



A machine screw can be substituted for the broken head of the finger which catches the spring wire holding chassis of Setchell Carlson 427 in cabinet.

Stewart-Warner 61TR36 (9029-B), 61TR46 (9029-H), 61TR56 (9029-J), 61TR66 (9029-K), 61TR76 (9029-L)

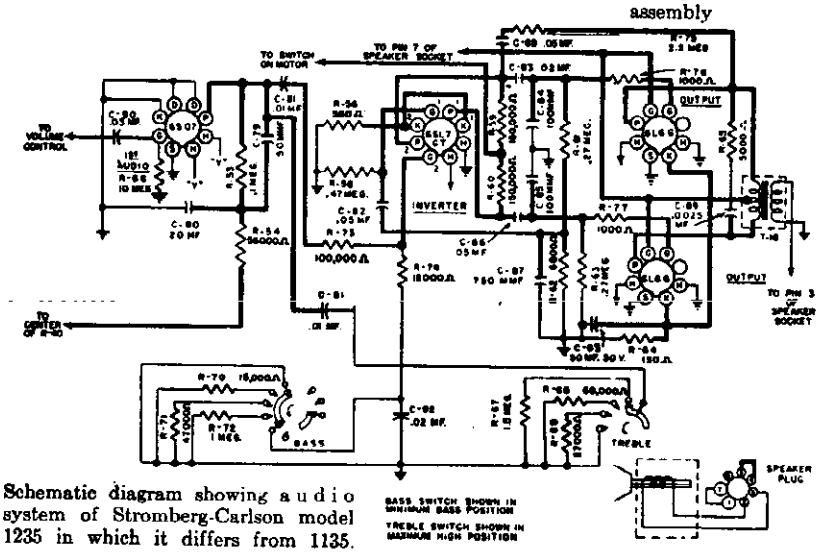
These models are the same as the 61TR36 shown on *pages 15-9 and 15-10 of Rider's Volume XV*, except for the addition of a 0.0008-μf capacitor 52 part No. 502470. This is connected at the junction of resistor 27 and the phono-pickup cable socket to ground when an L-70-Z cartridge is contained in the tone arm used with the DT-505049 changer.

Stromberg-Carlson 1235

This model is similar to Model 1135, appearing on *pages 16-8 to 16-10 and 16-16 to 16-19 of Rider's Volume XVI*, except for the following changes. The audio system has been changed and is shown in the accompanying diagram. Connections have been omitted from pins 1, 2, 3, 4, and 7 of the wire record socket. Pin 6 is grounded and the 17,000-ohm resistor, R-79, has been removed. Pin 5 is still connected to the junction of R46 and R47. A 1000-ohm resister, R-41, has been added to the top of the bleeder. There is no connection to the junction of R-41 and R-40.

The following additional parts are used on the Model 1235.

149246	R-64	150 ohm, 5 watt
28155	R-56	560 ohm, ½ watt
149247	R-41	1000 ohm, 5 watt
28158	R-76, 77	1000 ohm, ½ watt
28168	R-62	6800 ohm, ½ watt
28172	R-70	15000 ohm, ½ watt
28179	R-68	68000 ohm, ½ watt
28191	R-72	1 megohm, ½ watt
28193	R-67	1.5 megohm, ½ watt
149121	R-75	2.2 megohm, ½ watt
149125	R-66	10 megohm, ½ watt
25485	C-81	0.01 μf
29891	C-86, 88	0.05 μf
110494	C-90	0.05 μf
111012	Electrolytic	50 uf
41489		6SL7 tube
30224		Plug
161230		Output transformer
33964		Bull's eye socket assembly



Schematic diagram showing audio system of Stromberg-Carlson model 1235 in which it differs from 1135.

TELETONE 139, 140, 141, 149, 157, 163, 164, Chassis H

These models are the same as Model 135, Chassis H, appearing on *Misc. Page 16-11 of Rider's Volume XVI.*

Teletone 161, 167, 168, 171, 174, Chassis T

These models are all the same as Model 150, Chassis T, appearing on *pages 17-2 and 17-3 of Rider's Volume XVII.*

Wells-Gardner 7A41-593

This model is the same as Model 7A41-704 appearing on *pages 12-8 to 12-11 of Rider's Volume XII.*

Truetone D-696

This model is the same as Model D-727, which appears as Model 175 on *Detrola page 9-1 of Rider's Volume IX.*

Truetone D1118B

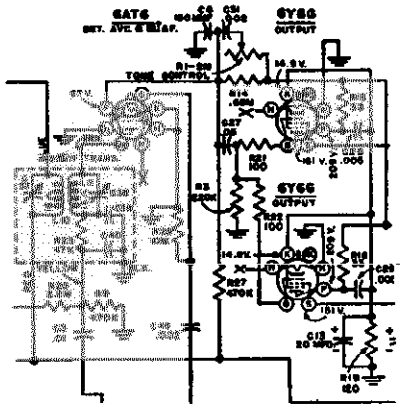
This model is similar to the D1118A model, shown on *pages 13-68 and 13-69 of Rider's Volume XIII* except for the following changes: The antenna trimmer (C2), part number 17A1116, mounted on the loop aerial assembly in the issue A model has been removed. The 1400-kc adjustment as given in the alignment procedure is omitted. The 1400-kc adjustment is made at the factory and need not be made in the field.

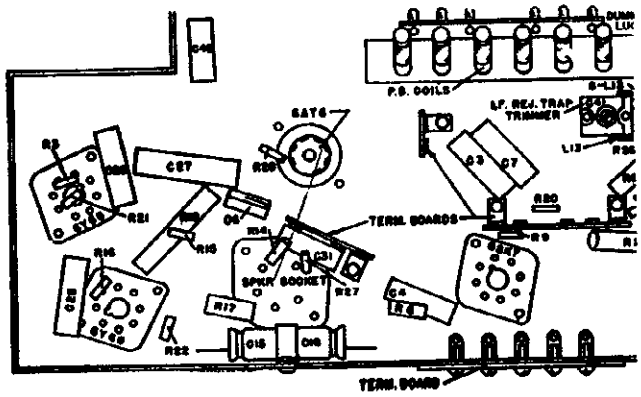
Westinghouse H-110A, H-111A, H-137A, and H-138A, Chassis V-2102-2

These models are the same as Model H-104 on *pages 15-1 to 15-4 of Rider's Volume XV*, except that the tone control circuit has been modified and a 6AT6 miniature tube replaces the 6SF7 tube used originally. The tube layout is the same, but certain components have been added, as may be seen in the accompanying diagrams.

The following parts should be added to the parts list.

Part No.	Description
RCP10W6202A	Capacitor, 0.002 μf, 600 v. (C48)
RC10AE474M	Resistor, 470K ¼ w. (R27)
RC10AE106M	Resistor, 10M ¼ w. (R28)

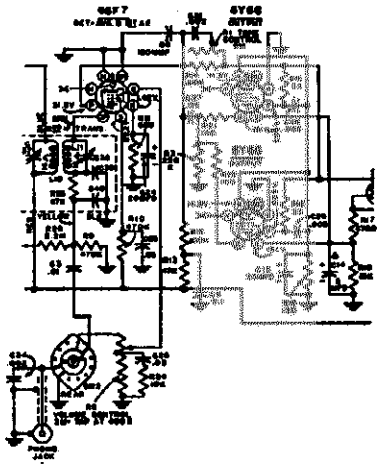




Changes in the tone control circuit, above, and in the parts layout, left, of the Westinghouse Chassis V-2102-2.

Westinghouse H-110, H-111, H-137, and H-138, Chassis V-2102-1

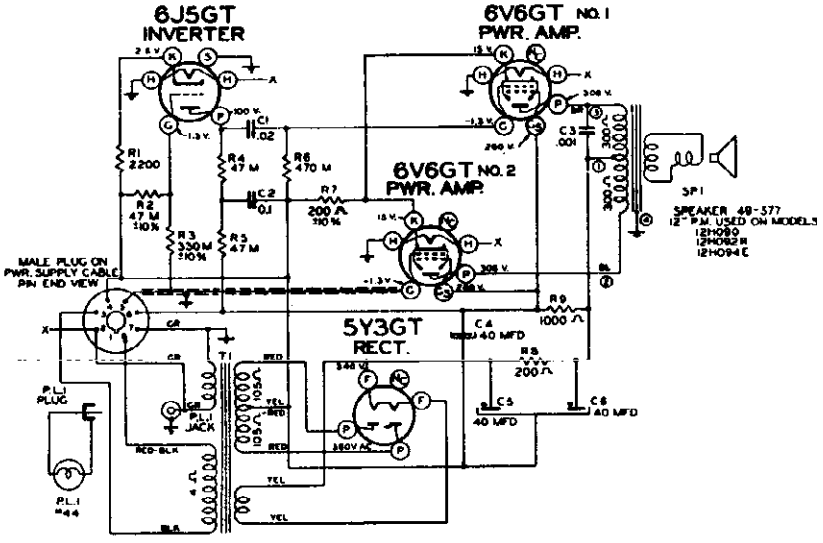
These models are the same as Model H-104 on *pages 15-1 to 15-4 of Rider's Volume XV*, except that the tone control circuit has been modified. This change is illustrated in the accompanying diagram.



The modified tone control circuit of the Westinghouse Chassis V-2102-1.

Zenith 12H090, 12H091, 12H092, 12H093, 12H094, Chassis 11C21Z

These models are similar to Mode 12H090, Chassis 11C21, on *pages 15-87 t 15-94 of Rider's Volume XV*. The diffe ence between these chassis appears in th power supply and the audio section. Cha sis 11C21 uses an electro-dynamic speake and the field of the speaker is used as choke in the power-supply filter circui Chassis 11C21Z uses a permanent magne speaker. To convert Chassis 11C21 t 11C21Z, it is necessary to replace th speaker field with a 200-ohm, 5-watt resist (R8 in the accompanying diagram). 40-μf capacitor must be connected fro the center tap of the powe transform to pin number 6 of the power-supply cab plug, as shown in the diagram. C40 ar C41 must be changed from 30μf to 40 (they appear as C5 and C6 in the 11C21 chassis). A 1000-ohm, 3-watt resistor (R must be connected between the screen gr of the first beam-power output tube ar the center tap of the output transforme The capacitor shown as C3 in the accor panying diagram is capacitor C39 in th schematic on *page 15-87, 88 of Rider Volume XV*.



The audio section and power supply of the Zenith chassis 11C21Z

IMPORTANT: Only difference between RC 180 & RC 181 is shape of pan.

OPERATING INSTRUCTIONS

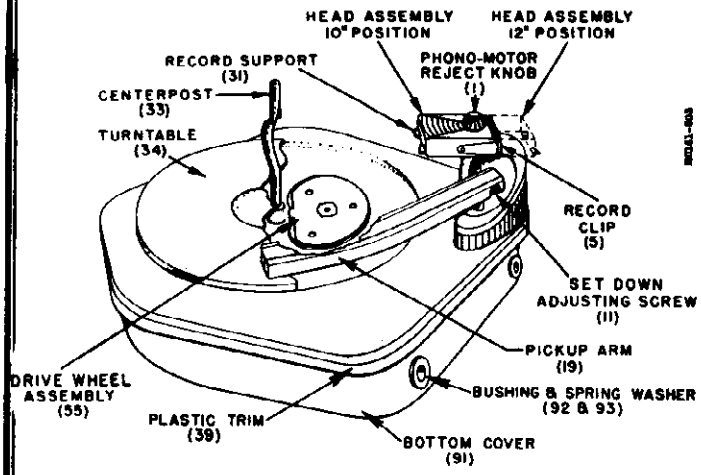


Figure 1A - Record Changer RC181, Top View.

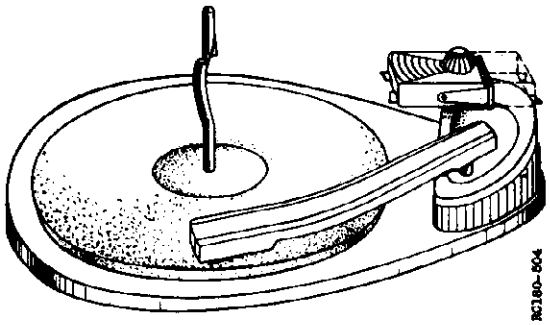

Figure 1B - Record Changer RC180, Top View Showing Pear-Shaped Pan.

1. SETTING FOR SIZE OF RECORD

The size of record for which the record changer is set to play is determined by the position of the head assembly (See Figure 1). With the embossed design toward the centerpost, the changer is set for 10-inch records. With the embossed design away from the centerpost, the changer is set for 12-inch records.

To change the setting, rotate the head assembly in either direction, until it clicks and locks in the desired position.

A slight amount of pressure may be required to begin the rotation when the head assembly is locked in an operating position.

2. STARTING THE RECORD CHANGER

To load the record changer, move the record clip (5) away from the centerpost (33) and place the records on the centerpost. The bottom record is supported by the offset in the centerpost and the record support (31).

Move the record clip so that it rests on the top record.

Turn the Phono-Motor switch knob (1) to the ON position. Then press down on this knob momentarily. The bottom record will drop to the turntable and the Record Changer will play the entire stack of records automatically.

3. REJECTING A RECORD

To reject a record at any time, press down o the Phono-Motor switch momentarily.

4. STOPPING THE RECORD CHANGER

This Record Changer cannot be turned off b means of Phono-Motor switch during its chang cycle. If the On-Off switch on the radio is used t turn off the changer, it is advisable to stop it whe the changer mechanism is out of cycle.

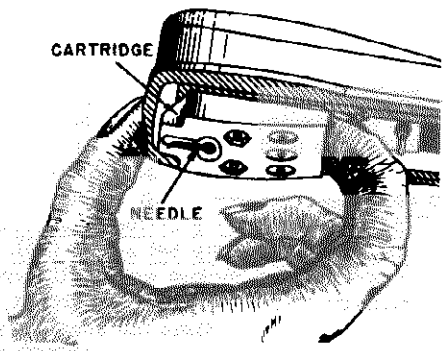

Figure 2 - Removing Cartridge by Pulling Down on Back Edge.

5. REPLACING CARTRIDGE AND NEEDLE

Before replacing, see cartridge service data i paragraph 14.

Remove the old cartridge (25) by getting you finger nails or a small screwdriver under it a shown in Figure 2 and pull down on the back edge Press new cartridge into place again, making sur to push near its back edge where its pins go into th socket.

THE CHANGE CYCLE

6. DESCRIPTION OF CHANGE CYCLE
(See Figures 1, 3 and 4)

If at all possible, we recommend that you carefully observe the operation of a changer that is in normal operating condition. It is a good idea to rotate the turntable by hand and repeat the changing cycle until you understand the function of each part. It is important to note that this changer employs the oscillating type trip, which depends upon the in and out movement of the pickup arm caused by the eccentric groove in the record. This is different than previous Admiral Changers which tripped when the pickup arm reached a given position.

The changer operates as follows: The changer mechanism is driven during its change cycle by the knurled hub of the turntable rotating the rubber-tired drive wheel (55). During normal playing, the drive wheel is held in a neutral position as illustrated in Fig. 1 & 3A, so that the indentation prevents the tire from contacting the knurled hub. The drive wheel (55) is held in this position by the trip stop wire (81A) and the cam stop stud (58A) on the control cam (58).

During the record play and as the needle enters the eccentric groove, the pickup arm is moving in toward the centerpost. The pawl (87A) is moving across the trip serrations (83). When the eccentric groove in the record causes the pickup arm to move away from the centerpost, the pawl tends to reverse its direction but its sharp point catches in one of the trip serrations (83) and moves the trip lever (81). As the eccentric groove moves the pickup arm back in toward the centerpost, and then away from the centerpost again, the pawl (87A), again locks in one of the trip serrations, moves the trip lever (81) far enough so that the trip stop wire (81A) is no longer engaged with the cam stop stud (58A). This oscillating trip action is dependent upon the adjustment of the trip set screw (85). If it is adjusted properly, the pickup arm will move away from the centerpost, toward the centerpost, and as it comes away the second time the changer will trip and start its change cycle. (See paragraph 8.) The position of the drive wheel (55) at this moment is shown in Figure 3B.

This allows the cycle spring (82) to pull the control cam clockwise (bottom view). Since the control cam (58) and the drive wheel (55) are on the same shaft, the drive wheel is turned so its rubber tire is against the knurled hub of the turntable (see Figure 3B). The turntable now rotates the drive wheel (55) which in turn rotates the control cam (58). As soon as changer has been tripped, the trip cocking spring (80) causes the trip lever (81) to return the trip stop wire (81A) to the normal playing position.

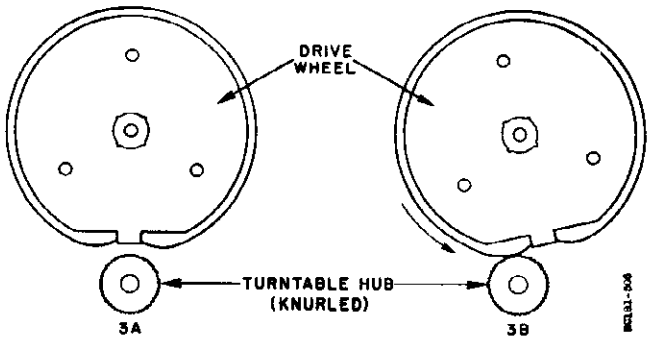

Figure 3 - Drive Wheel Positions.

Roller (72) riding on the control cam moves the pivot link (70) which in turn rotates the control plate (69). The rotation of the control plate (69) causes its inclined tab (69A) to ride against the lift rod (16) which lifts the pickup arm from the record. The arm control lever roller and stud (87B) then engages the safety arm (76). Further rotation of the control cam (58) moves the pivot link (70) causing further rotation of the control plate (69) causing the pickup arm to move to the right, clearing the record. This much has taken place in approximately one-third of the total rotation of the control cam.

As the control cam rotates further, its push-off stud (58B) engages with the end of the slot in the pushoff link assembly (62), moving it. This movement is transmitted through the push-off arm (62A) and as a result, the push-off shaft (8) is rotated. This rotates the push-off cam (8A) which in turn slides the push-off plate (30) forward and drops the next record to be played. (Note that the record stack rests on the record support shelf (31) and not on the push-off plate as on the RC170 and RC170A. The small slide at the top end of the centerpost holds back all records other than the bottom one when the push-off plate (30) moves forward.

As the control cam continues its rotation, the pivot link (70) moves back following the cam, since the roller (72) is kept in contact with the cam by the control plate spring (71). This moves the control plate (69) back, the arm control lever (87) moves the pickup arm to the set-down point for the record to be played. The pickup arm is held above the record because the lift rod (16) is still resting at the top of the inclined tab (69A) on the control plate (69). The set-down point is governed by the set-down adjusting screw (11). (See figure 1 & 5.) The shoulder on the set-down arm (88A) holds the pickup arm at the set-down point until it is pushed back by the

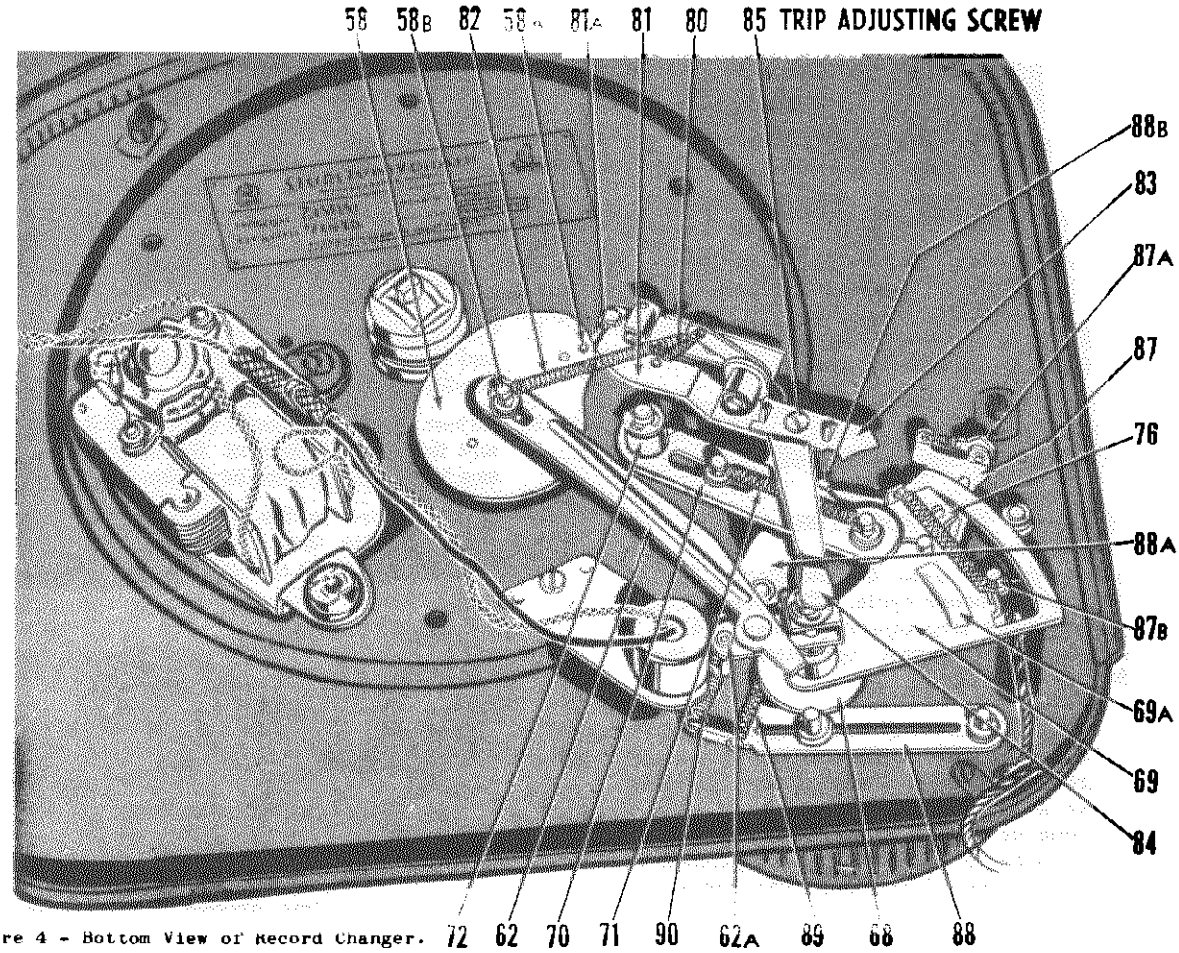

Figure 4 - Bottom View of Record Changer.

THE CHANGE CYCLE - Continued

edge of the control plate engaging the set-down arm stud (88B). The arm is then free and starts moving down toward the record starting groove.

When the record changer is set to play 10-inch records, the set-down arm (88A) through the tension of the set-down spring (89) moves the arm in to-the centerpost until the arm return roller and stud (87C) reaches the shoulder of the set-down arm (88A). The pickup arm is held in this position until the control plate (69) engages the set-down arm stud (88B), pushing the set-down arm back, releasing or freeing the pickup arm.

When the changer is set for 12-inch records the size change eccentric (68) moves the set-down and size change assembly (88) so that the arm return roller and stud (87C) does not travel as great a distance along the set-down arm (88A) before it reaches the shoulder. Therefore the pickup arm cannot move in toward the centerpost as far as for 10-inch records, during change cycle.

When the On-Off reject knob (1) is pressed down, the push-off cam and shaft (8) moves the reject link (84) down. This movement causes the trip lever (81) to move which prevents the trip stop wire (81A) from engaging the push-off pin (58A). The change cycle then proceeds in the manner described above.

ADJUSTMENTS

7. ADJUSTMENT OF SET-DOWN POINT

Adjustment of the set-down point, for either 10-inch or 12-inch records, is made by adjustment of the set-down adjusting screw (11), see Figures 1 & 5. Turning this screw in moves the set-down point of the pickup arm farther away from the centerpost and turning the screw out moves it closer to the centerpost. The proper set-down point for 10-inch records is between 4-5/8" and 4-11/16" from the needle to the near side of the centerpost. The proper set-down point for 12-inch records is between 5-5/8" and 5-11/16" from the needle to the near side of the centerpost.

To make the set-down point adjustment, proceed as follows:

1. Set the record changer for 10-inch records.
2. Press down on the Phono-Motor switch knob (1) momentarily and rotate the turntable by hand through the change cycle until the pick-up arm moves down toward the turntable.

ADJUSTMENTS - Continued

3. Check the distance between the needle and centerpost.
4. Adjust set-down screw (11) and repeat steps 2 and 3 until the proper distance between needle and centerpost is obtained.
5. Set Record Changer for 12-inch records, rotate the turntable by hand through the change cycle and check the 12-inch set-down point. This should be very close to being correct without further adjustment.
6. If any fine adjustment for 12-inch records is necessary, make the adjustment and repeat steps 5 and 6 for the 10-inch position.

8. ADJUSTMENT OF TRIP ADJUSTING SCREW

This Record Changer uses the oscillating trip principle to begin the change cycle. Therefore it is very important that the trip adjusting screw (85) is properly adjusted for correct operation of the changer. (See Figure 4 and 6.)

The trip adjusting screw (85) is properly adjusted when the changer trips into change cycle after the eccentric groove in the record has caused the arm to move away from the centerpost once or twice, that is, one or two backswings of the arm, before it trips into cycle. Some eccentric grooves cause greater movement of the arm than others.

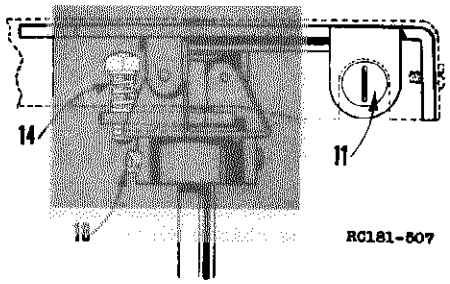

Figure 5 - Arm Detail Showing Adjustments.

Consequently the changer might trip with only one backswing on some records and with two backswings on others.

The ideal adjustment of screw (85) for best operation, is when the smooth side of the trip serrations (83) and the point of the pawl (87A) are horizontally even, as shown in Figure 6.

When adjusting the trip adjusting screw (85) proceed as follows:

1. Connect changer motor to power source and turn Phono-Motor switch on and off as needed to check adjustments.
2. Adjust screw (85) until the point of the pawl and the smooth side of the trip serrations are horizontally even or at the same level.
3. Place record on the turntable and check to make certain that the changer trips into change cycle with one or two backswings.

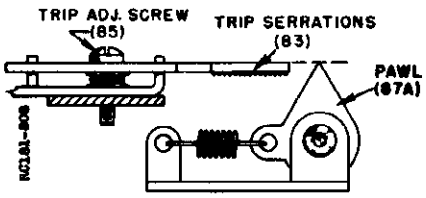

Figure 6 - Positioning Pawl Trip Serrations.

NOTE: The eccentric groove of a record should be used when checking the trip adjustment. Do not lift the pickup arm and move it, in toward the centerpost and out, by hand.

If the trip adjusting screw is turned out too far it will take more than two backswings of the arm to trip into cycle. If the screw is almost all the way out the changer will not trip.

If the screw is too far in, there will be excessive drag and wear on the trip serrations, pawl point and the record eccentric groove. Consequently this adjustment should be made carefully.

SERVICE AND REPAIR

9. ADJUSTING THE PICKUP ARM HEIGHT (See Figure 5.)

Before adjusting the pickup arm height, make sure that the cartridge (25) is all the way in its holder (23), and that the needle projects 1/16" from the cartridge (see paragraph 14).

This changer is designed so that if the pickup arm rests 1/4" above the changer pan, the arm will automatically lift high enough, during change cycle, to clear the top record of a stack twelve 10-inch records or ten 12-inch records on the turntable, and will not lift enough to touch the bottom record of a stack to be played.

With the Record Changer out of cycle and the pickup arm clear of the turntable, adjust screw (14) so that the needle is approximately 1/4" above the top of the changer pan. Turning the screw in lowers the arm and turning it out raises the arm.

After this adjustment has been made, the changer should be run through the change cycle to make certain that the pickup arm does not touch bottom of record stack. If, for some reason, the arm lifts too high, a compromise adjustment should be made. That is, turn screw in and lower arm slightly. If the pickup arm is held slightly above the record by riding on the edge of the base housing (28), the Allen set screw (18) should be loosened and the pi-

SERVICE AND REPAIR - Continued

vot spring and hub assembly (17) moved up on the shaft just enough so that the arm will rest 1/4" above the top of the pan. Generally there should be no clearnace between the pivot spring and hub (17) and retaining ring (26).

10. REMOVING THE PLASTIC BASE HOUSING (28) (See Figures 4 and 8)

Should it be necessary to remove the plastic base housing, proceed as follows:

1. Remove retaining rings (73 and 74).
2. Release one end of the index spring (90).
3. Lift the entire head assembly up from the top of the changer.
4. Loosen Allen set screw (18) and lift complete pickup arm assembly off.
5. Remove retaining ring (26) and spring washer (27).
6. Remove three screws (29) holding base.
7. Lift off the plastic base housing (28).
8. When reassembly has been completed, the pickup arm height should be carefully checked and adjusted, if necessary, by means of the lift adjusting screw (14).

11. REMOVING TURNTABLE AND BEARING ASSEMBLY

To remove the turntable it is only necessary to grasp the table by its edges and lift up. Before replacing the turntable, make sure that the recessed part of the drive wheel (55) is towards the centerpost. If necessary, turn drive wheel counter clockwise about a turn so it locks in this position. The pickup arm should be positioned away from the turntable. In replacing the turntable, force is not needed to seat it. Make sure, however, that the idler wheel of the motor has been pushed in towards the centerpost and that the wheel is making contact with the inner side of the turntable flange. In some cases it may be found that the two cork washers, after considerable use, are compressed so the turntable will rub. To build the stack up, an extra cork washer should be used. This third cork washer may be placed at the top or bottom of the stack.

The washers (35) and thrust bearing assembly (36) are removed by sliding them off of the centerpost. In replacing, have them in the order shown in Figure 8.

12. REMOVING BOTTOM COVER (91)

To remove the bottom cover (91) from the record changer, remove the two rear screws (44) through the bottom. Then press on the front edge of the bottom cover; this frees the changer from the slotted mounting brackets at the front of the bottom cover. To replace bottom cover, reverse above operations.

The changer must float on the springs (43) to prevent microphonic feedback, thus these springs must be re-installed properly. The wider end fits around and hugs the extrusion in the mounting brackets in the bottom cover. The narrow end of the spring fits over the threaded bushing on the changer pan (45). In some changers it has been necessary to add spacer washers beneath the narrow portion of the spring (43) to assure "free floating" of the changer.

13. MOUNTING 407B1 MOTOR TO CHANGER

The model 407B1 motor may be used with this record changer but it is necessary that a fibre or felt washer be used as a spacer between the motor mounting grommet and the changer pan. The No. 401A106 shakeproof motor fastener can be used to then mount the motor.

14. CARTRIDGE (See Figure 7)

The new Admiral pick-up cartridge uses an entirely new principle since it is not a crystal, magnetic, or capacitive device. The pick-up element is made of special rubber which is a high resistance electrical conductor (R-1 & R-2). The resistance varies as the length of the rubber is changed. A Monel metal needle, osmium tipped, is clamped to the center of the resistive rubber as shown at B. As the needle moves back and forth in the record groove, it alternately lengthens the rubber on one side and shortens the rubber on the other side.

A DC voltage is applied at A. The voltage drop from B to C varies as the resistance changes due to the "back and forth" movement of the needle. The varying voltage drop is in reality an alternating voltage of audio frequency. This voltage is applied through the coupling condenser (Cc) to the grid (G) of the audio amplifier tube.

Trouble Shooting: If you suspect the cartridge or needle and have a replacement cartridge available, the quickest test is to try the other cartridge. This is very simple since the Admiral cartridge plugs in. Remove the old cartridge as described on page 1 and plug in the replacement cartridge. If replacing cartridge does not correct the trouble or if no replacement is available, proceed as follows:

1. Make sure radio operates satisfactorily on radio stations.
2. Turn switch to Phono and turn volume control up high. Touch the needle with finger... If a loud hum is heard, circuit from B to G is not open or shorted. If hum is not heard, check circuit from B to G.
3. If hum is heard, check voltage across outer terminals on bottom of cartridge. Generally it should measure from 80 to 100 volts DC. See circuit diagram for individual chassis. If voltage is correct, cartridge should be replaced.
4. If voltage is not correct, check circuit for fault. In case of distortion, check coupling condensers.
5. If the needle is bent, it can be straightened by bending it down so that it projects 1/16" from cartridge. If should then be pressed back several times with a flat object.

SERVICE AND REPAIR - Continued

Do not attempt to repair cartridge or remove the cap on the cartridge assembly as this will void the warranty.

15. LUBRICATION

Under normal operating conditions, the motor should never require oiling. The rest of the changer, however, should be lubricated with grease whenever it comes into the shop for repairs or adjustment. All pivot and friction points should be greased adequately but not excessively. A good grade automobile chassis grease may be used for this purpose.

The push-off shaft (8), powdered iron roller (72), oilite bearings, used in the turntable hub and base housing, may be lubricated with SAE No. 20 motor oil.

Care should be taken to prevent any of the lubricant from coming into contact with the drive or idler wheel tires. Also be careful, when using oil, that an excess does not seep into the felt of the turntable.

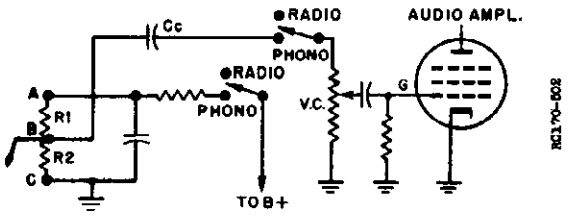
16. REPLACEMENT PARTS

In some cases replacement parts from the factory may be a different type than those being replaced. These parts will be of a later production but may be used as replacement parts. In cases where rivets or adapting parts are needed, they will be included with the replacement part.

17. CAUTIONS!

1. See that the rubber tires on both the drive wheel and the idler wheel are kept clean and free from oil, grease, dirt or any foreign material. Carbona or carbon tetrachloride may be used for cleaning these parts.
2. The drive wheel assembly (55) appears to be almost identical with that used on the RC170 and RC170A. These parts are not interchangeable.
3. When replacing the rubber tire (54) do not bend the tab on the drive wheel over too far as this may result in the tire catching or rubbing on the drive wheel pressure spring (57).
4. If the On-Off reject knob (1) cannot be pulled off with the fingers, pry very carefully.
5. When removing or replacing the pawl spring (86) care should be taken not to stretch it.
6. When removing or replacing the pickup arm (19), always loosen the Allen set screw (18) and lift off the complete assembly. The pivot spring, hub and pin assembly (17) can be removed from the pivot plate assembly (13) and replaced much more readily with the complete pickup arm assembly off of the changer.
7. Washers (75) and (63) have the same dimensions except that (75) is thicker. Do not replace washers (63) with (75) or vice versa.

ADMIRAL CARTRIDGE
BASIC CIRCUIT



SEE SCHEMATIC FOR EXACT CONNECTIONS ON INDIVIDUAL MODELS

Figure 7 - Basic Circuit for Admiral Cartridge.

8. When replacing the switch mounting bracket (65) or the trip bracket (79) be sure to locate the half punches in the holes in the pan before tightening their mounting screws (66).
9. When replacing the on-off switch assembly (67) care should be used in bending the tab fasteners so that the switch is mounted firmly to the bracket.
10. The powdered iron roller (72) is similar to the roller used on the RC170 and RC170A except that the ends are chamfered. The new roller (chamfered) can be used on both the RC170 and RC180 models. The old style roller should not be used on the RC180 or RC181.

18. RECORD CHANGER TROUBLE SHOOTING

1. Records Do Not Drop To Turntable Or More Than One Record Drops.
   (a) Check the distance between the inside edge of the centerpost (33) and the edge of the record support (31). This distance should be 4-61/64" ± 1/32", in the 10-inch position. This dimension is very critical.

   If distance does not meet specifications, bend the centerpost slightly toward or away from the head assembly as needed.

2. Changer Repeatedly Trips Into Change Cycle.
   (a) Check for broken or loose trip cocking spring (80), or
   (b) Check for broken or missing reject spring (2), or
   (c) Check for bent reject link (84).

3. Changer Will Not Trip.
   (a) Check for broken or loose cycle spring (82), or
   (b) Check On-Off switch cover (67). If cover is not assembled to switch properly, it may bind push-off link and arm (62) preventing cycle spring (82) from pulling the main cam (58) around.

4. Changer Will Not Reject.
   (a) Check for bent reject link (84).

5. Cannot Get Proper Set Down.
   (a) Check for broken or loose set-down spring (89), or
   (b) Check for broken or loose set-down adjusting spring (11).

87C		Arm Return Roller (Part of 87)
88	G400A222	Set Down & Size Change Assembly
89	405A93	Set Down Spring
90	405A92	Index Spring
91	G400D260	Bottom Cover (Consoles only)
92	27A24	Bushings in Bottom Cover (Consoles only)
93	405A99	Spring Washer for bushing (Consoles only)

†Before replacing, see appropriate caution in paragraph 17.
*40783-2 and 40784-2 are the same as 40783 and 40784 respectively except that three 401A106 fasteners are included. Also note that some 40781 motors were used in production.

RC180 & RC181 PRODUCTION CHANGES

A few minor changes have been made in the late production of RC180 & RC181 Record Changers. These changes are included in the RC182 Two Speed Record Changer.

The most important change is the addition of an adjustable reject link (84) which assures more positive rejecting action. See Figure12. This new reject link consists of reject arm support (84A) spotwelded to trip lever (81), reject arm (84B), adjusting screw (84C), spring washers (84D), and flat washer (84E). The new and old links are interchangeable.

The record clip (5) and the head cover (7) are now made of plastic. The set-down adjusting screw (11) was 1/2" long; it is now 3/4" long.

Part numbers for these parts are listed below:

Ref. No.	Part No.	Description
5	403A 32	Record Clip (Plastic)
7	403A 31	Head Cover (Plastic)
11	45-750-C2-47	Screw, Set-down Adjusting 4-40x3/4 BH MS
84	G400A 266	Reject Link & Trip Lever Assembly
84A	G400A 230-1	Reject Arm Support & Trip Lever
84B	401A 237	Reject Arm
84C	65-375-C2-39	Screw (6-32x3/8 BH MS)
84D	405A 98	Spring Washer
84E	481 68-2	Flat Washer

FAULTY REJECT AND TRIP ACTION

Before making reject or trip adjustments on the RC180, RC181 or RC182 Record Changers, it is very important to see that the reject spring (2) is holding the push-off shaft (8) up as far as it will go. If it is not, erratic reject and trip action may result. Possible causes of the spring not holding the push-off shaft up are: the knob (1) may be loose; the spring (2) broken, missing or placed incorrectly; or push-off shaft binding.

When servicing an RC180, RC181 or the new RC182 Two Speed Record Changer which repeatedly rejects records, will not trip or trips erractically, proceed as follows:

Old Type Reject Link #401A222
(See Fig. 4 in RC180 & RC181 Service Manual.)

1. Make certain that the On-Off Reject knob (1) is tight and down as far as it will go on the push-off shaft (8).
2. Check to be sure that the reject spring (2) pulling the push-off shaft (8) up as far as will go. The reject spring (2) should rest washer (3) and should not slip between it a the push-off shaft (8).
3. Bend the end of the reject link (84) enough that when it is resting on the end of the pus off shaft (8) it causes the top of the trip st wire (81A) to be level with the top of t main cam stop stud (58A). See Figure11.
4. Adjust the trip adjusting screw (85) until t point of the pawl (87A) is even with t smooth side of the trip serrations (83) outlined in paragraph 8 of the RC180 & RC1 service manual.
5. It may be necessary to repeat steps 3 and making slight re-adjustments until the chan er will reject and trip properly.
6. If the changer will not trip properly aft carefully making the above adjustments, r place the reject link with the new type.

New Type Reject Link #G400A266
(See Fig12)

1. Repeat steps 1 & 2 as outlined above.
2. Adjust the reject link adjusting screw (84 until there is approximately 1/32 of an in space between the round end of the reje arm (84B) and the rivot on the push-off ar and link assembly (62). If there is no spa between these two parts, it will be possib for the changer to begin its change cyc when the On-Off Reject knob is turned to t "OFF" position.
3. Adjust the trip adjusting screw (85) until t point of the pawl (87A) is even with t smooth side of the trip serrations (83) outlined in paragraph 8 of the RC180 & RC1 service manual.
4. If the top of the trip stop wire (81A) is level with the top of the main cam stop st (58A) as shown in Figure11, bend the wi enough to make it even with the top of t stud.
5. If necessary, repeat steps 3, 4 and 5 until t changer rejects and trips properly.

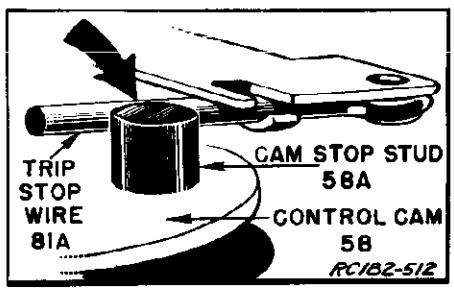

Figure11 - Positioning Trip Stop Wire.

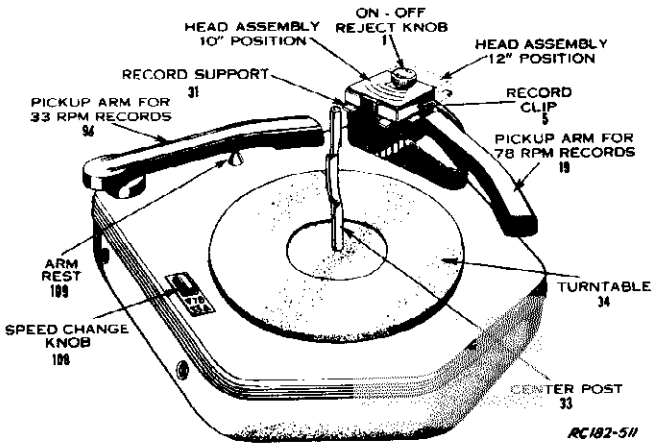
The RC182 Two Speed Record Changer is a modification of the RC181 in order to adapt it for manually playing the new 33-1/3 RPM records in addition to either automatically or manually playing the standard 78 RPM records.

The major differences are the addition of a second pickup arm, a new two speed motor, a speed change switch and knob, and a few related miscellaneous parts. Figures12,13 &14 and the parts list on the back page indicate the parts which have been added to modify the RC181 for playing the 33-1/3 RPM records.



RC182 Two Speed Record Changer.

OPERATION

The pickup arm on the right side of the RC182 Record Changer is for automatically or manually playing the standard 78 RPM records. The operation of this part of the changer is described in detail in the RC180 and RC181 Record Changer Service Manual.

The second pickup arm, at the rear of the changer is for manually playing the new 33-1/3 RPM records.

In order to play this new type record, merely move the speed change switch to the "33" position, place the 33-1/3 RPM record on the turntable, turn the changer on by means of the "ON-OFF REJECT" knob and place the pickup arm for 33-1/3 RPM record, on the record. When moving the speed change switch to either position make certain that it "clicks" or "snaps" into the desired position.

When the record has finished playing, the changer will automatically shut off. If the pickup arm is lifted from the record and moved toward its arm rest, the changer will automatically turn on unless the "ON-OFF REJECT" knob has been turned to the "OFF" position.

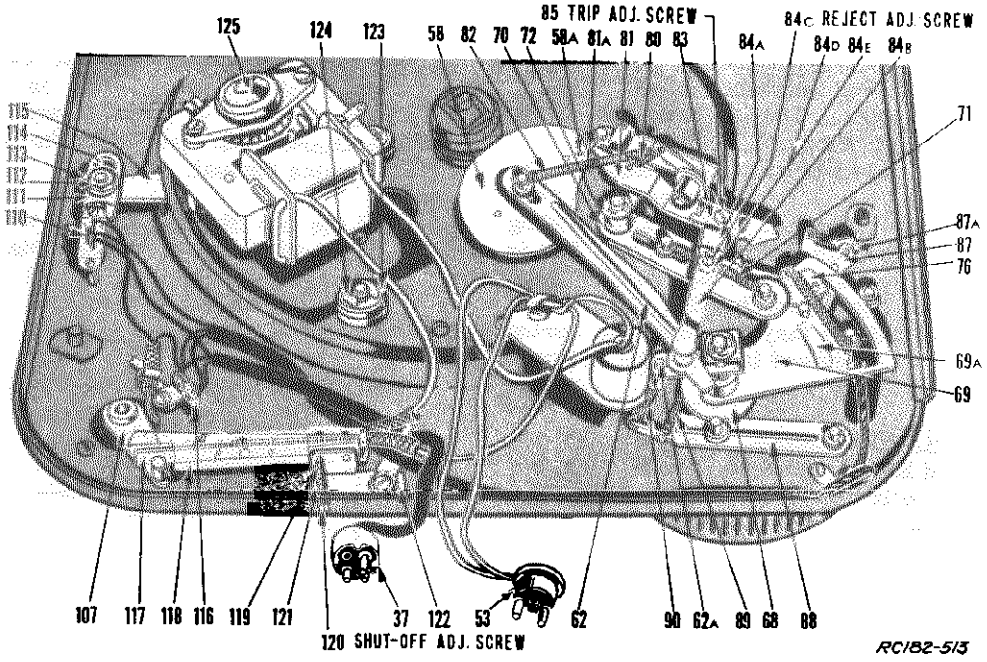


Figure12 - Bottom View of RC182.

NEEDLE FOR 33 RPM PICKUP ARM

The needle (95) used in the 33-1/3 RPM pickup arm is an osmium tipped needle especially designed for playing 33 RPM records. The point of the needle has a radius which is only 1/3 of the radius of a standard needle. To prevent possible damage to "microgroove" records, be abolutely certain when replacing a needle that the correct needle is used.

TWO SPEED MOTOR (125)

The turntable speed of the RC182 Two Speed Record Changer is changed mechanically. When the speed change knob (108) is moved to the "33" position, the speed change arm (115) moves. This causes the 33 RPM drive shaft to pivot and ride against the idler wheel (126). Simultaneously, the 33 RPM pickup arm (94) is switched into the circuit, and the 78 RPM pickup arm (19) out of the circuit, by means of switch (110). When the speed change knob is moved to the 78 RPM position, the speed change arm causes the 33 RPM drive shaft to pivot away from the idler wheel (126).

When the speed change switch knob (108) is moved, make certain that it "clicks" or "snaps" into position. If it is not moved far enough, the speed of rotation will change but the correct pickup arm will not have been switched into the circuit.

Note that the 33 RPM drive shaft is driven by the 78 RPM drive shaft by means of a rubber belt (130). This belt should be clean and free from oil. If the belt is greasy or stretched, it might possibly slip which would cause the turntable speed to vary resulting in unsatisfactory operation.

AUTOMATIC SHUT-OFF ADJUSTMENT

When the changer is playing 33 RPM records, it should shut-off when the needle is approximately 2-1/4 inches from the near side of the centerpost.

If the changer motor shuts off before or after the arm reaches this point, merely turn the shut-off adjusting screw (120) in or out until the roller on the arm stop and shaft assembly (107) opens the contacts of the leaf switch (117) when the needle is 2-1/4 inches from the near side of the centerpost.

If this adjustment is insufficient to obtain prop shut-off, reposition the arm stop and shaft assem (107) as follows:

1. Loosen Allen set-screw (104). With the pic up arm (94) resting on the arm rest (10 move the arm stop and shaft assembly (1 until it touches the rear flange or lip of changer pan.
2. Tighten the Allen set-screw (104). Adj screw (120) for proper shut-off.

SERVICE HINTS

1. The dimensions of the two speed motor are su that an extra cork washer (131) has been added u der the turntable hub to keep the turntable from ru bing against the idler wheel drive shafts. This co washer (approximately 3/64" thick) should not omitted.

2. The rubber mounting grommets (123) are t same as those used for mounting the RC180 a RC181 motor, except that they are put on so the co portion of the grommet is against the changer pa The grommets are mounted in the opposite directi in the RC180 and RC181.

3. The largest of the four holes in the switch li (111) is slightly off-center. When replacing or r installing this part, be sure the narrow side toward the nearest edge of the changer pan or bas

Installing this part with the narrow side towa the center of the changer pan will cause the spe change knob (108) to bind making it extremely di cult to switch from one speed to another.

4. Fibre washers (113) and (114) have the same mensions except for thickness. The thin was (113) should be placed between the spacer nut (1 and the switch link (111). The thicker washer (1 goes between link (111) and the speed change a (115).

MODEL RC182

ADMIRAL CORPORATION

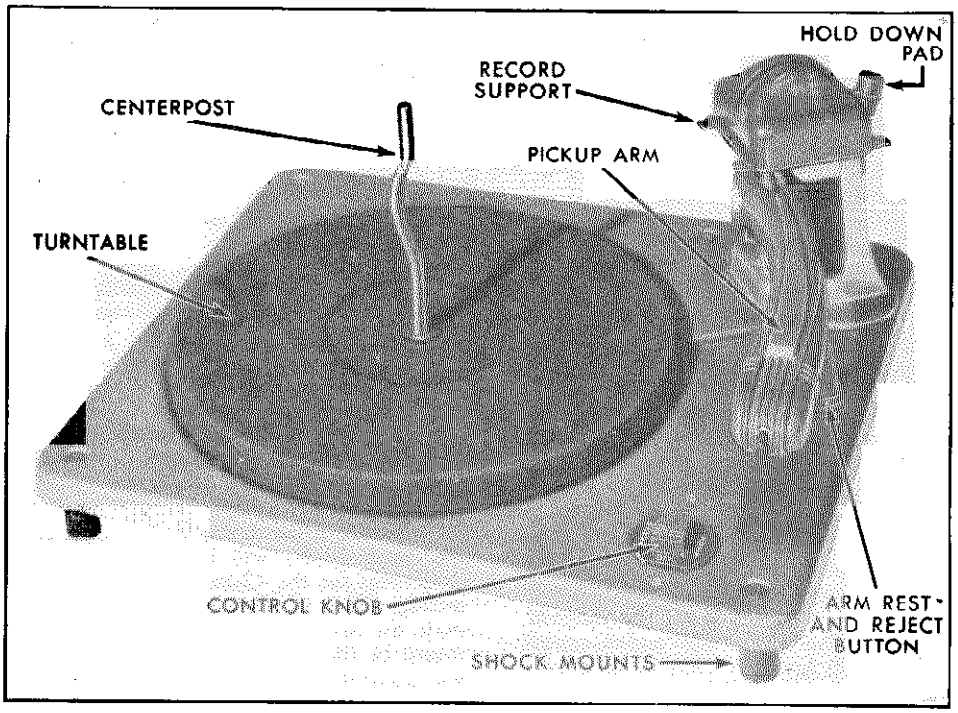

FIGURE 1. RECORD PLAYER, TOP VIEW

1. SETTING FOR SIZE OF RECORD

The size of record for which the record changer is set to play is indicated by the number (on the top of the cover assembly) nearest the turntable.

To change the setting, grasp the record support and cover assembly and rotate it a half turn until it snaps into place with the correct record size toward the turntable. **In changing the setting from 10-inch to 12-inch, rotate the assembly counterclockwise only; in changing from the 12-inch to the 10-inch setting, rotate the assembly clockwise only.**

2. STARTING FOR AUTOMATIC PLAY

Load the record changer with a maximum of ten twelve-inch or twelve ten-inch records, and set the hold down pad so that it rests on the top record. Move the control knob to the auto-on position which will set your record changer for automatic play and start the turntable rotating.

Press down on the reject button which is located on top of the arm rest or push down on the pickup arm momentarily if it is setting on the arm rest. The entire stack of record will be played automatically.

3. MANUAL PLAY

Set record support and cover assembly for size record you intend to play and place record on turntable. Move control knob setting to manual-on position and press down on reject button or push down on pickup arm momentarily if it is setting on the arm rest. If you desire to play the record for the second time in succession press down on reject button and the record will be played again. After record has been played manually grasp pickup arm and place on arm rest and remove record.

Reject button may be used during manual play only when playing standard ten or twelve inch records otherwise it must be done manually.

4. REJECTING A RECORD

To reject a record at any time and start playing the next one, merely press down on the reject button. This may be done while playing manually also.

5. UNLOADING RECORDS

To remove the records it is advisable to have the changer mechanism out of cycle. However, it is possible to unload the changer while it is in cycle so long as the pickup arm is clear of the records.

Move the control knob to the off position before lifting pickup arm to arm rest and remove records.

When removing records, hold them lightly and lift straight up.

CAUTIONS

1. **Do not place your unit on a radiator or other source of heat. The pickup may be damaged by heat.**
2. **Never use force to stop the motor or turntable.**
3. **Do not leave records on the supports as they are liable to warp. To protect your records, keep them in a record file, album or cabinet when not in use.**
4. **Records which have become warped or damaged will slide on one another when playing, resulting in unsatis factory operation.**
5. **Never leave the pickup arm with the needle resting on record or the turntable.**
6. **Do not let the pickup arm drop off of the arm rest.**
7. **When setting for size of records, be careful not to breal the hold down pad.**

THE CHANGE CYCLE

6. DESCRIPTION OF CHANGE CYCLE. (See Figures 2, 5, and 6.)

While a record is playing and as the pickup arm moves toward the center of the record, the arm control pin (28A) on the arm control assembly (28) moves along the portion of the arm control track (33B) as indicated at "P", figure 2. As the record reaches the pickup or trip point, the pin reaches point "T" on the track. As it moves into the recessed position in which it is shown in the illustration, it permits the trip spring (32) to pull the arm control plate (33) forward towards the centerpost (37). As the arm control plate is drawn forward, the stop tab (33A) on the arm control plate (33) is withdrawn from behind the reject catch (51) on the eccentric cam (53). The cam, which no longer is held in place by the stop tab (33A), is pulled over by the eccentric cam spring (54) until the rubber tire makes contact with the knurled roller (46) on the turntable shaft (38A). This knurled roller, which rotates with the turntable shaft, rotates the eccentric cam. In turn, this forces the riser plate assembly (34) back along its guide rods (42A) away from the centerpost (37). As soon as the riser plate begins to move, the push-off cam and shaft assembly (36) rides along the inclined track (34C) of the riser plate (34). This action causes the push-off cam and shaft assembly (36) to be drawn downward; as a result the pickup arm lift (21) presses down on the arm lift bearing pin (15), causing the pickup arm to be raised clear of the record. Then the riser plate tab (34B) contacts and moves the arm control assembly (28) which, since it is coupled to the pickup arm support assembly (23) carries the pickup arm away from the centerpost and clear of the edge of the turntable. As the riser plate (34) continues to travel further along the guide rods (42A), the riser plate motion bracket (34A) contacts and rotates the push-off cam and shaft assembly (36); as a result, the push-off arm (5), which is coupled to the push-off cam and shaft assembly (36) causes the push plate (7B) to drop a record to the turntable.

During the second half of the change cycle, the pressure of the push plate spring starts to return the push plate (7B) and push-off arm (5) back to their normal position. At the same time, the motion of the eccentric cam (53) and the guide rod recoil spring (35) propel the riser plate (34) toward the centerpost. The arm control assembly (28), and hence the pickup arm, are drawn back by the tension in the set-down spring (27). After the arm reaches this point directly above the set-down point, the riser plate (34) has moved far enough back towards the centerpost (37) to allow the push-off cam and shaft assembly (36) to ride down the inclined track (34C) of the riser plate (34). This lowers the pickup arm onto the record. As the eccentric cam (53) aided by the eccentric cam spring (54) completes its revolution, the rubber tire of the cam moves away from the knurled roller (46) on the turntable shaft and the reject catch (51) to rest against the stop tab (33A) of the arm control plate (33). The change cycle is completed.

7. DESCRIPTION OF DETERMINATION OF 10-INCH AND 12-INCH SET-DOWN POINTS.

During the early part of the change cycle, the arm control plate (33) has traveled (in a direction away from the centerpost) until the size change stop (33C) reaches the cam (36B) of the push-off cam and shaft assembly. The distance traveled by the arm control plate (33) will depend on the size of the record being played; the distance is less for a 12-inch setting than for a 10-inch setting. (This is true because the push-off cam [36B] presents its short radius to the size stop [33C] for the 10-inch setting and presents its long radius to the size change stop for a 12-inch setting.) This variation in distance traveled means that the arm control track (33B) will be in a position closer to the centerpost for the 12-inch setting than for the 10-inch setting. This in turn means that during the change cycle the arm control pin (28A) whose path is determined by the motion of the arm control assembly (28) will leave its recessed position, and will ride along the "S" portion of the arm control track for the 12-inch setting and along the "L" portion for the 10-inch setting. (See Figure 2.)

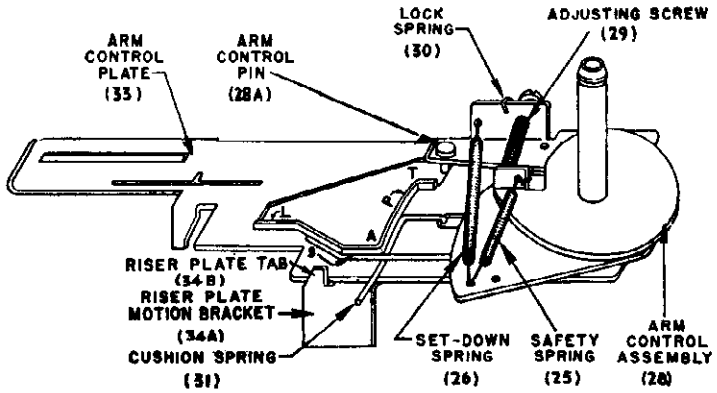

FIGURE 2

As the pickup arm moves back towards the record during the second half of the change cycle, it will be stopped when the bracket (28C) reaches the adjusting screw (29). How far the arm returns before being stopped depends on whether the arm control pin (28A) has been riding in the "S" or "L" portion of the arm control track. If the pin has been riding in the "S" or 12-inch portion of the track, the arm will be stopped at a point directly above the 12-inch set-down point; if the pin has been riding in the "L" or 10-inch portion, the arm will be stopped at a point directly above the 10-inch set-down point.

8. REJECTING A RECORD. (See Figures 3 and 6.)

The reject button (59A) is located on the top of the arm rest (59). The parts used to provide push button rejection are shown in Figures 3 and 6.

Figure 3 shows the changer going thru cycle, that is, in the process of rejecting a record. When the changer is out of cycle the reject catch (51) engages both the stop tab on the arm control plate and the reject arm (44A). If the changer is allowed to finish playing the record, the stop tab on the arm control plate is withdrawn from behind the reject catch (51); the eccentric cam (53) is then pulled against the knurled roller (46) and the change cycle begins. However, when the reject button (59A) is pressed the reject trigger wire (64) pulls the reject arm (44A) from behind the reject catch (51); the eccentric cam (53) is then pulled against the knurled roller (46) and the change cycle begins.

9. MANUAL PLAY.

The control knob (60) is located on top of the motorboard (72). The parts used to provide manual play are shown in figures 5 and 6.

To play manually, move the control knob (60) to the left. This will shift switch mounting to the left and cause manual control bracket (44B) to be engaged, so that size change stop (33C) is prevented from coming forward and completing change cycle.

The reject button may still be used as explained in Paragraph 8 even though the control knob is set for manual play.

ADJUSTMENTS

CAUTIONS

1. **See that the drive pulley and the rubber tire on the motor (61) and the rubber tire on the eccentric cam (53) are kept clean and free from oil, grease, dirt, or any foreign material. Carbona or carbon tetrachloride may be used for cleaning these parts.**

2. **If replacement of any parts requires the removal of the lift adjusting collar (10), pickup arm support assembly (23), or the push-off arm (5), be sure to re-position or replace these parts as directed in paragraphs 11, 12, and 14 respectively.**

TOOLS REQUIRED

#6 Bristol Set Screw Wrench
#6 Allen Set Screw Wrench
#8 Bristol Set Screw Wrench
#8 Allen Set Screw Wrench
Lift Out Tool (2 Required)

} Can be obtained as Kit.

10. REMOVING CHANGER FROM CABINET FOR ADJUSTMENT.

When it is necessary to remove changer from cabinet for adjustment this can easily be done with the aid of the lift out tool furnished as specified above. *Wires must be disconnected first.*

The changer is mounted on four rubber shock mounts (73), their location can be quickly identified by the location of the four phillips head screws (76) on the motorboard (72). Hold lift out tools by long handle, one in each hand and pry up under bulb of rubber mount, two at a time. Pry up on two that are located on the same side of motorboard. When one side is free of cabinet, wedge something under motorboard so the free mounts do not fall back into the hole. Use the same procedure on the other two mounts and the changer is free of cabinet.

To install changer back in cabinet line up rubber mounts with holes in cabinet and push down on motorboard. The changer is automatically locked in cabinet, connect wires and changer is ready for operation.

11. SET-DOWN POINTS AND PICKUP OR TRIP POINT.

(If the pickup arm support assembly [23] has been removed or if its set screws are loose, it must be repositioned as described in paragraph 13 before adjusting the set-down points and pickup or trip point.)

This changer is designed so that the 10-inch set-down point, the 12-inch set-down point, and the pickup or trip point are simultaneously adjusted in a single operation. It is recommended that you make the adjustment at either of the set-down points. This adjustment is made by means of the adjusting screw (29) shown in Fig. 3. Turning this screw counter-clockwise will cause the arm to set down closer to the centerpost; turning it clockwise will cause the arm to set down further

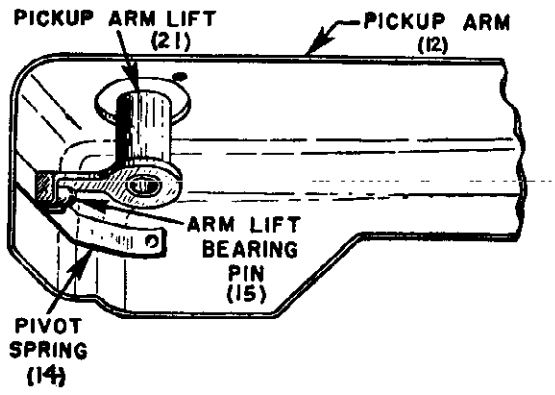

FIGURE 4

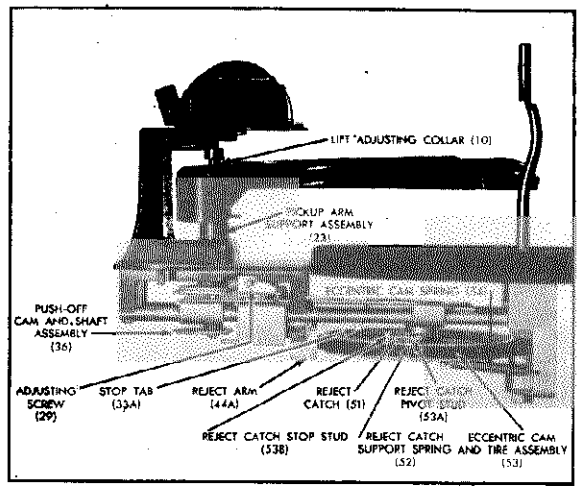

FIGURE 3

away from the centerpost. One turn on the screw will move the arm about ¼ inch.

If the adjusting screw (29) will not change the seting sufficiently, the pickup arm support assembly (23) may be out of position (see paragraph 13)

The set-down point when using a straight-shank needle will differ slightly than when using an offset shank needle.

If you do not know which type of needle is to be used by the customer, we suggest the following settings when tested with a straight needle: measuring from the side of the centerpost, 4⅝" for the 10-inch set-down point, 5⅝" for the 12-inch set-down point, and 1-19/32" for the pickup or trip point.

If you know which type of needle will be used by the customer, and test with that type of needle, the following settings are recommended:

Measuring from the side of the centerpost, 4-21/32" for the 10-inch set-down point, 5-21/32" for the 12-inch set-down point, and 1⅝" for the pickup or trip point.

When using an offset-shank needle, slight variations in set-down point can often be corrected by loosening the needle screw and rotating the needle slightly.

12. PICKUP ARM HEIGHT.

When properly adjusted, the pickup arm height should be such that, without a needle and with a single record on the turntable, the arm should be about 1/32" above the record. The arm height depends on the location of the lift adjusting collar (10). As the collar is moved down, the arm is raised, and vice versa. When necessary, the pickup arm height may be adjusted by re-positioning the lift adjusting collar (10) as follows·

CRESCENT INDUSTRIES, INC.

SERVICING AND REPAIR

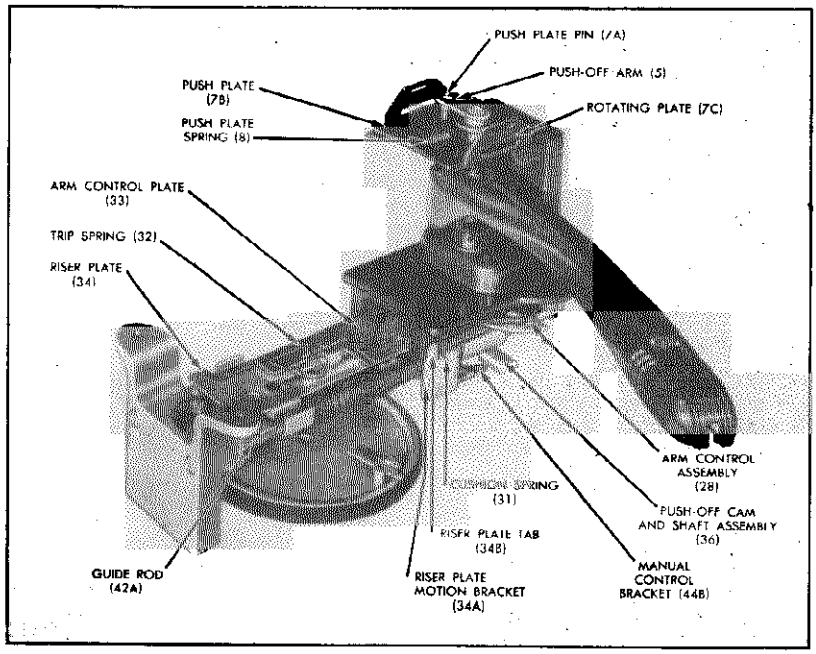

FIGURE 5

(a) The changer should be out of cycle.

(b) Lift the pickup arm and check to see that the pickup arm lift (21) is positioned properly over arm lift bearing pin (15). (See Fig. 4.)

(c) Remove needle and place pickup arm on turntable close to its edge.

(d) Loosen set screw in lift adjusting collar (10).

(e) Remove slack by pushing up on push-off cam and shaft assembly (36). Do not compress the arm lift shaft spring (36C).

(f) Using a #6-32 Bristol wrench, place it in the set screw and slide the lift adjusting collar (10) down until it is snug against the pickup arm lift (21).

(g) Tighten set screw in the lift adjusting collar.

(h) Check height.

13. RE-POSITIONING PICKUP ARM SUPPORT ASSEMBLY (23).

To assure proper set-down adjustment, this must be done carefully as follows if set screws are loose or if pickup arm support assembly (23) has been removed.

(a) Turn adjusting screw (29) (see paragraph 11) clockwise 2 full turns.

(b) Place a 12" record on the turntable.

(c) With the changer out of cycle, manually move the arm control assembly (28) outwards as far as it moves freely. In this position, the arm control pin (28A) will be located as indicated at "A" in Figure 2.

(d) Place pickup arm so that needle rests in first playing groove on the 12" record.

(e) Tighten the two set screws in pickup arm support assembly (23).

(f) Make the final set-down adjustment as described in paragraph 11.

14. REMOVING COVER (3) FROM HEAD ASSEMBLY (7).

(a) To remove cover (3) from head, squeeze cover at ends and lift up enough for cover to come free of rotating plate (7C).

(b) Remove hairpin spring from hold down plate (4) and slide hold down plate (4) out of rotating plate (7C).

15. RE-POSITIONING PUSH OFF ARM (5).

This must be carefully done if set screws are loose or push off arm (5) has been removed.

(a) Rotate the record support to the 10-inch position. Remove push off arm (5).

(b) Line up push off cam (36C) with push off arm (5) so they are parallel. If the push off is still faulty set push off cam (36C) slightly back of push off arm (5), this will give a little less push off on 10-inch side and little more on 12-inch side. Reverse this procedure for more push off on 10-inch side.

(c) Put push off arm (5) in position leaving push off arm about 1/32" above top of arm lift shaft.

(d) Tighten set screws in push off arm.

16. CHANGER REPEATEDLY GOES THROUGH CHANGE CYCLE WITHOUT PLAYING RECORD.

(a) Mounting screw on eccentric cam (53) may be loose. Tighten.

(b) Cushion spring (31) has slipped out of position and is on wrong side of riser plate tab (34B). Re-position spring. (See Figure 5.)

(c) In normal operation, the trip spring (32) holds the arm control plate (33) against the riser plate (34). If the trip spring is faulty, it permits the arm control plate to rise too high above the riser plate. This causes the reject catch (51) to pass underneath the stop tab (33A). To correct, bend the legs of the trip spring closer together. If necessary replace trip spring.

(d) Eccentric cam (53) is bent so that reject catch (51) passes underneath stop tab (33A) on the arm control plate (33). To correct, straighten cam by putting changer out of cycle and pressing upward on cam near reject catch.

17. NEEDLE SLIDES ACROSS PORTION OF RECORD AFTER SET-DOWN ON 12-INCH RECORD.

Cushion spring (31) has slipped out of position and is on wrong side of riser plate tab (34B). Re-position spring. (See Figure 5.)

MODEL C-250

CRESCENT INDUSTRIES, INC.

See Exploded View, Figure 6, for Identification of Parts.

Ref. No.	Part No.	Description
1	2C3-A1	Hold Down Pad
2	405-A4	Hold Down Spring
3	2C3-B2	Cover
4	2C1-A14	Hold Down Plate
5	G400-A66	Push Off Arm Assembly
6	1A44-37	Set Screw (Bristol Head #6-32x1/8")
7	C250-A3	Head Assembly
7A		Push Plate Pin (Part of 7)
7B		Push Plate (Part of 7)
7C		Rotating Plate (Part of 7)
8	405-A33	Push Plate Spring
9	6C-312	Screw (#6x5/16" Phillips Flat Hd. Type Z)
10	402-A57	Lift Adjusting Collar
11	1A44-38	Set Screw (Bristol Head #6-32x3/16")
12	C250-A8	Pickup Arm, Pivot Spring and Arm Lift Bearing Pin Assembly. (Does not include 16-20 incl.)
13		Rivet (pickup arm pivot spring) — Supplied as a group. Order Part No. C250-A9
14		Pivot Spring (pickup arm) — Supplied as a group. Order Part No. C250-A9
15		Arm Lift Bearing Pin — Supplied as a group. Order Part No. C250-A9
16	405-A13	Spring Clip (pickup arm)
17	409-A1	Pickup Cartridges — Interchangeable
	409-A2	Pickup Cartridges — Interchangeable
	409-A3	Pickup Cartridges — Interchangeable
18	3A2-3-21	Lockwasher, #4 Split — Doz.
19	42-250	Screw (Fil. H.M.S. #4-40x1/4"; Mtg. Cartridge
20	402-A43	Needle Screw for Cartridges
21	G400-A86	Pickup Arm Lift Assembly
22	405-A46	Brake Spring
23	G400-A73	Pickup Arm Support Assembly
24	2C4-C1	Base Casting
25	405-A41	Safety Spring

37	G400-B21	Centerpost
38	C250-B13	Turntable
38A		Turntable shaft (Part of 38)
39	412-A1	Cork Washer
40	415-A2	Thrust Bearing Assembly (Replace as a unit)
41	412-A9	Cork Washer
42	C250-B14	Turntable mounting and guide rod Assembly
42A		Guide Rods (Part of 42)
43	6C-625	Screw (#6x5/8 Fil. Hd. Type Z)
44	C250-A6	Reject Manual Control Assembly
44A		Reject Arm (Part of 44)
44B		Manual Control bracket (Part of 44)
45	405-A25	Reject Arm Spring
46	2C2-A1	Knurled roller, turntable shaft
47	1A44-13	Set Screw (Bristol Head #8-32x1/8")
48	3B1-29	Lockwasher, 1/4" I.D. — Doz.
49	402-A41	Hex nut (1/4"-20; used on centerpost)
50	405-A15	Hairpin Spring
51	2C1-A8	Reject Catch
52	405-A50	Reject Catch support spring — Doz.
53	G400-A117	Eccentric cam and tire assembly
53A		Reject Catch pivot stud (Part of 53)
53B		Reject Catch Stop stud (Part of 53)
54	405-A47	Eccentric Spring
55	4B1-57-47	Flat Washer (eccentric cam)
56	3B1-26-47	Lockwasher #8 I.T. — Doz.
57	84-250	Screw (B.H.M.S. #8-32x1/4" for mtg. cam) — Doz.
58	406-A1	Rubber Tire (Eccentric cam)
59	C250-A15	Arm Rest Assembly
59A		Reject Button (Part of 59)
60	C250-A16	Reject lever Assembly
61	405-A25	Reject lever spring
62	1A20-14-21	Screw (#6x3/8" Drive Screw; used for reject lever mounting)
63	414-A13	Reject trigger wire
64	2C3-B3	Control Knob
65	C250-A5	Switch Mounting Assembly
66	405-A22	Spring Washer
67	2C14-A2	Manual Control wire
68	G400-A57	Idler wheel assembly (Used with motor 407-B1 only.)
	G400-A59	Idler wheel assembly (Used with motor 407-B10 only.)
	C250-A17	Idler wheel assembly (Used with motor 407-B9 only.)
69	405-A35	Spring, idler wheel (Used with motor 407-B1 only.)
	405-A36	Spring, idler wheel (Used with motor 407-B10 only.)
	2C5-A6	Spring, idler wheel (Used with motor 407-B9 only.)
70	407-B1	Motor, complete with idler wheel; 105-125 Volts. 60 cycle (Motor 407-B9, 407-B10 are interchangeable with 407-B1.)
	407-B6	Motor, complete with idler wheel; 105-125 Volts. 50 cycle (Motors 407-B7, 2C7-B1 are interchangeable with 407-B6.)
	2C7-B2	Motor, complete with idler wheel; 220 Volt. 60 cycle (Motors 2C7-B4, 2C7-B6 are interchangeable with 2C7-B2.)
	2C7-B3	Motor, complete with idler wheel; 220 Volt. 50 cycle (Motors 2C7-B5, 2C7-B7 are interchangeable with 2C7-B3.)
71	2C5-A3	Motor snap fasteners, motor mounting

The following parts are not identified in exploded view, figure ???

72	C250-B2	Motorboard Assembly (Does not include 73, 74, 75, 76)
73	2C6-A3	Rubber shock mount
74	2C2-A5	Motorboard mounting stud
75	4B1-72	Flat Washer, #10 I.D.
76	100-500	Screw (Phillips countersunk flat head)
77	9B1-15	Solder lug
78	10B1-18	Terminal Board
79	2C5-A5	Faston Washer, fastening base to motorboard

SPECIFICATIONS

Power Consumption at 117 volts ..... 18 watts

Voltage Rating ..... 105 to 125 volts at 60 cycles

Speed at 117 volts ..... 78 r.p.m.

Starting Torque at 117 volts ..... 27.5 in. oz.

Weight less records ..... 7.5 pounds

Type of Pickup
- P-72 ..... Variable Reluctance
- P-73 ..... Crystal

Type of Needle
- P-72 and P-73 ..... Permanent Osmium Point

Maximum Record Capacity
- 12 inch ..... 10 records
- 10 inch ..... 12 records
- 10 and 12 inch intermixed ..... 10 records

DESCRIPTION AND OPERATION OF THE CHANGER

RECORD LOADING

The record spindle shelf is to be loaded to a maximum of 12 ten inch, 10 twelve inch, or to the red line on the spindle with both sizes, intermixed. The stabilizer arms must be moved into the recess of the spindle to prevent interference in loading the records.

The tone arm set-down is always in 10" position unless a 12" record has just been dropped from the spindle shelf. In dropping to the turntable, the 12" record strikes the intercepter lever #58698, contacting the tone arm swing lever #58698, imparting movement to the tone arm lift lever #58694 and causing the tone arm to be set down to 12" position.

RECORD CHANGING

After the changer is loaded with records, the control button is pressed to start the record change cycle. Rotation of the main cam will actuate the compression lever causing the compression rod to depress the inner-spindle assembly. The four-prong spring support (spindle shelf) has receded into the outer spindle and the rubber sleeve on the spindle, being compressed, has expanded, and therefore holds all but the bottom record which descends to the turntable. Then the tone arm return lever moves the tone arm into position to be lowered to the record by following the cam track. The tone arm moves across the record until the selection is finished and the trip mechanism functions. Finally, the tone arm is lifted and carried over the record until clear of the record stack and the next record is released, completing one change cycle. In this manner all the records in the stack are played.

AUTOMATIC STOP

The weight of the records on the spindle allows the record lift lever to follow the contour of the main cam. When the last selection is played, a spring lifts the record lift lever into position to move the automatic stop pawl inward. The main cam carries the stop pawl into engagement with the switch lever, thus stopping the changer.

SPRING MOUNTING

The changer is solidly mounted on a panel which is floated upon spring mountings. These spring mountings eliminate rumble or feedback and insulate the changer from any cabinet vibration occasioned by the sound waves emanating from the speaker. This vibration, if transmitted through the tone arm to the pickup, would be amplified in the audio system of the radio and passed into the speaker again. The spring mountings also cushion the changer from sudden jars or shocks.

To remove the changer from the cabinet, remove four acorn nuts located on the corners of the mounting panel and lift panel out of cabinet. In some cases it is necessary to remove the cabinet drawer before removing the mounting panel.

On the underside of changer loosen screw next to spindle (paragraph B, section 7), and turn lock so that turntable may be removed from changer. Remove three screws and lift changer out of mounting panel.

CYCLE OF OPERATION

STUDYING THE CYCLE

The record change cycle consists of the sequence of motions required to move the pickup into position on a record, play the record, remove the pickup and place a record into position. Since movements of various parts are being performed simultaneously, it is impossible to follow all of the actions at one time. A suggested method is to select one certain cycle of operation. For example the raising of the tone arm, moving it over the record and the replacement on the record may be studied while running the changer slowly by hand. After the motions associated with the tone arm are understood, another portion of the changer may be observed.

TRIP ASSEMBLY

Motion of the tone arm is transmitted through the tone arm crank to the tone arm lever and pin assembly #15194 which is secured to the tone arm support tube with lever #58695. When the needle enters the trip grooves of a record, the increased velocity of movement impels the tone arm lever against the starting reset lever #58853. The start-

ing reset lever then engages the starting pawl on the turntable hub.

THE CHANGE CYCLE

The turntable is driven through an idler pulley by the electric motor, the turntable being free on the spindle. A gear on the turntable hub meshes with the main cam gear. Several teeth are left off the main cam to stop it in playing position. After a selection has been played, the trip mechanism moves the starting reset lever, which is part of the main cam assembly #13672, forward at the right speed and correct distance to permit it to mesh properly with the starting pawl on the turntable hub. As the main cam rotates, the tone arm lift lever #58694 lifts the tone arm upward and the tone arm return lever moves the tone arm over the record. The compression lever #57240 will actuate the compression rod #55424, which will in turn depress the inner-spindle assembly #11379. During this cycle the rubber sleeve #62152 has expanded and is holding all but the bottom record. At the same time the spindle shelf recedes into the outer spindle #55334, dropping the bottom record to the turntable. By following the cam track the tone arm return lever moves the tone arm into position to lower the pickup needle to the starting groove in the record. The main cam is now in playing position, disengaged from the turntable hub gear. One change cycle has been completed.

PICTORIAL REPRESENTATION

The following series of photographs, with a corresponding brief explanation of each phase, are inserted to illustrate the movements of pertinent parts of the changer during a change of record cycle.

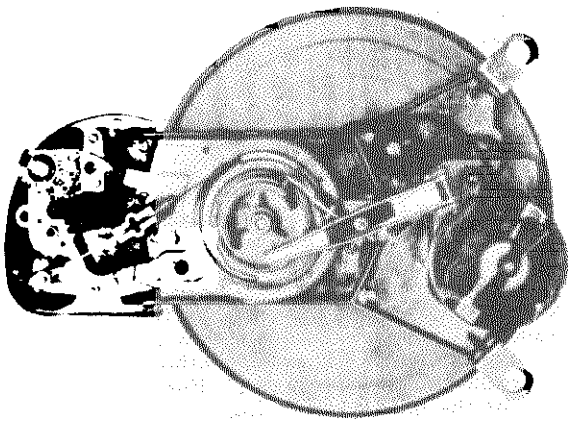

FIGURE A

The main cam is driven through the gear on the turntable hub. When a change cycle is completed, the main cam disengages from the turntable gear because several teeth are left off the main cam gear. The tone arm is in position on the record and free to follow the playing groove. This phase of cycle is called the playing position.

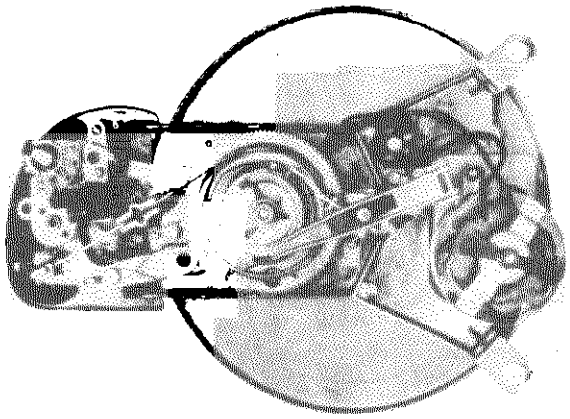

FIGURE B

The change cycle has just begun. The tone arm lift lever has raised the tone arm from the record and the tone arm return lever has started to move the tone arm away from the turntable. The compression lever assembly has started to pull the compression rod, thus beginning to recede the spindle shelf into the outer spindle and expanding the rubber sleeve on the spindle.

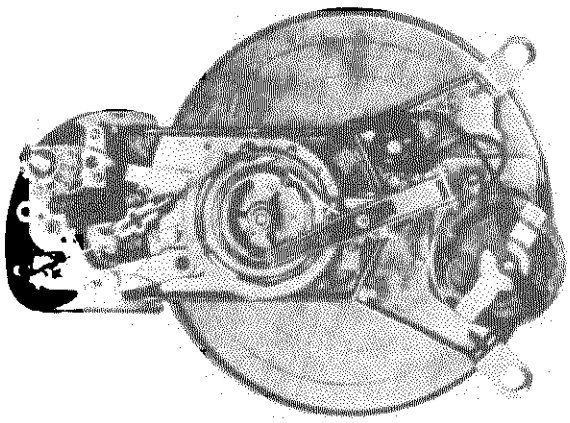

FIGURE C

The tone arm has moved outward, clear of the turntable, and the spindle shelf has fully receded into the outer spindle, dropping the bottom record to the turntable. The rest of the record stack is held by the expanded rubber sleeve. The spindle shelf has started to return to its former position.

CHANGER LUBRICATION

The record changer should be lubricated and cleaned periodically or when a major part or assembly is replaced. Dirt, old oil, or grease may be removed with carbon tetrachloride or other similar cleaning fluid.

Use only a good grade of electric motor oil.

Care should be exercised to prevent an excess of oil being used on any part and that no oil gets on the velocity trip assembly, motor pulley, idler pulley or turntable rim. There is a self-lubricating type bearing in the turntable with an oil reservoir which may be filled through the four holes in the turntable hub.

Once a year a thin coat of light grease of the vaseline type may be applied to all surfaces of the main cam that contact lift levers and record lift lever roller. Also grease all working parts on the main cam and oil other moving parts (see figures D & E) except those that rely upon friction, i.e., contact surfaces being dry.

PRECAUTIONS

With mechanical devices, much information pertinent to lubrication can be obtained by observation. Obviously, it will be seen that certain parts of rotating or sliding machinery must be lubricated,

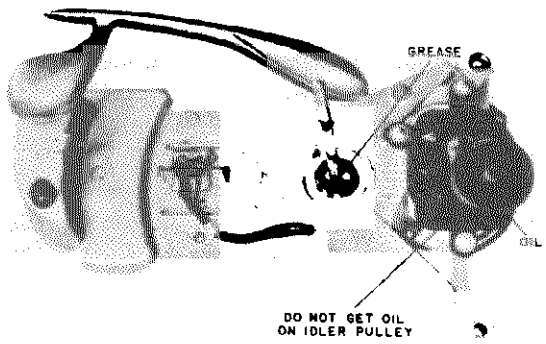

FIGURE D

but that other parts depend upon contact surfaces being dry and free from foreign substances, such as grease, so that proper friction exists. Where lubrication is indicated, it should be applied judiciously, avoiding any excess lubricant that may be transferred or thrown to some part designed for dry operation.

Inspect parts not requiring lubrication to make certain they are clean. Always be sure to use the type of oil or grease recommended for lubricating specified items.

55335	— Cam Spacer (Inside Main Cam Hub).
55336	— Mtg. Bolt for Main Cam.
2019-007	— 1/4" S.P. Int. Lockwasher.

Inspect parts not requiring lubrication to make certain they are clean. Always be sure to use the type of oil or grease recommended for lubricating specified items.

PARTS REPLACEMENT

A. REASSEMBLING PARTS

When repairs are being made, a careful check should be made of all moving parts in order to make sure that no binding occurs. Check all moving parts for binding before springs are connected.

All levers which operate on shoulder studs should be assembled with the burred side of the retaining washer away from the lever to prevent the washer from binding on the lever.

B. TO REMOVE AND REPLACE TURNTABLE

Remove the changer from the cabinet, and from the bottom side of the main frame (near the spindle) loosen the screw which holds the turntable down, so that it is clear of the pinion gear. The turntable may then be raised from the top side of the changer. Care must be taken not to damage the cork washers next to the bearing.

When replacing the turntable, see that the cork washer 60597, then the bearing race 58716, bearing retainer 13816, and another bearing race and cork washer are installed in this sequence (see Figure 1). Align these parts with the center spindle. When pushing the turntable over the spring assembly, push firmly but cautiously, avoiding too much pressure which may damage the springs. When the turntable is in place, move hold-down into groove in turntable hub and tighten screw.

C. TO REMOVE IDLER PULLEY

After the turntable has been removed, the idler pulley can be removed by slipping off the small hairpin cotter on the end of the idler pulley shaft.

When replacing the pulley a single drop of oil should be used on the pulley shaft.

CAUTION:

Do not allow oil to get on either the idler pulley or the turntable rim.

D. TO REMOVE AND REPLACE SPINDLE ASSEMBLY

Remove nuts from bottom of compression rod. Lift compression lever 57240 out of position. Remove E washers and record lift bracket 58700. Pull spindle assembly out from top side. Do not attempt to repair assemblies but replace with new parts. To reassemble, push assembly inside of outer spindle from the top. Put record lift bracket in place and install E washers. Swing compression lever into position and install flat spring 58789, nuts 37344 and 2015-002 and No. 3 lockwasher. Tighten nuts on compression lever until rubber sleeve on spindle reaches .330" to .337" diameter when fully compressed. Use Glyptal to secure lock nuts.

E. TO REMOVE AND INSTALL MAIN CAM ASSEMBLY (Fig. 1)

Remove turntable (paragraph B). Remove nuts from bottom of spindle and turn compression lever back to clear cam. Disconnect spring from tone arm lift lever 58694. Remove nut 36857 from under side of cam and withdraw bolt 55336 from top side of changer. Slide cam out carefully so as not to bend any levers on baseplate side. Adjust screw 55397 so that tension on starting reset lever 58853 is 6 to 8 grams. Use Glyptal on bottom side of screw. To reinstall the cam replace cam shim 37338, slide bolt through from top side of changer and slide cam into place being sure that spacing shim 37338 is not lost. Cam should have insert spacer 55335. Use flat washer 37339, lockwasher 2019-007 and hex nut 36857. Reinstall tone arm lift lever 58694 and attach spring 64431. Swing compression lever into place and install flat spring, two nuts and lockwasher. Secure these nuts with Glyptal after spindle assembly has been adjusted. Reassemble turntable (paragraph B.)

F. TO REMOVE AND INSTALL TONE SWITCH & BRACKET ASS'Y 13825

Disconnect pickup lead wires from socket 80030. Remove two screws which hold bracket to baseplate. Lift bracket from assembly.

To reinstall, insert tone switch coupling 64464 between rejects plunger 55420 and switch 90243. Replace screws 2000-157 and lock washers 2019-004. Resolder pickup wires to socket; the black wire should be connected to the center terminal.

G. TO REMOVE AND REPLACE TONE KNOB & PLUNGER ASSEMBLY 09353

Remove Tone Switch and bracket assembly 13825 (paragraph F). Lift plunger assembly out from top side. Unscrew reject knob 59486 while holding shaft 55420 rigid. Remove spring 64474 and knob 57262 by lifting over top of shaft. To reassemb place knob 57262 on shaft. Drop spring into kn and screw reject knob onto shaft. Push assemb in from top side of changer so that pointer is markings on baseplate. Reinstall tone switch a bracket assembly (paragraph F).

H. SHIPPING CHANGER

The changer is solidly mounted on a mounti board. The mounting board is mounted upon fr floating springs.

When shipping the changer, a hold-down b should always be used on each side of the chang mounting board to hold the changer securely the cabinet. A cardboard spacer ⅛" thick shou be placed adjacent to the shipping bolts betwe the mounting board and the cabinet. The tone a may be held securely to the outer edge of the tu table by arranging a cardboard strip to fit over t spindle and hold the tone arm down.

I. INSERTING PHONO PLUG

The phono input plug must be inserted into t phono socket as far as possible to avoid "grid hur If hum presists, check ground connection of sock

OPERATIONAL ADJUSTMENTS

J. TONE ARM HEIGHT ADJUSTMENT

Load a 10" record on the spindle and turn turntable by hand through cycle until the tone a is at its highest point. From bottom side of chan er, loosen hex nut 2015-007 and adjust screw 37 to tone arm height desired. Tighten locknut lift lever.

To remove lift lever 58694, release spring 54 and withdraw lever from slot. To reinstall, ins pin 55325 in lift lever. Insert lift lever in slot a connect spring.

K. NEEDLE LANDING ADJUSTMENT

Place a 10" record on spindle and press reje button. Changer should continue in cycle un coming into playing position. Observe wheth or not the needle lands in starting groove (abo 3 32" from outside edge of record). If needle lan too close to outer edge of record, turn top tone ar adjusting screw 55328 with coin in direction i dicated on baseplate. If needle landing was t far from outer edge of record, turn adjusting scre in opposite direction. Hold top of spindle down ar press reject button to check needle landing.

12" needle landing will usually not require a justment. If required, it should be made only aft 10" adjustment has been corrected. For errat needle landing, check the wire leads to see th they do not bind or interfer with the tone arm.

L. VELOCITY TRIP ADJUSTMENT

Break the seal on the adjustment screw 553 which is located in hole in bottom of cam ne spindle. Turn to the left to tighten until the ton arm will trip on the record. To check adjustme lever 58706 on cam should contact both lugs c turntable hub when tone arm is in last playin grooves of record before tripping. Seal scre thread with Glyptal to prevent screw from comin out of adjustment.

M. RECORD FEED

1. DOES NOT DROP RECORDS
   a. See that stabilizer arms are not down under the record stack.
   b. Check vertical clearance in spindle. Should be approx. 1/64".
   c. Check the records to see that the label is not extended into the center hole.

2. DROPS MORE THAN ONE RECORD
   a. Check center hole of record for being chipped or oversized. (This changer will not chip or break records).
   b. If 12" record hangs on interceptor lever 58698, check slot in changer head for burrs. This lever should move freely with a slight drag on the side of the slot.

3. CHANGER DOES NOT START
   a. If changer does not start immediately, press reject button a second time.
   b. Check if phono plug and line cord are in their respective sockets.
   c. If further trouble, turn turntable several revolutions to be sure that changer was not shut off during cycle. Press reject button to start.

4. CHANGER SHUT-OFF

Changer should shut off after last record is played. Spindle should have approx. 3/32" vertical motion when no records are on spindle. One 10" record should be sufficient weight to depress spindle so that changer will not shut off. If changer does not shut off or if it shuts off before last record is played, see that spindle is not sticking. It should have a free vertical motion. Also check stop pawl for binding.

N. REPRODUCTION

1. No response.
   a. Audio system. Check with radio reception.
   b. Pickup leads shorted.
   c. Pickup cartridge dead. Try new cartridge.
2. Distorted tone.
   a. Worn needle.
   b. "WOWS" or variance in speed.
      (1) Oil on idler pulley and turntable rim.
   c. Warped records.
   d. Defective pickup cartridge.
      1. Use of badly chipped records or records with breaks.
      2. Dropping tone arm on record.
3. Thumping noise.
   a. Groove in idler pulley worn by motor drive pulley. Result of idler pulley being held stationary with motor running.
      1. Sand idler pulley smooth or replace pulley.
4. "Grid Hum".
   a. Insert phono input plug into phono socket as far as possible.
   b. Check electrical ground connection of phono socket.
5. Mechanical Hum.
   Check alignment of turntable motor armature.

CHECKING THE CHANGER

Check the needle landing with full stack of records, intermixed. This is done by loading the spindle shelf with 10 records, both 10" and 12" and pressing the control button to reject a record and put the changer into operation. The stabilizer arms must be moved into the recess in the spindle to prevent interference in loading the records. Allow the first record to play through and trip, observing the needle landing on several 10" and 12" records, then trip records up to and including nine. Allow the ninth record to play through and feed number ten automatically, observe needle landing, automatic trip and automatic shut-off.

Check electrical operation by turning radio program switch to phono position and playing a record. The tone clarifier should be checked in each position by listening to reproduction. As a rule, old worn records should be played while the switch is in the No. 1 position. Position 2 is for normal records, while No. 3 gives wide-range reproduction from the new high-fidelity recordings.

PARTS LIST

Part No.	Description
07593	Record Lift Lever Bracket Assy.
07594	Turntable Assembly
07651	Record Lift Lever Assy.
09370	Mtg. Spring Assy.
11377	Tone Arm Support Tube & Brkt. Assy.
11379	Inner Spindle Assy.
11437	Phono Motor Assy.
11464	Pickup Lead Assy. For P-72, P-73
13674	Upper Spindle Assy.
13816	Ball Bearing & Retainer (for turntable)
13819	Idler Pulley
13825	Tone Switch & Brkt. Assy. Complete
15193	Tone Arm Swing Lever Assy.
15194	Tone Arm Lever & Pin Assy.
15195	Compression Lever Assy.
15196	Automatic Stop Switch Assy.
15197	Tone Arm Crank & Pin Assy.
15220	Main Cam (casting only)
15237	Idler Brkt. and Stud Assy. (on Phono motor)
25112	.01 mfd. 200 volt Condenser
25276	.02 mfd. 200 volt condenser
36857	1/4-28 Hex nut (to mount main cam)
36882	H. P. Cotter
37066	Acorn Palnut
37155	Spade lug (for tone arm lift lever spring)
37332	#6 Special flat washer (to mount reject lever assy.)
37333	"E" Washer (for tone arm adjusting stud)
37334	#10-32 x 7/8" H. H. bolt (to mount outer spindle)
37335	#4 x 3/8" o.d. washer (for mounting levers on main cam)
37337	#4-36 x 1/4" Bdg. H.M.S. (Mtg. screws for levers on main cam—reject, tone arm hold out)
37338	Shim Washer (to mount main cam)
37339	Flat Washer 1/4" i.d. x 5/8" o.d. x 1/16 thick (to mount main cam)
37340	Brass Washer (to mount motor)
37341	#8-32 x 7/8" hex head bolt (for tone arm crank assy.)
37343	#3 x 5/16" o.d. flat washer (on bottom of record spindle)
37344	#3-48 special hex nut (spindle height adj. nut)
37390	"E" washer (small) for record spindle
37421	"E" Washer (to mount idler pulley, idler pulley brkt. and ventilator fan)
37511	#10-32 x 5/8" H.H.M.S. (on tone arm lift lever)
37512	"E" washer (large) for record spindle
37646	Mounting bolt (for mtg. changer to mtg. board) (two required)
54308	Thrust Washer for idler pulley and idler pulley Brkt.
54309	Thrust Washer for motor ventilator fan
55325	Lift Lever Pin
55328	Tone arm set down adjustment stud
55329	Pin for tone arm interceptor lever
55332	Pin for compression lever
55333	Pin for record lift lever
55334	Outer spindle
55335	Cam spacer (inside main cam hub)
55336	Mounting Bolt for Main Cam
55337	Motor Mtg. Spacer
55339	Tone Arm Hinge Pin
55341	Tone Arm Lift Rod
55345	Sleeve support washer for record spindle
55395	Hinge pin for reject link
55396	Mounting pin for starting lever
55397	Trip adjustment screw
55416	Mounting bolt (one required to mount changer to mounting board)

Part No.	Description
55420	Manual reject plunger rod
57248	Main cam switch
57262	Tone Clarifier Knob (Chrome) for P-
04128	Tone arm for P-72, P-73 (Less Picku
58692	Interceptor reset lever
58693	Switch & reject lever
58694	Tone arm lift lever
58697	Tone arm adjustment lever
58698	Tone arm interceptor lever
58701	Turntable hold down Brkt.
58702	Bearing support washer (under tur table bearing)
58706	Starting lever
58707	Reject lever (on main cam)
58708	Tone arm hold out lever
58709	Hold out locking lever
58716	Bearing race washer (for turntable)
58789	Compression spring
58851	Tone switch bracket
58852	Manual reject link
58853	Starting reset lever
58854	Starting lever spring
58971	Ventilator fan for phono motor
59486	Reject Button For P-72
09367	Reject Button & Plunger ass'y. for P-
60597	Cork washer for turntable bearing (f turntable)
62152	Rubber sleeve for record spindle
62173	Rubber motor mtg. grommets
64429	Reset spring
64430	Reject Spring
64431	Lift lever spring
64433	Spring for tone arm adjustment
64434	Spring for tone arm interceptor lever.
64437	Tone arm counterbalance spring
64452	Cam switch spring
64464	Switch release spring
64465	Tone switch coupling link
64466	Spring for tone arm hold out lever
64467	Trip spring
64471	Spring for idler pulley
64474	Spring for reject button
64476	Lead-in spring
71235	Magnetic Pickup for P-72
71243	Crystal Pickup for P-73
77240	3300 ohm 1/2 watt resistor
77246	15K ohm 1/2 watt resistor
80030	Phono output jack
80150	4 prong motor plug (male)
80327	2 prong molded pickup socket
90243	Tone selector switch
92256	Felt Washer for turntable bearing
92335	Felt washer for motor ventilator fan
2003-155	#6-32 x 1/4" F.H.M.S. (to mount ton arm adjusting lever)
2006-011	#2-56 x 7/16" Fil. H.M.S. (to moun cam switch)
2015-001	#2-56 Std. Hex nut (to mount cam switch)
2015-002	#3-48 Std. Hex nut (lock nut for spindl height adj.)
2015-007	#10-32 Std. hex nut
2017-004	#8 i.d. x 3/8" o.d. flat washer (for ton arm crank assy.)
2019-007	1/4" S.P. Int. lockwasher (to mount mai cam)
2085-205	#6-32 x 1/4" Truss H.M.S. (for mtg reject lever)
2085-215	Motor mtg. bolt #6-32 x 5/8"

CYCLE OF OPERATION

Records should be examined before placing them on the shelves. Badly warped records, badly chipped records, or records with breaks, should not be used. The record shelves are set for the size record to be played (either 10" or 12") by turning either shelf to the position indicated on the decal, then the correct number of records should be placed on the record shelves. (Twelve 10" or ten 12"). The tone arm should be on its rest.

Move the control switch which starts the phonograph and move the reject button sidewise. The changer will go into cycle, lifting the tone arm off the rest and swinging it under the stack. The tone arm should swing clear of the record stack, a record should drop to the hooks, pause, then gently settle to the turntable. The tone arm should swing back and be lowered to the starting groove on the record. When the record is played the above cycle is repeated until all the records have been played.

The turntable is screwed onto the spindle and gear assembly and both are driven through the idler pulley by the motor.

When the reject button is moved, the reject lever pushes the starting lever into position to engage the pawl on the spindle gear. This moves the main cam assembly forward at the right speed and the correct distance to cause the gears to mesh properly. Then the main cam goes through a complete revolution. When the cycle is completed the main cam gear disengages from the spindle gear because several teeth are left off it. This is called the playing position.

First the Tone Arm is lifted off the record through the Tone-Arm Lift Lever (07215). As soon as it is elevated both the Record Plungers move toward the Spindle to center the record for the drop to the Turntable; if no record is on the shelves the Automatic Switch is turned off, however the cycling switch makes the changer complete the cycle. As this happens the Tone Arm Return Lever (09123) moves the Tone Arm from under the record stack. The Rear Record Plunger moves forward at the same rate of speed as the eccentric portion of the Spindle and the Front Plunger moves. This pushes the record off the Rear Shelf where the Rear Record Plunger catches it. Both Front and Rear Plungers move backwards at the same rate as the Spindle does, pushing the record off the Front Shelf and dropping it to the Front Hooks, the record pauses here until the Hooks move to center the record in respect to the Spindle. Then both Hooks snap back out of the way, allowing the record to settle gently to the turntable. Next the Tone Arm swings into the proper position and is lowered to the record. A wire feed-in spring acts against the Tone Arm Crank to feed the Tone Arm into the music grooves in case there is no feed-in groove on the record.

To accomplish the record feed there are three sections of the Main Cam, together with the Centering Lever and Rocker Arm Assembly, involved. The first section of the Main Cam is a "Boss" illustrated at the end of the Tone Arm Lift Lever in Fig. A. The Second section is the Trip Roller Assembly on top of the Main Cam. The third section is the "slot" in the Tone Arm Lift portion of the cam adjacent to the Trip Roller Assembly.

The action is as follows: As the Main Cam rotates, the "Boss" strikes the Centering Lever and Rocker as shown in Fig. B, this moves the Record Plungers toward the Spindle. Because this pressure is applied through a spring, variations in record diameter are of little consequence. After the Boss passes the Centering Lever, the Trip Roller strikes the Rear Rocker the first time moving the Rear Record Plunger forward and the Front Record Plunger is also moved forward, Fig. C. As the Main Cam moves on, the Record Plungers go to a central position then both move backward, Fig. D, then resume the central position, this is while the record rests on the Hooks. Then the Centering Lever drops into the "slot" in the Main Cam, Fig. E, the Front and Rear Hooks are suddenly withdrawn from the record and it drops to the Turntable.

The trip action of the P-62 is positive and is set to trip automatically when the needle reaches a predetermined distance (1⅞") from the spindle.

The following five illustrations show the cycle of operation of a P-62 Capehart Changer.

Figure A. When the cycle is complete the Main Cam disengages from the Spindle Gear because several teeth are left off the Main Cam Gear. This position is called the playing position.

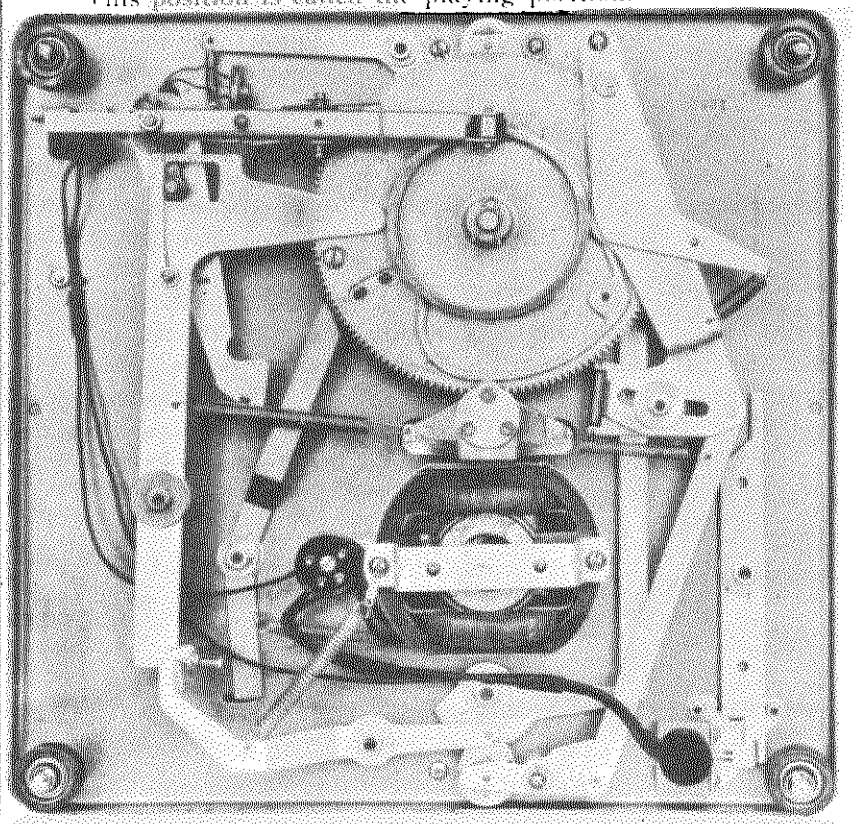

FIGURE A

FRONT

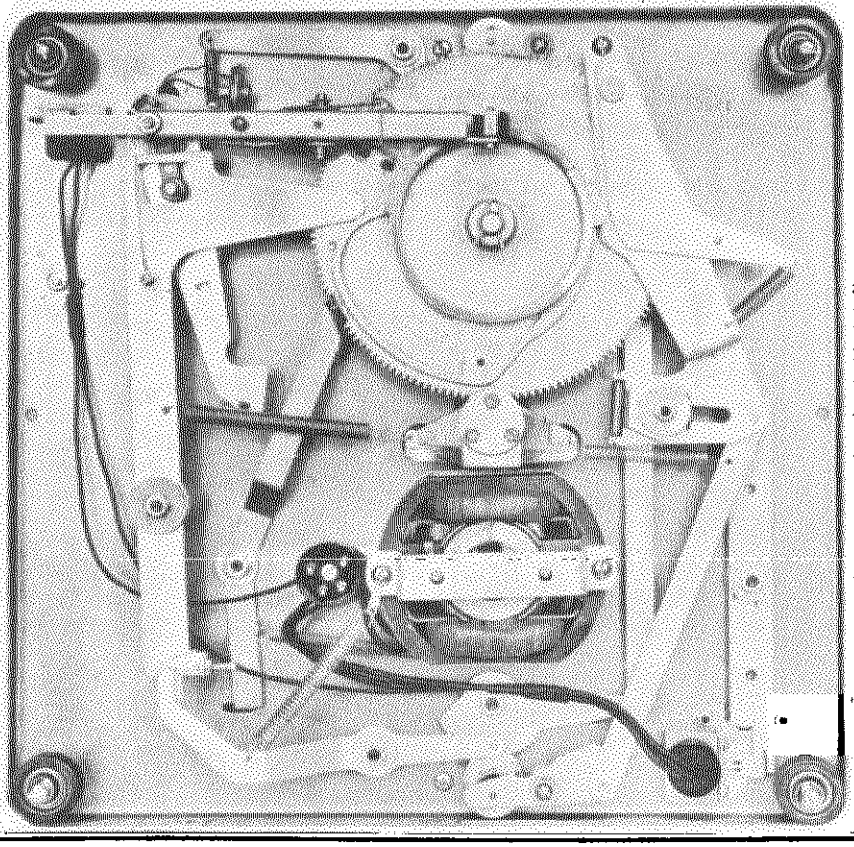

FIGURE B

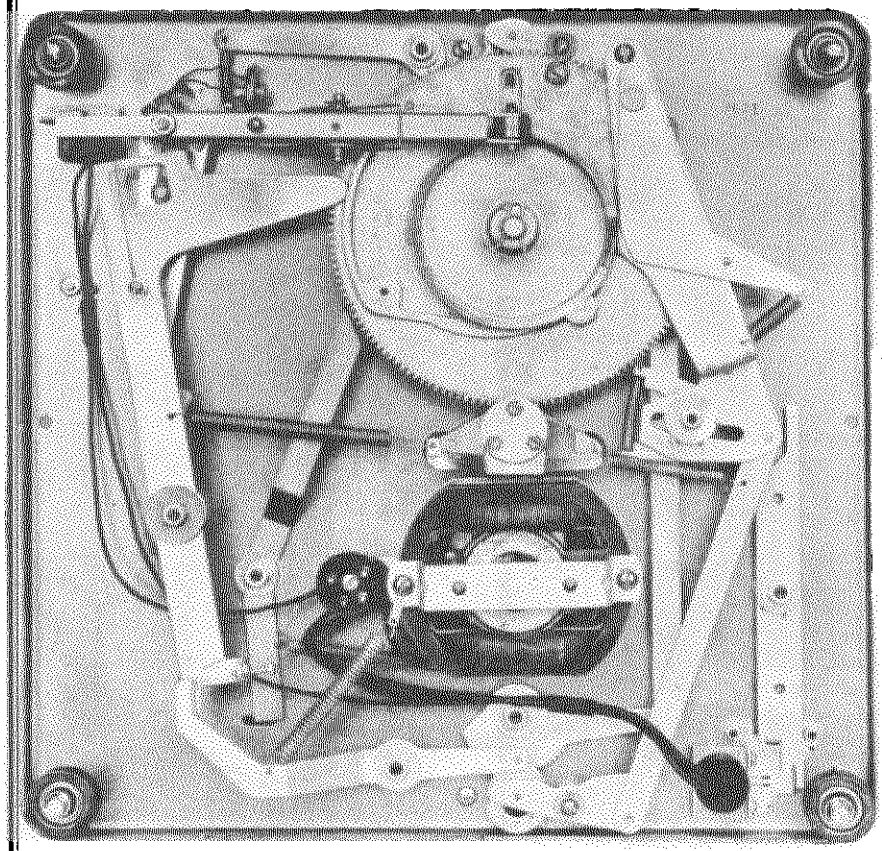
In figure B the Main Cam advanced so the "Boss" on Main Cam has moved the Cer ing Lever Return Arm away f the cam, which because of the turn Spring causes the Cente Arm through the Rocker Levers Plunger Shafts to move the Re Plungers toward the Spindle. to the motion being transmi through the Return Spring, diffe diameter records are handled ec ly well. The equalizer spring in exactly centering the recor regard to the Spindle. Note, in illustration the Tone Arm Sv Lever is part way up the Shoulder.

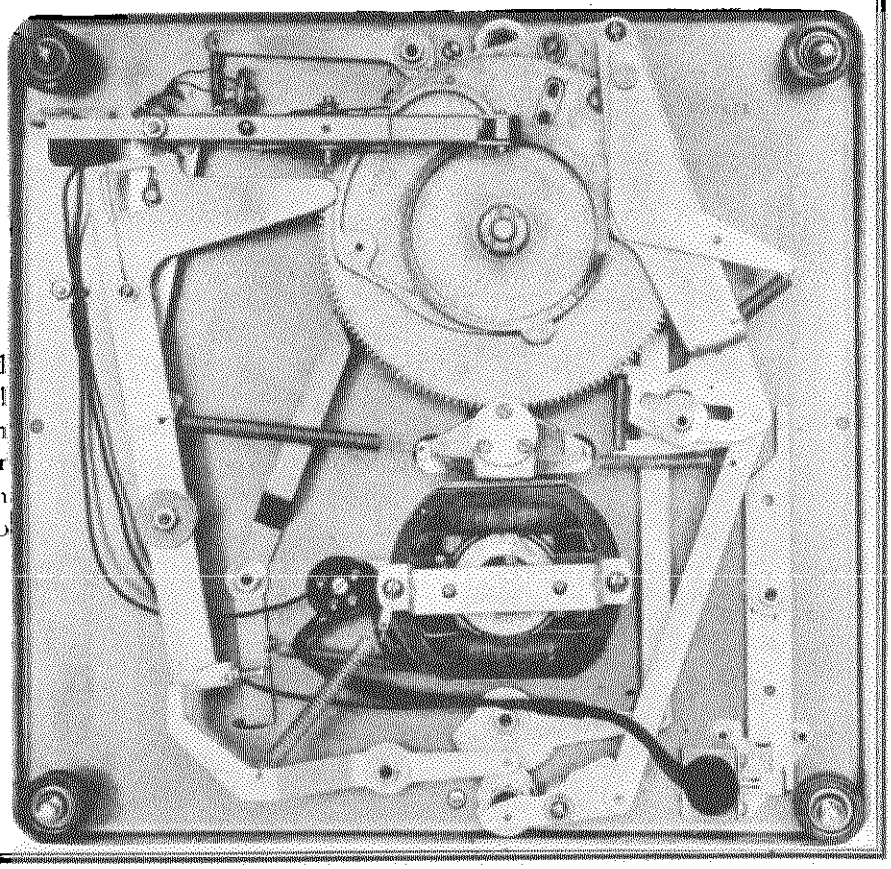
MODEL P-62 FARNSWORTH TELEV. & RADIO CORP.



In Fig. C the Trip Roller (part of Main Cam Assembly) has advanced to move the rear plunger rocker away from the spindle, at the same time moving the front plunger rocker toward the spindle. Due to the Plunger Shafts, which transmit the motion of the Rockers to the Record Plungers, the Record Plungers move in the opposite direction from the Rockers, i.e. Front Record Plunger moves away from the Spindle. This causes the record to be pushed off the Rear Shelf and drop to the Rear Hooks.

FIGURE C

FRONT



Between C & D the Record Plungers go through the central position and assume the position shown in Fig. D where the Rear Record Plunger moves away from the Spindle causing the record to drop to the Front Hooks.

FIGURE D

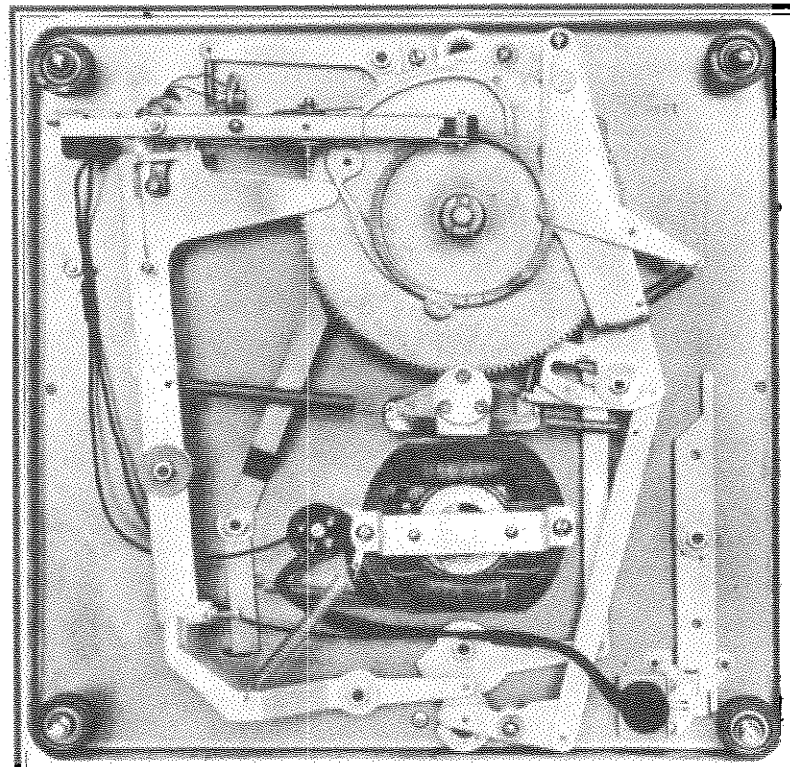


FIGURE E

In Fig. E the Centering Lever Return Arm has dropped into the "Slot" in the Main Cam, moving both Plungers Rockers toward the Spindle, causing the Front and Rear Hooks to snap back, permitting the record to settle flat on the turntable. In this illustration the Tone Arm Swing Lever is returning to the normal position.

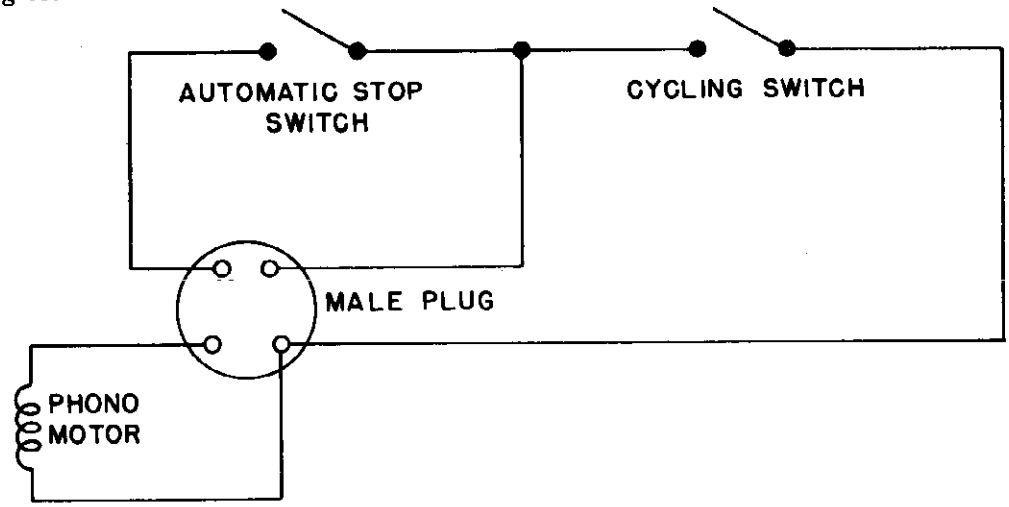

FIGURE 10 — CIRCUIT DIAGRAM

MODEL P-62 FARNSWORTH TELEV. & RADIO CORP.

SERVICE SUGGESTIONS

1. TO REMOVE TURNTABLE 13442

The Spindle Gear may be wedged, by a screwdriver between it and the Main Cam, to prevent its turning while the Turntable is unscrewed from the Spindle. When removing the Turntable make certain none of the Spacer Washers are lost. These Washers often adhere to the Turntable because of an oil film from the Felt Washer. When replacing Turntable make sure it is properly tightened. NEVER USE GAS PLIERS TO HOLD SPINDLE.

2. TO REPLACE OR ADJUST IDLER PULLEY 13441

First remove Turntable. The Idler Pulley is used to transfer power from the Motor Pulley 55106 to the Turntable. If the Idler Spring tension is incorrect the Turntable speed may be too high or too low, it should fall between 76.59 R.P.M. and 80.00 R.P.M. This tension is adjusted by loosening the Motor Mounting Screw holding the Spring Holder 45176 and turning the Spring Holder until the required tension is secured.

If it is necessary to replace the Idler Pulley remove the Hair Pin Cotter 36869 and the Thrust Washer 50209. After removing the Idler Pulley also remove the Thrust Washer used underneath the pulley. If the Idler Pulley is replaced both Thrust Washers should be also.

When replacing the Pulley a single drop of oil should be used on the Pulley Stud.

CAUTION—Do not allow oil to get on either the Idler Pulley or the Turntable Rim.

3. ALIGNMENT OF RECORD SUPPORT SHELVES

The center line of the record shelves should form a straight line, in 10″ position, which passes through the center of the spindle. The shelves should be exactly 9 and 41/64 inches apart, plus or minus .005″, and should be equidistant from the spindle. In the event it becomes necessary to change the spacing of the record shelves it is recommended that shims be used to adjust them. In some cases if oversized or undersized records are used it may be necessary to change the spacing of the shelves.

4. ALIGNMENT OF RECORD SPINDLE

To prevent feedback the Spindle, Gear and Bracket Assembly is rubber mounted and can shift in transit. To reposition the spindle loosen all three mounting screws, position the spindle and tighten all three mounting screws equally; so as not to force the spindle out of place which may happen if one screw is tightened first.

5. SHELF LOCKING LEVER ADJUSTMENTS

The Front Record Shelf 57111 should be lined up with the record spindle in the 10″ position. The Shelf Locking Cam 15010 is lined up with the center line of the Gear Sector Assembly and adjusted until the Locking Lever is properly seated in the Shelf Locking Cam. The Record Shelf should not be permitted to slip when adjusting these parts.

When aligning the Rear Shelf Locking Cam the Locking Lever Hex Head Mounting Screw may be loosened to permit the necessary adjustment to properly align the Shelf Locking Cam and Shelf Locking Lever.

6. RECORD DROP

If a record fails to drop due to the record plunger not coming out far enough, remove the plunger shaft assembly (No. 15076 or 15077) and check to see if it is bent. If neither of these are bent and both front and rear plungers do not have sufficient travel loosen screw 2012-209 (Fig. 7 Page 12) and move screw out toward rim of main cam. Make sure that the plunger shafts are not reversed as they are not interchangeable. If the front plunger, only, lacks sufficient travel loosen screw 2000-221 (Fig. 9 Page 14) to a sliding tension and lightly bump stud 56848 out slightly toward edge of changer baseplate. Retighten screw to maintain adjustment. If the rear plunger, only, lacks sufficient travel loosen the corresponding mounting screw on the rear of the changer and bump the stud lightly toward the edge of the changer baseplate. Retighten screw to maintain adjustment.

7. NEEDLE LANDING AND TRIP SETTING.

Needle landing must be set correctly for 10″ record before any attempt is made to set the trip lever. Loosen the Allen set screw in the trip lever collar and loosen the set screw in the tone arm crank. Insert a .008″ spacer between the tone arm

SERVICE SUGGESTIONS---Continued

support bracket and the top of the tone arm support post. Set the automatic on-off switch in manual position, set the record support shelves in 10" position and run the changer by hand through cycle until playing position is reached. Press down on the tone arm support tube and up on the tone arm crank. Set the needle in approximately 3/32" from the outside of a 10" record. Press the tone arm crank pin firmly against the outer edge of the cut-out in the tone arm return lever. This will depress the feed-in spring slightly. Tighten the tone arm crank set screw. Move the tone arm in until the needle is 1⅞" from the center of the spindle. Set the trip lever so that it is touching the end of the starting lever and starting to move the lever in to engage the pawl on the spindle. Tighten the Allen set screw in the trip lever collar.

8. TONE ARM HEIGHT ADJUSTMENT (See Fig. 9)

With records on the shelves, the top of the pickup arm at the highest point in its return should be 3/16" below the bottom of the lowest record on the shelves. When so adjusted the needle will not slide across the top of a stack of twelve ten inch records during the change cycle. To set this correctly, remove the power plug from the changer at that part of the cycle where the tone arm has reached maximum lift and just before it starts to swing out. In this position loosen locknut No. 2015-007 and adjust machine screw No. 36881 for correct tone arm height. Tighten locknut securely after correct adjustment is made.

9. STARTING LEVER.

If there is a tendency for the spindle to "jump" when the cycle starts due to the main cam and spindle gear not meshing properly, it is probably due to the end of the starting lever being bent.

10. MOTOR SPEED

Due to commercial tolerance it is impossib to secure motors which will run at exactly 78.2 R.P.M. Our limits are from 76.59 R.P.M. to 80.(R.P.M.

In the event it becomes necessary to get exa speed on one of these changers choose a mot pulley that gives a slightly higher speed than r quired. Using a fine file reduce the diameter the motor pulley a little at a time until the require speed is secured.

11. THE FOLLOWING SIMPLE OILING II STRUCTIONS WILL RESULT IN *MINIMUM OF SERVICE CALLS—*

Every six months or once each year, two three drops of oil should be put on the two fe washers in the Spindle Gear Bracket. One wash is located at the bottom of the Spindle Gear, tl other is at the top of the bracket and is accessib by removing the Turntable. Two or three dro of oil on the felts in the Motor. One drop of on the Pin for the roller of the Tone Arm Li Lever. A very light application of White Vaseli on the teeth of the Main Cam, also some on tl face of this Cam where the Tone Arm Swing Lev rides. A single drop of oil on the 10" and 1 plungers. Care should be exercised to prevent excess of oil being used on any part.

No further lubrication on the tone arm bearir will be necessary unless a replacement is mad In this case a thin film of vaseline may be used.

Care should be taken to see that no oil gets the motor pulley, idler pulley or rim of the tur table.

Use only a good grade of machine oil with viscosity of SAE 10.

MODEL P-62 FARNSWORTH TELEV. & RADIO CORP.

PARTS LIST FOR P-62 RECORD CHANGER

Part No.	DESCRIPTION

PARTS LIST FOR P-62 RECORD CHANGER

Part No	DESCRIPTION
07026	Front Locking Lever Assy.
07027	Rear Locking Lever Assy.
07215	Lever & Brake Spring Assy.
07325	Starting Lever Assy.
07344	Connecting Link Assy.
07345	P. U. Socket & Bracket Assy.
07376	Spindle Gear
09123	Tone Arm Return Lever & Feed-In Spring Assy.
09271	Record Changer Mtg. Spring Assy. (4 required)
11180	Feed-In Spring Assy., Tone Arm Return Lever
11278	Pickup Head Assy.
13305	Centering Lever & Rocker Assy.
13441	Idler Pulley
13442	Turntable
15010	Front Gear & Cam Assy.
15011	Rear Gear & Cam Assy.
15076	Front Plunger Shaft Assy.
15077	Rear Plunger Shaft Assy.
15078	Trip Roller Assy., Main Cam
15157	Tone Arm Support Brkt. & Tube Assy.
15203	Trip Lever, Collar & Spring Assy.
31142	Stop Switch Escutcheon
34312	Pin for Tone Arm Lift Lever Roller
34313	Hinge Pin
34316	Pin for Tone Arm Lift Lever Brkt
36112	#10 Flat Washer
36114	#10—32 x 21/32 H H Bolt
36115	#10—32 x 1½ Spec. H H Bolt, Tone Arm Return Lever Mtg
36116	#10—32 x ¼ Spec. H H Bolt, Tone Arm Lift Lever Mtg.
36117	#10—32 x 1" Spec. H H Bolt
36118	Turntable Washer
36129	¼—28 Std. Hex Nut
36136	#10 Flat Washer
36231	#10—32 x ½ Spec. H H Bolt, Reject Lever Mtg.
36465	#6—32 x ⅝ Spec. R H M S
36624	#6—32 x ½ Phil Bdg. H M S
36690	#10 Flat Washer, ½" O. D. x .042"
36778	#4—36 x ⅜ F H M S, Record shelf cover mtg.
36845	#10 Flat Washer
36860	#8 Flat Washer
36865	#10—24 x ½ H H M S
36867	#10 Flat Washer
36868	Brass Washer
36869	H P Cotter
36871	#6—32 x ¼ H H M S
36873	Spring Wave Washer
36874	Flat Washer
36875	Washer, Main Cam Mtg. Stud
36876	H P Cotter, Main Cam Mtg. Stud
36878	#10 Flat Washer
36881	#10—32 x ½ H H M S
36882	H P Cotter for Lift Lever Roller Pin
36883	H P Cotter for Tone Arm Lift Lever Brkt
37066	Acorn Palnut, Record Changer Mtg.
37067	Flat Washer, Record Changer Mtg.
37172	#4—36 x ⅛ Spec. Flat H M S, Chrome
37173	#6—32 x ⅜ Phil Oven H M S, On-off switch escutcheon mtg
39229	Spring, Tone Arm Lift Lever
39234	Spring, Tone Arm Return Lever
39236	Spring, Reject Lever
39245	Spring for Idler Pulley
42165	Spacer
43182	Tone Arm Lift Rod
44027	Motor
45176	Tension Spring Holder
46292	Mounting Bracket for Tone Arm Lift Lever
50204	Cork Washer (small) ¾" O. D.
50206	Rubber Mtg. Grommet
50209	Thrust Washer for Idler Pulley
54102	Fibre Spacer for Turntable Spindle
54151	Pick-Up Wire Insulating Sleeve
55001	Roller for Tone Arm Lift Lever
55051	Motor Pulley (50 Cycle)
55106	Motor Pulley (60 cycle)
56102	Spacer, Spindle Mtg. Brkt.
56103	Spacer, Tone Arm Return Lever Mtg.
56112	Spacer, Front Locking Lever
56122	Spacer, Rear Locking Lever

RECORD STANDARDS

Major record manufacturers have adopted standards intended to govern the physical characteristics of records produced. Such standards are of course necessary in order that records may properly operate automatic changers.

Below is outlined certain manufacturing standards.

Some records, however, are yet being issued which do not conform to established standards. Some years ago, the knife-edge was unknown—yet today, many cases of faulty operation are traceable to various forms of knife-edge records.

The old masters are yet being used for pressings, resulting in lack of feeding or trip grooves.

Other factors to be considered when tracing malfunction of the record changer are thickness of the record, warpage and chipped edges.

DIMENSIONAL STANDARDS 10" & 12" RECORDS

RECORD SIZES (A)	WEIGHT	OUTSIDE DIA. (B)	THICKNESS (C)	CENTER HOLE (D)	ECCENTRICITY OF HOLE (E)	OUTER EDGE (F)	LEAD SPIRAL (G)	DIA. FIRST GROOVE AT RECORDING PITCH (H)	MIN. INSIDE DIA. RECORDING (I)	ECCENTRIC GROOVE D. (J)	ECCENTRICITY OF ECCENTRIC GROOVE (K)	GUARD CIRCLE (L)
12"	11½ to 12 oz.	11 7/8 ± 1/16	.090 +.010 −.020	.286 +.001 −.001	.005 MAX.	"V" CONTOUR	FROM OUT EDGE	11 1/2 +.020 −.020	4	5 3/8	1/8	3 5/8
10"	7 to 7½ oz.	9 7/8 ± 1/16	.075 +.020 −.005	"	"	"	"	9 1/2 +.020 −.020	4	3 3/8	1/8	3 1/16

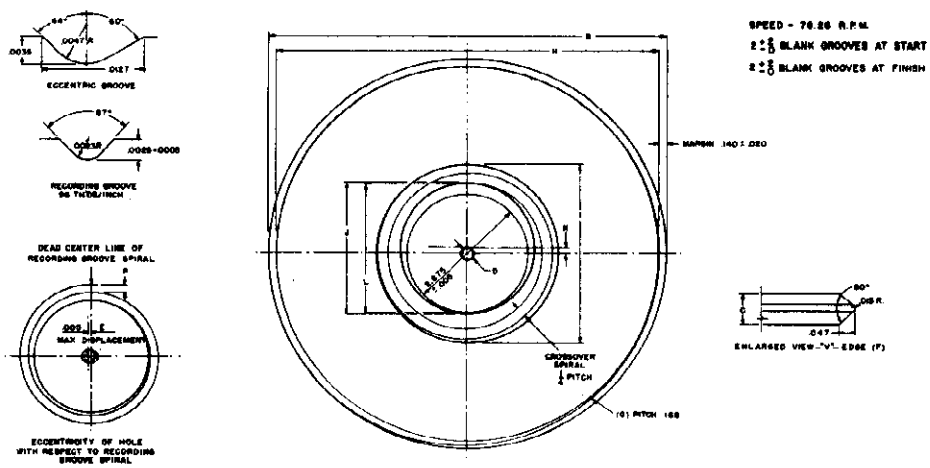

Figure 1

INSTRUCTIONS FOR INSTALLING IMPROVED LOWER RECORD SUPPORT ASSEMBLY WITH DOUBLE SEPARATOR KNIFE

1. Remove the pin from below the base plate on the separator hook assembly. (Part No. 09218.)
2. Screw on adjusting nut. (Part No. 37347.)
3. Replace the pin in the separator hook assembly.
4. Adjust the separator hook post (Part No. 561178), so that the lever arm will have a 1/32" clearance over the cam. (Part No. 57135.)
5. Secure separator hook post with locking nut.
6. Remove the four screws from the lower record support assembly. (Part No. 09189.)
7. Remove the reversing arm lock, lock screw, lock spring, and lock spring anchor stud and install them in the new lower record support assembly.
8. Remove the record reverse guide arm assembly (Part No. 67340) and install it on the new lower record support assembly.
9. Install the new lower record support assembly in the machine and adjust the record ejector arm to clear the bottom of a 10" record by 1/32".
10. Adjust the separator hook assembly to fit the slot in the record ejector arm.
11. Replace the upper record support with the new support (Part No. 57256). Use the same screws in doing this. No adjustment is required with this change.
12. Refer to: Reshaping the Interceptor Reset Lever, Page 15.

MODEL 41-E, CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

Herein is presented a complete listing of the various checks which may be applied to the 41E changer in determining the cause of malfunction. It is recommended that the serviceman follow the listing in detail prior to customer delivery. Having followed the procedure several times and having so gained familiarity with the various checks, he may then employ this section simply as a guide.

Reference is made to section X whose indexing follows that of this section.

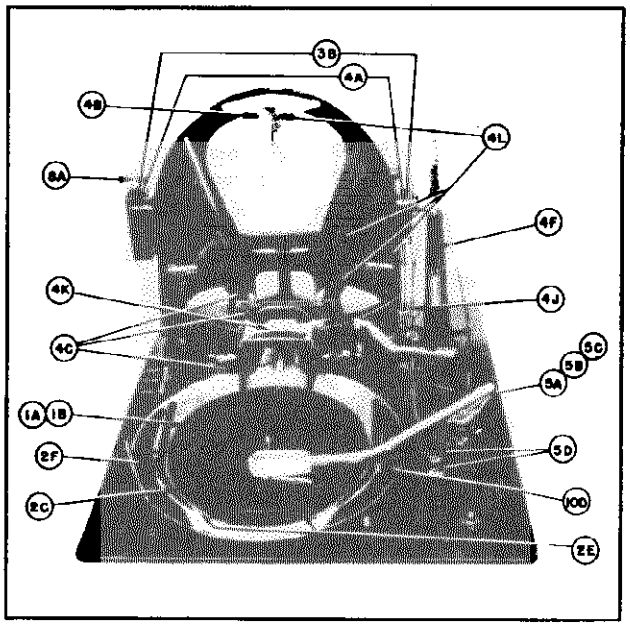

Figure 2A

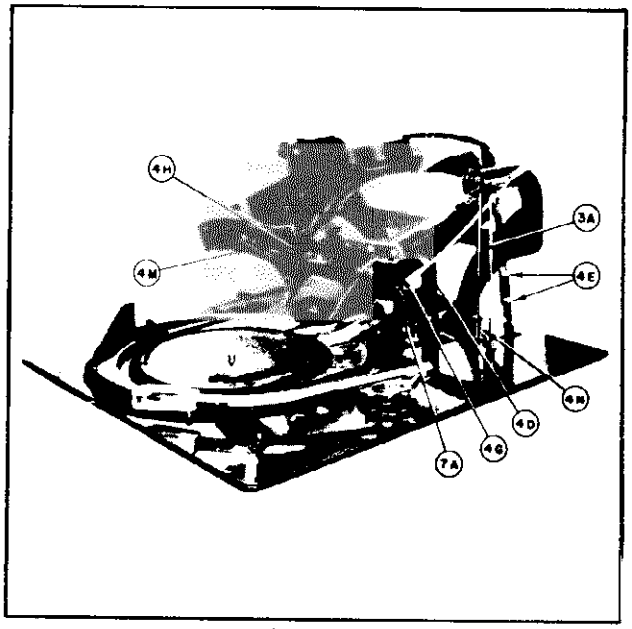

Figure 2B

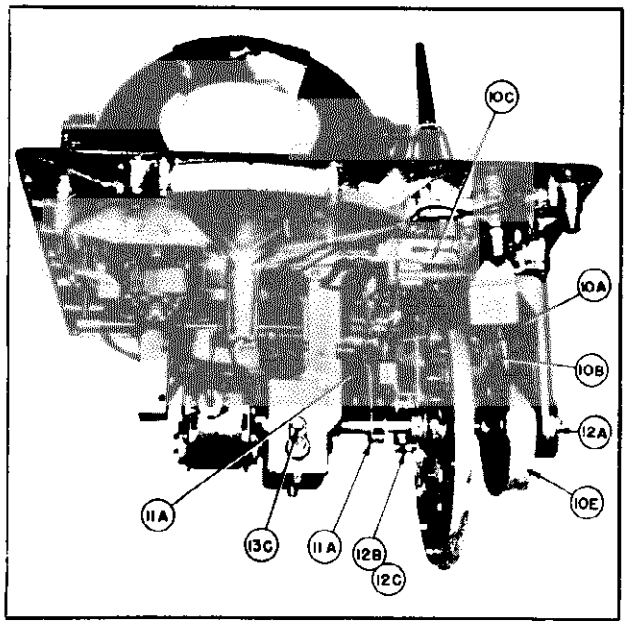

Figure 2C

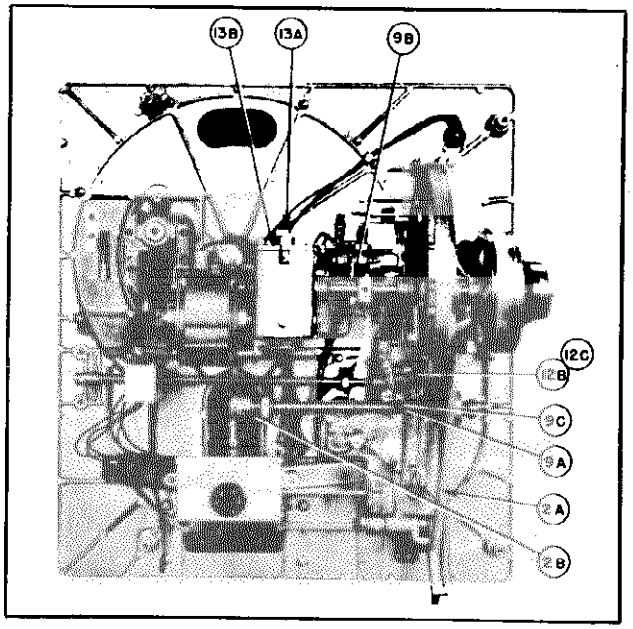

Figure 2D

TURNTABLE

1. A. Check height of turntable.
   B. Check to see that the turntable cover is of the later type with the felt extending 3/8" beyond the plastic. Also check to see that 1/8" felts have been installed on the baseplate under the bosses of the record tray.

RECORD TRAY CHECKS

2. A. Check the position of #561264 record tray slide arm spring.
   B. Check for binding between record tray gears.
   C. Check centering of record tray with turntable.
   D. Check the second pause position of the record tray.
   E. Check 10" rubber bumpers #62101.
   F. Check 10" record guard for smooth operation and roughness.

3. A. Check the distance from the center of #561297 magazine pivot pin, which is mounted in the buckhorn section of the #57138 magazine support, to the milled section of the baseplate, on which is mounted #561178 record separator hook post.
   B. Check distance between buckhorn pivot arms.

MAGAZINE CHECKS

4. A. Check distance between magazine pivot arms.
   B. Check position of the upper record support Part No. 57162 on changers incorporating the single-action separator knife, and part No. 09349 on those using the double separator knife.
   C. Check centering of record magazine in relation to #05084 record bumper guide and felt assembly and record tray.
   D. Check adjustment of #2000-269 magazine stop adjustment screw.
   E. Check adjustment of magazine linkage.
   F. Check #07340 record reverse guide assembly,
      a. centering in magazine
      b. parallel to 12" record
      c. trueness and width of fork section.
   G. Check the adjustment of #15115 record separator stop adjustment.
   H. Check the action of #15124 record separator and hub assembly.
   J. Check the relation between the end of #15124 record separator and hub assembly and #55016 record separator hook.
   K. Check the #561177 record support bracket.
   L. Check lubrication and surfaces.
   M. Check lower record support felts for loose ends and proper shape.
   N. Check record separator hook post #561178.

TONE ARM

5. A. Check tone arm height.
   B. Check the distance of travel of the tone arm in toward the turntable spindle on a 12" record.
   C. Check pickup.
   D. Check 10" and 12" adjustments.

TRIP SLIDE ASSEMBLY

6. A. Check trip slide and arm assembly.
      a. height above baseplate at rubber roller end,
      b. slide action
      c. working freely in pressed sleeve bearing in baseplate
      d. tension setting of #561213 friction trip lever screw
      e. setting of stop.

RECORD BUMPER GUIDE

7. A. Check #05084 record bumper guide and felt assembly.
      a. position
      b. curvature of ends.

8. A. Check play control.

BELOW CHASSIS—Reverse Arm Mechanism

9. A. Check position of #561238 reverse segment adjustment cam.
   B. Check adjustment of reverse arm linkage.
   C. Check adjustment of #09197 reverse arm unlocking lever assembly.

TONE ARM MECHANISM

10. A. Check horizontal and vertical position of #09198 tone arm crank assembly, also relation to #07313 tone arm swing lever assembly.
   B. Check position of #561375 tone arm brake spring collar.
   C. Check action of #13408 tone arm stop bracket assembly.
   D. Check for roughness, at the point of interception with a 12" record, of #13408 tone arm stop bracket assembly.
   E. Check position of #57142 tone arm cam.
      a. horizontally on main cam shaft.
      b. clockwise and anti-clockwise on main cam shaft for timing with main cam.
   F. Check tone arm trip pin.

MERCURY SWITCH OPERATION

11. A. Check the position of #561221 main cam shaft mercury switch reset lever,
      a. timing with main cam
      b. point of interception with #561222 mercury switch dog. Check the clearance between #09176 trip slide assembly and #561222 mercury switch dog.

MAIN CAM SHAFT ASSEMBLY

12. A. Check for horizontal play in the main cam shaft with the record magazine tilted up.
   B. With the selector lever in the one side position and while the changer is going through change cycle, check clearance between #561204 magazine slide arm selector pin and the #57154 gravity operated main cam switch rest pin (rest pin is part of the #57135 main cam casting) with the play taken up in the #07341 magazine slide arm rivet assembly toward the main cam. With the selector lever in the one side position and while the changer is going through change cycle, check for definite interception of #561204 magazine slide arm selector pin and #57155 spring loaded main cam switch with the play taken up in the #07341 magazine slide arm rivet assembly away from the main cam.
   C. Check cam switches #57154 and #57155.
   D. Check lubrication on the cam tracks.
   F. Check for screw in cam. (See page 15.)

GEAR REDUCTION BOX

13. A. Check adjustment of #561246 gear box end thrust screw.
   B. Check cover alignment.
   C. See that bottle of oil s placed in the gearbox.

MODEL 41-E,
CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

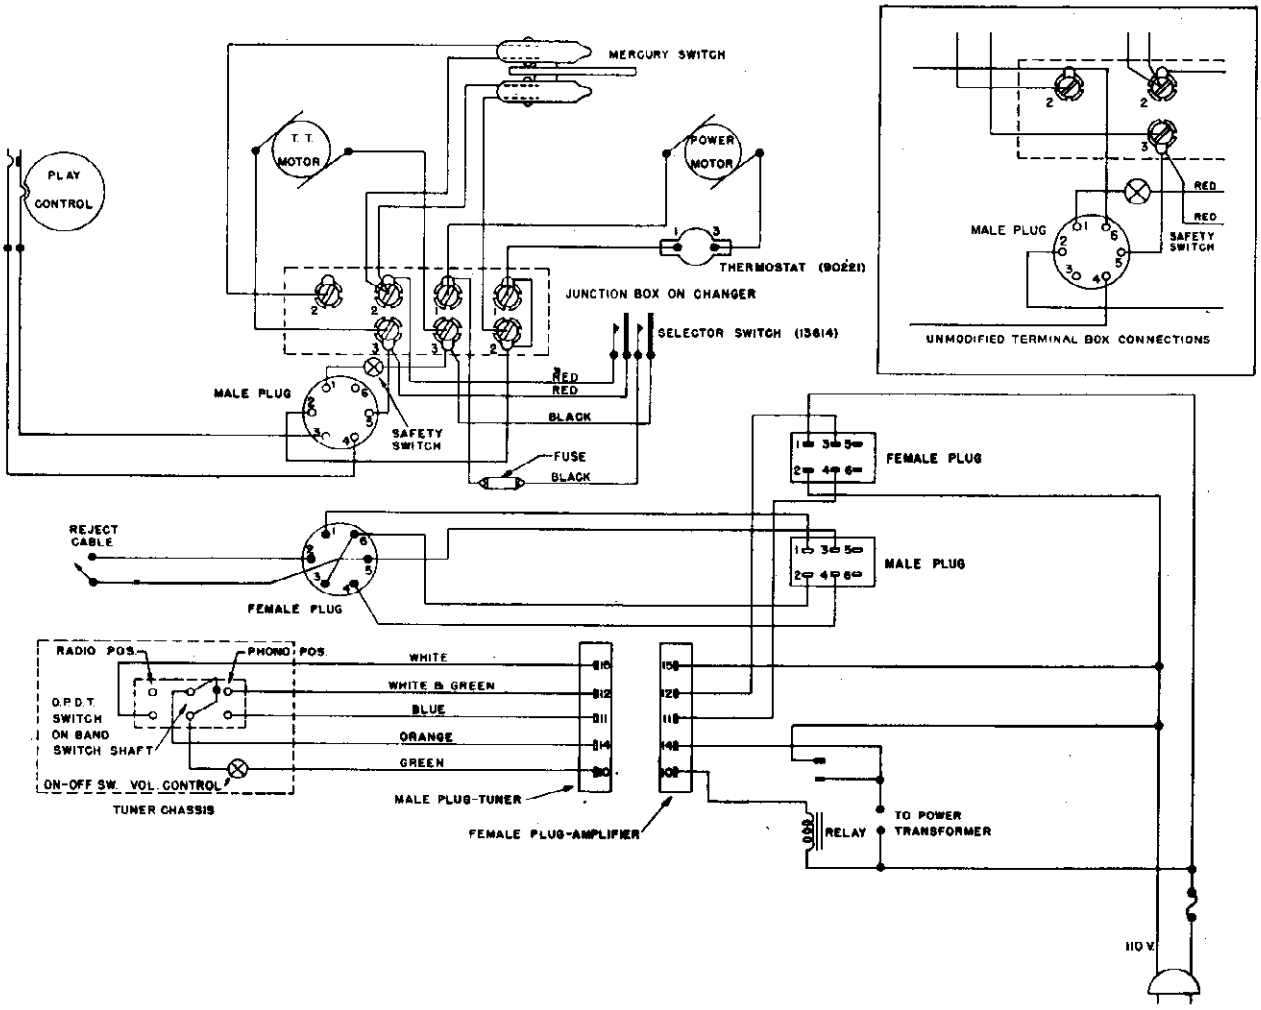

Figure 3

In the Electrical System of the 41E Changer we have:

1. Two (2) mercury switches mounted on one bracket and actuated by the mechanical trip. One operates the Cycle Motor. The other is used to keep the changer in operation to complete the cycle, should the instrument be turned off during a change cycle. These may be used to shut off current, when working under baseplate, by raising bulbs.

2. There is a manually operated switch on top of the base that opens the circuit of both motors (T. T. and C. M.) so that the changer may be stopped during any part of the cycle.

3. There is a switch that opens the circuit of the cycle motor when the shift lever is placed in the manual position.

4. Also built as part of the changer is a play control which shuts the whole instrument off after it has completed the desired number of selections. The play control is mechanically operated by the action of the magazine.

WIRING MODIFICATIONS

Wiring modifications have been two in number. (1) No fuse was incorporated in the early changers. (2) Junction box wiring was originally as here shown, which we shall term the "unmodified" changer. Identification is by a colored dot painted on the bearing cover plate of the main cam support bracket as follows:

Red dot or no dot—unmodified changer.
Brown dot—modified changer.

This modification was occasioned by the introduction of N4 instruments using the 41E changer.

At the same time, connecting cables (terminating in the 6-prong socket) of instruments other than the N4-series were changed by the addition of a jumper between terminals #3 and #6. Such a cable change permits the use of a modified changer in any instrument. Only the modified changer may be used in the N4 instrument.

The thermostat (safety) switch is mounted on the cycling motor.

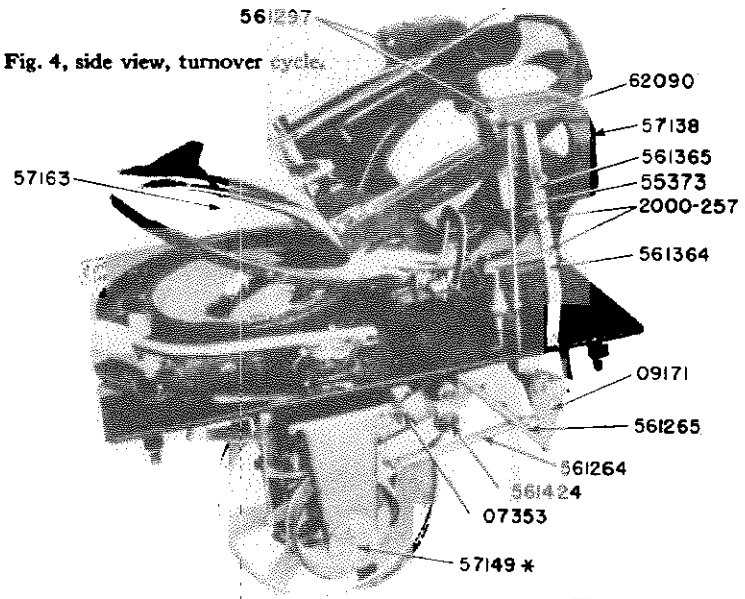

Fig. 4, side view, turnover cycle.

CAPEHART

INSTRUCTIONS FOR INSTALLING MAGAZINE SUPPORT TIE RODS

PARTS NEEDED

Right Hand Tie Rod	Left Hand Tie Rod
1 Tie Rod (Part #55373 7 15/16" long threaded at both ends	1 Tie Rod (Part #55423) 5 1/16" long threaded at both ends
2 Flat Metal Washers	2 Flat Metal Washers
1 Lock Washer	2 Lock Washers
3 Hex Nuts	4 Hex Nuts

Run one (1) nut to the full extent of the threads on each end of the rods.

1. Remove magazine link assembly (consisting of parts #561364 and #561365.)

2. Remove the four screws (under base plate) holding the magazine support (#57138), tip the magazine upward and lift magazine support backward with a folding motion, resting the support on a box or other object of proper height to prevent strain on the play control wires.

3. Drill hole in base plate 3/4" from center of separator hook boss, which will be 3 1/2" from rear of base plate and 3 27/32" from right side of base plate (as viewed in cabinet) using 13/64" drill (see drawing).

4. Drill hole in magazine support 7/16" deep with No. 25 drill, 9/16" from the center of magazine pivot pin set screw and 1/4" from edge. NOTE: DO NOT use same drill as used on base plate!

5. Tap hole in magazine support, using #10-24 bottom tap. Use care in tapping to prevent breakage of the top. Remove shavings from hole.

6. Drill hole in baseplate 3/8" from left edge and 2 3/4" from rear of base plate, using 13/64" drill (see drawing).

7. Remove play control cover plate and drill hole in the bottom of play control box 2 3/4" from rear and 5/8" from outside of box.

8. Screw short threaded end of tie rod (#55373) into magazine support as far as it will go. See that the flat washer is under the nut. Lock the nut using an end wrench.

9. Fasten the bent end of the tie rod (#55423 to the play control box (as shown) with the lock washer on inside of box. Replace control box cover plate.

10. Raise magazine support into position, inserting the rods into the holes drilled in the base plate. Replace the magazine support mounting screws.

11. Replace magazine link assembly, lower end first. The upper shoulder screw (#55009) (Fig 6.) can usually be replaced by moving magazine slightly. Otherwise, the link screws #2000-25 must be loosened.

12. Place nuts on ends of the rods protruding through the base plate and draw up the right hand nut until the distance from the top of the milled section around the hook post to the center of the magazine pivot pin is 7 9/16". Draw up the left hand nut an equal amount. Tighten the nuts above the base plate to lock the adjustment, and recheck the distance.

13. Adjust tension of the magazine. (See part 4, pages 17-18). Check the record separator hook (#55016) to see that it does not touch end of record separator (#15124).

The installation of these tie rods is intended to retain the permanency of magazine support adjustment during transit of instruments from factory to dealer. Some dealers feel that this is a desirable modification to add to early production 41-E Record Changers, when instruments are given a thorough test before delivery to a customer. It is for this reason that the foregoing instructions are herein included.

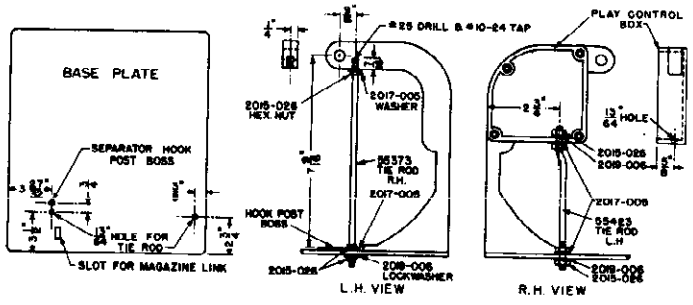

Fig. 26

MODEL 41-E, CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

OPERATING POSITIONS

On the baseplate is located the selection-arm for the three functions; manual, one side and both sides.

Manual

In this position, the instrument operates without the changer mechanism functioning—only the turntable revolves. A switch is provided at the right-front portion of the baseplate whereby the turntable may be stopped while manually changing records.

One Side

When the selector lever is in the ONE SIDE position, each record in the record magazine is played on one side only, in sequence. The records are turned over when returned to the magazine. Therefore, the second side is played on the second playing.

Both Sides

Each record is played on both sides when in this position, whereby continuity is had when selections are continuous from one side to another. In addition, the uninterrupted-playing capacity of the changer is doubled over that of conventional record changers.

LOADING MAGAZINE

To load the record magazine, place one record in the magazine with its lower edge resting on the record support bracket and push it back snugly against the shoulder of the lower record support with the top of the record in front of and resting against the lower part of the upper record support. Then the rest of the records may be placed in the magazine either singly or in groups, assuming that all records are on the record support bracket.

To load an album set of records, select the first record, place it on the record support bracket with the "A" side toward the turntable. Move the selector lever to the ONE SIDE position and press the reject button. As soon as the first record moves to the turntable, move the selector lever to the proper position for the type of album set. Check the play control and if at or near zero, reset.

TO PLAY RECORDS

After the records have been placed in the magazine, turn the program switch on the radio to "Phono" position and the "Off-On" switch on the right side of the changer to "On" position.

The changer will not start if the play control is set at "Off."

PLAY CONTROL

The play control is located at the front of the magazine. This Capehart development allows any number, up to fifty, recorded selections to be played, after which the instrument stops automatically. The play control is set by turning the knob beside the dial until the desired number of selections to be played appears opposite the pointer. If for any reason, it is desirable to have the play control inoperative, the dial may be turned beyond the number 50 until the word "OUT" is seen.

NOTE: When the play control dial is at "OFF" the record changer cannot be started.

NEEDLE LANDING

Ten-inch setting—Allow the changer to deliver a 10" record to the turntable and the tone arm to move over the record. Stop the changer with the "OFF-ON" switch and lift the tone arm so that a coin may be inserted in the slot in the tone arm indexing screw marked 10. If the tone arm is moved away from the turntable spindle, a definite stop will be noticed. Beyond this point a spring tension will tend to return the arm to the correct landing on the record. The arm should be against this "stop" while turning the 10" indexing screw. Start the changer and reject the record. Check the needle landing on the next record. If incorrect, repeat the adjustment.

Twelve-inch setting—The same procedure is followed as explained for the 10" setting except that it is necessary to use 12" records and the adjusting screw marked 12.

REJECT BUTTON

A "reject button" is located on the panel of the tuner compartment. By pushing this button, any record which is being played may be rejected. The button should be depressed for one or two seconds.

HOW IT OPERATES

"THREE CHANGERS IN ONE"

The best approach to a knowledge of the 41E changer is to accept it on the basis that it is really "Three Changers in One." A study of each of the three fundamentals will enable a quick analysis of trouble.

The first operation, (Manual), is accomplished by placing the Selector Lever in the "Manual" position, thus opening the Mercury Trip Switch circuit so the changer mechanism does not trip at the end of a record.

The second operation, (Play one side).

1. Pickup Arm is elevated.
2. Pickup Arm swings clear of Record Tray.
3. Record Tray lifts to deliver record to Magazine.
4. As record in Record Tray touches Record Support Bracket, another record is discharged from the Magazine.
5. After record is expelled from the Magazine, the Record Tray returns part way and pauses.
6. Magazine tilts, and waits to deliver record to Record Tray, which starts down again.
7. Record Tray again pauses to allow record to settle over Spindle.
8. Magazine returns to normal position as does Record Tray.
9. Pickup Arm swings in and needle is lowered to record.

The third operation, (Play both sides).

1. Pickup Arm is elevated and swings clear of the Record Tray.
2. The Record Reverse Arm and Guide swing around in front of the Magazine.
3. The Record Tray places the record against the Reversing Arm and starts back to normal position, pausing midway.

4. The Magazine tilts to slide the reversed record onto the Record Tray, pauses in its return until the record touches the front of the Tray, and then returns to normal position.
5. The record settles over the Spindle.
6. The Tray returns to normal position.
7. Pickup Arm swings against either 10" or 12" indexing screw depending on size of record.
8. Needle is lowered on record.

ONE SIDE CYCLE

The selector lever is moved to the one side position. The change cycle is started by the tone arm moving in to the trip groove of a record. In this position the trip slide assembly is moved in toward the turntable spindle. The Trip Bracket on the turntable strikes the hook on the trip slide assembly. This motion is transmitted to the mercury trip switch mounting bracket pushing it off the reset lever on the main cam shaft. The mercury switch drops, thus energizing the cycling motor. The Pickup Arm is elevated and swung clear of the Record Tray, which lifts the record off the Turntable and delivers it to the Magazine. Just before the tray with the record reaches the point where the record touches the sloping face of the Record Support Bracket, a record is rejected from the Magazine by the Record Separator. When the changer is in cycle, the Main Cam revolves; on its periphery is a raised portion that lifts the Record Separator Hook Arm, drawing the Record Separator Hook down, thereby raising the Record Separator and three records. One record is lifted to the shoulder of the Lower Record Support Assembly, and the Hook which is part of the Record Separator, and located on the center line of the Lower Record Support Assembly, engages the two bottom records of the stack and lifts them slightly. This assists in the discharge of the record from the Magazine by forcing the second and third record back against the first record, thereby helping to push it off the separator knife into the record well. The record drops to the Rubber Bumpers in the well while the Record Tray is delivering a record to the Magazine. The tray starts downward and its curved tail-piece lifts the record as the Magazine starts to tilt. The Record Tray pauses midway on its downward trip until the Magazine moves to the highest horizontal point, thus allowing the record to slide out; the Magazine then remains stationary until the record slides against the front of the Record Tray which resumes its downward movement, only pausing to allow the Magazine to lower the center hole of the record over the Spindle. The Record Tray returns to normal position as does the Magazine, the Pickup Arm swings in and is lowered, and the mercury trip switch is raised by the reset lever on the main cam shaft striking the mercury mounting bracket.

On One Side position the reverse arm linkage is locked to prevent the reverse guide from moving around in front of the magazine. Also a pin (561204 Fig. 11) on the magazine slide arm assembly is pushed into position to engage a shoulder on switch (part No. 57155) on the main cam. This throws the switch and keeps the magazine slide arm pin in the outer track.

BOTH SIDES CYCLE

The selector lever is moved to the "Both Sides" position. The cycle is started as outline under "One Side Cycle."

After the Pickup is elevated, the Record Re verse Arm and Guide Assembly swings around i front of the Magazine. When it gets to the re versing position and the Tone Arm is clear of th Record Tray, the Tray raises. As the Tray raises the record slides back against the Rear Rubbe Bumpers, and the Tray compresses the spring arr of the Record Reversing Guide. The record touche the slanting face of the Support Bracket while th Tray continues up, and the record slides up thes faces to the top surface of the Support Bracket When the Record Tray starts to return, the sprin tension of the Record Guides pushes the botton edge of the record off the support bracket and a the record Tray pauses midway to the normal o playing position, the Magazine tilts, causing th record to slide down the Record Guide. The Maga zine reaches its furthest excursion and returns par way, where it pauses, and the Record Tray con tinues downward to nearly the normal position About the time the record touches the front of the Tray, the Magazine returns to the normal position after the record has dropped over the Spindle. The Record Tray then returns to normal, and the Pick up Arm is returned as in the one side cycle.

If one carefully watches the Magazine in the Both Sides Position, it will be noted the travel of the Magazine is shorter in the "Turnover" cycle than in the change cycle. It will also be observed that there are two tracks on the side of the main cam facing the gear reduction box. The pin on the Magazine Slide Arm follows the outer track when the magazine is tilted to its highest position to discharge a record. It follows the inner track when turning a record over. The passage of the pin through one track automatically throws the switch (part No. 57155) into the opposite position so that on the next cycle the pin follows the other track thus permitting alternate discharge of a record from the magazine and then turning the record over.

In the turnover operation the gravity operated switch (part No. 57154,) strikes a lever on the Magazine Slide Arm assembly. This unlocks the reverse arm linkage permitting the reverse arm crank and roller to follow the outer edge of the main cam and thus moves the reverse arm and guide around against the front of the magazine to turn the record over. The crank and roller continue to follow the main cam until it reaches the highest point on the cam which returns the reverse arm and guide back to normal playing position. It is locked in this position until the next turnover cycle. Caution! Do not attempt to move the guide around by hand.

The segment gear which meshes with the pinion gear on the reverse crank and pin assembly has an arm which also engages a part of the record separator hook moving it off the main cam and preventing a record being discharged from the magazine during the turn-over cycle.

Due to the impossibility of covering the action of each part in the changer in the brief description above, it is essential that every service man spend considerable time observing the action of each part of the changer under each of the conditions outlined above.

MODEL 41-E,
CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

The numbering system employed in this section coincides with and refers to that of the check-list of section V. These are adjustments which may be applied to the changer in the correction of malfunction, adjustments to be effected in the event that the check list routine reveals some discrepancy. These adjustments are also referred to in the "complaint" section.

It must here be pointed out that some adjustments are interdependent with others. Therefore, after making an adjustment, if not sure that some other adjustment beforehand proper has not been disturbed, the check list should be referred to in checking other pertinent points.

TURNTABLE—Part 1

A. The top surface of the turntable should be level with the milled surface of the baseplate on which is mounted # 15133 tone arm support housing and lower bearing assembly (Note: check with a straight edge ruler long enough to extend over the complete turntable and to the milled surface). The allowable tolerance is 1/64" high or low. If this check shows the turntable to be high or low beyond this allowable tolerance, it can easily be corrected by pressing the spindle in the desired direction in the turntable. The spindle is a pressed fit in the turntable.

NOTE: To remove turntable, remove set-screw in turntable well.

RECORD TRAY—Part 2

A. Due to the use of light records, it has been found necessary to relocate the position of # 561264 record tray slide arm spring. On the first run of 41E changers, this spring was hooked to the upper pin of # 09171 magazine slide arm lever assembly. It should be mounted in a hole drilled in # 09171 magazine slide arm lever assembly through the F (the F prefixes the casting part number.) Too much tension may hang up Record Tray just before play position.

B. If the tray gears bind, the pause position of the record tray will vary with different weight records. An easy way to check for binding gears is to run the changer through change cycle stopping at the second pause position of the record tray (without records) and press lightly on the tray, if then the tray is found to assume a lower position, the gears are likely to be binding. To correct a binding condition of the tray gears, remove # 561424 eccentric shoulder screw and work tray up and down by hand with .012 shim stock between the gears. Tray gears should be aligned so that when the tray is in max. upward position, the first tooth of the tray gear will mesh in between the 2nd and 3rd teeth of the drive gear.

C. After the gears are properly meshed, the record tray should be adjusted sidewise until the turntable is uniformly spaced within the tray at the time when the record tray is raised until the front edges of the 10" felts are level with the turntable cover. After the tray has been properly positioned sidewise, tighten the two Allen set screws (36855 Fig. 5) holding the tray pivot pins, then check to see that no side play exists.

D. With the record selector lever (59172 Fig. 6) in the "One-side" position, run the record changer through a cycle. It will be noted that before the tray has come to rest in its playing position it has paused twice. So to adjust the elevation of the tray it is necessary to stop the changer in the portion of the cycle where the tray has reached the second point where it pauses. In this position the front points of the 10" felts in the record tray should be level with the turntable cover. (A straight edge should be used). If the level is not the same, loosen the nut (36857) on the back of the eccentric screw (561424. See Fig. 4.) Adjust this screw until the felts are the same height, then while holding the screw to prevent its turning, tighten the nut. A slight pressure approximately equivalent to the weight of a 10" record should be applied downward on the tray so as to duplicate normal operating conditions when this adjustment is made.

E. If bumpers are too high, the 12" records will catch on them when sliding on the tray. If too high, trim off as required.

F. Check 10" Record Guard # 57163 to see that there are no burrs and that it is not binding on the tray as where it enters the base plate. Guard roller and bracket assembly # 15116 should be adjusted so that 10" guard is not too high and rubs against 12" records. See that all polished and chrome surfaces are clean and polished.

BUCKHORN—Part 3

A. This distance should be 7 9/16". If the changer does not incorporate a buckhorn brace, this should be installed before making further adjustments. See page 21 for instructions.

B. This distance should be 13 7/16" between the inner surfaces of the buckhorn pivot arms. If this distance is found to be incorrect it can be adjusted by striking the buckhorn with a rubber hammer. Move in the desired direction by striking side of pivot arms.

MAGAZINE—Part 4

A. This distance is 13¼" (outside dimensions of pivot arms).

B. The # 57162 upper record support should be back as far as possible yet so adjusted to allow a straight (not warped) record to rest against both sides. If the upper record support is more forward, a 10" record that is followed by a 12" record may fail to be discharged from the magazine. Note new upper record support, page 20.

C. Stop the changer just as the record magazine lower forks are even with # 05084 record bumper guide and felt assembly. If not evenly spaced, shift the # 561297 magazine pivot pins allowing no side play in the magazine.

D. The record magazine should always return snugly against the magazine stop screw (2000-269). If it does not, it is necessary to place selector lever on one-side position and run the changer through its cycle until the magazine attains the maximum height position as shown in Fig. 6. Stop the cycle

by use of the on-off switch. Loosen the two adjusting screws on the magazine actuating link to a sliding tension. Press downward on the lower part of the magazine thus lengthening the magazine link assembly. Now resume the cycle, and when the magazine touches the magazine stop screw, the magazine will adjust itself, after which the adjusting screws on the link assembly should be tightened securely. Avoid too much tension to prevent distortion of #57138 magazine support. Too much tension may cause failure of changer to start change cycle.

E. Just as the changer is starting a reverse cycle and the #07340 record reverse guide assembly has just swung around in front of the magazine, stop the changer and check to see that the reverse arm fork (#55015) projects approximately 1/16" beyond reverse arm crank pin (#15144) with the magazine held firmly against #2000-269 magazine stop screw. If not, correct by adjusting stop screw.

F. (a) After the #07340 record reverse guide assembly has swung around in front of the magazine, stop the changer and see that it is equally spaced between the ends of #56177 record support bracket. If not, loosen the two screws mounted up through #57143 record reverse arm and shift in the desired direction.

(b) If the guide is parallel with the 12" record, it should return and rest against the rubber bumper on the magazine support assembly, in such a position as shown in Fig. 5. If the eccentric cam (561235 Fig. 7) is properly adjusted, the guide will rest against the rubber bumper; however, if the record reverse guide does not properly return, loosen the nut holding the eccentric cam and rotate the cam slightly until the correct position is secured. CAUTION! Do not attempt to move the record reverse arm and guide assembly in front of the magazine by hand.

(c) The upper fork section should be parallel with the magazine so as to avoid pushing one side of a 12" record over the outer 10" rubber bumpers on the tray before the other. If this is not the case unclip the fork from #39130 reverse guide spring and form in the desired direction. Also if the ends of this upper fork are too close together, it will be noted that the tray has a tendency to raise the reverse guide assembly. To correct this unclip from the #39130 reverse guide spring and bend the ends of the fork out.

G. With the magazine tilted up set the separator knife stop so as to allow at least 1/64" and not more than 1/32" between the record separator and a "V" edge 10" record. (With a 10" record in the magazine, the upper edge of the record separator should be flush with the top of the lower support.) To adjust the position of the record separator, move the record separator stop to the position desired by loosening the two screws (2012-151) holding this stop. This stop (15115) is shown clearly in the end view portion of Fig. 14, and is located at the rear of the right bottom side of the magazine. When the magazine has returned to playing position the record separator hook should then be readjusted. Make sure that screws #2012-151 are not too long. These should be 6-32 x 1 16" binder head screws.

H. The end of the record separator that comes in contact with the records, should be as snug against the magazine as possible without binding. To accomplish this, it may be necessary to remove the record separator and bend the end toward the hook so that it will be perfectly free at that end and then bend it 3/8" from the hub toward the knife end and reinstall it. It now may be binding some against the magazine but with a thin screw-driver it can be bent back a little at a time to arrive at its proper position. It may be found helpful to slightly bend the tip end away from or toward the magazine casting for the use of some of the present records on the market. Check to see that the knife operates freely.

J. Adjust the #55016 record separator hook so that the #15124 record separator and hub assembly will not be disturbed as the magazine comes back to its normal position. Hook should not touch end of knife. If a complete turn of the hook gives more adjustment than is desired, some adjustment may be gained by bending the end of the record separator.

K. The top surface of the outer ends of #561177 record support bracket should be slightly higher than the rear rubber bumpers on the record tray with the tray in the vertical position. Two Allen screws are provided in the magazine directly under the record support to make this adjustment if needed. If the outer ends of the record support bracket should be slightly lower than the rubber bumpers on the tray, records will be pulled back off of the record support bracket as the tray starts to lower itself. Adjust screws #2041-132 so that the lower record support #561177 lifts the record off the rear record tray bumpers #62102.

L. See that rollers on the magazine are operating freely and that all polished and chrome surfaces that contact the record are kept clean and polished.

M. The position of these felts (#92197) is shown in Fig. 14. Check to see that they are securely cemented to the magazine and that the inner ends are cut off at a 45 degree angle so as not to restrict the dropping of records.

N. This post should be adjusted for improved operation of the single-action separator by raising until the roller on separator lever 561212 clears the periphery of the main cam by 1/32", lock into position by a lock nut. (To add this lock nut, 1. remove pin from below baseplate on separator hook assembly 09218, 2. screw on adjusting nut 37347 (size), 3. replace pin in separator hook assembly, 4. adjust separator hook post 561178 so that lever arm will have 1/32" clearance on cam 57135, 5. secure separator hook post with locking nut.)

TONE ARM Part 5

A. Check tone arm height. Pick up needle should barely clear turntable cover when the tone arm swings over without record on turntable. Adjustment is made with slotted head screw #2043-133. After setting is correctly made, one or two drops of shellac placed on top of screw will prevent loss of setting from vibration. Alcohol may be used to free screw.

B. The tone arm should come in far enough on a 12" record for the stylus to freely come in past the label on the record. If this condition does not exist, it is possible that the tone crank assembly #09198 is being restricted by the tone arm swing lever assembly #07313 being bent down at the point of interception or there is not enough clearance in

the cut out portion of the tone arm swing lever assembly. This can be easily corrected by removing the tone arm swing lever assembly and filing 1/32" in the cut out portion of the tone arm swing lever where the tone arm crank rides against. CAUTION! Be sure to file evenly across this 5/8" portion of the tone arm swing lever assembly.

C. See that the pickup is parallel to the record.

D. 10" adjustment: For 10" adjustment allow the changer to deliver a 10" record to the turntable and the tone arm move over the record. Stop the changer by use of the On-Off switch after the changer has completed its cycle. Lift the tone arm to give access to the indexing screw marked 10. As the tone arm is moved away from the spindle a definite "stop-point" will be noticed. Beyond this point, a spring tension will tend to return the tone arm to the correct landing on the record. The tone arm should be against the "stop point." while turning the 10" indexing screw. The needle landing should be 3/32" in from the edge of both 10" and 12" records. Allow the changer to complete one more cycle and note the tone arm set down. If incorrect the above adjustment should be repeated. If 10" record adjustment is not sufficient, see part 11a.

12" adjustment: For 12" adjustment the same procedure as above should be followed except a 12" record should be used and the indexing screw marked 12 is adjusted. When used with a 12" record the tone arm stop bracket (13408 Fig. 24) is pushed down by the record and allows the 12" indexing screw to control the needle landing. Note: Tone arm action will be erratic if bracket # 57145 is bent. Make sure that tone arm trays pin # 561239 does not screw into support too far and bind the tone arm lift rod. Check for burrs in bearing assembly.

TRIP SLIDE ASSEMBLY—Part 6

On instruments using the piano wire spring on trips, remove and discard the piano wire spring from trip slide assembly # 09176. Carefully reinstall the various parts, except for piano wire spring, being sure to maintain their original relationship. Be sure that the trip stud on the tone arm support tube assembly is carefully inserted inside of the "U" shaped trip lever # 561190.

The stop is to be set so that it will only be intercepted by the lower portion of the trip slide assembly and set so as to make it impossible for the trip clip, mounted on the underside of the turntable, to ever catch on the end of the trip slide assembly (this would stall the turntable). This can easily be checked by replacing the turntable and turning by hand while holding the trip slide assembly in toward the spindle and noting the amount of travel of the upper portion of the trip slide assembly, if this is three fourths of the possible travel, the stop is set correctly.

A. Should be at least 1/8" above the baseplate, also check to see that it will definitely be intercepted by the trip clip, mounted on the under side of the turntable. If it is too high, the turntable trip clip mounting screws will strike # 561299 trip stud causing a clicking noise. As not to disturb the slide action, all bending should be at the end opposite the rubber roller. The action should be positive with no possibility of sticking. Use no lubricant. This should work free enough as not to require more than 1½ grams pressure to move it at the rubber roller end. If this is not the case polish with crocus cloth the surfaces causing the friction (the stud on the trip slide assembly and the pressed sleeve bearing in the baseplate. In polishing the pressed sleeve bearing in the baseplate, better results may be gained by using a circular motion, that is by wrapping the crocus cloth around a pencil. Set this screw as to gain a tension of from 5 to 7 grams at the rubber roller end. Whenever trip is re-adjusted, screw No. 561213, Fig. 18, page 13, should be removed. When replacing screw in order to "HOLD" its adjustment, use a slight amount of cement or shellac on the threads. After proper adjustment, has been effected, let stand five or ten minutes until cement sets.

RECORD BUMPER GUIDE—Part 7

A. The record bumper guide # 05084 (or "U" bracket) and felt assembly should be mounted as far toward the magazine side of the changer as possible and yet not restricting the record tray from dropping into its rest position. The bottom ends should be curved as far as possible toward the turntable and yet still allowing a 12" record (to check, use as thick a record as is normally ever used on the changer) to drop freely into the record well onto the sponge rubber bumpers.

PLAY CONTROL—Part 8

A. Make sure that the spring on the magazine is so adjusted that the play control will move positively as the magazine comes to its rest position. Check to see that the # 59181 play control escutcheon is not restricting the movement of the play control knob and dial assembly.

NOTE: When replacing play control knob and dial assembly, place the dial in off position so that the contact points are left open, in that manner there is no strain or pressure on the dial, which will allow shoulder screw to be replaced without binding cork washer or rachet gear.

REVERSE ARM MECHANISM—Part 9

A. With the Record Selector in the Both Sides position, run the changer through a cycle until the point is reached where the Record Reverse Guide swings in front of the Magazine. In this position the Crank Pin should touch the side of the Record Reverse Fork that is toward the magazine without binding.

B. Stop the changer just before it has completed a reverse cycle, that is just as the roller on # 09172 reverse arm crank assembly is on the highest point on the outer periphery of the main cam and check to see that the pin on assembly 15144 reverse pinion crank and pin is centered or free in the slot of record reverse fork part # 55015. If not free, adjust # 561235 eccentric adjusting screw. See Fig. 10. Caution, with the use of an eccentric screw, two maximums and two minimums may be reached with the full 360 degree turn of the screw. Use the 180 degree swing most favorable to keep the # 561196 reverse arm link away from the baseplate rib which it works near to.

C. Now allowing the changer to complete the reverse cycle and the roller has just dropped off the highest point of the main cam, check to see that the hook on #09197 reverse arm unlocking assembly is just holding the roller off of the main cam. This can be checked, either of two ways, first by unlocking and locking it by hand to see that the pressure is on the hook or by checking to see that the roller can be turned by hand. If this adjustment is incorrect, loosen #2000-155 set screws and adjust center eccentric screw, after correct adjustment tighten set screws. See Fig. 10. It may be necessary to loosen screw 2012-263 and turn eccentric spacer 561238 slghtly to insure more positive action of hook. In making this adjustment, make sure that the point of reverse arm unlocking lever #09197 does not catch on the main cam track walls—should clear by 1/16". Be sure the screw 2000-167 in Fig. 7 is screwed half way in and locked with the nut. This prevents the Separator Hook from ejecting a record from the magazine during the Reverse Cycle, and allowing the record to be caught under the returning magazine, due to its inability to reach the turntable while another record is being reversed. If not, adjust eccentric cam #561238 Fig. 7 until pin is properly set.

TONE ARM MECHANISM—Part 10

A. To determine the proper position of the tone arm crank assembly, it is necessary to set the 12" record adjusting screw #561194 in the center of its eccentric swing and then set the tone arm crank so that the tone arm pickup stylus will set down properly on the edge of a 12" record. If the allen set screw #2041-132 in the 12" tone arm-adjusting nut #561255 is facing either side of the changer (or nearly so) and the tone arm to setting down correctly on 12" records it can safely be assumed that the tone arm crank assembly is horizontally set correctly. For vertical setting, see that there is at least .008" play up and down of the tone arm support bracket #57145. Also check to see that the tone arm crank assembly is far enough down in the tone arm swing lever assembly #07313. It may be necessary to use more than one cork washer above the tone arm crank assembly or a thicker washer.

B. With the changer in the playing position the tone arm brake spring collar should be just against the spring. If the collar is too far up against the spring, the movement of the tone arm will be restricted. If the collar is not up against the spring, the tone arm lift rod #561270 may not smoothly follow the cam track and a little chatter is heard.

C. The action of the tone arm stop bracket assembly should be free enough to be readily actuated by a very light record. Failure to be perfectly free may be found to be that the torsion spring is bent too much at the end or ends. It is very important that the intercepter reset lever #561285 is so formed as to raise the intercepter lever to the highest point, not just past center and depending on the torsion spring to raise it the rest of the way.

D. If the point of interception with a 12" record is found to be rough or with a burr be sure to properly grind off and polish.

E. a. By stopping the changer just as the to arm has swung out to its extreme limit, check see that the pin on the tone arm swing lever a sembly #07313 is not binding on the tone arm ca To correct a binding condition move the tone ar cam further in toward the main cam.

b. The tone arm cam should be so timed wi the main cam so as to just allow the tone arm swing out before the tray rises. Setting the to arm cam at this point minimizes the possibili of the tone arm starting to raise as the chang stops in the playing position.

MERCURY SWITCH OPERATION—Part

A. a. The #561221 main cam mercury swit reset lever should be so adjusted on the main ca shaft as to allow the changer to stop the chan cycle as the highest point on the outer periphe of the main cam has passed the roller on #091 reverse arm crank assembly approximately 3/ Examine for burrs on top edge of part No. 56122

b. The mercury switch dog should be inte cepted by the main cam shaft mercury switch res lever on its outer edge (the edge opposite the bend

NOTE: Wire to mercury switches must be fr (not stiff) and long enough for freedom of motio

MAIN CAM SHAFT ASSEMBLY—Part 12

A. About .020" horizontal play is permissib in the main cam shaft, if greater loosen the fo mounting screws of the outer main cam sha mounting bracket and place shims between moun ing bracket and base plate at the outer edge an tighten screws.

B. It will be noted that shortly before th changer completes a change cycle (one side pos tion), the selector pin passes very close to the re pin on the main cam and should these pins b intercepted by one another, the changer will eith jerk at this point or possibly stall. It is possibl that the #561216 magazine slide arm selecto lever is so formed that it is pushing the selecto pin further in than is actually necessary to defi itely retrack the #57155 spring loaded main ca switch. More clearance may be gained by eithe slightly reforming the magazine slide arm selecto lever or filing a little off the end of the rest pin o the main cam or both.

C. Should operate freely and have a minimun of side play.

D. Use petroleum jelly such as Vaseline.

GEAR REDUCTION BOX—Part 13

A. Check for end play in Second Reductio gear shift. Adjustment made with changer in play ing position. Loosen lock nut 36861, turn screw 561246 up snug and back out approximately 1/ turn until shaft does not bind. Tighten lock nut Trip changer and run through one cycle. If cyclin motor will not start, adjustment is too tight. I gear chatters, adjustment is too loose.

B. If cover is not aligned properly, it will caus binding of gears.

C. Should use two ounces of special Capeha gearbox oil.

MODEL 41-E, CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

MAINTENANCE OF THE CHANGER

SECTION VIII

References are to section X, that showing adjustments to the changer.

1. RECORD BREAKAGE
   - A. See page 16.
   - B. All polished surfaces on magazine and tray should be cleaned
   - C. Improper loading
2. CHANGER NOISE
   - A. Motor noise. Misalignment of motor or gear
   - B. A "groaning" noise may be heard as magazine is tilting if the thrust bearing adjustment on the gear reduction box is too loose.
   - C. The record bumper guide may be adjusted improperly, allowing 12" records, especially, to strike the lower bent portion of the bumper guide and be deflected against the back of the record magazine, instead of dropping on the rubber bumpers in the baseplate. This occurs as the record is separated and dropped from the record stack. If an early correction is not made the felt may be worn off the bumper guide, causing extra noise.
   - B. Rubber bumpers in record tray may be worn, permitting records to strike tray instead of bumper.
3. NEEDLE DRAGS ON TURNTABLE COVER
   Check tone arm height, adj. sec. 5A. See adj. sec. 5A
4. POOR TONE
   - A. Wow may be due to worn spot on idler pulley
   - B. Check pickup and tubes
5. IMPROPER NEEDLE LANDING
   - A. Check tone arm adjustments, adj. sec. 5D.
6. DOES NOT TRIP PROPERLY
   - A. See Adj. sec. 6A
   - B. Stud on baseplate under turntable may be holding trip lever out too far to contact trip pin on the turntable.
   - C. Cycling motor or changer stalls or jams.
7. TRIP CLICK
   - A. See fig. 18
   - B. See Adj. sec. 6A
8. REVERSE ARM MOTION SLUGGISH
   - A. Adj. sec. 4D, E, F, J, 9A, B, C
   - B. Pickup arm binding
   - C. Adj. sec. 10A, B, E
9. RECORD NOT CENTERING ON SPINDLE
   - A. Adj. sec. 3A, B, 4A, 1A, 2A, B, C, D, E
   - B. 12" records jamming in magazine
   - C. Adj. sec. 7A
10. TWO RECORDS COMING OUT AT ONE TIME
    - A. See adj. sec. 4H
    - B. Be sure that record chips are not lodged behind knife
11. MAGAZINE JUMPS (JERKS) AT FULL RETURN
    - A. Adj. sec. 4E, F
12. RECORD TRAY STICKING
    - A. Adj. sec. 2A, B
13. CHATTERING GEARS, GEARBOX
    - A. Adj. sec. 13A
    - B. Check lubrication
14. CHISEL EDGE RECORD HANGS UP behind record support bracket projections in turnover cycle
    - A. See 4L, adj. sec.
15. RECORDS FAIL TO MOVE INTO WELL
    - A. Magazine rollers should be free and oiled
    - B. See adj. sec. 4B, G, H, J, M, N
    - C. Insufficient records. Six to sixteen provide best operation
    - D. Warped records and/or chips on edges.
16. 12" RECORDS MARKED NEAR EDGE IN PLAYING GROOVE
    - A. See adj. sec. 1A, B, 2F, 10C, D
17. 12" RECORD HANGING UP IN MAGAZINE, usually occurring when followed by number of 10" records
    - A. See adj. sec. 4D, 7A
    - B. See that the wires in the record tray are properly imbedded
18. 12" RECORDS CATCH ON 10" RUBBER BUMPERS
    - A. See adj. sec. 2E
19. RECORD COMES OUT ON TURNOVER CYCLE
    - A. Make sure stop screw #2000-167 on separator hook arm #57172 does not hang on cam #561238
20. MOTOR STALLS
    - A. Check whether actually stalled when energized or if not energized by holding piece of iron against frame to detect magnetic field

    IF NOT ENERGIZED
    - A. Check switch operated by record selector lever (cycling motor)
    - B. Play control in out position or defective points (both motors)
    - C. On-Off switch (both motors)
    - D. Thermostat (cycling motors)
    - E. Fuse in terminal box. (Cycling notes)
    - F. If reject button is pressed and released before main drive shaft rotates sufficiently to drop mercury switch. (Cycling motor). Instruct operator to hold reject button down for a few seconds rather than only for an instant.
    - G. Unmodified changer with N4 instrument

    IF ENERGIZED
    - A. Defective motor
    - B. Check thrust on motor drive shaft (cycling motor)
    - C. Check alignment of motor and gearbox cover (cycling motor)
    - D. Mercury switch binding (cycling motor)
    - E. Check changer for jams (cycling motor)
    - F. Defective mercury switches (cycling motor)

RESHAPING THE INTERCEPTOR—RESET LEVER

As an aid in record-separation by action of the separator knife, the two steps outlined below are given. These lead to an extra "Kick" by the separator knife which has been found to be advantageous in separating records which do not conform to manufacturers' standards.

First, disassemble the interceptor reset lever and bend a larger radius of curvature on the end as sketched:

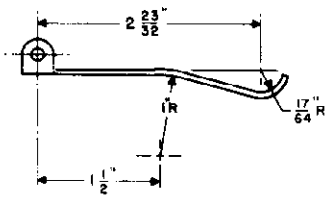

Fig. 25

This larger curvature is to assure that the end of the interceptor reset lever which contacts the main cam will pass over the machine bolt next added.

Second, drill the main cam with a #45 drill at the point giving GREATEST ELEVATION of the separator lever.

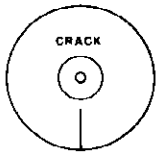
Tap with a 4-36 tap and install a 4-36, 1/8" binder head machine screw. This is the same screw which is used in the tray assembly, No. 36278. This operation must be done with due care, that the hole be drilled without damage to the cam and that the tap be not broken off in the hole. Since we are dealing with aluminum, it is recommended that a thread finer than #36 be not used. Remove burrs from the main cam outside periphery.

FARNSWORTH TELEV. & RADIO CORP. MODEL 41-
CAPEHART

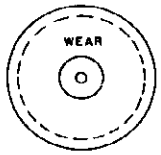
PROBABLE CAUSE OF RECORD INJURY

Figures shown here of record injuries are exaggerated merely to illustrate damage which might occur to records due to improper changer adjustments. For example records with small nicks or wear might have to be scrutinized closely observe the damage. If they are prevalent t changer should be adjusted to eliminate furth record damage.

LARGE NICK
Magazine too far forward. Record support pins bent.



CRACK
Magazine too far forward. Magazine overloaded (more than 16 records).



WEAR
Interceptor lever too tight or burr on top of lever. Install felt-edge turntable cover. Check record tray adjustment.

SMALL NICK
Made in turnover position. Check shoulder on reco support bracket. These should not be too steep. File a use crocus cloth or replace with later type of bracket.

SMALL BREAK
Record failing to drop in well. Dropping late or sticki on slide rolls of magazine. Improper knife height adjustme

LARGE BREAK
Complete breakout caused by failure of record to sl from magazine to tray. See items 2 and 4 of section VI.

The following tools are necessary to complete adjustment of the 41E changer.

Part No.	Description
37149	1/4" Allen wrench
88086	#8 Allen wrench
88326	#6 Allen wrench
88327	#10 Allen wrench
88065	8-32 Bristol wrench
37159	6-32 Bristol wrench

3/8" Spintite wrench
11/32" Spintite wrench
5/16" Spintite wrench
1/4" Spintite wrench
9/16 flat end wrench
7/16" flat end wrench
4" or 6" Crescent adjustable end wrench
Heavy screwdriver
Medium screwdriver
Medium Phillips screwdriver

REPLACING GEARS, COLLARS AND SHAFTS

SECTION IX

The expense and inconvenience of stocking complete taper pinned assemblies has been eliminated by adopting standard automotive practice. This method of supplying shafts drilled, or gears or collars drilled through one side, allow the individual parts to be reamed to an accurate taper for the pin. Parts finished with pilot hole drilled are designated with ▼.

To replace a gear or collar, center the pilot hole with the small diameter of the present taper pin hole in the shaft and drill through to the other side of the gear or collar, using size drill specified in the table below. Then, using the specified size taper reamer, the hole is reamed through the shaft and gear or collar. Be sure the large diameter of taper in the gear or collar will align with the large diameter of taper in the present hole in the shaft when the parts are in correct position. The pin may now be inserted.

To replace a shaft, the gear or collar is installed in correct position on the shaft and the specified size reamer run through gear or collar and shaft pilot hole. Insert taper pin.

Drill and Taper Reamer Size

Description	Drill	Tap Rear

MODEL 41-E, CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

LUBRICATING THE CHANGER

The 41-E changer is shipped with a one-ounce bottle of oil. THIS OIL MUST BE PLACED IN THE GEARBOX PRIOR TO OPERATION. A medicine dropper is convenient for this operation.

Materials needed: Light oil SAE 10; lubriplate; carbon tetrachloride; cleaning cloth; wrench, to fit gear reduction box cover screws; screw driver.

Approximately twice a year a few drops of oil should be applied in the oil holes at each end of the cycling motor. The turntable motor armature should be raised vertically by hand and a few drops of oil applied to the lower bearing. The turntable should be removed and oil applied to the upper turntable drive bearing being careful not to get any oil on the rubber tired idler pulley or the inner rim of the turntable. The idler pulley should be removed and a drop or two of oil placed on its bearing. If the changer is out of the cabinet the hair pin cotter and lower thrust washer can be removed and the idler pulley taken out. If the changer is in the cabinet it will be easier to remove the three motor mounting screws and lift up the motor thus exposing the hair pin cotter and washer. Apply a few drops of oil to the felt washer above the center turntable spindle bearing.

The main cam tracks and slide arms should then be thoroughly cleaned using a cloth saturated with carbon tetrachloride. The cam tracks and slide arms should then be covered with a light coat of lubriplate.

The oil in the gear reduction box should not need replenishing for an indefinite period of time. However, if in doubt the cover can be removed allowing the oil to drain and after replacing the cover one ounce may be added either by removing the pipe plug in the cover or removing the neoprene plug in the side opposite the cycling motor. A medicine dropper is convenient for placing oil in the gearbox.

CONVERSION TO 50 CYCLE OPERATION CAPEHART 41-E RECORD CHANGER

The Capehart instrument normally operates from power mains supplying 105-125 volts at 60 cycles. Operation from 50 cycle mains, without conversion, would result in

(1) slow turntable speed

(2) turntable-drive motor would overheat and might become damaged.

Conversion for 50 cycle operation may be made in the following steps:

1. Obtain from the Capehart Service Department at Fort Wayne, Indiana, a kit for making the conversion consisting of (a) Special 50 watt resistor with mounting assembly (b) Turntable motorshaft spring bushing (c) "50 cycle" tag to be attached to the cabinet, indicating the conversion. This kit is part No. 41135

2. Remove the set-screw in the turntable well and remove turntable. Should the ball bearing upon which the shaft revolves come out, it must be replaced before replacing turntable

3. Place the bushing spring over the turntable motor shaft.

4. Replace turntable and tighten set screw in turntable well.

5. Mount the resistor assembly as shown on the accompanying sketch.

6. Remove jumper between terminals 1 and 2 on the terminal strip.

7. Move the turntable wire from #3 to #1.

8. Move thermostat wire from #1 to #2.

9. Connect the resistor between terminals 1 and 3.

10. Attach the "50 cycle" tag to the inside of the cabinet in a prominent place.

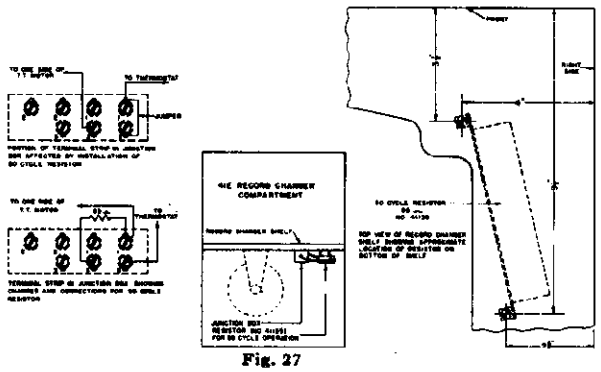

Fig. 27

PARTS

Part No.	Description
05074	Play control knob and dial assembly
05084	Record bumper guide and felt assembly
07313	Tone arm swing lever assembly
07314	Play control pawl assembly
07340	Record reverse guide assembly
07341	Magazine slide arm rivet assembly
07353	P. U. socket and bracket assembly
09171	Magazine slide arm lever assembly
09176	Trip slide assembly
09180	Switch lever assembly
09182	Reverse arm lever, crank and pin assembly.
09185	Mtg. bracket assembly, mercury switch
09197	Reverse arm unlocking lever assembly
09198	Tone arm crank assembly
11278	Pickup head assembly
13408	Tone arm stop bracket assembly
13419	Reverse arm and fork assembly
13422	Record tray assembly
13424	Turntable assembly
13432	Play control switch assembly
13583	Idler pulley
13614	Switch and bracket assembly, manual
13494	Reverse pinion and crank assembly
13710	Cement for turntable cover
15115	Record separator stop assembly

ELECTRICAL-MECHANICAL SPECIFICATIONS

Power Consumption at 117 Volts
- Turntable Motor ..... 17 Watts
- Cycling Motor ..... 91 Watts

Voltage Rating ..... 105 to 125 Watts at 60 Cycles*

Turntable Speed at 117 Volts ..... 78 r.p.m.

Maximum Record Capacity
- 10 Inch Records ..... 16 Records
- 12 Inch Records ..... 16 Records
- 10 Inch & 12 Inch Intermixed ..... 16 Reco

(Records Can Be Played on Both Sides or One Side Only)

Type of Pickup ..... Capehart True Tim

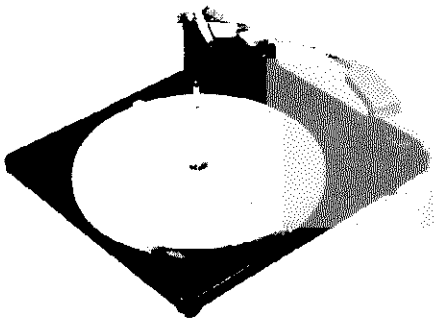
Type of Needle ..... Permanent "Precious Metal" Po

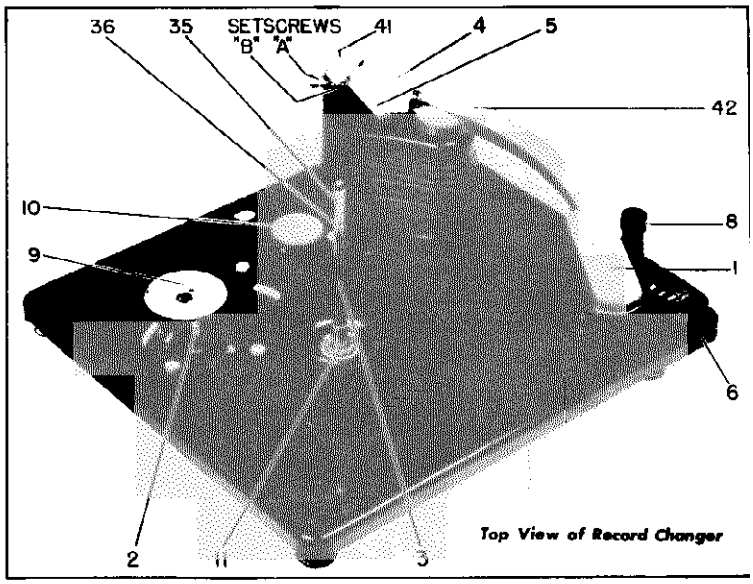
*50 Cycle Operation with Modification.

MODEL 41-E, CAPEHART

FARNSWORTH TELEV. & RADIO CORP.

Part No.	Description
15116	Guard roller and bracket assembly (10")
15124	Record separator and hub assembly
15133	Tone arm support housing and lower bearing assembly
15146	Separator hook arm assembly
34159	Arm lever pin magazine slide
36236	#6—32 x 1/2" Phillips O.H.M.S., St., St. Br., Play control
36278	#4—36 x 3/16" Bd. H.M.S. steel, stat. br., record tray
36279	#4—36 x 1/8" Bdg. H.M.S. steel
36835	Driv-Lok pin, type 1/8" x 3/4"
36845	#10 flat washer 3/4" O. D.
36852	5/32 x 5/8" Driv-Lok pin, type "F," gear box
36853	1/4-20 x 1/4" Allen cup pt. set screw, st., park., tone arm cam
36854	Cotter pin, 1/16" x 1/2"
36855	#10—24 x 1/4" Allen set screw
36856	3/8-24 hex nut, magazine slide arm
36857	1/4-28 hex nut, tray slide arm assembly
36858	#10-24 x 3/8" Hex H.M.S. steel, cad., gear box cover
36859	#10 flat washer 3/8" o.d. steel, chrome, magazine link assembly
36860	#8 flat washer, 1/2" o.d.
36861	7/16-20 hex nut, gear box thrust lock
36862	Flat washer, magazine slide arm
36864	#0 x 1 3/16" taper pin main cam collar
36865	#10-24 x 1/2" H.H.M.S., tone arm crank
36873	Spring wave washer, play control knob and dial assembly
36880	Rivet 1/8" x 1/8" steel, chrome, record reverse guide arm assembly
36882	Hairpin cotter
36911	#0 x 3/16" drive screw, main cam switch arm
36933	#5-40 x 1/2" R.H.M.S., play control switch mtg.
36984	Driv-Lok pin type "E" 3/32" dia. x 3/4" lg., tray shaft
37172	#4-36 x 1/8" flat hd. M.S. brass, brt. nic., tone arm
37180	#6 x 1/4" R.H.S.T.S., P.K. type "A" cad., junction box cover
37250	#4 x 1/4" R.H.M.S. self-tap. screw, P.K. type "2" cad., manual switch cover
37363	Flat washer (brass)
37364	Hairpin cotter (Hubbard #115)
39130	Reverse guide spring
44036	Cycling motor
44037	Turntable motor
48013	3 amp., 250 v. fuse
54093	Bearing support shim, main cam shaft
54094	Cork washer, friction trip
54095	Motor to gear box gasket
54096	Gasket, thrust cover plate
54097	Cover plate gasket, large, reduction gear box
54162	Turntable cover assembly
54274	Fuse cover
55009	Shoulder screw, magazine link
55010	Screw, Reversing arm lock
55014	Record tray shaft collar▼
55016	Record separator hook
55231	Sleeve bearing, second reduction shaft
55358	Sleeve spacer
55373	Buckhorn brace
55375	Tone arm rest
561177	Record support bracket, chrome
561178	Separator hook post
561179	Tray hinge pin
561180	Reversing arm lock
561182	Main cam shaft▼
561189	Turntable trip bracket
561190	Auto. stop trip lever
561191	Selector shaft▼
561192	Spacer, magazine slide arm
561194	Adjusting screw, 10" and 12" set down
561196	Reverse arm link
561198	Locking lever hook
561201	Cycling motor mtg. bolt, long
561203	Shoulder screw, reverse arm link
561204	Selector pin, magazine slide arm
561212	Separator lever
561213	Friction trip lever screw
561215	Selector lever lock
561216	Magazine slide arm selector lever
561220	Spring stop washer, record tray shaft
561221	Mercury switch reset lever, main cam shaft
561222	Mercury switch dog
561224	Main shaft gear, second reduction▼
561225	Second reduction gear and shaft
561230	Shoulder screw, reverse unlocking lever
561231	Record tray shaft▼
561232	Magazine roller bracket
561233	Magazine roller
561234	Record tray slide pin
561235	Eccentric shoulder screw, reverse lever
561236	Spring wave washer, friction trip
561237	Spring, magazine slide arm unlocking lever
561238	Adjustment cam, reverse segment stop
561239	Tone arm trip pin
561240	Spacer, tone arm stop bracket
561241	Spacer, tone arm swing lever
561242	Sleeve bearing, record tray, magazine pivot, and second reduction shaft (cover plate)
561243	Sleeve bearing, small, main shaft
561244	Sleeve bearing, large, main shaft
561246	End thrust screw, gear box
561248	End thrust plate, turntable shaft housing and reduction gear box
561254	Tone arm hinge pin
561255	Tone arm set down adjustment nut
561256	Shoulder screw, main cam
561257	Shoulder screw, main cam
561263	Hair pin spring, main cam switch arm
561264	Spring, record tray slide arm
561265	Spring, magazine slide arm lever
561266	Spring, magazine slide arm selector lever
561267	Spring, selector shaft
561268	Spring, magazine slide arm selector pin
561269	Spring, reverse segment arm lever
561270	Tone arm lift rod
561272	Manual switch lever and hub (on selector shaft)
561273	Record tray slide arm
561274	Locking plate, selector lever
561275	Spring, record separator
561283	Play control cover plate
561284	Play control ratchet
561285	Interceptor reset lever, tone arm set down
561286	Interceptor reset lever bracket, tone arm set down
561292	Play control stud
561293	Play control pawl screw
561297	Magazine pivot pin
561298	Record tray shoulder screw, 10" guard
561299	Trip stud
561301	Magazine slide roller
561302	Tray slide roller
561303	Magazine slide arm shoulder screw
561304	Shoulder screw, mercury switch mount
561306	Spring stud, tone arm stop bracket
561307	Reset lever hinge pin, tone arm stop
561363	Mounting bracket, cycling motor
561364	Magazine link, lower
561365	Magazine link, upper
561369	Reverse guide rest pin sleeve
561370	Reverse guide rest pin
561371	Shoulder screw, separator knife
561372	Tray shaft bearing, main frame
561373	Shoulder screw, reverse segment
561374	Cycling motor mounting bolt, short
561375	Collar, tone arm brake spring
561376	Main frame turntable spindle bearing (2 required)
561413	Main shaft ball bearing and race
561414	Trip spring clip
561415	3/16" dia. thrust ball bearing, gear box and turntable spindle
561416	5/32" dia. ball bearing, tone arm support housing (17 required)
561417	Pipe plug (reduction box)
561418	1/4" dia. ball bearing, reduction box main shaft
561420	Anchor stud, reverse arm lock spring
561424	Eccentric shoulder screw
57135	Main cam (casting only)▼





Top View of Record Changer

GENERAL

This record changer is designed to operate from a power source of 105-125 volts a-c, 60 cps. It will automatically play twelve 10-inch records or ten 12-inch records at a single loading. The turntable speed is 78 rpm.

MANUAL OPERATION

1. Turn record support (4) so that its long curved surface faces the spindle.
2. Turn the hold-down finger (5) so that it slants across the corner of the record changer.
3. Twist the top of the spindle (35) so that it aligns into a smooth spindle with the lower part (3) of this assembly.
4. Place the record on the turntable and push the switch button (6) to ON position, then gently lower the pickup on the first groove of the record.
5. When the record is through playing, depress switch as indicated for reject and allow tone arm to reset on record, then gently lift tone arm (42) and place on rest position and push switch to OFF position.

AUTOMATIC OPERATION

1. Twist the top of the spindle (35) so that the top part is "off-center" and a little step appears.
2. For 10-inch records, turn the record support (4) so that its short side is towards the spindle. For 12-inch records the long, curved side should face the spindle. Keep the hold-down finger (5) turned slantwise across the corner.
3. Place the records to be played on the spindle (35). They will rest on the record support (4) and the step (36) of the spindle. Swing the hold-down finger so that it rests on the top record.
4. Start operation by moving the switch button to ON position, then push down on this button. The records will play through and then will repeat the last record until the operation is stopped. If you wish to reject a record before it has finished playing, push down on the switch plate button.
5. To stop the phonograph before or after all records are played, remove any records remaining on the record support. Depress switch button and allow tone arm to reset on record, then gently lift tone arm and return it to its rest post.
6. Push switch plate button (6) to OFF position.

OPERATION PRECAUTIONS

1. Use only unwarped records for automatic operation. For warped, odd size or home recorded records, play as for manual operation.
2. Never use force to start or stop the motor or any part of the record changing mechanism.
3. Do not store the records on the record post or on the turntable as they may warp, especially if the temperature is high.
4. Do not allow oil or grease to come in contact with the drive wheels or any other rubber part.

LUBRICATION

Use light grease (Lubriplate or equivalent) on the following:

1. Worm gear and main cam gear.
2. All cams.
3. Spindle bearing.

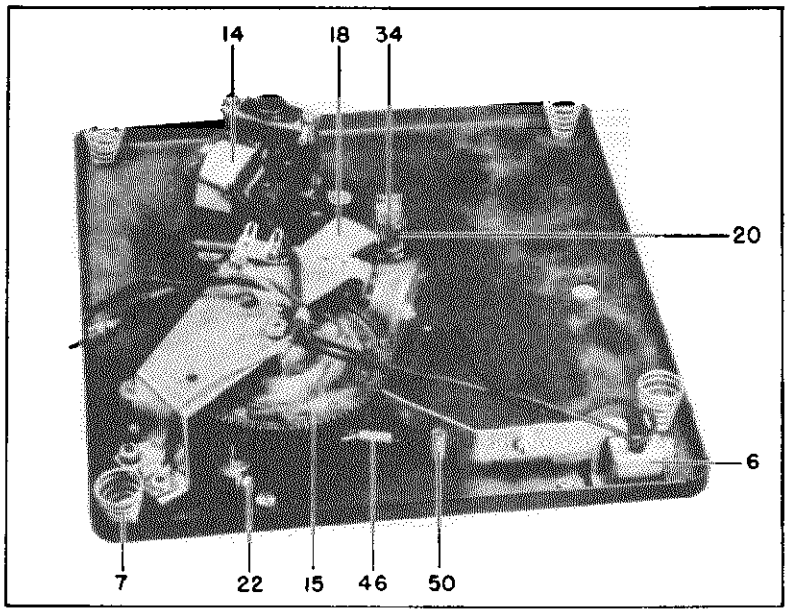
Use light machine oil on the following:

1. All shafts before insertion in bearing (replacement).

Keep oil or grease away from drive pulleys or other rubber parts.

RECORD CHANGER REPLACEMENT PARTS LIST

CAT. NO	REFERENCE	DESCRIPTION
RBH-001	14	MOTOR—Phono motor 105-125 v., 60 cycles (complete)
RHW-001		WASHER—"C" washer 9/32"
RHW-002		WASHER—"C" washer 5/16"
RMB-002	11	BEARING—Turntable ring bearing
RMF-002	5	FINGER Record stabilizer finger
RMM-012		FAN—Fan assembly (external fan motor)
RMM-014	31	BAR—Manual trip bar
RMO-001	6	SWITCH—Power switch
RMP-002	24	PIN—Tone arm lift pin
RMR-001	19	ROLLER—Feed cam roller
RMS-011	7	SPRING—Shock mounting spring
RMS-012	45	SPRING—Stop lever spring
RMS-013	46	SPRING—Trip lever spring
RMS-014	58	SPRING Pull-in spring
RMS-022	53	SPRING—Record feed spring
RMS-023	62	SPRING—Carrier lever spring
RMS-026	42	SPRING—Counterbalance spring
RMS-027	41	SPRING—Stabilizer finger spring
RMS-028	50	SPRING—Trip bar spring
RMS-045		SPRING—Motor idler wheel spring (external fan motor)
RMS-046		SPRING—Motor idler wheel spring (internal fan motor)
RMS-047		SPRING—Motor drive pinion spring (internal fan motor)
RMS-053		SPRING—Selector rod spring (assembled at end of 40)
RMT-002		TURNTABLE Turntable used with internal fan motor
RMT-006		TURNTABLE—Turntable used with external fan motor
RMW-019	9	WHEEL—Idler wheel (external fan motor)
RMW-020	9	WHEEL—Idler wheel (internal fan motor)
RMX-002	16	DRIVE—Flexible drive shaft
RMX-023	3	SPINDLE—Turntable spindle assembly
RMX-024	36	ECCENTRIC—Spindle eccentric assembly
RMX-025	35	CAP Spindle cap assembly
RMX-026		ASSEMBLY—Thrust bearing assembly
RMX-027	20	PINION—Pinion gear assembly
RMX-031	17	GEAR—Worm gear assembly
RMX-032	10	WHEEL—Drive wheel assembly
RMX-035		ASSEMBLY—Feed sector assembly (cam gear end of feed arm)
RMX-043	15	CAM—Cam gear assembly
RMX-048		ROD—Stabilizer finger rod assembly
RMX-050	16, 17	DRIVE Drive assembly (with vibration damper)
RMX-051	40	ROD—Selector rod assembly
RMX-053	25	LEVER—Stop lever assembly
RMX-054	21	LEVER—Sweep lever assembly
RMX-057	12	LEVER—Carrier-trip lever assembly
RPX-010		PICKUP—Magnetic pickup
RPX-016	1	TONE ARM—Tone arm assembly (less pickup)



Bottom View

PICKUP

A special General Electric magnetic pickup is used in this changer which will give superior results from the standpoint of high fidelity, low surface noise, and negligible record wear. This pickup is not replaceable with a crystal pickup as the ratio of output voltage levels of the two types is at least 70 to 1, the pickup supplied having an extremely low output.

The pickup is supplied with a semipermanent-type stylus. Dust and foreign matter should be removed from the stylus assembly at regular intervals with a soft brush. Make sure the stylus arm is centered between the stops. This clearance should be 9 to 11 mils on each side.

CYCLE OF OPERATION

INITIATING THE CHANGE CYCLE—Pushing the *control button* (6) forward turns the power ON and starts the turntable rotating. Automatic cycling may be started by depressing the button (6). This movement pivots the *trip bar* (31), causing engagement with the *carrier lever* and its attached *drive wheel* (10). This *drive wheel* (10) contacts the rim of the turntable and rotates with it. This motion is transmitted through the *flexible coupling* (16) to the *worm drive* (17), which in turn drives the *main cam* (15).

CYCLING—A single revolution of the *main cam* (15) results in a complete automatic cycling of the changer. This includes selection of a record from the stack, lifting the *tone arm* (1) from its rest position and setting the needle in the first groove of the record. Near the completion of the revolution, the automatic *trip cam* (13) which has the *block* (65) on the *trip lever* (12) riding on its outer surface, drops into a depression on the *trip cam* (13) which causes the *carrier lever* to return to its original position so that the *drive wheel* (10) will disengage with the turntable rim.

RECORD FEED—The outer surface of the *main cam* (15) controls the record selection. Motion of the *feed cam roller* (19) about the cam groove causes the *feed sector lever* (18) which is engaged with the *record feed pinion* (20), to turn the *eccentric* (35) to the proper position for a record selection and to then return, allowing the record to drop over the *spindle* (3).

PICK-UP ARM MOVEMENT—The inner surface of the *main cam* (15) controls the *pick-up arm* movement. The tone arm is lifted by the motion of the *lift pin* (24) as it contacts the outer vertical edge of the cam as the latter rotates. The direction of swing of the tone arm is controlled by the engagement of the *main cam* (15) with the *sweep lever pinion* (29). The *sweep lever* (21) connects directly to the *tone arm* (1) by means of a *clamp* (22) around the pick-up arm *pivot sleeve* (23). A boss projecting from the upper side of the *main cam* (15) displaces the *stop lever* (25) at the end of the change cycle, thus permitting the tone arm to proceed across the record.

POSITIVE TRIP ACTION—As the tone arm runs in the inner groove of the record after the playing of that record, the *sweep lever* (21) hits the *positive trip screw* (28) mounted on the *trip lever* (12). This action re-engages the *drive wheel* (10) with the rim of the turntable and starts a new cycle.

10-INCH OR 12-INCH OPERATION—Setting the *record support shelf* (4) to the 10-inch or 12-inch position lowers the selector rod (40) a definite amount. The raising and lowering of this rod determines whether the *stop lever* (25) positions against the *rod* (40) or the *cap* at the top of the rod. This regulation of the distance that the *sweep lever* (21) will travel determines whether the tone arm which is attached to the *sweep lever* (21) will lower on the first groove of a 10-inch or 12-inch record.

SERVICE ADJUSTMENTS

The turntable is driven by means of a friction *idler wheel* (9). The driving power is transferred from the motor *bushing* (2) to the *drive wheel* (9) and then to the rim of the turntable. It is important, therefore, that the *motor bushing* (2) and the *idler wheel* (9) be kept clean of grease, oil, dirt, or any foreign matter. Any quick drying solvent like naphtha is satisfactory for cleaning these parts.

A. *Tone Arm Drop-point*

The point at which the stylus of the tone arm drops on the record is adjusted by loosening slightly the *sweep lever clamp* (22) and repositioning the *tone arm* (1) with respect to the *sweep lever* (21) sufficiently so that the proper landing point is obtained. The stylus should land approximately ⅛-inch in from the edge of the record when properly adjusted. When the landing adjustment has been made for 10-inch records, the landing will be correct for the 12-inch records.

B. *Position of Record Support (4)*

The angle through which the record support rotates when changing from its 10-inch to its 12-inch position, and the position of its edge with respect to the records it supports when in either of its two positions may be adjusted by means of the two positioning screws "A" and "B," see Figure 1. Screw "A" adjusts the 12-inch position; screw "B" adjusts the 10-inch position.

The position of the record support for either 10-inch or 12-inch records is correct when the support is symmetrical with respect to the records being supported (so that the record will drop from both corners of the support simultaneously).

C. *Positive Trip*

The time at which the changer starts to cycle is adjustable by turning the positive trip screw (28). Turn the screw clockwise to delay tripping or cycling of the mechanism and counterclockwise to trip earlier in the playing cycle. The

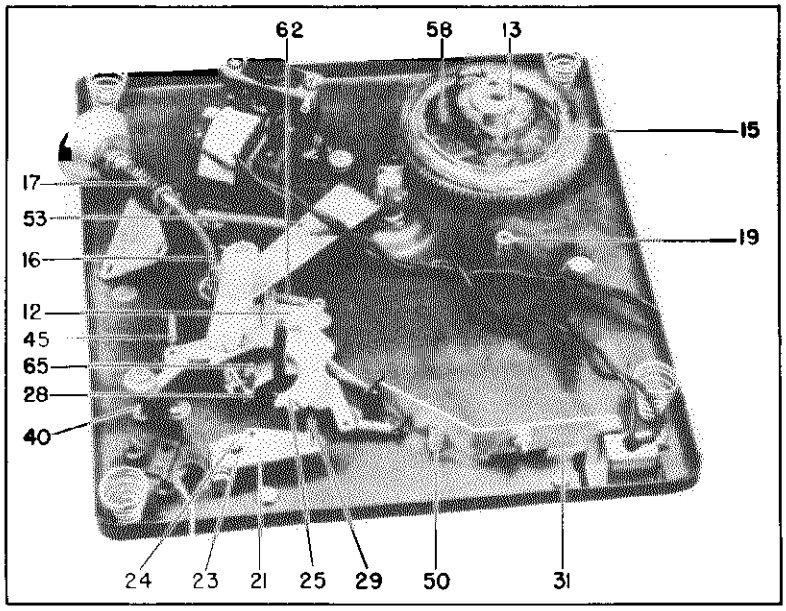


Fig. 3. Bottom View (Cam Removed)

screw should be adjusted so that the changer trips when the needle is 3 1/8 inches in from the edge of a 10-inch record. This adjustment is rather critical and should be made accurately.

D. Alignment of Eccentric (36)

The alignment of the eccentric (36) is accomplished by loosening the clamping screw on the *feed pinion* (20), shifting the position of the eccentric so that it is aligned with the spindle (3) and retightening the clamping screw.

The position of the eccentric is correct if it is aligned with the spindle when the mechanism is not in a change cycle.

E. Alignment of Spindle Cap (35)

The alignment of the spindle cap (35) is accomplished by loosening the two setscrews holding the *cap index cam* (34) in place, rotating the *cap index cam* until the *spindle cap* (35) is aligned with the spindle (3). Tighten the two setscrews.

TROUBLE SHOOTING CHART

SYMPTOMS	REMEDIES OR CAUSES
RECORD SELECTION	
1. Records drop unevenly from record support.	1. (a) Check adjustment B.
2. Records do not slip on or off the spindle smoothly.	2. (a) Check adjustment D. (b) Check adjustment E.
3. Records fail to drop.	3. (a) Check adjustment D. (b) Check adjustment B.
4. Records drop more than one at a time.	4. (a) Check adjustment E. (b) Check center hole in records—probably too large.
5. Records fail to stay on spindle cap when loading.	5. (a) Check adjustment E.
TONE ARM MOVEMENT	
1. Needle lands incorrectly.	1. (a) Check adjustment A.
2. Needle fails to feed in after landing.	2. (a) Check *pull-in spring* (58)—probably too weak.
3. Needle lands properly on record but slides in on record.	3. (a) Check for broken stylus in pickup. (b) Pull-in spring (58) too strong.
TRIPPING-CYCLING	
1. Changer fails to trip.	1. (a) Check adjustment C.
2. Changer trips too soon.	2. (a) Check adjustment C. (b) Check record—may be eccentric.
3. Changer trips continuously.	3. (a) *Trip lever spring* (46) too weak. (b) *Trip block* (65) on trip lever turned out of line or catching edge worn. (c) Disengaging *cam* (13) worn. (d) *Carrier lever spring* (62) too strong.
4. Changer trips but fails to change—turntable continues to turn.	4. (a) *Carrier lever spring* (62) too weak. (b) Grease on drive wheel or turntable rim.
MOTOR	
1. Changer is sluggish or motor overheats.	1. (a) Check lubrication—oil old or gummy. (b) Incorrect line voltage. (c) Defective motor winding. (d) Check binding of worm on main cam.
2. Motor rumble heard in record reproduction.	2. (a) Shipping bolts not removed from motor board.

Record Changer B-27-RC: for Motorola 1946 Home Set Models 55F11, 65F11 & 12, 65F21, 75F31 and 85F21 (dark brown paint finish).

Record Changer B-28-RC & phono oscillator chassis HS-18: for Motorola 1946 Wireless Record Players, Models WR6, WR7 & WR8. (Same as B-27-RC except for the power switch and addition of phono oscillator chassis HS-18).

Record Changer B-29-RC: for Motorola 1946 Home Set Models 95F31 & 95F31B (same as B-27-RC except light brown paint finish).

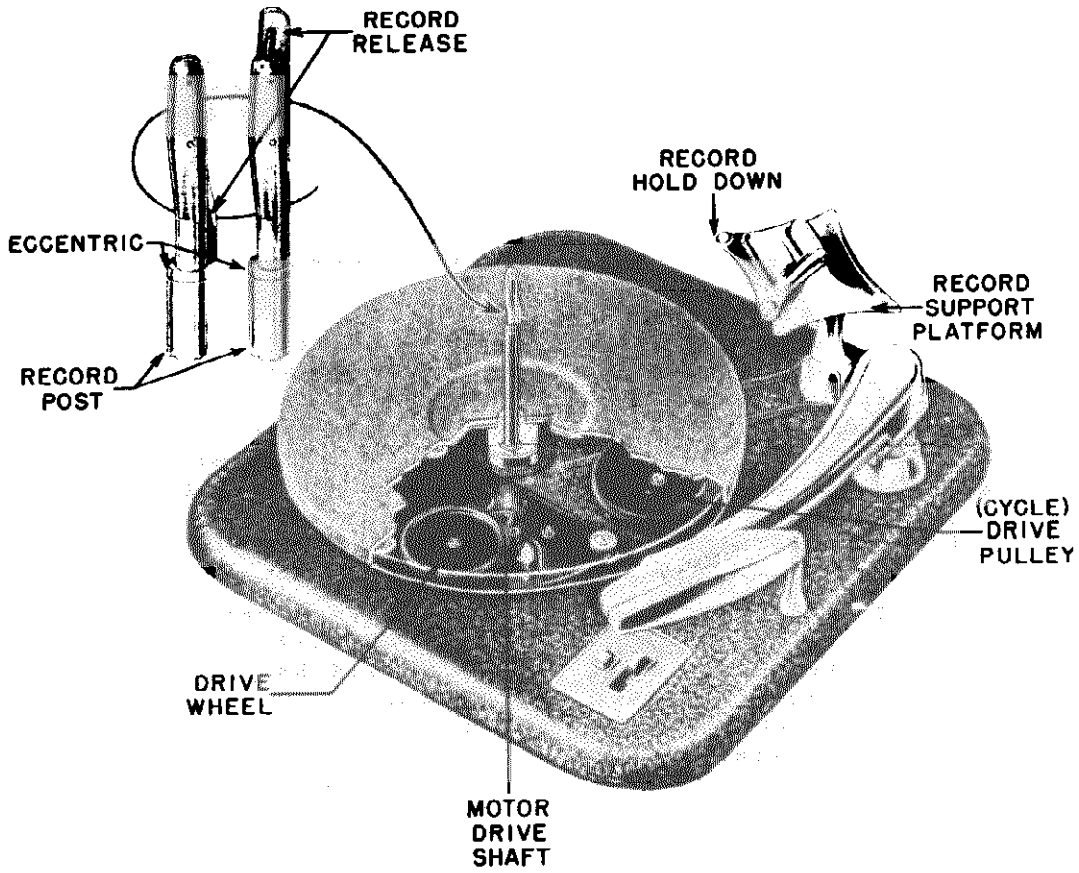

FIGURE 1 TOP VIEW OF RECORD CHANGER

Record Changers B-27-RC and B-28-RC are the revised and improved versions of Record Changers B-24-RC and B-25-RC, respectively. Fundamentally, the changer is the same, that is, it operates on the same general principle but numerous revisions in manufacturing methods, types of material, finishes, etc., have been made.

The revised record changers can be distinguished from the original changers by the new model number which is stamped on the bottom of each revised record changer base. From the top, the B-27-RC, B-28-RC and B-29-RC Record Changers can be easily identified by the large adjustment nut at the base of the record support platform.

For your guidance, we are listing the revisions that were incorporated in the changers. These may be found on page Record changers B-24-RC and B-25-RC may be revised to include some or all of the revisions by following the detailed information given on page

MODELS B-27-RC, B-28-RC, B-29-RC, B-31-RC — MOTOROLA INC. — MODELS B-32-RC, B-33-RC

IMPORTANT POINTS TO REMEMBER WHEN SERVICING RECORD CHANGERS

WARNING: Do not lift record changer by record post or record support platform! Always lift the changer by its base only.

IMPORTANT: Final adjustments on record changer are to be made with the changer horizontal and supported on springs by its 4 corners. AVOID DISTORTING THE BASE WHEN MAKING FINAL ADJUSTMENTS. Placing a mirror below the changer would permit the service man to make observations and adjustments without getting into awkward positions.

CHECK THE RECORD FIRST

Before attempting to service or adjust the record changer, check the records first to make sure they are not causing the trouble. This instrument will handle most of the 10 or 12 inch records available on the market, but it is not guaranteed to handle all of them. Records must be in good mechanical condition and should not be chipped, particularly around the center hole. Do not try to play automatically, records that are too thick, too thin, or that are oversized or undersized, in regard to the diameter of record or centerhole. Do not mix 10 and 12 inch records on the changer.

Warped records can slip on the turntable and introduce "WOWS". Such records may be flattened by placing between two pieces of flat plate glass and then heating in the sun or oven. Do not overheat. Allow record to cool for several hours before removing glass.

Old records made before the days of automatic record changers may not change automatically, due to the difference in thickness, or to lack of the proper eccentric groove at the finish. Most of the old records, however, may be played one at a time.

RECORD CHANGER OPERATION

SUMMARY OF OPERATION INSTRUCTIONS

As many as 10 ten-inch or 8 twelve-inch records may be loaded and played automatically on this record changer at one time.

Set the record support for the size records to be used and place records on spindle. Records will be supported above turntable by the small ledge formed by the off-set in the spindle and the record support platform. Steady the stack with the record hold-down plate.

The left hand button will start the motor. Momentarily, push the right hand button to the reject position to start the cycle. Last record will be repeated until the machine is stopped. Lift up the pick-up arm only while it is resting on the record.

To play records manually, push right hand button to MANUAL position and load records one at a time. When loading, hold the record at a slight angle so that the edge is under the lip of the record support. The record support should be turned to the 12" position to allow more room for loading and unloading records.

The wireless record players have a 3 position power switch (Record Changer B-28-RC); the switch is marked "OFF-TUBES ON - MOTOR ON" In the center (TUBES ON) position the tubes are on but the turntable does not revolve; this position is used when changing records. In the "MOTOR ON" position, the tubes are on and the turntable revolves. To turn player completely off, it is necessary to push the switch to the "OFF" position.

The wireless record players are set to 1560 KC at the factory. It is necessary to tune your radio to this frequency before record can be heard.

If the radio is a push-button type, it is desirable to set one button for the wireless record player.

TO CHANGE FREQUENCY

NOTE: The 1560 KC position was selected as a good average setting for most localities. If by chance you receive a strong radio station at that frequency, you should retune the record player to some other frequency that is reasonably free from interference. The oscillator can be adjusted to any frequency between 1250 KC and 1750 KC.

Proceed as follows:

1. Turn your radio dial to some other frequency between 1250 KC and 1750 KC where there is no radio station interference.

2. While the record player is operating, carefully adjust the tuning screw until you can hear the recorded music through your radio. The tuning adjustment may be reached by removing a plug button on top of the unit. Its exact location is shown in Figure 2. To lower frequency, turn screw clockwise; turn screw counterclockwise to increase frequency.

When the tubes are renewed or if music is distorted, reset the oscillator adjustment under the chassis, as follows:

1. Let the instrument overhang the edge of a table or console so the control is accessible from below. See Figure 2 for location.

2. Turn the oscillator control full counterclockwise.

3. Start the record player and tune in the record on the radio.

4. Push left hand switch to center position; turntable will stop revolving.

5. Turn the control full clockwise - carrier should disappear.

6. Very slowly turn the control back in a counterclockwise direction until a "plop" is heard in the radio speaker.

7. The control should remain in the position where the "plop" appears.

MOTOROLA INC. MODELS B-27-RC, B-28-RC, B-29-RC, B-31-RC, B-32-RC, B-33-RC

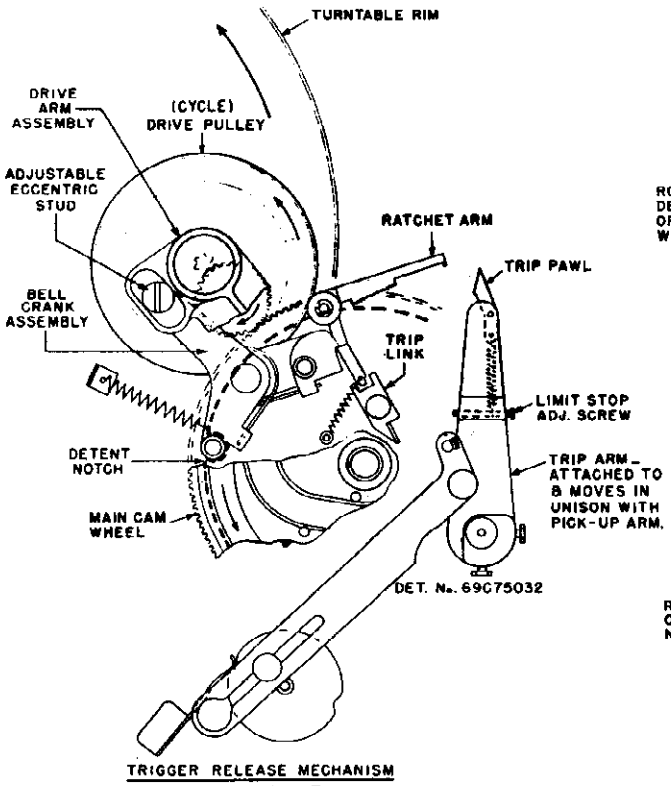
THEORY OF OPERATION

By referring to the various photographs and figures which will be found in the service manual, you can readily follow through the changing cycle from the continuity given hereafter:

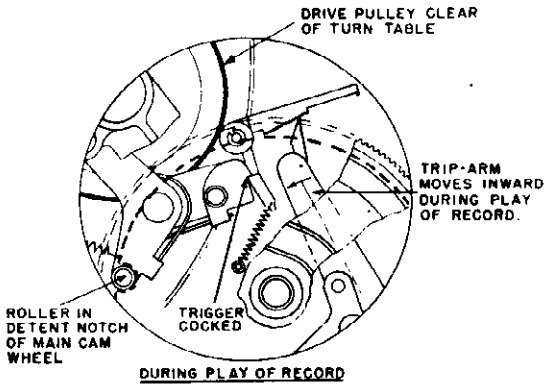
The turntable is rim driven. Power is transmitted to it from the motor shaft by means of a rubber tired drive wheel. The record spindle does not revolve; it is fixed to the record changer base.

The heart of the record changer is the main cam wheel. On it are cast all the cams, extrusions etc., required to perform all the operations during the changing cycle. See Figure 4.

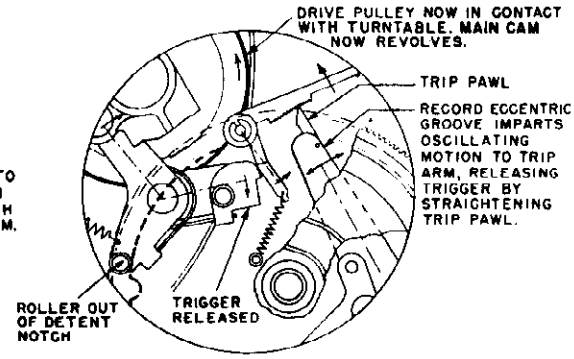
The only mechanism that operates during the playing of a record is the motor and turntable. The changing mechanism is entirely disengaged until the change cycle starts.



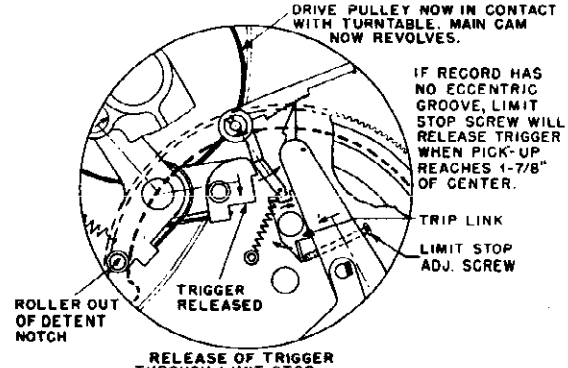
TRIGGER RELEASE MECHANISM
FIGURE 5



DURING PLAY OF RECORD
FIGURE 5A



RELEASE OF TRIGGER THROUGH PAWL & RATCHET ARM
FIGURE 5B



RELEASE OF TRIGGER THROUGH LIMIT STOP
FIGURE 5C

FIGURE 5. RELEASE OF TRIGGER AND START OF CYCLE (BOTTOM VIEW)

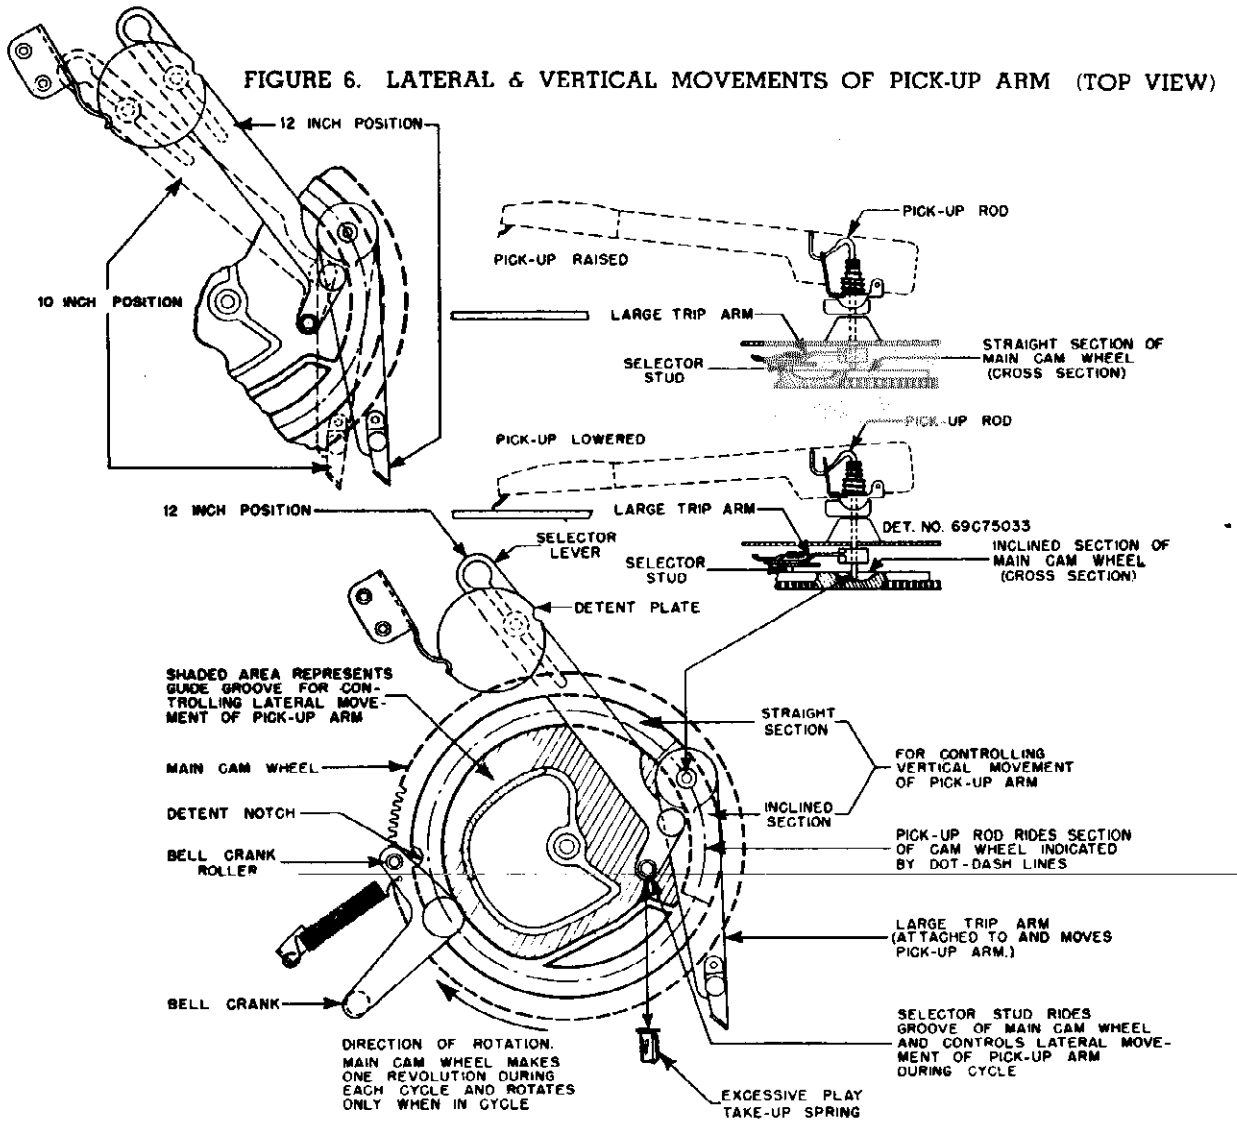
In explaining the theory of operation, let us begin from the point where the record changer is just finishing a record.

The needle in the pick-up finishes the record and enters the eccentric groove. This imparts an oscillating motion to the pick-up arm, which in turn, causes the trip pawl to release the trigger through its action against the ratchet arm. See Figures 5A & B. If the record does not have an eccentric groove, the limit stop will trip the trigger when the pick-up needle reaches a point 1-7/8" of the spindle center. See Figure 5C.

Tripping the trigger, releases the bell crank assembly, allowing its tension spring to push the cycle drive pulley up against the inside rim of the revolving turntable, starting the changing cycle. See Figures 5B & C. With the same motion of the bell crank, its roller leaves the detent notch in the rim of the main cam wheel and the main cam wheel revolves. The roller now rides on the rim of the main cam wheel and in this manner, holds the cycle drive pulley firmly against the turntable.

As the main cam wheel revolves, the pick-up rod rides out of the inclined section, raising the pick-up clear of the record. See Figure 6. After the pick-up arm is elevated, continued rotation of the main cam wheel swings the pick-up arm outward, clear off the record. The lateral movement

FIGURE 6. LATERAL & VERTICAL MOVEMENTS OF PICK-UP ARM (TOP VIEW)



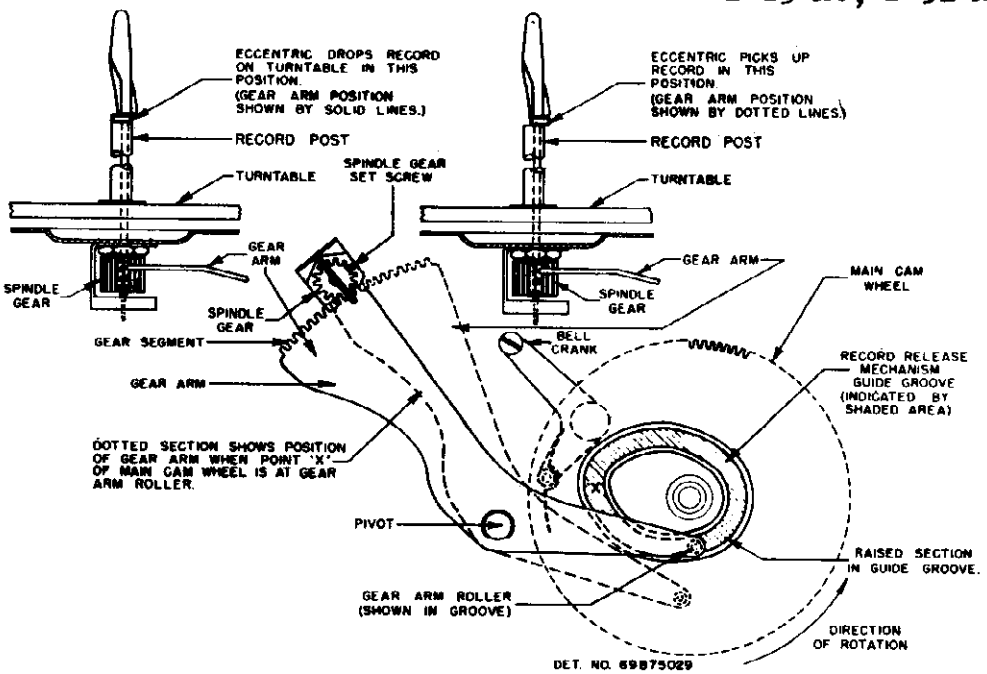


FIGURE 7. RECORD DROP MECHANISM (BOTTOM VIEW)

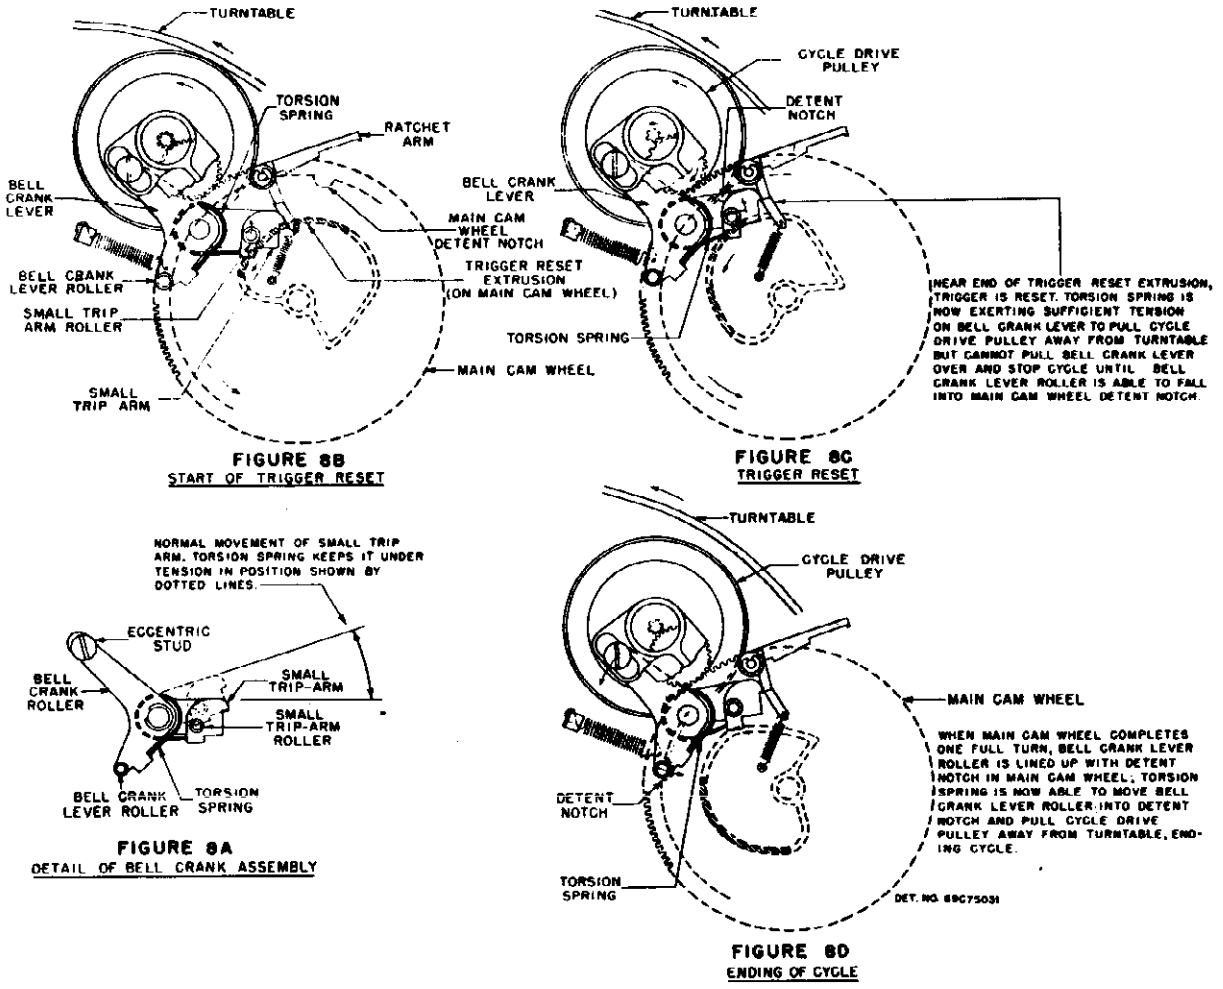

FIGURE 8. TRIGGER RESET AND CYCLE STOPPING MECHANISM (BOTTOM VIEW)

of the pick-up arm is controlled by the selector stud which rides in a specially shaped groove in the main cam wheel See Figure 6.

At the same time the pick-up arm was being lifted and swung clear, the record release cam was rotated through 180° by the gear segment arm to pick up a record and then back to its normal position in line with the record on the turntable. The movement of the segment gear is controlled by the specially shaped groove on the bottom of the main cam wheel. See Figure 7.

Continued rotation of the main cam wheel swings the pick-up arm (by the action of the selector stud riding in the top groove of the main cam wheel) back over the first groove in the record and the arm is gently lowered on to the record when the inclined section of the main cam wheel reaches the pick-up rod. See Figure 6.

As the main cam wheel approaches the full 360 degree point of its rotation the reset extrusion pushes against the trigger reset stud of the small trip arm, causing the trigger to be "cocked" ready for the next cycle, and in the same motion applies spring tension through the torsion spring to the bell crank lever so that when the main cam wheel detent notch reaches the bell crank lever roller, the roller falls into it, pulling the cycle drive pulley away from the turntable, causing the main cam wheel to stop, thus ending the cycle. See Figure 8.

A shorting switch, operated by the straight and inclined sections of the main cam wheel, shorts the pick-up cartridge whenever the record changer is in cycle. This keeps all unwanted noises from reaching the speaker.

Turning the record support post to accommodate the size record being used, automatically sets the mechanism so the pick-up needle will come down in the middle of the blank area between the outer edge and the first groove of the record. Turning the record post, positions the large trip arm so that the attached pick-up arm will swing out farther for 12 inch records and closer in for 10 inch records. See Figure 6.

The right hand button controls a three position mechanical switch. Through it it is possible to start the changing cycle at any time regardless of whether or not the record has been completely played. By this means a record can be rejected. This lever can also be pushed into the manual position at any time without damage to the mechanism. Figure 9 shows the mechanics behind the switch.

A self-centering cam device built into the base of the pick-up arm prevents damage to the mechanism, should the arm be accidentally touched while the instrument is in a changing cycle. Should you accidentally move it out of adjustment, the self-centering device will automatically return the arm to the proper position.

PHONOGRAPH NEEDLE

The changer is equipped with a permanent point (sapphire or precious metal) long-life needle that is good for several thousand plays, unless damaged by dropping or mishandling. For best results use Motorola phonograph needles; they have been especially designed for use in these changers.

To replace phonograph needle, it is only necessary to loosen the small set screw that holds the needle in place. The set-screw is accessible through a small hole in the front of the pick-up arm; use a small screwdriver to avoid damaging the crystal cartridge or pick-up arm.

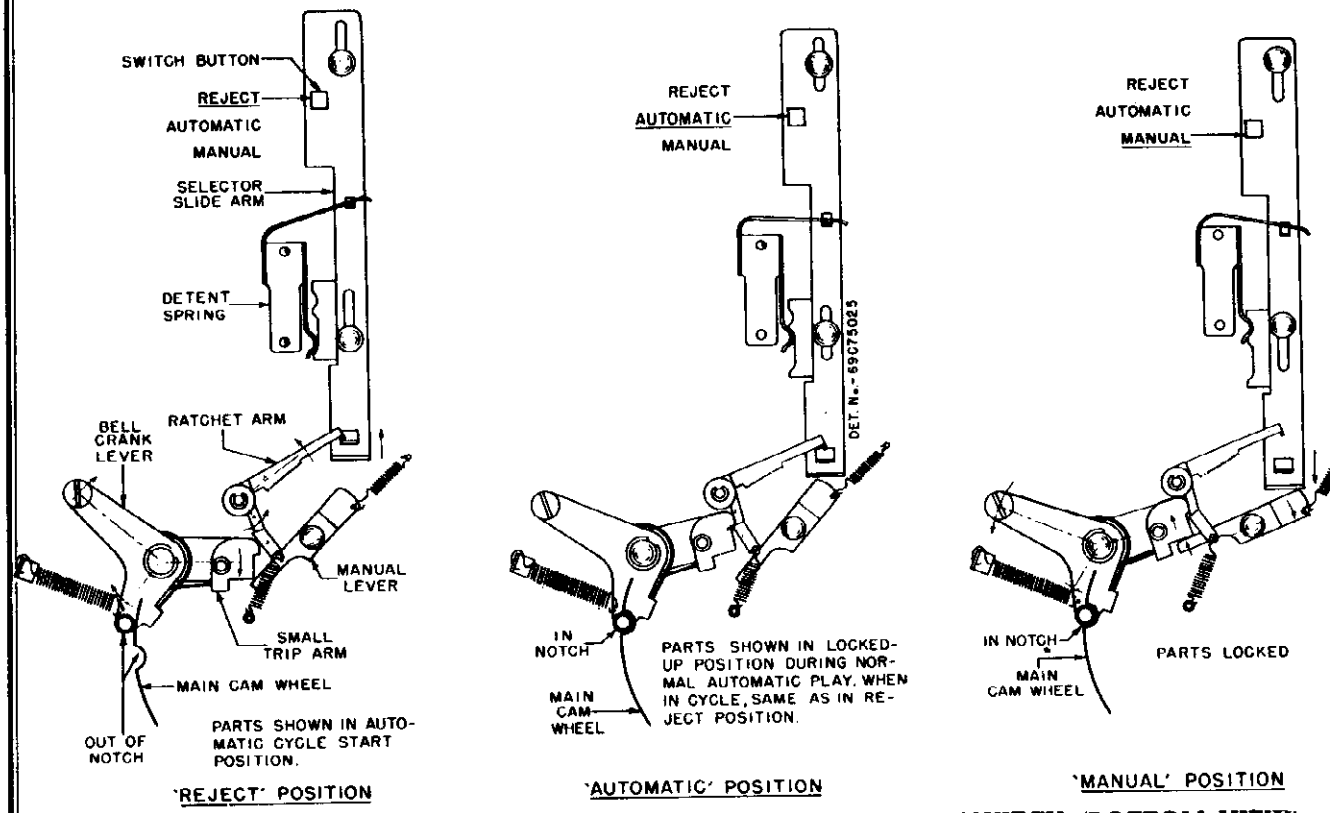

FIGURE 9. MECHANICS BEHIND REJECT-AUTOMATIC-MANUAL SWITCH (BOTTOM VIEW)

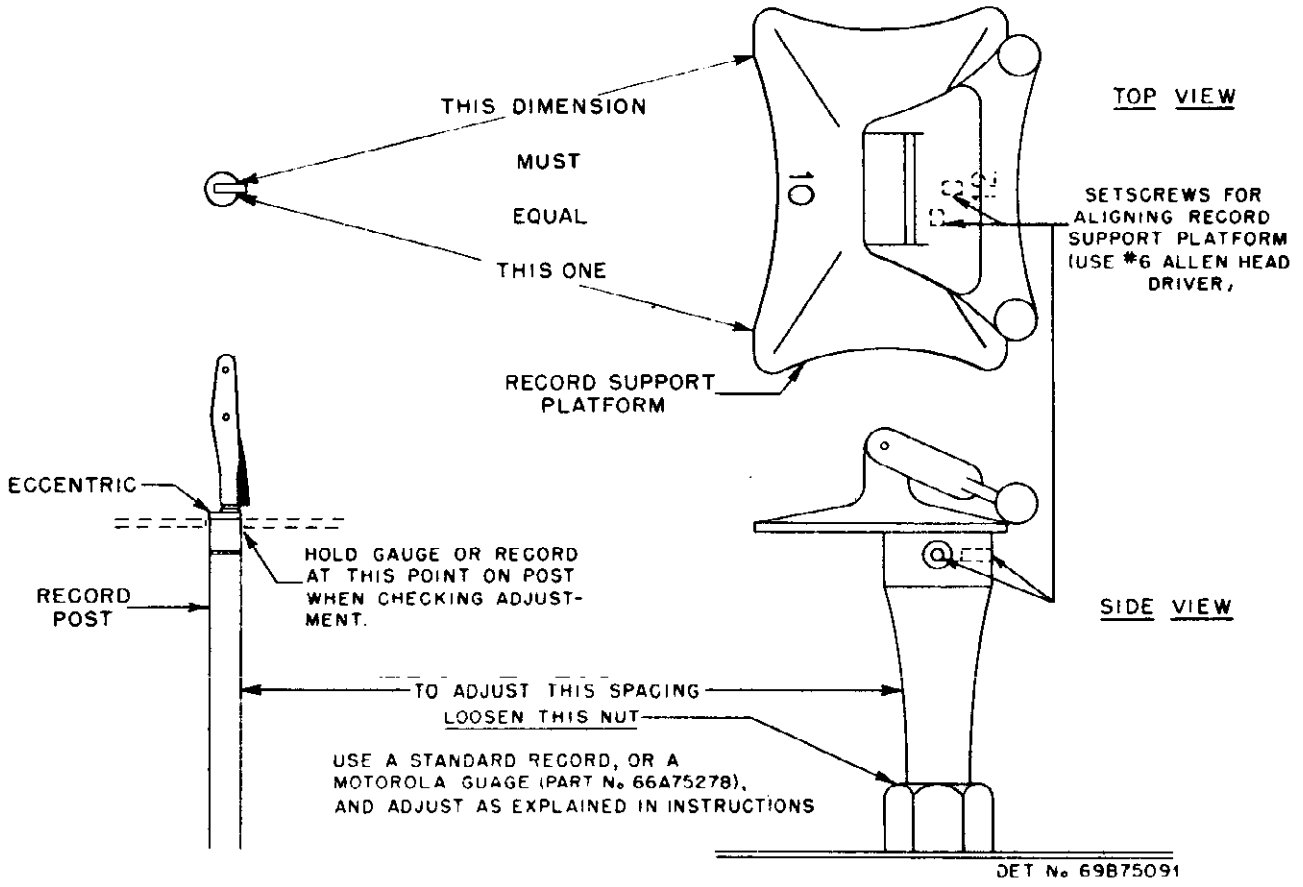

FIGURE 10. RECORD SUPPORT PLATFORM ADJUSTMENT DETAIL

MODELS B-27-RC, B-28-RC, B-29-RC, B-31-RC MOTOROLA INC. MODELS B-32-RC, B-33-RC

ROUTINE CHECKS AND ADJUSTMENTS

LINING UP THE RECORD SUPPORT PLATFORM

It is important that all points on the "lip" of the record support platform be equi-distant from the center point of the spindle. This will assure that all points of the record will leave the platform at the same time. If the record support is too far out of alignment, the record would actually hang on the point nearest the spindle and fail to drop properly. See Figure 10. The record support platform must also be spaced properly from the record post.

TO CHECK ADJUSTMENT OF RECORD SUPPORT PLATFORM

1. Turn the record support platform to the ten-inch position, making sure it is turned so that the selector lever falls into the detent notch.

2. Slip a ten-inch record over the record post and cycle the changer once to allow the record to drop on the turntable, then stop the changer.

3. Lift the record so it is in line with the top of record post (not eccentric) as shown in Figure 10. The record should clear the lip of the record support platform equally at all points and the gap between the record and record support platform should be just large enough to let the record clear the platform.

NOTE: The 10" record used should have a diameter of 9-7/8" ± 1/64.

TO ADJUST RECORD SUPPORT PLATFORM

1. If one point of the record support platform is nearer the record than the other, the position of the platform may be adjusted after loosening the two allen head set screws located directly under the record support platform. Use a #6 allen head driver (Motorola part number 66X10704).

2. The spacing between the record post and the record support platform can be varied by loosening the large hex nut at the base of the record support base (see Figure 10) and moving the platform, as required. The spacing should be such that the record, when held as shown in Figure 10, will just clear the platform.

NOTE: A "standard gauge" (Motorola part number 66A75278) can be used in place of a record when adjusting the platform.

3. TEST: After tightening the set screws, test the adjustment by running a ten-inch record through a complete cycle and check the point where the needle falls. If the needle misses the record by one inch, the record support platform is 180 degrees out of line with the detent plate and should be turned one-half turn without turning the detent plate.

ADJUSTMENT OF RECORD DROP MECHANISM

For minimum wear around the center hold of records and proper automatic dropping of records, it is important that the record release eccentric and record post line up perfectly at the end of each change cycle.

TO CHECK ADJUSTMENT OF RECORD DROP MECHANISM

1. Cycle the record changer once, by pulling the reject button.

2. At the end of the cycle, stop changer and carefully observe the position of the eccentric with respect to the record post. It should line up perfectly with the record post.

3. If at the end of a cycle the eccentric does not line up perfectly with the record post, re-adjust as described below.

TO ADJUST THE RECORD DROP MECHANISM

1. Pull the reject button and slowly revolve the turntable by hand until the gear arm roller is resting on the raised section of the record guide groove. See

Figure 7 for its location. The raised section of the groove is very small and resembles what is often taken for flash on castings. It serves to narrow down the guide groove at this point and in this manner insures closer alignment of eccentric and record post.

2. Loosen the slab head set screw in the spindle gear. The eccentric will now turn freely. See Figure 7.

3. Turn the eccentric so it is in perfect alignment with the record post.

4. Tighten slab head set screw in spindle gear. WARNING: Do not use excessive pressure when tightening slab head set screw. Excessive pressure may dent the eccentric tube and cause binding.

PICK-UP ARM LATERAL ADJUSTMENT

The lateral adjustment positions the pick-up arm so the needle will come down on the record at a point midway between the edge and the first groove of the record.

TO CHECK LATERAL ADJUSTMENT OF PICK-UP ARM

1. Turn the record support to the twelve-inch position.

2. Place a standard twelve-inch record on the turntable.

3. Start the changer and allow it to go through its cycle.

4. Note the point at which the needle contacts record. It should contact the record in the middle of the area between the first groove and the edge of the record.

5. If the needle doesn't come down at the proper point, adjust as described below.

TO MAKE LATERAL ADJUSTMENT OF PICK-UP ARM

1. Place a full stack (eight) of twelve-inch records on the turntable.

2. IMPORTANT: It is imperative to make the lateral adjustment while the selector stud is still riding in the groove of the main

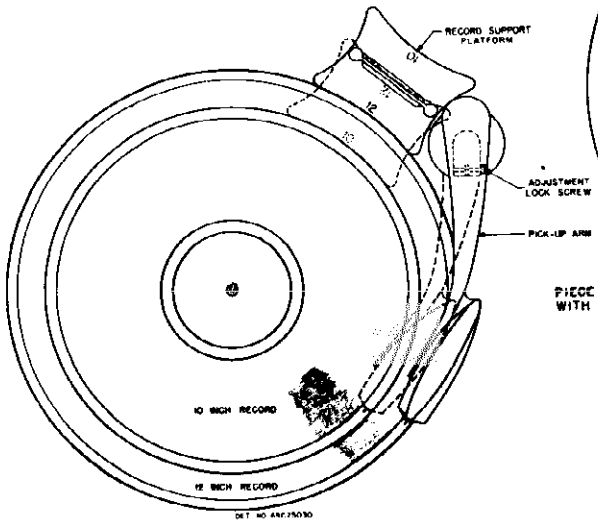

FIGURE 11. PICK-UP ARM LATERAL ADJUSTMENT DETAIL

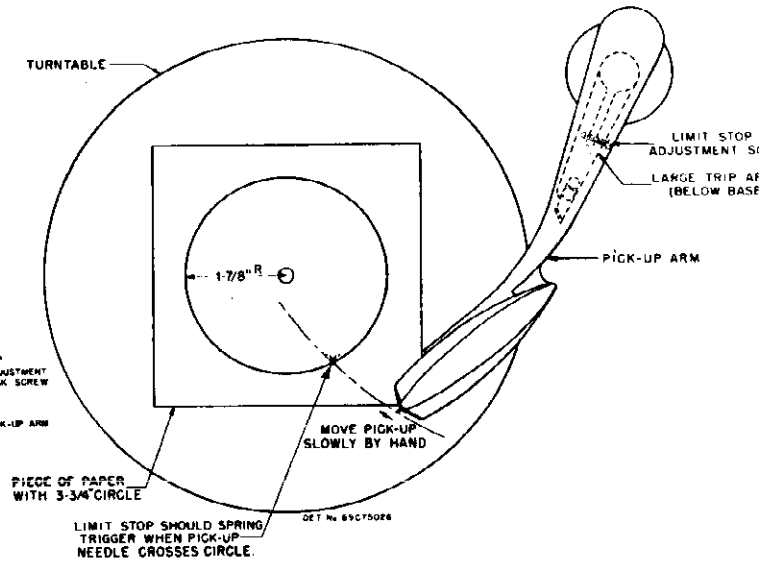

FIGURE 12. LIMIT STOP ADJUSTMENT DETAIL

cam wheel. See Figure 6. If the record player is stopped just before the needle contacts the top record of a full stack of records, the selector stud will still be in the main cam wheel groove and the pick-up arm will not be free to move annoyingly about while the lateral adjustment is being made. This is the reason for using a full stack of records on the turntable. If any pick-up arm side play is noted at this point, it should be eliminated by slightly spreading the play take-up spring on the selector stud. See Figure 6. Excessive play between the selector stud and main cam wheel groove will prevent needle from coming down at exactly the same spot on the record each time.

3. With a screw driver, loosen the adjustment lockscrew (see Figure 11) and then move the pick-up arm until phono needle is positioned correctly over the middle of the area between the edge and the first groove in the record.

NOTE: The lateral adjustment screw was omitted from B-27-RC and B-28-RC record changers after the first production run. It is suggested that the service man remove the lateral adjustment screws from changers he services; this will simplify adjustment.

4. After adjustment, tighten the adjustment lockscrew.

5. Check the adjustment by putting the changer through its cycle.

6. If further adjustment is required, repeat above steps 1 through 5.

7. Remove the twelve inch records and place a ten inch record on the turntable.

8. Turn the record support to the ten-inch position and cycle the changer. The needle should come down into the area between the first groove and the edge of the ten-inch record. If necessary, make minor compromise adjustments so needle will come down properly on both ten and twelve-inch records.

ADJUSTMENT OF THE LIMIT STOP

The limit stop mechanism permits the record changer to operate even though the record may not have an eccentric groove or if the eccentric groove is too close to the center hole.

Before checking or making adjustment on the limit stop, make sure the lateral adjustment is O.K.

TO CHECK LIMIT STOP ADJUSTMENT

1. Scribe a 3-3/4" diameter circle on a piece of stiff paper. Cut out a 1/4" hole at the center of the circle and slip the paper over the record post of the record player. See Figure 12.

2. Set up the record changer for twelve-inch records.

3. Turn on the record player, momentarily push the button to the reject position and allow the changer to complete one cycle. Stop the changer; the pick-up arm should now move freely.

4. Grasp the pick-up arm and slowly move it towards the record post. As the pick-up needle crosses the scribed circle line the trigger should be heard to "click over".

5. Should the trigger mechanism be actuated before or after crossing the scribed line, readjust as described below.

TO ADJUST THE LIMIT STOP

1. Move the pick-up arm to its resting post.

2. Reset the trigger mechanism by moving the button momentarily to the MANUAL position and then back to AUTOMATIC (center position).

3. With a screwdriver, adjust the limit stop adjustment screw.

which is located on the trip arm. See Figure 12. Turn the screw clockwise if the trigger is tripped after the needle crosses the scribed line, and counter-clockwise if it trips too soon.

4. Check adjustment by moving the arm manually across the scribed line.

5. If the adjustment is still not correct, repeat above steps 1, 2, 3, 4 and 5 until it is correct.

VERTICAL ADJUSTMENT OF PICK-UP ARM

This adjustment assures that:

1. The pick-up arm rests properly on the first record.

2. The pick-up arm will clear a full stack of records (10 ten-inch or 8 twelve-inch) on the turntable, during the changing cycle.

3. There will be sufficient clearance between the top of the pick-up arm and a record in position on the record support, during the changing cycle.

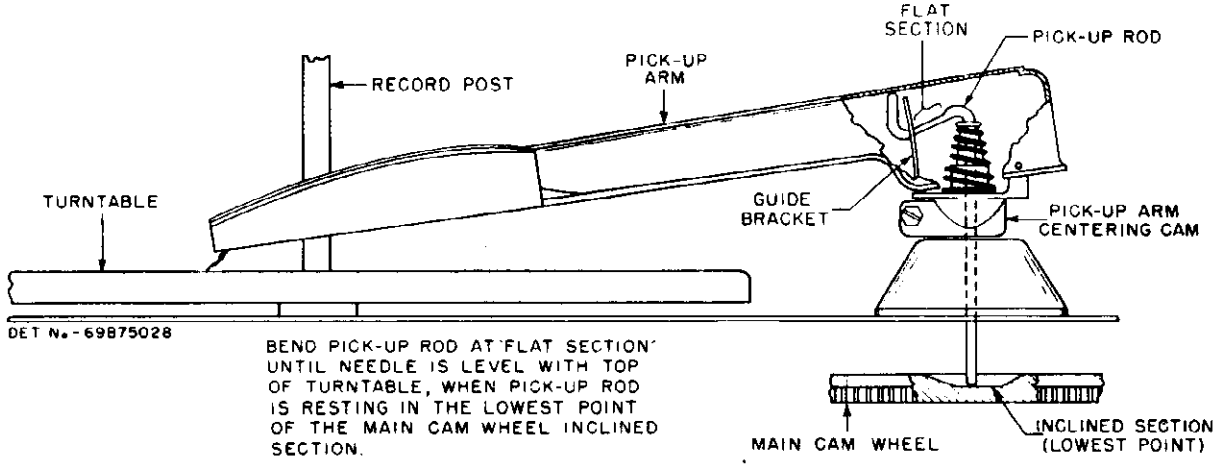

FIGURE 13. PICK-UP ARM VERTICAL ADJUSTMENT DETAIL

4. There will be sufficient clearance between the pick-up arm and the pick-up resting post during the changing cycle.

TO CHECK VERTICAL ADJUSTMENT OF PICK-UP ARM

1. Turn the record support to the twelve-inch record position and cycle the record changer. As soon as the changing cycle is complete, turn off the changer by means of the left hand button. The pick-up arm should now be resting alongside the turntable. Correct adjustment is indicated if the pick-up needle is exactly level with the top of the turntable.

2. Fully load the record changer with records. Use 10 ten-inch or 8 twelve-inch records of standard manufacture only. Start the changer and drop one record on the turntable. The pick-up should come down and rest normally in the playing position on the record.

3. Push the left hand button to the REJECT position momentarily and release. Now as the pick-up is lifted off the record, carefully note that there is clearance between the top of the pick-up arm and the bottom record on the record support.

4. Drop the full load of records (10 ten-inch or 8 twelve-inch) on the turntable. As the record changer is cycled, note the clearance between the pick-up needle and the top record.

ADJUSTMENT OF VERTICAL TRAVEL OF PICK-UP ARM

The pick-up rod (Figure 13) controls the vertical movement of the pick-up arm.

1. After the changer has completed its cycle and pick-up arm is resting in playing position, stop the changer by pushing the left hand switch to OFF. The pick-up rod will now be resting on the bottom of the inclined

section of the main cam wheel and the pick-up arm will be at its lowest point of vertical travel.

2. Lift the pick-up arm straight up, exposing the pick-up rod. With long nose pliers, bend the pick-up rod (along its straight portion) in the required direction till the pick-up needle point is level with the top of the turntable. See Figure 13.

3. Recheck as shown under TO CHECK VERTICAL ADJUSTMENT OF PICK-UP ARM. In some cases minor compromise adjustment will be required.

ECCENTRIC STUD ADJUSTMENT INSTRUCTIONS

This adjustment is one of the most important for dependable cycling of the record changer. It must be followed closely as too tight an adjustment will cause slow cycling and undue motor wear or the changer may keep cycling continuously; a loose adjustment may prevent changer from cycling at all. See Figure 3 for location of eccentric stud adjustment.

CHECK AND ADJUSTMENT OF ECCENTRIC STUD

1. Set changer in cycle and stop turntable when pick-up arm comes back to within one inch of right of turntable (almost the set down position).

2. Loosen eccentric stud completely so cycle drive pulley (see Figure 1) moves completely free of the turntable.

3. Rotate turntable by hand (counterclockwise) 90° (1/4 turn) and back (clockwise). Pick-up arm should not move.

4. With a screwdriver, turn eccentric stud until pick-up arm begins to move when rotating turntable by hand clockwise. Do not hold screwdriver on eccentric stud while checking adjustment.

5. When pick-up arm moves down with the clockwise rotation of turntable without slipping, but not up with counterclockwise rotation, the critical position of the adjustment has been reached.

6. Then tighten the eccentric just far enough to pick up the pick-up arm when rotating the turntable counterclockwise and the setting is complete.

7. To check for too tight adjustment, complete cycle of changer with motor operating. Complete change cycle should not take more than 7 seconds; if it takes longer, eccentric stud should be readjusted.

SERVICE INFORMATION

REPLACEMENT OF ECCENTRIC & TUBE ASSEMBLY (104) OR SPINDLE & RELEASE ASSEMBLY (113)

These two assemblies, reference numbers (104) and (113) are supplied only in factory matched sets for replacement purposes. For positive record changing performance, always replace assemblies (104) and (113) with a factory matched set. Do not replace one assembly without replacing the other at the same time. Lubricate parts before installing, use Lubriplate #105 grease.

TO REMOVE TURNTABLE

Refer to Figure 15 for location of parts.

1. Remove two screws (59) and spindle clamp (13).

2. Remove the spindle and release assembly (113).

3. The turntable can now be lifted off the record post (108). Make sure the eccentric (104) is in line with record post (108) otherwise it may be damaged when removing turntable.

CRYSTAL CARTRIDGE CONNECTION NOTE

Observe that one of the pins on the crystal pick-up cartridge is grounded through a copper strip to the cartridge case. It is important that the connecting lead shield be connected to this pin.

MECHANISM IS SLOW IN STARTING OR MOTOR HEATS UP

1. Check lubrication.

2. Dirt in bearings. Wash dirt out with carbon tetrachloride or similar solvent and relubricate. Use a #10 motor oil in the phono motor and turntable bearings and Lubriplate #105 grease on all other bearings and moving parts.

3. Check line voltage and frequency.

4. Motor damaged. If found damaged, remove motor and return it to factory for repair or replacement.

5. Room temperature abnormally low.

6. Eccentric stud adjustment set at maximum throw causing cycle drive wheel to drag on turntable rim. Correct by setting eccentric stud per instructions under ECCENTRIC STUD ADJUSTMENT.

7. Loose sleeve on motor drive shaft. Replace motor.

8. Slew motor. Replace motor.

9. Defective turntable bearing. Replace.

10. Grease on rubber rim idler wheel and/or inner rim of turntable. Clean off with carbon tetrachloride.

MOTOR FAILS TO RUN

1. Check to see that ON-OFF switch is OK and that power is being supplied to motor.

2. Trouble in motor winding. If easily seen, repair; otherwise, replace.

3. Damaged or frozen bearings. Replace motor.

4. Gummed oil or foreign material between armature and pole-piece. Clean out.

SQUEAKS OR OTHER NOISES DURING PLAYING OF RECORDS

1. Check lubrication (if squeaks are heard, they will usually be found to come from the records - not from mechanism).

2. Compare the squeak with and without a load of records. If squeak disappears when records are removed, then noise is obviously from records. Correct by rubbing a little wax on the turntable record post.

CHANGER IS NOISY WHEN IN CYCLE

1. Check lubrication.

2. See if any part has become loose or bent and is rubbing against a moving part.

3. Check center post eccentric shaft (104) lubrication.

"WOW" IN RECORD REPRODUCTION

1. Record is warped or otherwise defective, or the instrument is not being operated at normal room temperature (70°F). See CHECK THE RECORD FIRST

2. May be caused by slippage due to grease on idler wheel or inside rim of turntable.

PICK-UP ARM TRIPS OUT OF OSCILLATING GROOVES

1. Record changer not level.

2. Rough surface on catch surface of small trip arm (116). Repolish.

3. Ratchet arm (50) bent too close to trip pawl. Replace.

4. Pick-up arm main shaft binding in bearing.

(a) Ream out the hole.

(b) Sometimes the trip arm (117) may be too close to the base, causing a bind. To remedy, loosen its two setscrews (65) and space lightly.

5. Selector lever (117) may be bent out of shape and binding against detent plate (109). Straighten.

6. Selector lever (117) slot or retaining rivet on detent plate (109) may be undersize or oversize, respectively, effectively causing a binding feeling on the pick-up arm. Correct by spreading slot in selector lever (117).

7. Record may have oscillating groove covered with paper nameplate. Remove paper from oscillating groove.

8. Needle may be chipped. Replace.

CHANGER KEEPS CYCLING

1. Eccentric stud adjustment sets too tight. Correct per instructions found under ECCENTRIC STUD ADJUSTMENT.

2. Catch surface of small trip arm (116) or ratchet arm (50) worn to improper angle causing slipping apart of mating surfaces. Correct by replacing parts.

3. Bell crank torsion spring (83) may be too weak. Replace.

4. Ratchet arm (50) improperly formed. Replace.

CHANGER WILL NOT CYCLE

1. Weak pawl spring (82) causing non-mating of pawl on ratchet arm (50) teeth. Replace spring.

2. Pawl frozen on trip arm (117). Check for cause; if other than due to dirt or grease, replace entire trip arm and selector lever assembly (117).

3. Binding drive arm (17) or main cam wheel (9) on shaft (75). Replace parts or remove burrs.

4. Eccentric adjustment stud set at minimum throw. Cycling drive wheel (49) is not against inner rim of turntable. Correct by setting up as shown under ECCENTRIC STUD ADJUSTMENT.

5. Weak bell crank arm spring (79). Bend bracket to tighten spring or replace spring (79).

6. Bell crank arm (103) binding on shaft (84).

NEEDLE SETS DOWN ON RECORD WITH A WHIP MOTION

1. Pick-up arm centering cam (40) not seating properly during cycle caused by pick-up arm rod (57) pushing against its guide bracket. Correct by bending guide bracket forward to relieve pressure. See Figure 13.

RECORD WILL NOT DROP WHILE CYCLING

1. The record release in the spindle assembly (113) may not be protruding out enough from the spindle assembly. It should stick out as far as the eccentric does when the eccentric is picking up a record. If it doesn't and trouble persists, replace spindle assembly (113).

2. Eccentric (104) out of line with record post. Correct as shown in ADJUSTMENT OF RECORD DROP MECHANISM.

3. Set screw (111) loose on spindle gear (22). Tighten after readjusting.

REVISIONS INCORPORATED IN RECORD CHANGERS

NOTE: Changers that have been revised as indicated below, are known as B-27-RC and B-28-RC; without these revisions, the changers are known as B-24-RC and B-25-RC. A model number is stamped on the bottom of the B-27-RC and B-28-RC record changer bases; this will serve to easily identify these units. From the top, the B-27-RC and B-28-RC record changers can easily be identified by the large adjustment nut at the base of the record support platform.

Record changers B-24-RC and B-25-RC may be revised to include some or all of the revisions by following the detailed information given below Reasons for changes are given in the "remarks" column

OLD REF. NO.	OLD PART NO.	NEW REF. NO.	NEW PART NO.	DESCRIPTION	REMARKS
None	None	102	43A76396	Bearing, Oilite: ring type	Slips over record post and replaces the original ball bearings (2). Before installing a new Oilite bearing, pre-soak it in a good 20W motor oil for at least 1/2 hour.
3	1B71785	103	1B76783	Bell Crank Assembly: includes bell crank lever with eccentric stud and roller (4), torsion spring (83) and small trip arm (116)	Material in small trip arm (116) changed from aluminum to stainless steel to reduce wear. When installing this new part, place a small quantity of very light grease on the trigger catch surface. Directly interchangeable with old part.
18	47A72662	104	1B76770	Eccentric & Tube assembly	Re-designed to work with new spindle and release assembly (113). Cannot be interchanged with original part. Sold only in matched set with Spindle & Release Assembly (113). Lubricate lightly with Lubriplate #105 grease before installing.
21	1X71798	105	1X76781	Gear Arm Assembly: with re-inforcing channel	Reinforcing channel added to stiffen arm and reduce possibility of gear arm bending should record jam during change cycle. Revised part is directly inter-

OLD REF. NO.	OLD PART NO.	NEW REF. NO.	NEW PART NO.	DESCRIPTION	REMARKS
23	45A27549	23	45A27549-D	Lever, manual	Re-designed to prevent possibility of manual lever wedging itself between base and small trip arm (116). Directly interchangeable with old part.
None	None	106	2A76397	Nut, adjustment: acorn shaped	Used with redesigned record support post (115).
39	47D71605	39	47D71605-G	Pick-up arm (only): less all other parts	Hole drilled in arm to make needle replacement setscrew accessible from outside. This makes it unnecessary to remove crystal cartridge when replacing needle.
44	1X71797	107	1X76774	Platform & Clamp Assembly	The corners of the new record support platform have been cut off to reduce area that record hangs on. New platform is directly interchangeable with old one.
50	1X75569	50	1X75569-B	Ratchet Arm & Bushing Assembly	Notches added on revised part to give a better trigger mesh. Directly interchangeable with old part.
52	47A71702	108	47B76762	Record Post & Bearing Assembly	Redesigned to be used with new ring type Oilite bearing (102). When this part is used, the turntable retaining washer (96) and the ball bearings (2) are eliminated. Use with the new Oilite bearing (102) to directly replace old record post and bearing assembly (52).
74	1X71788	109	1X76778	Selector Shaft & Plate Assembly	Part differs from old assembly by use of new type of shoulder rivet. New rivet (part No. 5A76489) spaces selector lever from detent plate, thus eliminating rubbing or catching of selector lever (117) on selector spring (80). New selector shaft and plate assembly

					is not interchangeable with original one. A new trip arm and selector lever assembly (117) must be used with this revised selector shaft and plate assembly.
62	3S2672	110	3S9700	Setscrew, steel: 6-32 x 3/16, Allen head, cup-point machine screw; cadmium plated	Record support mounting screw was cone point type. Now it is changed to cup point (same as (63)) to permit easier adjustment of record support platform.
64	3S7119	111	3S7109	Setscrew, steel: 6-32 x 5/16 slabhead, cup point machine screw, cadmium plated	Length was 1/4". Increased for better wrench grip.
77	41A72568	112	42A76484	Spring, clip (cycle pulley retainer)	Re-designed to have greater holding power and facilitate removal and installation. Directly interchangeable with old part.
76	1B71709	113	1B76766	Spindle, & Release Assembly	Redesigned to provide greater ledge for records. Cannot be directly interchanged with old part (76). Must be used with the new eccentric and tube assembly (104). Sold only in matched set with Eccentric & Tube Assembly (104). Lubricate lightly with Lubriplate #105 grease before installing.
82	41A27491	114	41A76681	Spring, tension	Tension increased (approximately doubled) to give positive cycling action. Directly replaces old tension spring (82).
86	46B71653	115	46B76775	Support Post	Part redesigned by threading lower portion for adjustment nut (106). Replaces original support post, but adjustment nut (106) must also be used with it. Lockwasher (27) must also be replaced with flat washer (120). The redesigned support post and addition of adjustment nut permits adjustment of

OLD REF. NO.	OLD PART NO.	NEW REF. NO.	NEW PART NO.	DESCRIPTION	REMARKS
					and record post by simply loosening adjustment nut (106) from top of changer (no dismantling of changer required).
90	1X71787	116	1X76780	Trip Arm Assembly (small)	Material changed from aluminum to stainless steel to reduce wear. When installing this new part, place a small quantity of a very light grease on the trigger catch surface. Directly interchangeable with old part (90). Bell Crank Assembly now changes from (3) to (103).
91	1X71789	117	1X76779	Trip Arm & Selector Lever Assembly (large): consists of large trip arm assembly and selector lever and stud assembly, assembled together; pawl spring (82) and screws (65) & (58) not included.	Differs from old assembly by bend in selector lever (45A71632-B). Bend gives more clearance between selector lever and selector spring (80), eliminating rubbing. Use this new trip arm and selector lever assembly with the new selector shaft and plate assembly (109). Old and new assemblies are not directly interchangeable.
None	None	118	4K76609	Washer, brass: 9/16 x .316 x .010 thick	Washer added between drive arm assembly (17) and washer (98) to reduce main cam wheel play.
None	None	119	4A21491	Washer, brass: 9/16 x .316 x .020 thick	Washer added between record changer base and main cam wheel to reduce play. Washer is the same type as used in position (101).
None	None	120	4S1758	Washer, brass: 13/16 x .515 x .040 thick; bright nickel finish	Replaces lockwasher (27).
None	None	121	4S7569	Washer, steel: 5/16 x .145 x .027 thick; cadmium plated	Washer is inserted in slot of die cast pick-up shaft cam assembly (40) to eliminate possibility of cracking die casting when tightening lateral adjustment lockscrew. The lateral adjustment lockscrew (68) is passed through the washer.

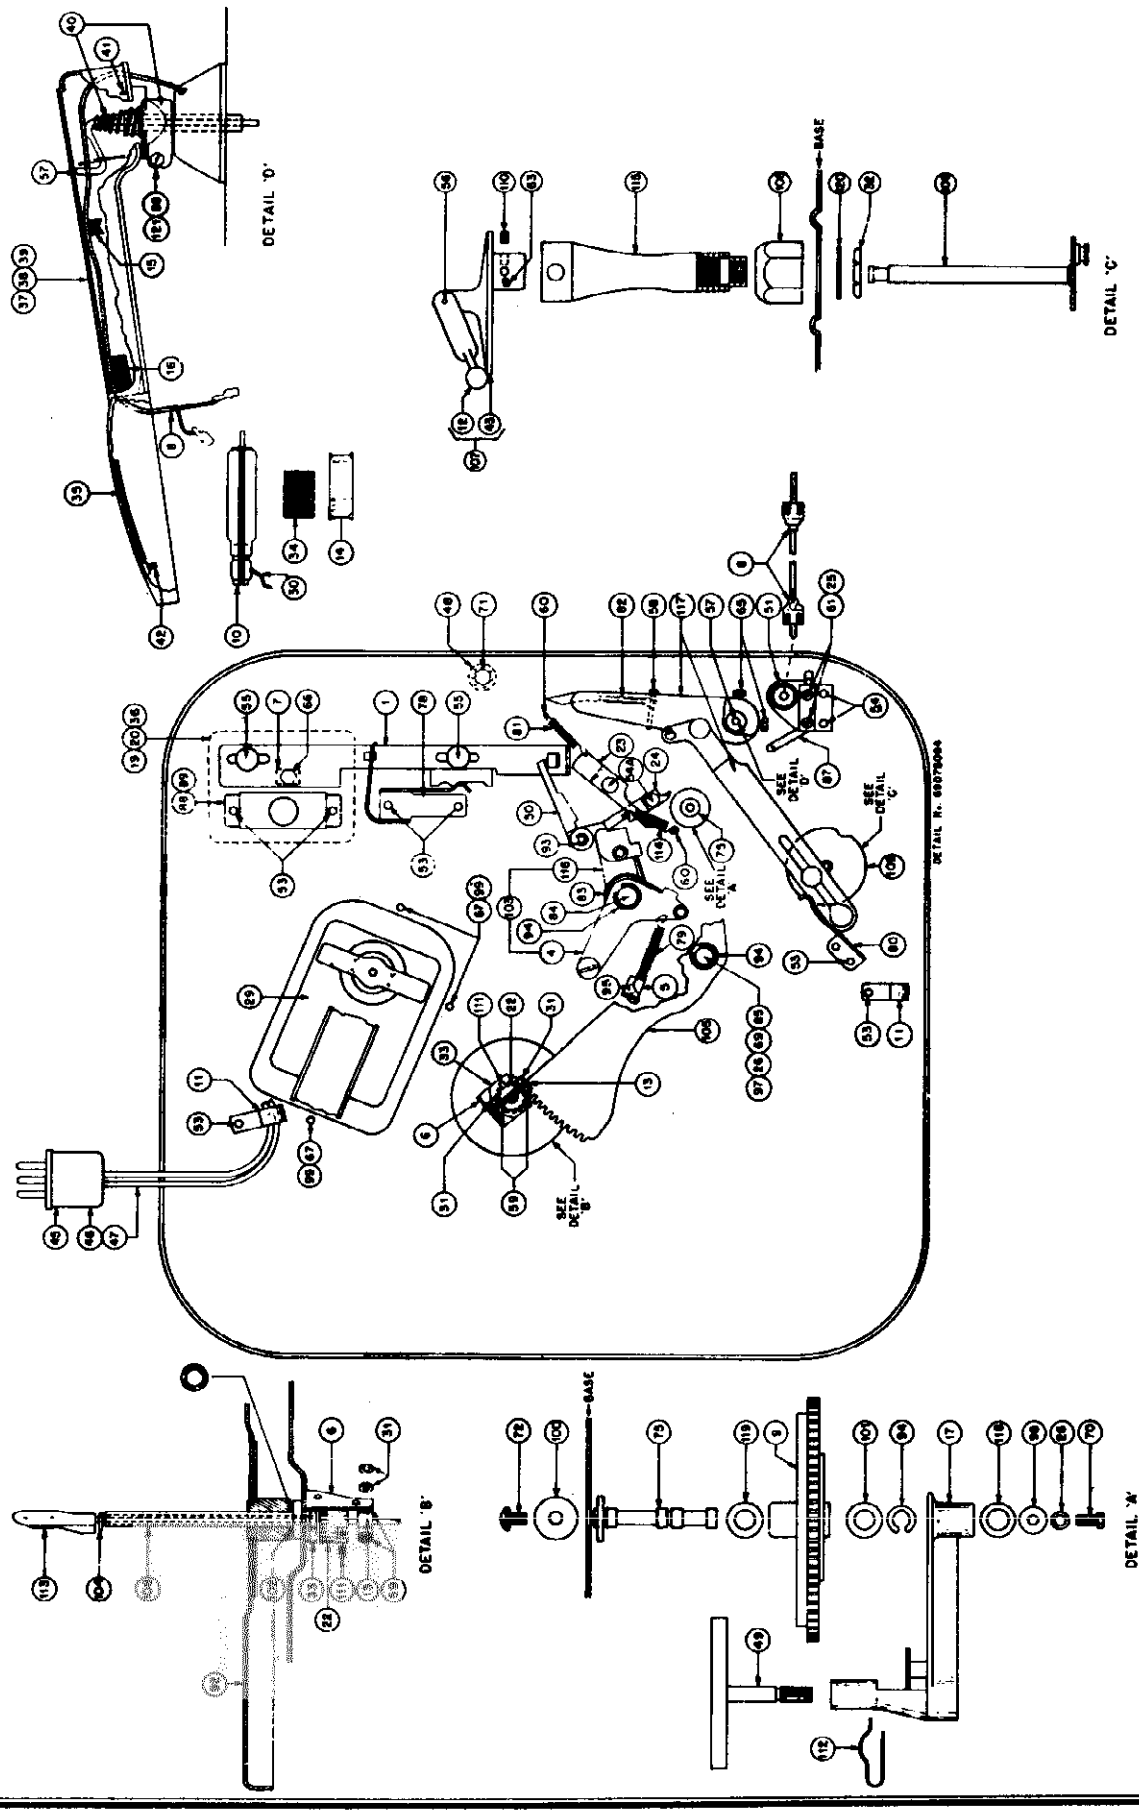

FIGURE 15. RECORD CHANGER PARTS LOCATION DETAIL

PARTS LIST

REF. NO.	PART NO.	DESCRIPTION
1	45B27543	Arm, selector slide
2	43X4554	Bearing, ball: .062 diameter (16 used in turntable bearing) B-24-RC & B-25-RC only. No longer used; replace with Oilite bearing (102)
3	1B71785	Bell Crank Assembly - B-24-RC & B-25-RC only. Replace with (103)
4	1X71786	Bell Crank Lever Assembly: consists of bell crank lever with eccentric stud and roller
5	7A72463	Bracket, mounting (anchors bell crank spring)
6	7A71686	Bracket, spindle
7	38A27564	Button, switch
8	1X72672	Cable & Pin Terminal Assembly (pick-up connecting lead)
9	1B71679	Cam Wheel & Bearing Assembly: die cast cam wheel with pressed in Oilite bearing
10	59A71618 or 59A74887	Cartridge, crystal
11	42K13135	Clamp, cable: 1/2"; cadmium plated (cable support)
12	42B71643	Clamp, record
13	42A71690	Clamp, spindle
14	42A75809	Clip, cartridge retainer: spring steel
15	42A72314	Clip, retainer: steel, 7/8 long (holds pick-up lead inside pick-up arm)
16	35A72628	Cushion, pick-up arm: sponge rubber, 19/64 x 3/8 x 1/2 long
17	1X71794	Drive arm assembly: die cast; includes brass idler gear
18	47A72662	Eccentric & Tube Assembly - Replace with matched (113) & (104)
19	13A27714	Escutcheon, switch (B-24 & 27-RC only)
	13K77077	Escutcheon, switch (B-29-RC only)
20	13A27526	Escutcheon, switch (B-25 & 28-RC only)
21	1X71798	Gear Arm Assembly: includes roller and bushing - B-24-RC & B-25-RC only. Replace with (105)
22	44B71634	Gear, spindle
23	45A27549	Lever, manual
24	45A74582	Link, trip
25	4S7695	Lockwasher, steel: #5 internal: cadmium plated (muting switch mounting)
26	4S7671	Lockwasher, steel: #8 split; cadmium plated (gear arm stud mounting - drive arm mounting)
27	4S8441	Lockwasher, steel: 1/2" external; cadmium plated. B-24-RC &
28	11M8605	Lubricant: Metal Lubriplate #105 (general lubricant)
29	59C71678 or 59C75524	Motor, Phono: complete: 117V, 60 cycles
30	47X72643 or	Needle, phonograph: sapphire tipped
	47X74920	Needle, phonograph: precious metal tipped
31	2S7019	Nut, steel: 4-40 x 1/4 hex; cadmium plated (spindle clamp mounting)
32	2K17206	Nut, steel: 1/2-28 x 5/8 hex; cadmium plated (record support mounting)
33	2A72311	Nut, special (record post mounting)
34	35A74665 or	Pad, cartridge (small): sponge rubber: 1/2 x 3/4 x 1/16 thick
	35K74908	Pad, cartridge (small): sponge rubber: 1/2 x 3/4 x 1/8 thick (cushion between cartridge retainer clip and cartridge. 1/16 pad used with Shure cartridge; 1/8" pad is used with Webster cartridge)
35	35A74664	Pad, cartridge (large): sponge rubber; 3/4 x 1-1/2 x 1/8 thick (pad between pick-up arm and pick-up cartridge)
36	32A27776	Pad, escutcheon: paper

REF. NO.	PART NO.	DESCRIPTION
37	1X76313	Pick-up Arm Assembly (less needle) complete with crystal cartridge, cable, shaft, pick-up elevating rod, guide bracket and cam assembly. (B-24, 25, 27 & 28 RC Only)
	1X77202	Pick-up Arm Assembly (less needle) same as above except for B-29-RC only)
38	1X71792	Pick-up Arm, Shaft & Arm Cam Assembly: complete but less crystal cartridge, lead and cartridge retaining parts. (B-24, 25, 27 & 28-RC only)
	1X77062	Pick-up Arm, Shaft & Arm Cam Assembly: same as above except for B-29-RC only
39	45D71605	Pick-up Arm (only): less cartridge and all other parts (B-24, 25, 27 & 28-RC only)
	49K77074	Pick-up Arm (only): less cartridge and all other parts (B-29-RC only)
40	1X72338	Pick-up Shaft & Cam Assembly
41	47A71685	Pin,pick-up arm: steel (hinges pick-up arm to shaft & cam assembly)
42	47A74656	Pin, cartridge locating: rubber; 7/64 diameter 5/16 long
43	64B71647	Plate, record support (B-24, 25, 27 & 28 RC only)
	64K77075	Plate, record support (B-29-RC only)
44	1X71797	Platform & Clamp Assembly: B-24-RC & B-25-RC only; no longer used; replace with (107)
45	28A27573	Plug: 3 pin
46	1X72351	Plug, Shell & Leads Assembly: 3 pin plug with two leads. (B-24, 27 & 29-RC only)
47	1X72498	Plug, Shell & Leads Assembly: 3 pin plug with three leads. (B-25 & 28-RC only)
48	46A27563	Post, pick-up resting; tenite
49	1X71795	Pulley & Shaft Assembly
50	1X75569	Ratchet Arm & Bushing Assembly
51	1X75267	Receptacle, Bracket & Switch Assembly (pick-up output receptacle & muting switch on bracket)
52	47A71702	Record Post and Bearing Assembly: antique copper finish; powdered iron bearing - B-24-RC & B-25-RC only. No longer used. Replace with (108) and use Oilite bearing (102) in place of the original ball bearings (2). Discard turntable retaining washer (96).
53	587716	Rivet, steel: .122 x 5/32; antique copper finish
54	587718	Rivet, steel: .122 x 3/16; antique copper finish
54A	5K21337	Rivet, shoulder (trip link & manual lever mounting)
55	5K72597	Rivet, shoulder (selector slide arm mounting)
56	47K76777	Rod, record clamp; steel, .062 diameter x 1-3/8 long; copper plated
57	47A71633	Rod, pick-up (pick-up arm elevating rod)
58	382697	Screw, steel: #2 x 5/8 PKZ slotted round head; cadmium plated (limit stop adjustment)
59	382286	Screw, steel: lockscrew, 4-40 x 3/16 locking type hex head machine screw: cadmium plated (spindle clamp)
60	382669	Screw, steel: #4 x 5/16 PKZ Phillips binder head: antique copper finish (spring anchoring studs)
61	381443	Screw, steel: 6-40 x 5/16 slotted binder head machine screw, nickel plated (muting switch mounting)
62	382672	Setscrew, steel: 6-32 x 3/16 Allen head, cone point: cadmium plated - B-24-RC & B-25-RC only. No longer used. Replace with cup point setscrew (110)
63	389700	Setscrew, steel: 6-32 x 3/16 Allen head, cup point machine screw: cadmium plated (record support mounting)
64	387119	Setscrew, steel: 6-32 x 1/4 slab head machine screw; cadmium plated; B-24-RC & B-25-RC only. Use longer screw (111) for replacement

REF. NO.	PART NO.	DESCRIPTION
65	3S7152	Screw, steel: 6-32 x 1/4 slotted hex head machine screw, cadmium plated (large trip arm mounting setscrews)
66	3S7506	Screw, steel: #6 x 1/4 PKZ plain hex head; cadmium plated (switch button mounting)
67	3S7342	Screw, steel: 6-32 x 5/8 slotted binder head machine screw; cadmium plated (motor mounting)
68	3S2288	Screw, steel: 6-32 x 3/4 slotted hex head machine screw; cadmium plated (pick-up arm lateral adjustment lockscrew)
69	3S2291	Screw, steel: 6-32 x 5/16 slotted hex head machine screw; antique copper finish (gear arm stud mounting)
70	3S7374	Screw, steel: 8-32 x 5/16 slotted hex head machine screw; cadmium plated (drive arm mounting)
71	3S2676	Screw, steel: #8 x 5/8 plain locking hex head; cadmium plated (pick-up resting post mounting)
72	3S2287	Screw, steel: 12-24 x 1/4 slotted binder head machine screw; antique copper finish (cam shaft mounting)
73	3A71612	Screw, adjustment: special; cadmium plated (pick-up arm lateral adjustment) - Remove & discard, no longer required
74	1X71788	Selector Shaft & Plate Assembly - B-24-RC & B-25-RC only
75	47A21298	Shaft, cam (for main cam wheel)
76	1B71709	Spindle Assembly - B-24-RC & B-25-RC only. Replace with matched (113) & (104)
77	41A72566	Spring, clip (cycle pulley retainer) - B-24-RC & B-25-RC only. Use improved clip (112) when replacing
78	41B71660	Spring, detent (for selector slide arm)
79	41A72337	Spring, drive arm tension
80	41A71635	Spring, selector (for 10-12 inch selector detent plate)
81	41A27775	Spring, tension (manual lever)
82	41A27491	Spring, tension (ratchet arm & pawl springs)
83	41A71676	Spring, torsion (used in bell crank assembly)
84	46A71620	Stud, bell crank lever
85	46A71631	Stud, shoulder (gear arm mounting stud)
86	46B71653	Support Post: B-24-RC & B-25-RC only. NOTE: If top adjustment type of record support is desired, replace parts (86) and (27) with (115) (106) and (120).
88	40A27846	Switch, slider: 2 position; with shell (B-24, 27 & 29-RC only)
89	40A27545	Switch, slider: 3 position; with shell (B-25 & 28-RC only)
90	1X71787	Trip Arm Assembly (small): small trip arm with roller. Use improved type (116) when replacing.
91	1X71789	Trip Arm and Selector Lever Assembly (large): consists of large trip arm assembly and selector lever and stud assembly, assembled together, less pawl spring (82) and screws (66) & (58). (B-24-RC & B-25-RC only)
92	59C71664	Turntable, phono
93	4K24125	Washer, "C" Spring (holds pick-up arm lateral adjustment screw in position and ratchet arm retainer) - Remove & discard; no longer required.
94	4A21941	Washer, "C" spring (bell crank retainer, main cam retainer & gear arm retainer)
95	4A19199	Washer, spring (used between mounting bracket that holds the bell crank spring and chassis base.)
96	4A74846	Washer, spring steel: special (turntable retainer) B-24-RC & B-25-RC only.
97	4S7623	Washer, steel: 3/8 x 11/64 x .033

REF. NO.	PART NO.	DESCRIPTION
98	4S7597	Washer, steel: 7/16 x .171 x .038 thick; cadmium plated (drive arm retainer)
99	4S1765	Washer, steel: 1/2 x .147 x 1/64 thick; cadmium plated (motor mounting)
100	4S7643	Washer, steel: 11/16 x 15/64 x .021 thick; antique copper finish (on cam wheel shaft mounting screw)
111	3S7109	Setscrew, steel: 6-32 x 5/16 slab-head machine screw; cadmium plated
112	42A76484	Spring, clip (cycle pulley retainer)
113	1B76766	Spindle & Release Assembly: furnished only in matched set with Eccentric & Tube Assembly (104)
114	41A76681	Spring, tension
115	46B76775	Support Post (B-27 & 28-RC only)
	46K77076	Support Post (B-29-RC only)
116	1X76780	Trip Arm Assembly (small)
117	1X76779	Trip Arm & Selector Lever Assembly (large): consists of large trip arm assembly and selector lever and stud assembly, assembled together; pawl spring (82) and screws (65) & (58) not included
118	4K76609	Washer, brass: 9/16 x .315 x .010 thick
119	4A21491	Washer, brass: 9/16 x .315 x .020 thick
120	4S1758	Washer, brass: 13/16 x .515 x .040 thick; bright nickel finish
121	4S7569	Washer, steel: 5/16 x .145 x .027 thick; cadmium plated
101	4A21491	Washer, brass: 9/16 x .315 x .020 thick (main cam wheel thrust washer)
102	43A76396	Bearing, Oilite: ring type (should be pre-soaked in grade 20W motor oil for at least 1/2 hour before installation)
103	1B76783	Bell Crank Assembly: includes bell crank lever with eccentric stud and roller (4), torsion spring (83) and small trip arm (116).
104	1B76770	Eccentric & Tube Assembly: furnished only in matched set with Spindle & Release Assembly (113)
105	1X76781	Gear Arm Assembly: with re-inforcing channel
106	2A76397	Nut, adjustment: acorn shaped
107	1X76774	Plate & Clamp Assembly (B-24, 25, 27 & 28-RC only)
	1X77083	Plate & Clamp Assembly (B-29-RC only)
108	47B76762	Record Post & Bearing Assembly
109	1X76778	Selector Shaft & Plate Assembly
110	3S9700	Setscrew, steel: 6-32 x 3/16; Allen head, cup-point machine screw; cadmium plated

PHONO OSCILLATOR CHASSIS HS-18

C-1	21R6535	Capacitor, fixed: mica; 25 mmf. 500V
C-2	21R6641	Capacitor, fixed: mica; 100 mmf. 20% 500 V
C-3	20A14502	Capacitor, trimmer: 16-160 mmf; with mounting bracket
C-4	21R6535	Capacitor, fixed: mica; 25 mmf. 500V
C-5	21R6638	Capacitor, fixed: mica; 1000 mmf. 500V
C-6	23A20867	Capacitor, electrolytic: 10-10-10 mf 150V; with mounting strap
C-7	8S9816	Capacitor, fixed: paper; .05 mf 400V
C-8	8S9816	Capacitor, fixed: paper; .05 mf. 400V
L-1	24A20892	Coil, oscillator
R-1	6R6056	Resistor, fixed: carbon; 47,000 1/2W Ins.
R-2	18A20869 or 18A71773	Resistor, variable: 10,000; screwdriver adj. type
R-3	6R2122	Resistor, fixed: carbon; 4.7 meg 1/2W Ins.
R-4	6R6101	Resistor, fixed: carbon, 4700 1/4W N.I.
T-1	25A17449	Transformer, Power
	42A22318	Clip, line cord: formed wire (holds line cord against chassis)
	30K31258	Cord, line & plug: 3 conductor; rubber covered

WR6, WR7 & WR8 MECHANICAL PARTS

PART NO.	DESCRIPTION
32K31259	Lock, line cord: fibre (holds line cord to chassis)
29R5207	Lug, soldering: #6; hot tinned
2S7051	Nut, steel: 3/8 -32 x 9/16 hex palnut; cadmium plated (bias control mounting)
9A22182	Receptacle, plug: 1 prong
9A27674	Receptacle, plug: 3 prong
5S7707	Rivet, steel: .122 x 5/32; nickel plated (tube socket and bias control mounting bracket)
5S7701	Rivet, steel: .122 x 3/16; nickel plated (osc. coil and trimmer mounting)
5S7703	Rivet, steel: .122 x 7/32; nickel plated (Power transformer and receptacle mounting)
5S7708	Rivet, steel: .122 x 9/32; nickel plated (line cord lock mounting)
3S7454	Screw, steel: #8 x 1/4 PKZ plain hex head; cadmium plated (cover mounting)
3S7456	Screw, steel: #8 x 1/4 PK A slotted acorn head; antique copper finish, mounts HS-18 to B-25-RC or B-28-RC
9A6738	Socket, tube; octal; saddle type
4S7578	Washer, brass: 5/16 x .130 x .025 thick (power transformer mounting)
4S1719	Washer, steel: 3/8 x .140 x .030 thick; cadmium plated (line
38A10544	Button, plug: for 1/4" hole; copper oxide finish
42X22210	Button, plug: fits 3/8" hole; copper oxide finish
16D71242	Cabinet, wireless record player: metal (WR6)
16E71007	Cabinet, wireless record player: wood (WR7)
1X75247	Cabinet, wireless record player: fibre; (WR8), includes 4 cover mounting brackets
32K70058	Cover, bottom (WR6)
32K70059	Cover, bottom (WR7)
32C72668	Cover, bottom (WR8)
37K15841	Foot, rubber: 3/4 diameter (WR7)
3S7163	Screw, steel: 8-32 x 1/4 slotted hex head machine screw: cadmium plated (bottom cover mounting - WR8)
3S7345	Screw, steel: 10-32 x 1/2 slotted round head machine screw; cadmium plated (Record changer mounting - WR6)
3S7329	Screw, steel: 10-32 x 2-1/4 slotted hex head machine screw; cadmium plated (record changer mounting - WR7)
3S7325	Screw, steel: 10-32 x 2-3/4 slotted hex head machine screw; copper plated (Record changer mounting - WR6)
41A21807	Spring, cushion (bottom) (WR7)
1X72458	Phono Pick-up Lead Assembly: 15" long
3S7439	Screw, steel: #4 x 1/2 slotted acorn head wood screw; antique copper finish (bottom cover mounting - WR6 and WR7)
3S7437	Screw, steel: #5 x 3/8 round head wood screw; antique copper finish (anchor strip mounting - WR6 and WR7)
3S1319	Screw, steel: #6 x 1/2" slotted oval head wood screw; antique copper finish (lid support mounting WR7)
3S1321	Screw, steel: #6 x 3/8 slotted round head wood screw; statuary bronze finish (lid support mounting WR7)
32A30684	Strip, anchor (WR6 and WR7)
55B71779	Support, lid (WR7)
4S8206	Washer, steel: 3/8 x .171 x .027 thick; cadmium plated (bottom cover mounting - WR8)
4S7582	Washer, steel: 1/2 x .195 x .033 thick; cadmium plated (Record changer mounting - WR6)
4S7565	Washer, steel: 1/2 x .218 x .048 thick; cadmium plated (Record changer mounting - WR7)
4S7563	Washer, steel: 5/8 x .203 x .033 thick; cadmium plated (record

MODELS WR6, WR7, WR8
CHASSIS HS-18

MOTOROLA INC.

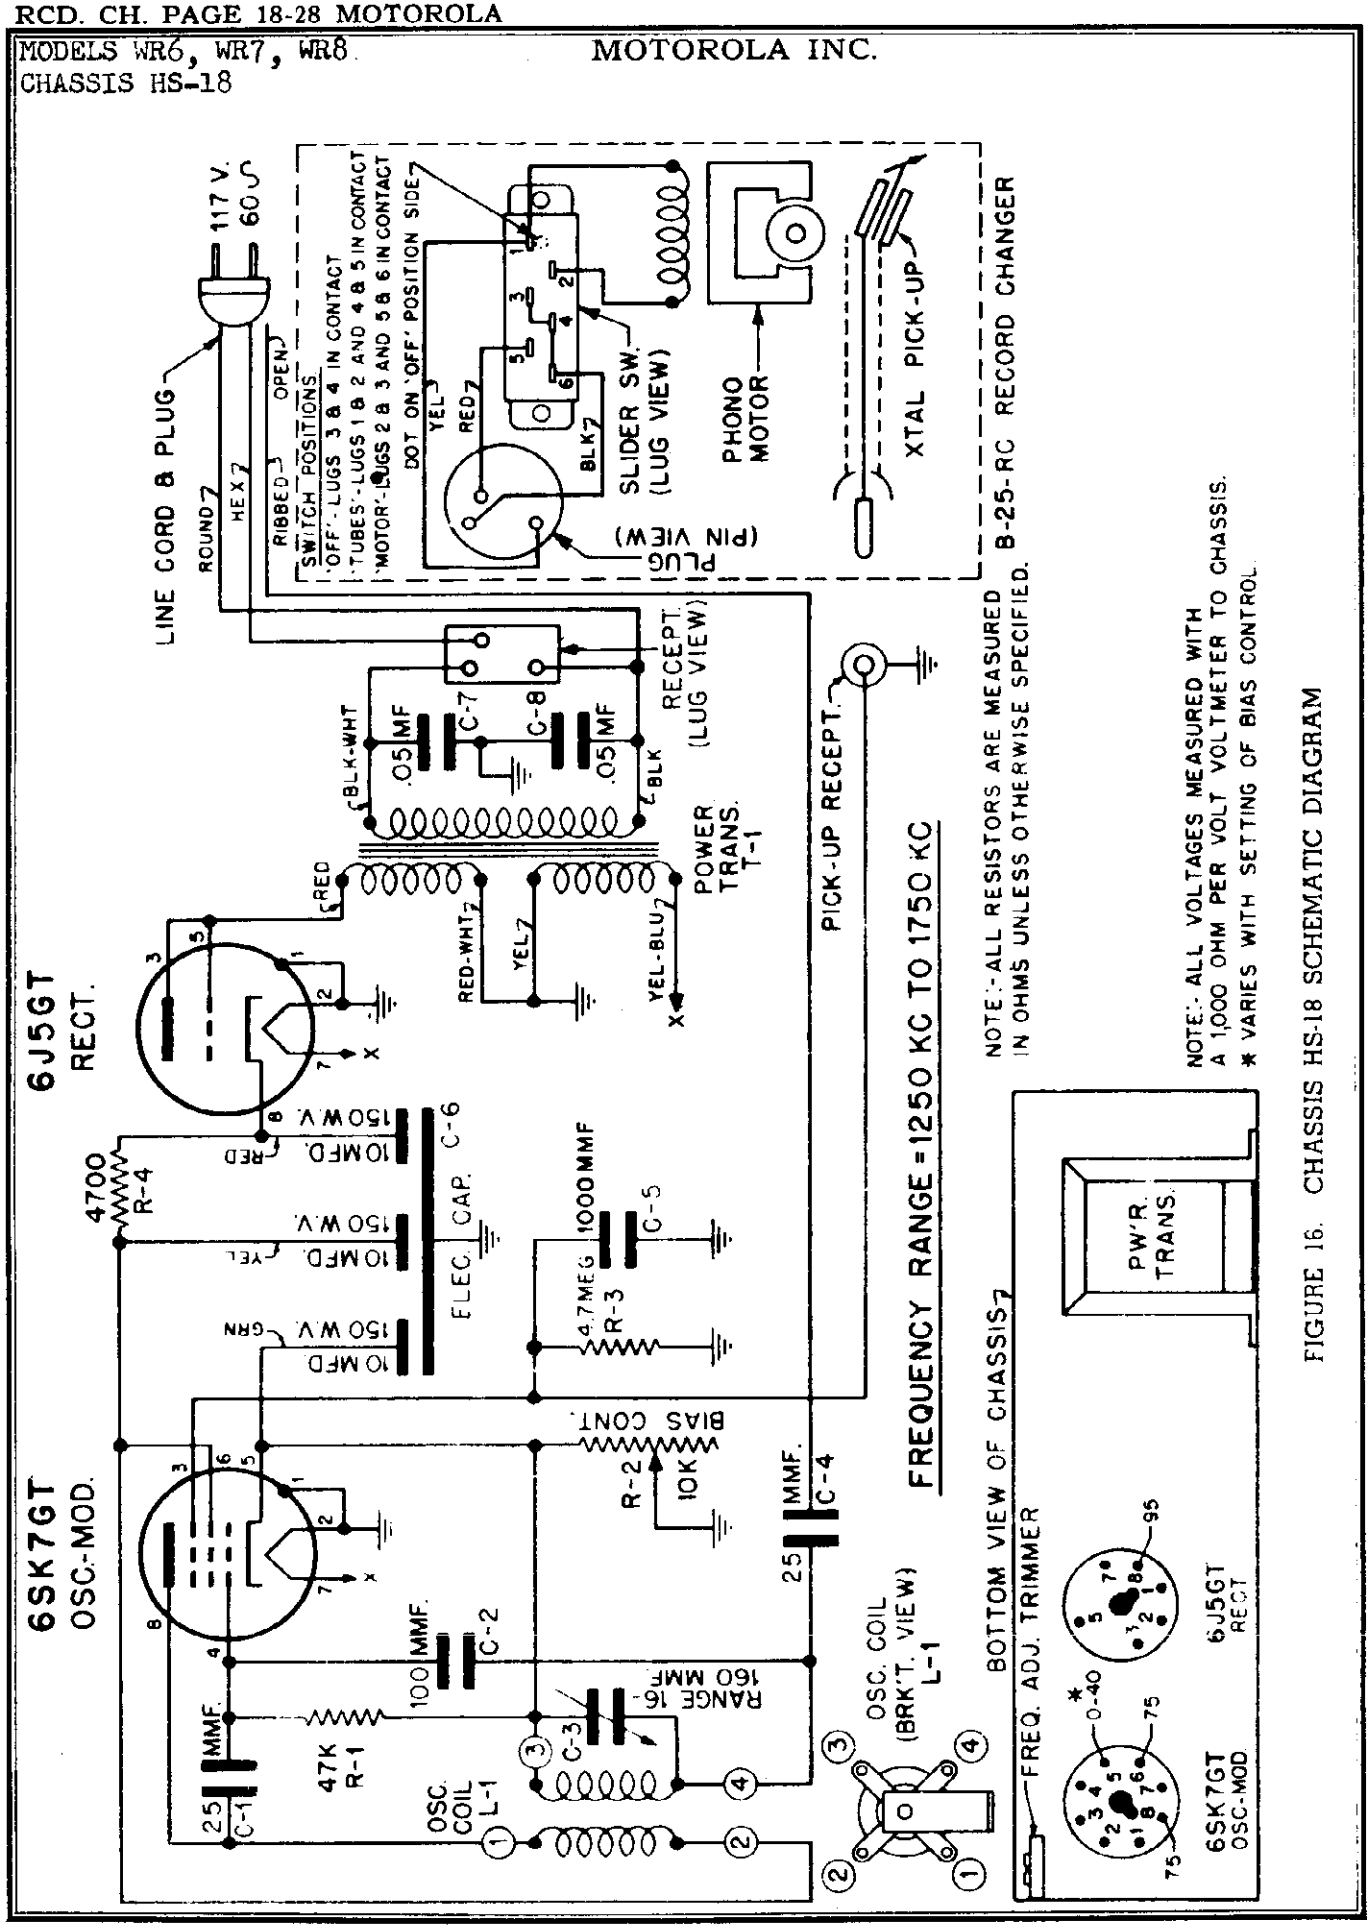

FIGURE 16. CHASSIS HS-18 SCHEMATIC DIAGRAM

These models are mechanically identical, the only difference being in the tone arm. This difference can be seen in figures 1 and 2. The tone arm on the D-10 employs a crystal pickup, while the tone arm on the D-10A is equipped with a dynamic pickup.

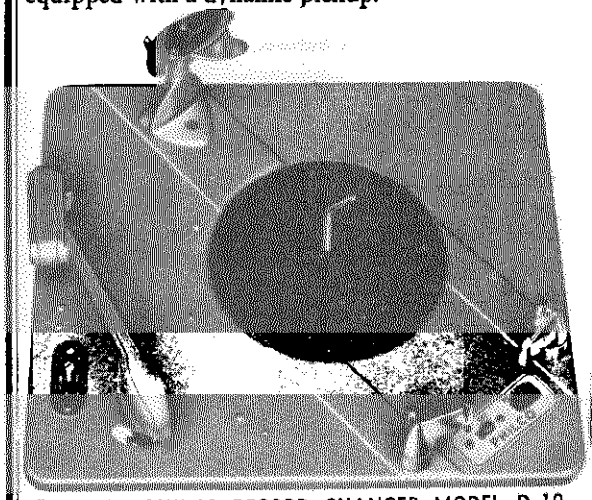

Figure 1. PHILCO RECORD CHANGER MODEL D-10

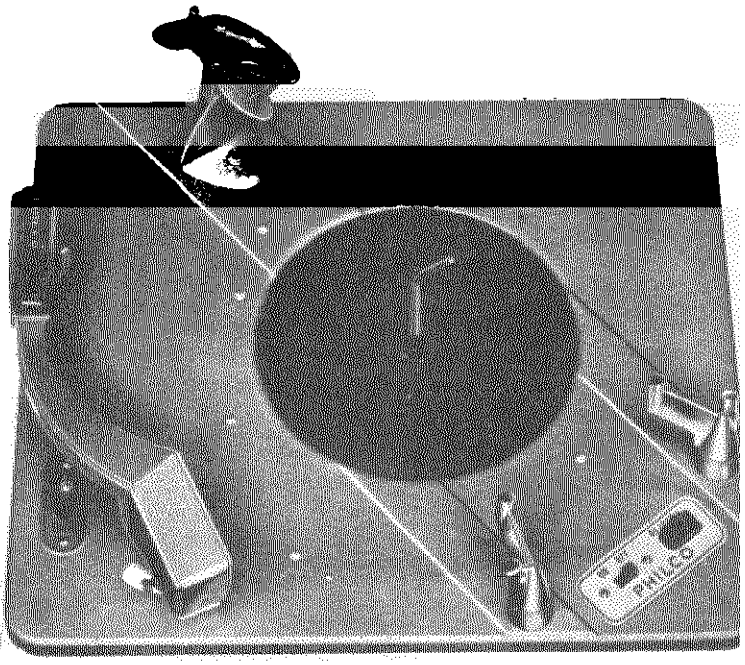

Figure 2. PHILCO RECORD CHANGER MODEL D-10A

PREPARATION FOR USE

OPERATING CHECKS—The following is a logical series of checks to be performed before the instrument is delivered to the owner. Should any of these checks reveal faulty operation, the correct adjustment will be found in the SERVICING section of this manual.

1. Without using a record, place the tone arm on its rest, set both record support levers and the record-separator post to their 12″ positions, as shown in figure 3. Set the manual-automatic lever to AUT. Turn the motor ON and operate the REJECT control; the changer should go through its cycle. Watch the tone arm swing out; it should clear the arm rest. At the completion of the cycle, the point of the needle should clear the changer base plate by $\frac{3}{32}$″.

2. Place a good 12″ record over the spindle and onto the record support levers and separator post. Operate the REJECT control and observe the action of the separator. The record should drop smoothly and evenly onto the turntable. The pickup should lower (index) so that the needle strikes the record approximately ⅛″ in from the outside edge.

3. Allow the record to play through and, when the needle enters the eccentric finishing groove, observe the tripping action; it is normal for the tone arm to ride the eccentric groove for three or four revolutions of the turntable.

4. Load the changer to capacity by placing nine more 12″ records on the supports. Reject each record with the REJECT control. The separator should select each record individually and each should drop smoothly. The tone arm, in its elevated position, should not strike the bottom of the remaining stack of records. After the full stack of records has dropped onto the turntable, the tone arm should lift high enough to clear the top record by ⅛″.

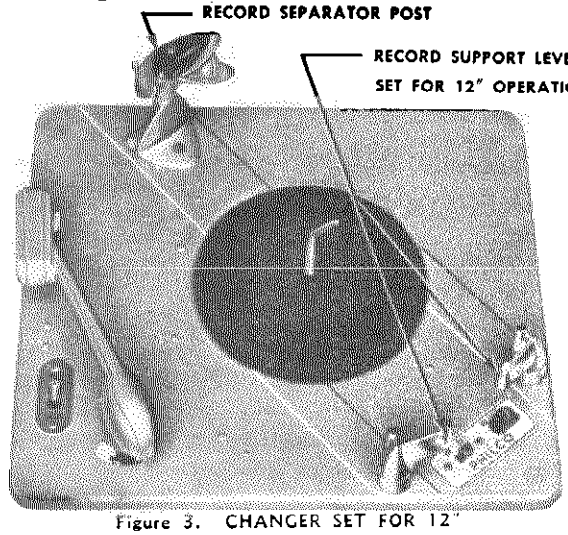

Figure 3. CHANGER SET FOR 12″ AUTOMATIC OPERATION

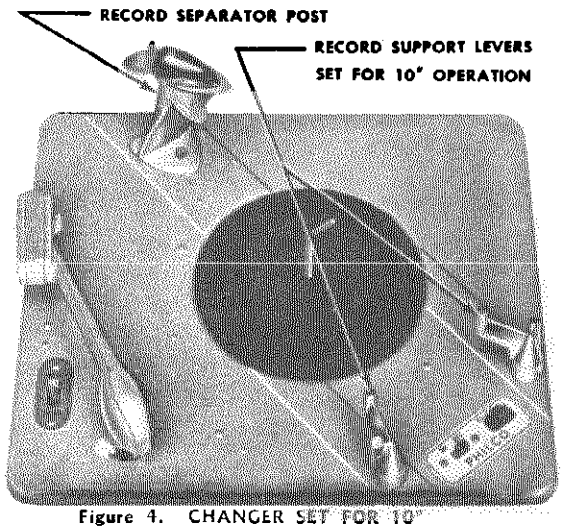

Figure 4. CHANGER SET FOR 10″ AUTOMATIC OPERATION

5. Place the manual-automatic lever at MAN; place the tone arm on its rest; shut off the motor and unload the changer.

6. Set the record support levers and record separator post in the 10″ position, as shown in figure 4. Place a good 10″ record over the spindle and onto the support levers and separator post. Set the manual-automatic lever to AUT, turn on the motor and operate the REJECT control. The record should drop smoothly and the tone arm should lower so that the needle strikes the record approximately ⅛″ in from the outside edge.

7. Allow the record to play through and observe the tripping action. Again, it should be smooth and positive.

8. Load the changer to capacity with eleven more 10″ records. Reject each record with the REJECT control, making certain that each record drops smoothly and individually. When the full stack has dropped onto the turntable, place the manual-automatic lever at MAN and play one record through to determine that the automatic mechanism is disengaged.

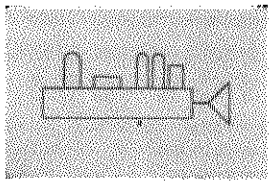
9. Turn the changer off as before, and unload.

PHILCO RADIO-PHONOGRAPH TROUBLE-SHOOTING PROCEDURE

The following tests are given for quickly localizing trouble in a Philco radio-phonograph. Be sure to make each test, in the order given, *before* removing the record changer from the cabinet.

If the trouble is found to be in the audio amplifier, refer to the radio service manual for the particular model under test. If the trouble is in some part of the record changer, refer to the SERVICING section of this record-changer manual.

1. AUDIO-AMPLIFIER TEST



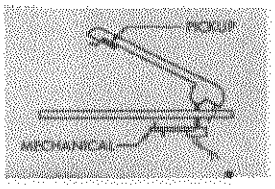
The audio amplifier is common to both the radio and phonograph sections of the combination. With a station tuned in, check the audio amplifier by noting the tonal quality and volume of the speaker output.

On models using the D-10A record changer, also check the phonograph pre-amplifier stage by applying a weak audio signal to the grid of the first audio tube of the radio; the signal should be just strong enough to be barely audible through the speaker. Then apply the same signal to the grid of the phonograph pre-amplifier tube. If the pre-amplifier stage is normal, an appreciable increase in volume will be noticed. An output meter connected across the output of the audio amplifier would normally indicate a gain of approximately five times.

If trouble is found in the audio amplifier, refer to the service manual for the particular model under test.

2. TONE-ARM TESTS

a. Pickup Test



Play a familiar record on the radio-phonograph, and listen to the reproduction. If the audio amplifier was found to be normal in the first test, distortion or low volume indicates trouble in the pickup or in the connecting leads to the radio chassis. Try a new needle if the output is distorted.

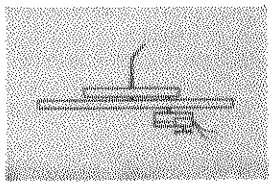
NOTE: It is advisable that a familiar record be carried as a regular part of the serviceman's test equipment.

b. Indexing and Tripping Test

Set the record separator post to the 12″ position and place a good 12″ record on the turntable. Set the manual-automatic lever to AUT, turn on the motor, and operate the REJECT control. Observe the action of the tone arm. It should rise and travel over to the record, with the needle making contact approximately ⅛″ in from its outside edge. After the record has played through, tripping of the mechanism should occur during three or four revolutions of the turntable.

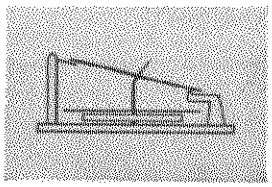
Set the record separator post to the 10″ position and, using a 10″ record, repeat the procedure.

3. TURNTABLE AND MOTOR TEST



Set the manual-automatic lever to MAN. Load the turntable with ten 12″ records and place the tone arm on the top record. Place a stroboscope disc, such as Philco Part No. 45-2900, on the record, and illuminate the disc with a lamp (preferably a neon bulb) operated on 60-cycle a.c. The dots in the row calibrated for 78 r.p.m. should appear to remain stationary, or drift slowly but smoothly forward or backward. Erratic motion of the dots indicates trouble in the drive mechanism.

4. RECORD-SEPARATOR TEST



Set the record separator post and the support levers to the 12″ position and load the changer with ten 12″ records. Set the manual-automatic lever to AUT, turn on the motor, and operate the REJECT control. Observe the action of the separator and the motion of the record as it drops. Repeat the operation of the REJECT control to drop each record in turn. The records should be released smoothly, one at a time.

Set the record separator post and the support levers to the 10″ position and, using twelve 10″ records, repeat the procedure.

If the records do not drop properly, an adjustment of the separator post or an alignment of the spindle may be necessary.

SERVICING

DESCRIPTION OF OPERATING CYCLE—Power for the motor is supplied from the power line through the ON-OFF switch. The turntable is rim-driven by a rubber-tired idler wheel between the motor shaft and turntable rim. A small gear, cast as part of the turntable at its hub, drives a larger composition gear to furnish power to the main cam of the changer mechanism through a pinion gear. The pinion gear is engaged with the main cam gear through action of the trip mechanism. The changer is so designed that the tone arm and record separator post mechanisms operate by levers in contact with the various surfaces of the main cam. The trip mechanism is operated by a pawl and ratchet assembly and starts the change cycle when the needle travels the eccentric finishing groove of the record. The trip mechanism is locked in a disengaged position when the manual-automatic lever is in MAN position.

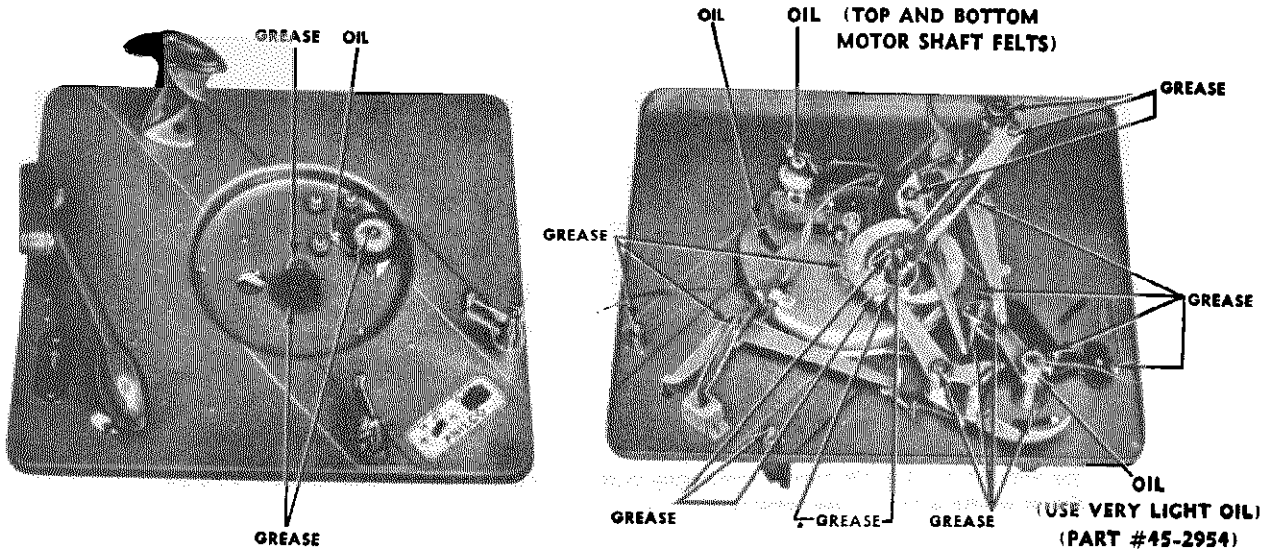


Figure 5. CHANGER LUBRICATION POINTS

CLEANING AND LUBRICATION — Cleaning and lubrication of the record changer should be done periodically or when a major part or assembly is replaced. Carbon tetrachloride or other similar cleaning fluid may be used to remove dirt, old oil or grease. All lubrication points are shown in figure 5.

PARTS NOT TO BE LUBRICATED— The following parts should not be lubricated at any time:

Separator
Trip pawl and ratchet (serrated surface)
Sliding segment on top of main cam.

PARTS TO BE GREASED—Using a light grease of the vaseline type, such as Philco Part No. 60130, lubricate the following parts:

All studs with moving parts attached.
Elevating lever where it contacts tone-arm lift rod.
Locating and tone-arm levers where they contact stud on trip arm.
Detent spring on manual lever.
Idler-wheel bearing stud.
Manual lever where it contacts trip-pawl stud in manual position.
Separator lever (both ends).
Main cam gear and pinion gear.
All shafts (except tone-arm shaft).
Record-separator-post shaft.
Record supports (under posts).
Turntable hub and composition drive gear.
Turntable bearing and ball bearings under turntable.

PARTS TO BE OILED—Using a good grade of light machine oil, lubricate the following parts:

Idler-wheel lever assembly.

CAUTION: Do not get oil on rubber tire, if so, remove immediately with carbon tetrachloride.

Motor-shaft felt oil retainers (top and bottom).
Tone-arm shaft (use very light oil such as Philco Part No. 45-2954).

Some parts and assemblies may have to be removed for proper lubrication. The correct procedure for the removal and re-installation of these parts and assemblies will be found in the REPLACEMENT OF PARTS AND ASSEMBLIES section of this manual.

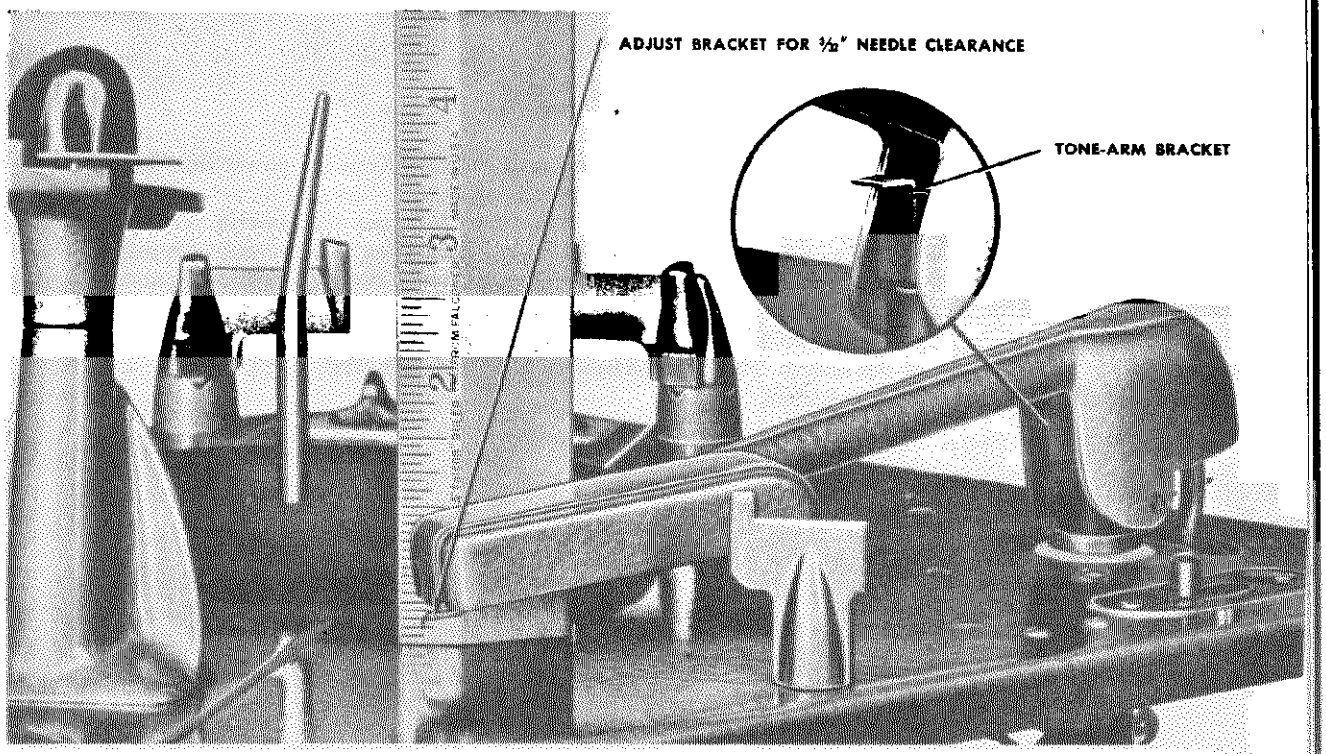

Figure 6. TONE-ARM BASE-PLATE CLEARANCE

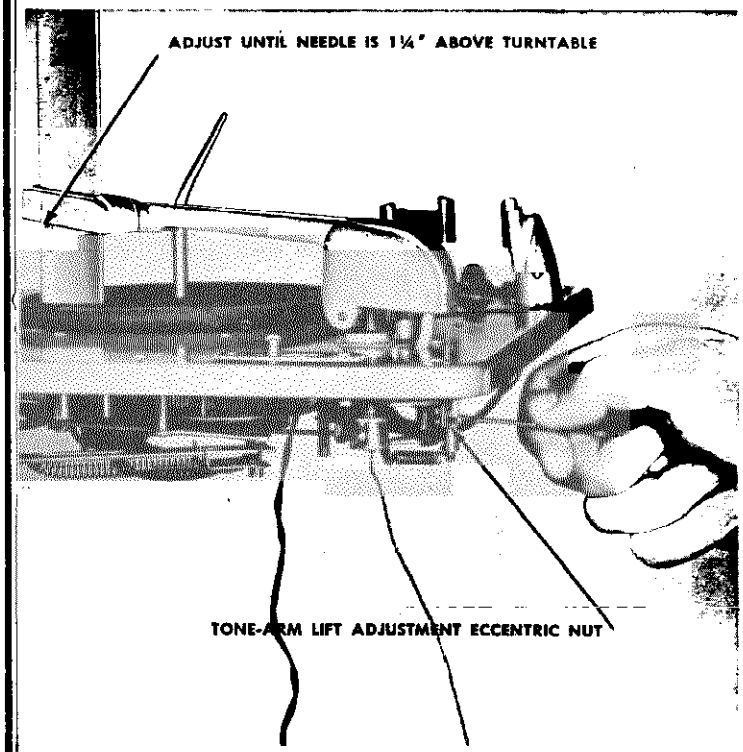

Figure 7. TONE-ARM LIFT ADJUSTMENT

TONE-ARM BASE-PLATE CLEARANCE — Without a record on the turntable and the changer out of cycle (playing position), the needle point should clear the changer base plate by $\frac{3}{32}$". To adjust, shape the tone-arm bracket, when necessary, as shown in figure 6.

TONE-ARM LIFT ADJUSTMENT—Without using a record, place the changer in automatic position; do not turn the motor on. Bring the tone arm into the center to actuate the trip. Manually revolve the turntable 1¼ turns. At this point, the needle should be 1¼" above the turntable. Adjustment is made by turning the eccentric nut on the tone-arm elevating assembly, figure 7, until the proper height is obtained.

12" INDEXING ADJUSTMENT

NOTE: As the 12" indexing adjustment affects the 10" indexing, any changes made in the 12" adjustment must be followed by an adjustment for 10" indexing. The 12" adjustment must be made first.

With the changer set for 12" operation, place a good 12" record on the changer and cycle the changer. Shut off the motor and stop the turntable when the needle is approximately ¼" above the record. Loosen the two setscrews (one has a flat end, the other a cone-pointed end) on the trip-lever assembly attached to the tone-arm vertical shaft. See figure 8. Holding the tone-arm lever lightly against the stop, move the tone arm until the needle point is approximately ⅛"

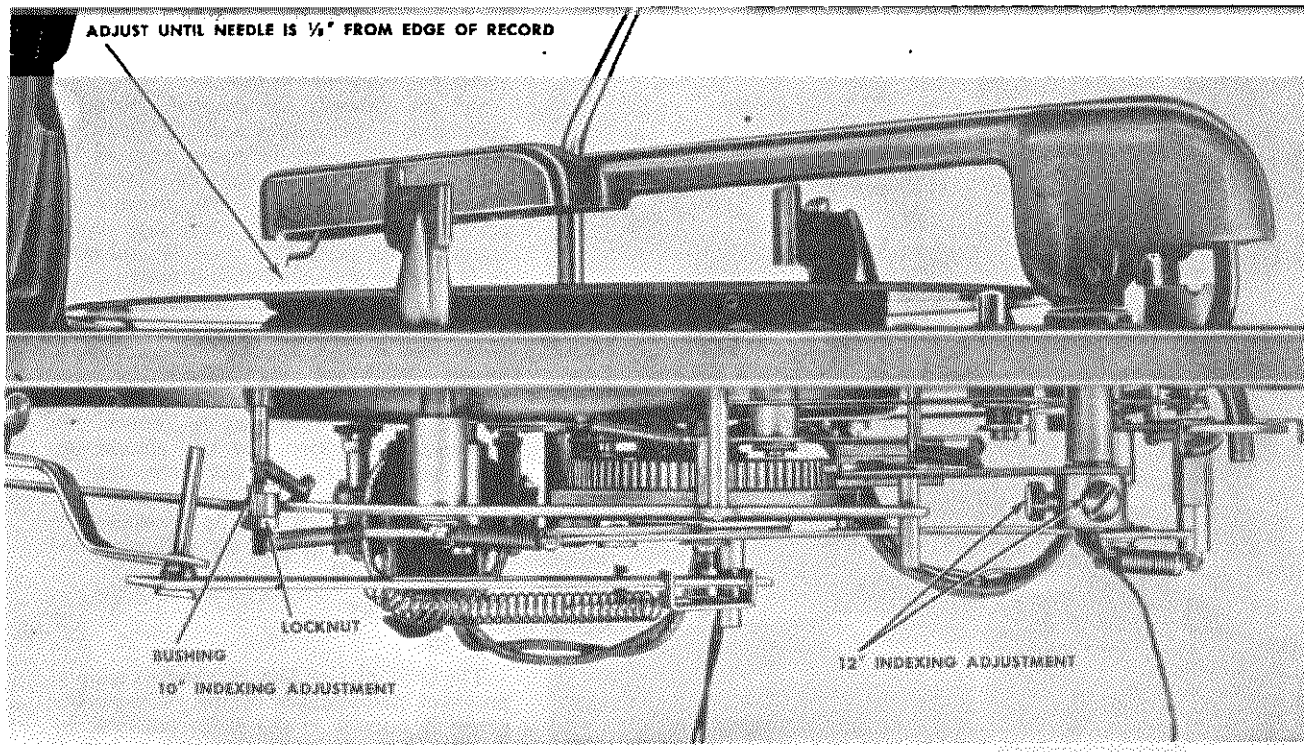

Figure 8. 12" AND 10" INDEXING ADJUSTMENTS

in from the outer edge of the record. Using a shim to provide .003" to .005" end play of the tone-arm post, first tighten the flat-end setscrew. Cycle the changer a few times to make sure the adjustment is correct; then tighten the cone-pointed setscrew.

10" INDEXING ADJUSTMENT—With the changer set for the 10" operation, place a good 10" record on the changer and cycle the changer. Shut off the motor and stop the turntable when the needle is approximately ¼" above the record. Referring to figure 8, loosen the locknut and turn the eccentric bushing directly above until the needle is approximately ⅛" in from the outside edge of the record. Tighten locknut. Cycle changer a few times to make certain the adjustment is correct.

TONE-ARM NEEDLE PRESSURE AND VERTICAL FRICTION

With a 2 oz. postal-type scale, similar to Philco Part No. 45-2958, hooked under the front edge of the tone arm, as shown in figure 9, lift the arm while noting the reading; lower the arm, again noting the reading. The difference in these two readings represents the vertical friction; this friction should not exceed 3/16 ounce. The reading midway between the two readings taken is the needle pressure. The crystal tone arm should have a needle pressure between 1 and 1¼ ounces. The needle pressure of the dynamic tone arm should be between ¾ and 1 ounce. If the tone arm pivot screw is too tight, excessive friction will result. Loosen lockscrew, adjust the pivot screw, and retighten the lockscrew. If the pivot screw is too loose, trip failure on some records is likely.

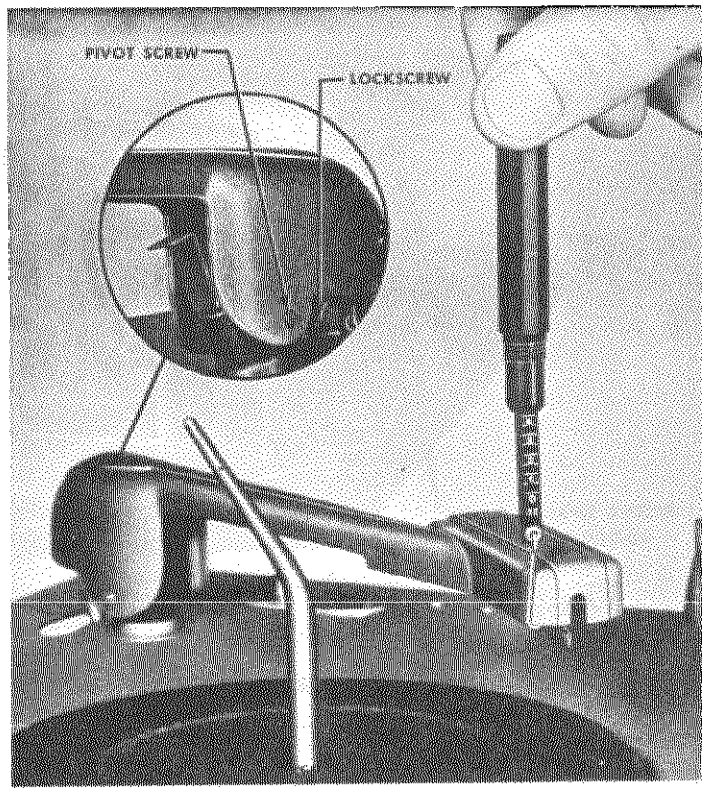

Figure 9. CHECKING TONE-ARM NEEDLE PRESSURE AND VERTICAL FRICTION

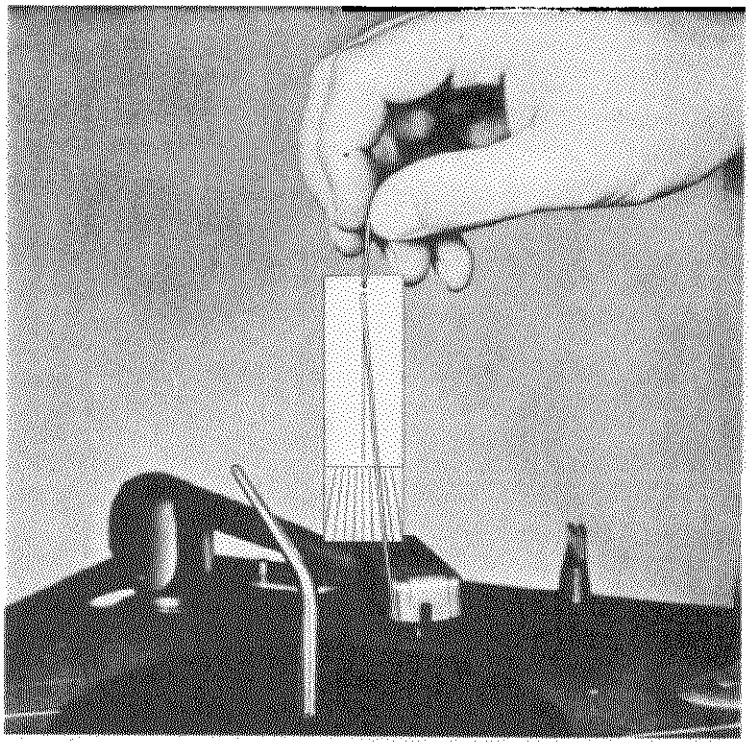

Figure 10. CHECKING TONE-ARM HORIZONTAL FRICTION

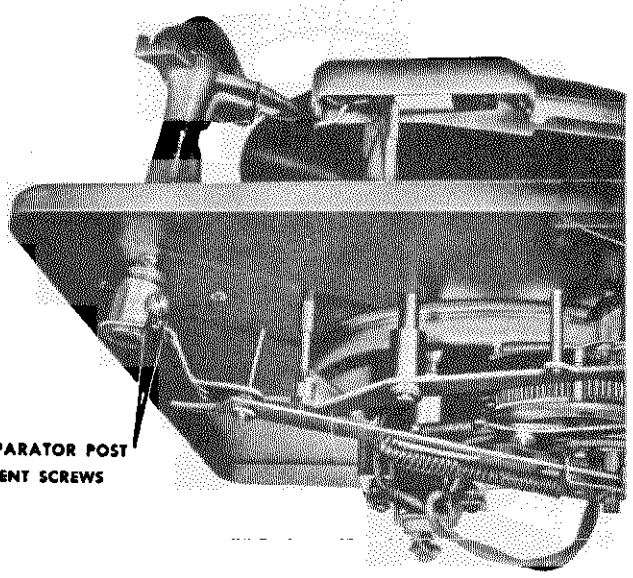

Figure 11. RECORD-SEPARATOR-POST ADJUSTMENT

TONE-ARM HORIZONTAL FRICTION AND TRIP SENSITIVITY

Set the changer for manual operation, and hook a pendulum scale, Philco Part No. 45-2953, under the front edge of the tone arm, as shown in figure 10. Move the tone arm with scale slowly toward the spindle, and back to the outer edge of the record. The pendulum scale is calibrated in $\frac{1}{16}$-ounce divisions, with 0 center. The average of both readings should not exceed $\frac{1}{8}$ ounce. Unlatch the trip; over the same range the average should not exceed $\frac{1}{16}$ ounce. With the trip latched, the horizontal reading in the direction toward the spindle should not exceed $\frac{5}{16}$ ounce. In the reverse direction, the trip should unlatch with a reading not exceeding $\frac{1}{2}$ ounce. If these specifications are met, many records which may be considered to have defective trip grooves will play and trip satisfactorily.

PICKUP TEST

D-10

The D-10 pickup may be checked simply, provided performance of the radio-phonograph is normal in the radio position, by playing a familiar record and listening to the tone quality and volume. If there is no reproduction, check for a short or open circuit in the shielded-wire pickup lead before replacing the pickup unit.

D-10A

The D-10A pickup may also be checked by the same listening test described for the D-10 pickup, provided radio performance is good and the pre-amplifier checks normal. If there is no reproduction, or if the reproduction is weak or distorted, check for a short or open circuit in the connecting leads and phono input transformer before replacing the pickup unit. The primary of the transformer should measure .1 ohm, and the secondary 7000 ohms.

D-10 or D-10A

If reproduction with either the D-10 or D-10A pickup is weak, but the leads and transformer check normal, replace the pickup unit as directed under REPLACEMENT OF PARTS AND ASSEMBLIES. If the reproduction is distorted, try a new needle before replacing the pickup unit.

RECORD-SEPARATOR-POST ADJUSTMENT

There are wide variations in records with respect to outside diameter, size of center hole, and thickness; we urge, therefore, that the record separator post adjustment never be made to any record, unless it has been carefully chosen to meet industry centerline specifications, as follows: For the

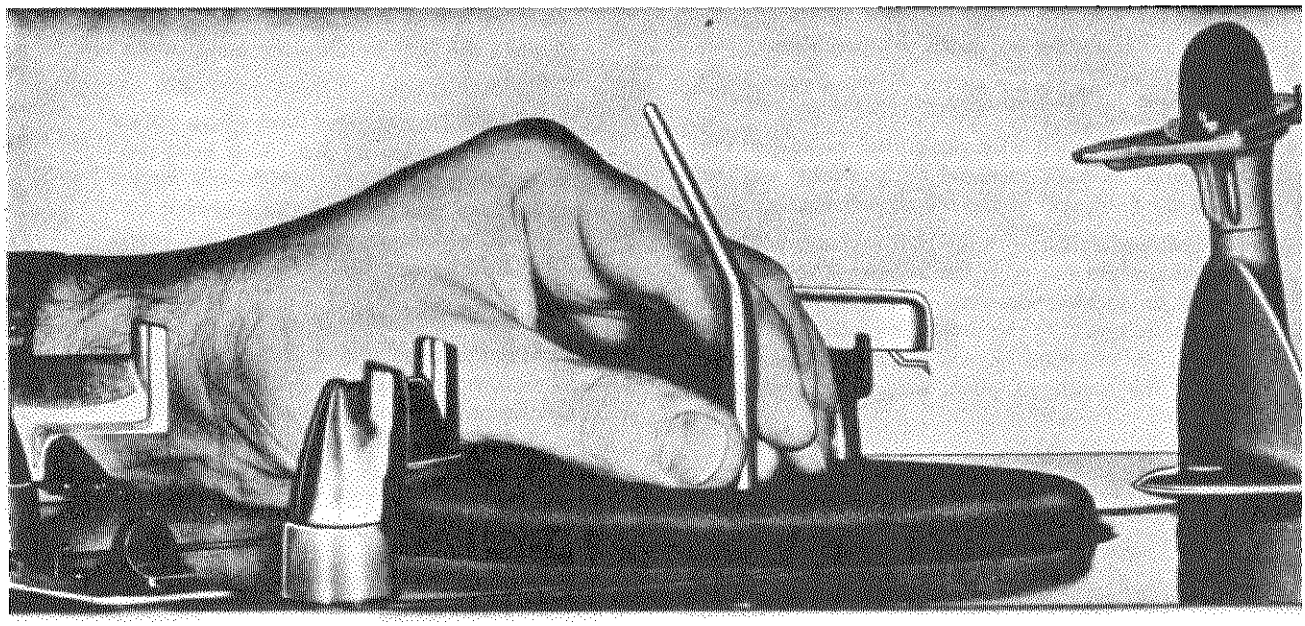
10" record—outside diameter, 9⅞"; center hole, .286"; thickness, .080"; for the 12" record—outside diameter, 11⅞"; center hole, .286"; thickness, .090". However, with an average record, observations can be made that should indicate a normal adjustment. With a 10" record placed on the separator post and both record supports, and with the record held on the separator post as far as the spindle will permit, the separator blade should not touch the record; the outer edge of the record should rest approximately in the center of the record supports. When held away from the separator base, the distance from the edge of the record to the separator tip should not exceed ⅛". With a 12" record placed on the separator post and both record supports, and with the record held on the separator post as far as the spindle will permit, the separator blade should not touch the record; the outer edge of the record should rest approximately in the center of the record supports. When held away from the separator base, the distance from the edge of the record to the separator tip should not exceed $\frac{1}{16}$". These conditions can be met precisely by adjusting the height of the spindle as shown in figure 12. However, the spindle should not be adjusted too low, as binding of the turntable will reduce speed. If the spindle is adjusted too high, the ball bearings may be allowed to escape, and the cleats on the spindle will damage the bottom record.

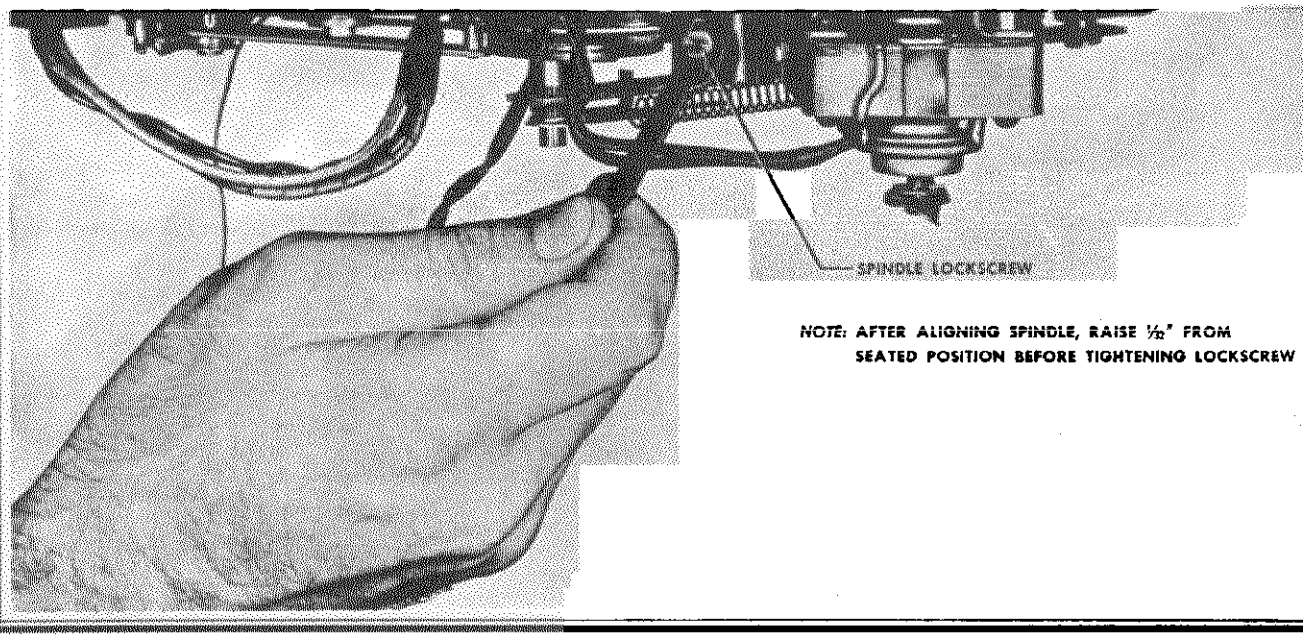
RECORD-SEPARATOR HEIGHT ADJUSTMENT

The changer is adjusted so that the separator blade engages a 10" record at a height of .060" ± .002", and a 12" record at a height of .070" ± .002".

SPINDLE ALIGNMENT—Loosen the hex-head setscrew in collar at bottom of spindle. Align spindle, with its top away from record separator post, so that tip of spindle points midway between the two record support levers.

Figure 12. SPINDLE ALIGNMENT





NOTE: AFTER ALIGNING SPINDLE, RAISE 1/32" FROM SEATED POSITION BEFORE TIGHTENING LOCKSCREW

REPLACEMENT OF PARTS AND ASSEMBLIES

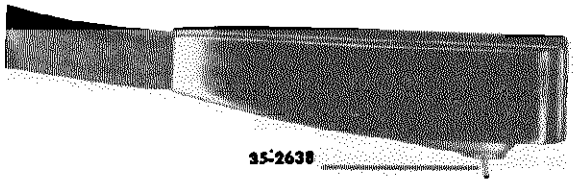


Figure 13. NEEDLE POSITION IN D-10A PICKUP

Whenever a part or assembly is found to be defective, or it becomes necessary to remove parts for lubrication, the following procedures are recommended. The part should be replaced by reversing the order of removal and adjusted according to the directions given in the SERVICING section of this manual. Be certain that the changer is out of cycle (playing position) before removing any parts or assemblies.

1. NEEDLE

a. The needle used with the crystal pickup in the D-10 changer may be replaced by loosening the setscrew at the front end of the crystal cartridge.

b. The needle used with the D-10A changer should be pulled straight out with the fingers. There are no setscrews or locking devices. When replacing the needle, make sure that the needle is placed so that its bend is in the direction of record rotation. See figure 13. Push the needle in place, using finger pressure only.

2. CRYSTAL

a. Remove tone arm, by loosening lockscrew and pivot screw. See figure 14. It is not necessary to unsolder the shielded cable, as there is generally enough slack to allow the arm to be turned over.

b. Remove the two screws and lockwashers which hold crystal to arm. See figure 15.

c. Lift out crystal cartridge and remove two jacks from end, as shown in figure 15.

3. DYNAMIC HEAD

a. Remove tone arm, by loosening lockscrew and pivot screw. See figure 14. It is not necessary to unsolder the shielded cable at the radio, as there is usually enough slack to allow the arm to be turned over.

b. Unsolder the wires from the head at points shown in figure 16.

c. Remove the bolt holding the head to the arm, and lift off head.

CAUTION: Do not place head where it may pick up iron filings or dirt. This head contains a powerful magnet which will attract and hold any small particles of magnetic material, and a delicate mechanism which will be damaged by any foreign material.

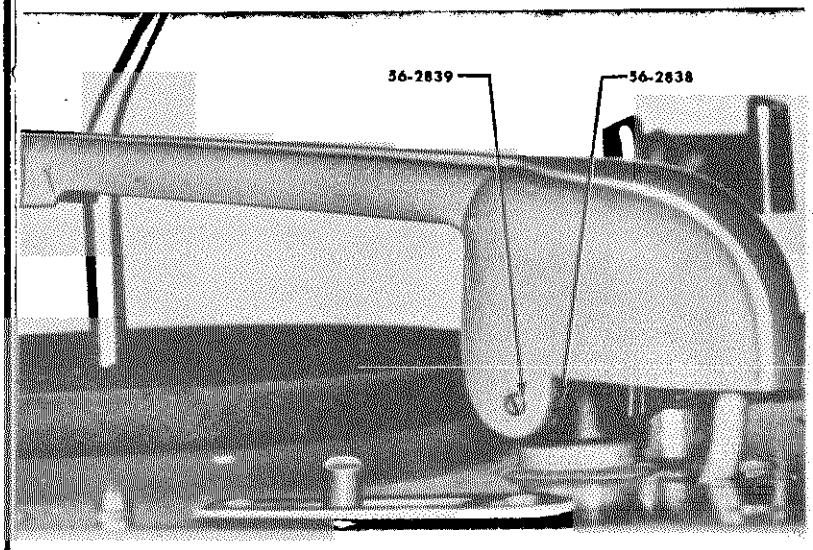
4. TONE-ARM ASSEMBLY

a. Unsolder end of the shielded cable which is soldered directly to a terminal panel in table model sets, and to a plug in floor models.

b. Loosen lockscrew and pivot screw. See figure 14.

c. Lift out tone arm.

Figure 14. TONE-ARM LOCKSCREW AND PIVOT SCREW



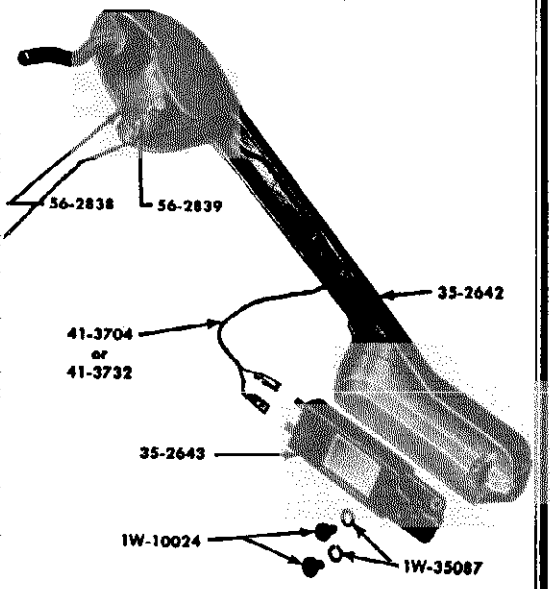


Figure 15. CRYSTAL CARTRIDGE REMOVED

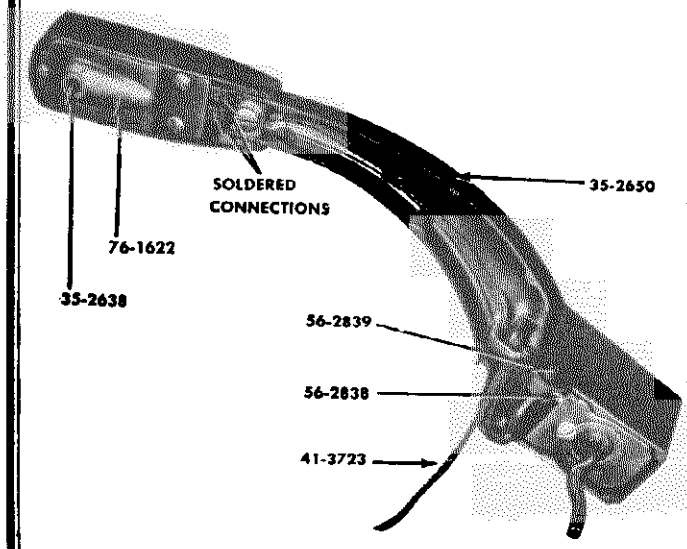

Figure 16 D-10A PICKUP, BOTTOM VIEW

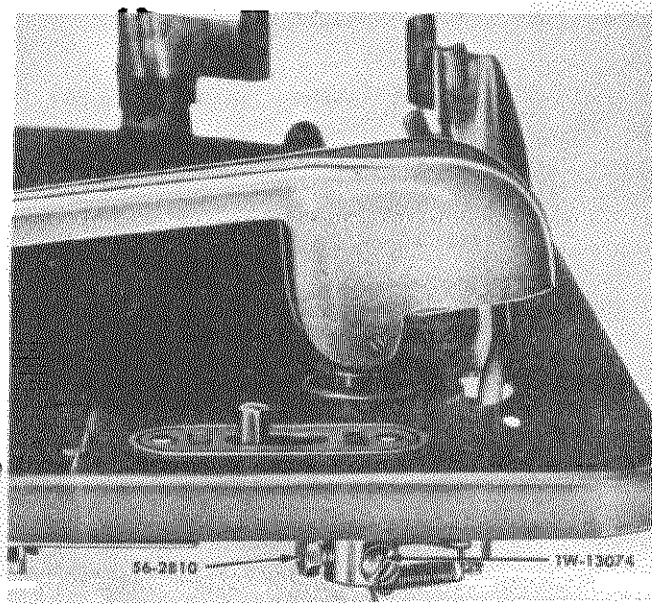

Figure 17. TONE-ARM-POST SETSCREWS

5. TONE-ARM AND POST ASSEMBLY

a. Unsolder the end of the shielded cable which is soldered to a terminal panel in table model sets, and to a plug in floor models.

b.. Loosen the cadmium-plated and bronze setscrews, figure 17, which hold the trip-lever assembly to the tone-arm post and remove trip-lever assembly.

c. Dress setscrew burrs from tone-arm-post shaft with a fine file to prevent damage to tone-arm bearing bushing. If these are thoroughly removed, the post will pass through the bearing freely.

d. Lift out tone-arm and post assembly, being careful not to lose the single ball bearing on top of bushing. The proper sequence of parts is shown in figure 18.

6. TURNTABLE

CAUTION: Be careful not to lose the eleven ball bearings and two thrust washers under the turntable gear. To prevent loss of the bearings when removing the turntable and spindle, place hand on container under spindle opening to catch any ball bearings that may fall out. These parts are shown in their proper relationship in figure 19.

a. Loosen setscrew 56-2810 in turntable-bearing bushing 56-2814, figure 20, and lift out spindle.

b. Lift off turntable.

Figure 18. TONE-ARM REMOVAL

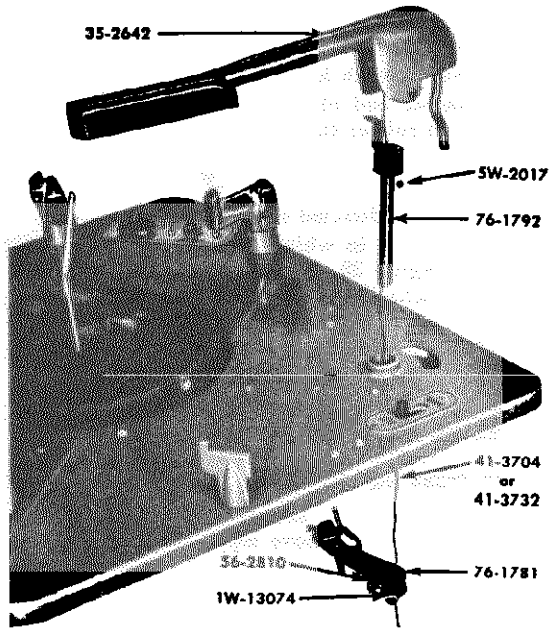

Figure 19. TURNTABLE REMOVAL

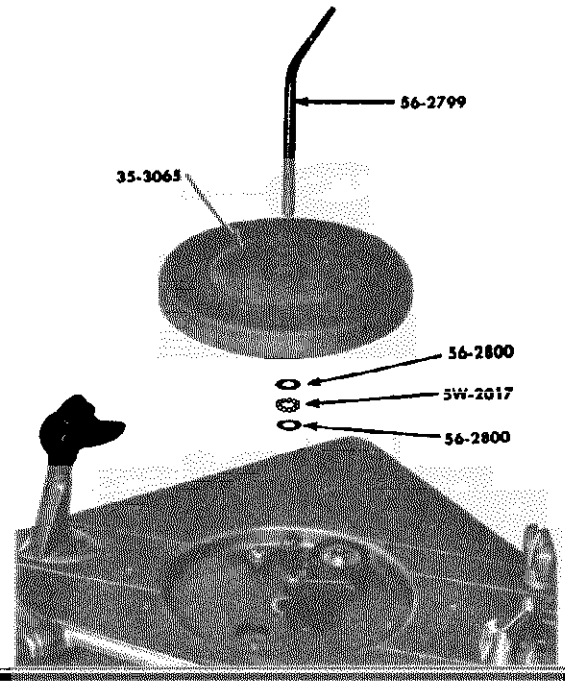

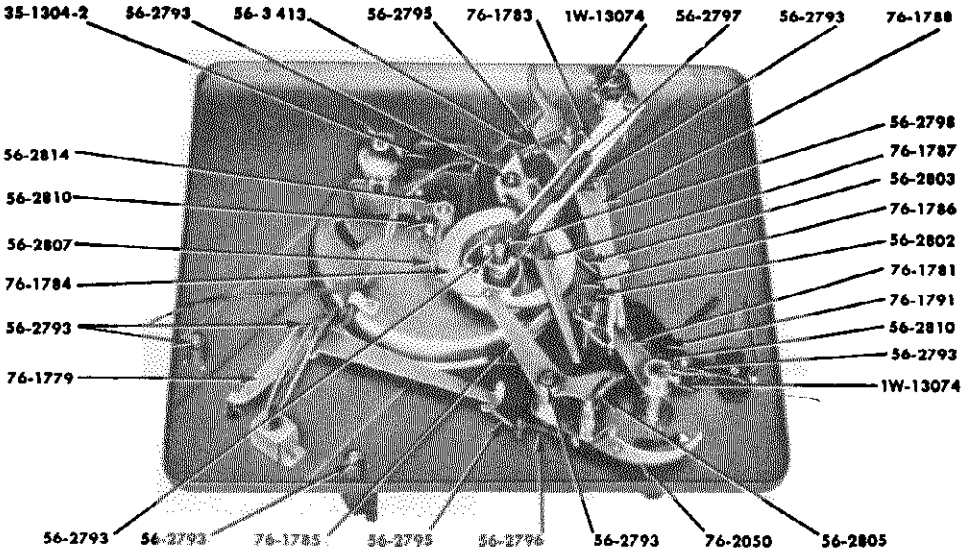

Figure 20. BOTTOM VIEW OF CHANGER

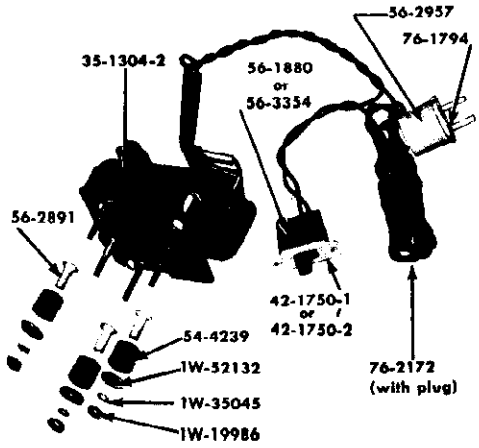

Figure 21. MOTOR REMOVAL

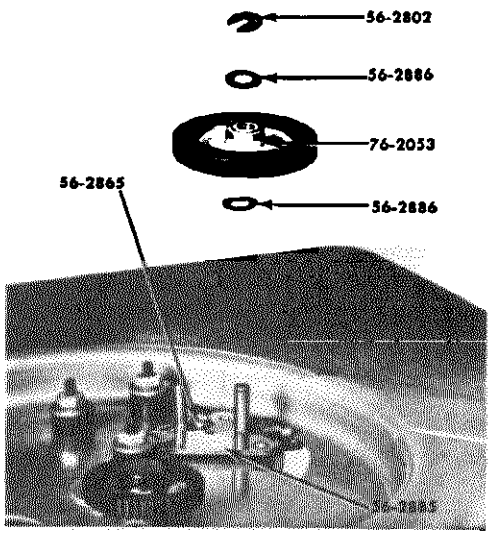

Figure 22. IDLER-WHEEL REMOVAL

c. Use grease on ball bearings, as directed in the CLEANING AND LUBRICATION paragraph of this manual, when replacing bearings. This will hold bearings in place for reassembly and will provide proper lubrication.

d. After replacing turntable, adjust height of spindle, as directed in the SERVICING section of this manual.

7. MOTOR

a. Remove turntable, as directed in paragraph 6.

b. Remove two screws from ON-OFF switch, and remove switch from base plate.

c. Loosen sheet-metal screw from clamp which holds wires against base plate, and lift wires from under clamp.

d. Remove three nuts from motor mounting bolts. Be sure there are three lockwashers, three flat washers, three rubber grommets, and three spacers, as shown in figure 21.

e. Lift out motor.

8. IDLER WHEEL

a. Remove turntable, as directed in paragraph 6.

b. Remove "C" washer with long-nose pliers.

c. Remove flat washer and idler wheel. See figure 22. Do not get grease or oil on rubber tire.

9. CAM-GEAR DRIVE-GEAR ASSEMBLY

a. Remove turntable, as directed in paragraph 6.

b. Drive out tapered pin in white metal pinion gear 56-2807 under base plate. See figure 20.

c. Remove lower (white metal) and upper (composition) gears.

10. SEPARATOR

a. Remove Phillips-head screw from plastic handle.

b. Remove plastic handle and separator. See figure 23.

11. SEPARATOR-POST ASSEMBLY

a. Loosen cadmium-plated and bronze setscrews in separator-lever assembly, figure 24, and remove separator lever from separator post.

b. Lift out post. See figure 23.

12. SEPARATOR-LEVER ASSEMBLY

a. Loosen cadmium-plated and bronze setscrews at separator-post end, figure 24.

b. Remove "C" washer and flat washer at cam-gear end and lift off lever.

13. TONE-ARM ACTUATING-LEVER ASSEMBLY

a. Remove separator-lever assembly at cam-gear end.

b. Remove tension spring 56-3413 from stud at short end of tone-arm actuating-lever assembly 76-1787. See figure 20.

c. Remove "C" washer and flat washer, and lift off lever.

14. TONE-ARM LOCATING-LEVER ASSEMBLY

a. Remove separator-lever assembly at cam-gear end.

b. Remove tension spring 56-3413 from tone-arm actuating lever 76-1787. See figure 20.

c. Remove tension spring 56-2795 from tone-arm locating lever 76-1788. See figure 20.

d. Remove "C" washer and flat washer and lift off lever.

15. TONE-ARM ELEVATING-LEVER ASSEMBLY

a. Remove lower tension spring 56-3414 from lower tone-arm elevating lever 76-1785. See figure 20.

b. Remove upper tension spring 56-2796 from upper tone-arm elevating lever 76-2050. See figure 20.

c. Remove "C" washer and flat washer and lift out both levers.

16. CAM-GEAR ASSEMBLY

a. Remove separator-lever assembly at cam-gear end.

b. Remove lower tension spring from tone-arm elevating levers and move lower tone-arm elevating lever away from cam gear.

c. Remove tension spring from stud at short end of tone-arm lever.

d. Remove "C" washer and flat washer from stud holding cam gear.

e. Lift tone-arm lever over stud on trip-lever assembly and hold away from cam gear with one hand while removing cam gear with the other hand, as shown in figure 25.

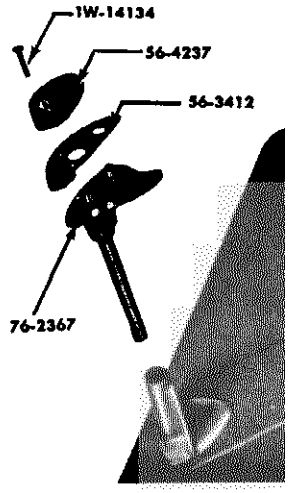

Figure 23. SEPARATOR-POST-ASSEMBLY REMOVAL

REPLACEMENT PARTS LIST MODELS D-10 and D-10A

SERVICE PART NO.	DESCRIPTION
27-6209	Socket, cable plug (D-10A)
35-1304-2	Motor (can be used on either model)
35-2638	Needle (D-10A)
35-2641	Tone-arm assembly (D-10)
35-2642	Tone arm (D-10)
35-2643	Cartridge, pickup (D-10)
35-2644	Needle (D-10)
35-2648	Tone-arm assembly (D-10A)
35-2650	Tone arm (D-10A)
35-3065	Turntable
35-5078	Plate, base
41-3704	Cable, shielded, tone-arm (D-10)
41-3723	Cable, shielded, tone-arm (D-10A)
41-3732	Cable, shielded, tone-arm (double conductor used on a-c and d-c sets)
42-1750-1	Switch, ON-OFF (Stackpole)
54-4235	Bumper (record)
54-4236	Knob (REJECT control)
54-4237	Cap, separator
54-4239	Grommet, rubber (motor mounting)
56-1880	Cover (Stackpole switch)
56-2027	Plug (shielded cable D-10)
56-2448	Cover, socket (D-10A)
56-2792	Spring, compression (record-support lever)
56-2793	Washer, "C"
56-2794	Nameplate (ON-OFF—REJECT)
56-2795	Spring, tension (reject lever and locating lever)
56-2796	Spring, tension (upper elevating lever)
56-2797	Spring, compression (separator lever)
56-2798	Slide, separator-lever
56-2799	Spindle, turntable
56-2800	Washer, bearing (turntable bearings)
56-2801	Washer (ratchet lever)
56-2802	Washer, "C" (ratchet lever and drive wheel)
56-2803	Spring, tension (ratchet lever)
56-2805	Spring, tension (lower elevating lever)
56-2806	Pin, pinion (pinion gear)
56-2807	Gear, pinion
56-2809	Nameplate (AUT-MAN)

SERVICE PART NO.	DESCRIPTION (Continued)
56-2810	Setscrew (hex head)
56-2823	Spring, detent (manual lever)
56-2838	Screw, pivot-locking (tone arm)
56-2839	Screw, pivot-point (tone arm)
56-2851	Spring (trip pawl)
56-2865	Spring, tension (idler wheel and segment ge
56-2891	Bushing (motor mounting)
56-2957	Cover (a-c plug)
56-3023	Bushing, eccentric (10" indexing)
56-3074	Spring (feed-in lever)
56-3412	Separator
56-3413	Spring, tension (tone-arm actuating lever)
56-3414	Spring, tension (tone-arm elevating lever)
76-1622	Unit, pickup (D10-A)
76-1775	Lever, support (right-hand)
76-1776	Lever, support (left-hand)
76-1777	Knob (REJECT)
76-1779	Reject-lever assembly
76-1781	Trip-lever assembly
76-1782	Separator assembly
76-1783	Separator-lever assembly
76-1784	Cam assembly
76-1785	Tone-arm elevating-lever assembly (lower)
76-1786	Ratchet-lever assembly
76-1787	Tone-arm actuating-lever assembly
76-1788	Tone-arm locating-lever assembly
76-1789	Gear assembly
76-1791	Manual-lever assembly
76-1792	Tone-arm shaft assembly
76-1794	Plug (a-c)
76-2050	Tone-arm elevating-lever assembly (upper)
76-2053	Wheel, idler
76-2172	Cable, a-c (with plug)
1W-14134	Screw, Phillips-head (separator cap)
5W-2017	Bearing, ball (turntable and tone-arm)
318-4316	Stud and lever assembly (idler wheel)

OPERATING CHECKS

The following is a logical series of checks to be performed before the instrument is delivered to the owner. Should any of these checks reveal faulty operation, the correct adjustment will be found in the SERVICING section of this manual.

1. Place the spindle into the turntable and turn the spindle so that the offset is toward the record shelf. The spindle should drop all the way into its slot.

2. Place the tone arm on its rest post, turn the record shelf fully counterclockwise to the 10" position and lift the record hold-down over and toward the corner of the changer, as shown in figure 2.

3. Place a good 10" record over the spindle and onto the record shelf. Bring the hold-down over onto the record.

4. Turn the master control switch to REJ (reject) and release; it will spring back to AUT (automatic). The changer should go through its cycle. Observe the action of the push-off mechanism; the record should drop smoothly onto the turntable. The pickup jewel should lower onto the record approximately ⅛" in from the edge.

5. Allow the record to play through and, when the jewel travels the eccentric finishing groove, observe the tripping action; it should be smooth and positive.

6. Load the changer to capacity by placing eleven more 10" records over the spindle and onto the record shelf. See figure 3. Reject each record with the master control switch and observe the changer action. The tone arm, in its elevated position, should not strike the bottom of the remaining stack of records. After the full stack of records has dropped onto the turntable, the tone arm should lift high enough to clear the top record by approximately ⅛".

NOTE

Should any record fail to drop onto the turntable, carefully examine the record before making any adjustments to the changer. An unusually thick record may not drop.

7. Turn the changer master control switch to OFF, place the tone arm on its rest post, and pull the spindle straight up and out; unload the records, and replace the spindle.

8. Turn the record shelf fully clockwise to the 12" position, as shown in figure 4.

9. Place a good 12" record over the spindle and onto the record shelf. Bring the hold-down over onto the record. Repeat steps 4, 5, and 6, using nine additional 12" records in step 6.

10. Place the master control switch at MAN (manual) and play one record through to determine that the tripping mechanism is electrically disconnected.

11. Unload the changer as outlined in step 7.

12. With the master control switch OFF, the idler wheel should automatically disengage from the turntable rim. Check by spinning the turntable manually; it should revolve freely.

NOTE

Should the tone arm be held during a change cycle, the safety device will permit the changer to cycle without damage to any parts or adjustments.

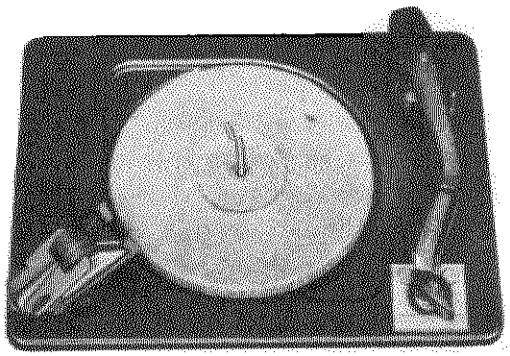

Figure 2—CHANGER, RECORD SHELF IN 10" POSITION.

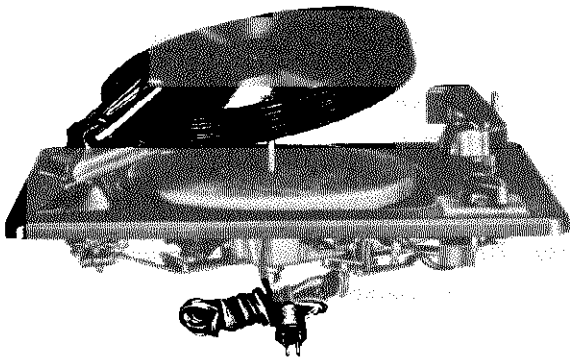

Figure 3—CHANGER, LOADED WITH TWELVE 10" RECORDS.

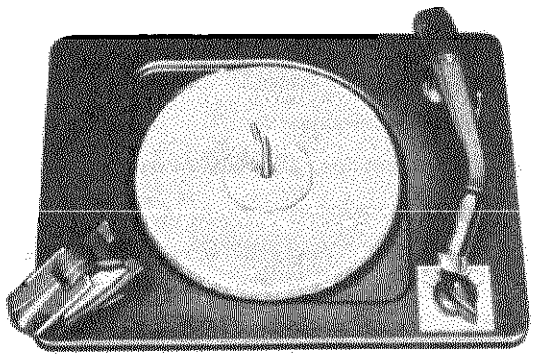

Figure 4—CHANGER, RECORD SHELF IN 12" POSITION.

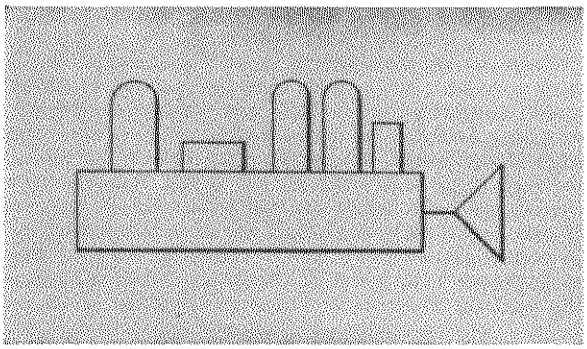
TROUBLE-SHOOTING PROCEDURE

The following tests are given for quickly localizing trouble in a Philco radio-phonograph. Be sure to make each test, in the order given, *before* removing either the radio chassis or the record changer from the cabinet.

If the trouble is found to be in the audio amplifier, or pre-amplifier, refer to the radio service manual for the particular model under test. If the trouble is in some part of the record changer, or in the separately-mounted phono input transformer, refer to the SERVICING section of this record changer manual.

1. AUDIO-AMPLIFIER TESTS

The audio amplifier, with the exception of the pre-amplifier and separately-mounted phono input transformer, is common to both the radio and phonograph



sections of the combination. With a station tuned in, observe whether the speaker output is normal by listening to its tonal quality and volume, with the volume control set to the tap. To locate the tap, set the tuning control for background noise between stations, or slightly out of tune with a station; then slowly turn the volume control from its minimum volume position until a sharp increase in high-frequency response is noted. The tap is at this point. The volume should be approximately the same in radio and phonograph operation.

a. Pre-Amplifier

Check the pre-amplifier as follows:

Remove the cable plug connection between the phono input transformer and radio chassis. Adjust the volume control for normal radio volume (tap on volume control). With the radio-phonograph set for phonograph operation, touch a test prod to the receptacle contact on the radio chassis; a loud audible response should be heard from the speaker.

If no response is heard, there is trouble in the pre-amplifier circuit; test the pre-amplifier tube before removing the radio chassis from the cabinet. An audible response merely indicates that the circuit is not completely inoperative, and does not conclusively indicate that the gain is normal.

b. Phono Input Transformer

Check the input transformer as directed on page of this manual.

2. TONE-ARM TESTS

a. Pickup

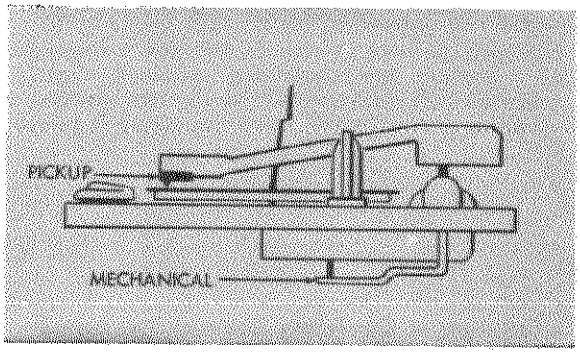
Play a familiar record on the radio-phonograph, and listen to the reproduction.

NOTE

It is advisable that a familiar record be included as a regular part of the serviceman's test equipment.

If the output is distorted, try a new needle. Distortion or low volume may indicate trouble in the pickup, phono input transformer, connecting leads, or pre-amplifier.

Further tests on the pickup are given on page of this manual. If the pickup is found to be faulty, it will be necessary to remove the record changer from the cabinet.



b. Set-Down

Set the record shelf to the 10" position, and place the tone arm on its rest post. Place a good 10" record on

the turntable, then turn the master control switch to REJ, and release. Observe the action of the tone arm; it should rise and travel over to the record, the needle coming down approximately ⅛" in from the outside edge of the record. If the tone arm does not set down correctly, the necessary adjustment may be made, as directed on page of this manual, without removing the record changer from the cabinet.

c. Lift

Set the record shelf for 10" operation and place a full stack of twelve 10" records on the changer. Start the changer by turning the master control switch to REJ and releasing. During the change cycle, the tone arm, in its elevated position, should not strike the bottom of the remaining stack of records.

Continue to reject each record until the full stack is on the turntable. Make sure that the tone arm clears the top record by ⅛" when the arm swings away from the spindle.

If either of these clearances is not correct, the lift adjustment may be made, as described on page of this manual, without removing the record changer from the cabinet.

d. Tripping

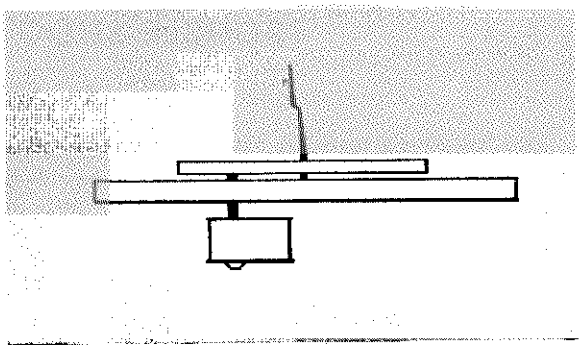
Play a record through, with the master control switch in AUT position. As the needle travels the eccentric finishing groove, tripping of the mechanism should be prompt and positive. The adjustments required are given on page of this manual.

3. TURNTABLE and MOTOR TEST

Load the turntable with ten 12" records. Place a stroboscope disc, such as Philco Part No. 45-2900, on the top record. Illuminate the disc with an electric light, preferably a neon bulb. The circle of dots on the disc indicating the turntable speed will normally appear to remain stationary, or will drift slowly in one direction or the other. The speed of the turntable should be 78 +3 −1.4 r.p.m. Erratic movement of the dots indicates unstable turntable speed.

If a stroboscope disc is not available, a small piece of paper may be inserted under the edge of a record to serve as an indicator, and the revolutions may then be counted and timed.

Remove the stack of records, and play a single record, preferably one containing sustained, high-frequency tones. Listen critically to the reproduction to determine if any "wow" (tone variation) is present.

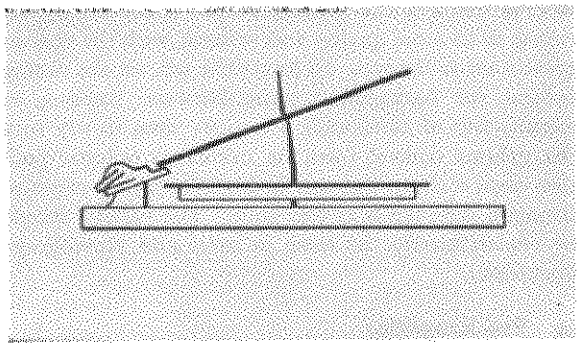


Wows are caused by unstable turntable speed. See page of this manual.

Unsatisfactory operation in the above tests indicates trouble in the motor, idler-wheel assembly, or turntable bearings.

4. RECORD-SHELF TEST

Turn the record shelf to the 10" position. Place a stack of twelve 10" records over the spindle. Turn the master control switch to REJ, and observe the record-dropping action. The record should fall smoothly; the edge of the record should leave the lips of the record shelf *after* the center has started to fall. Run through the change cycle, using the complete stack of records. If one record fails to change, examine the record for defects. Unsatisfactory record changing may be due to improper adjustment of the record shelf, including the push-off slider cam. These adjustments, given on page of this manual, require removal of the record changer from the cabinet.

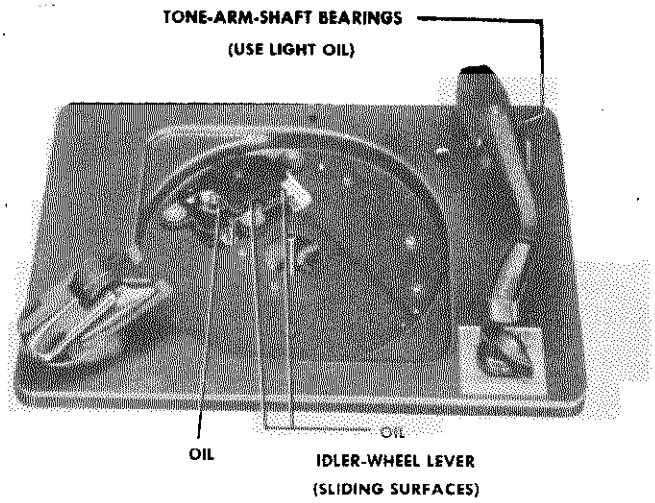


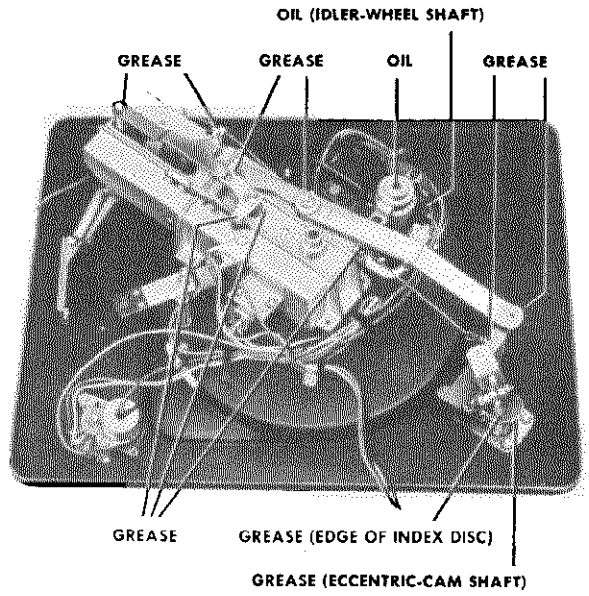
SERVICING

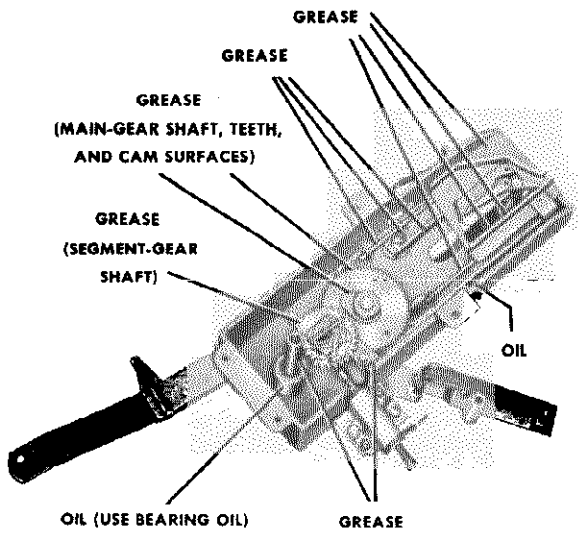
Description of Operating Cycle

Power for the motor is supplied from the power line through a master control switch having OFF, MAN, AUT, and REJ positions. The turntable is rim-driven by a rubber-tired idler wheel between the motor and turntable rim.

The changer mechanism is driven, by the turntable gear, through an intermediate gear having a retractable







segment; when retracted, this segment is held by a latch, thus mechanically disconnecting the turntable from the remainder of the changer mechanism while a record is playing. When the needle travels the eccentric finishing groove of the record, the change cycle is started, electrically, by a trip pawl riding a trip switch. This switch energizes a solenoid, driving its plunger against the intermediate-gear latch, and releasing the movable segment. The segment meshes with the turntable-hub gear, causing the changer mechanism to be driven through a cycle. At the completion of the cycle, the gear segment is retracted by a cam lever and is again held by the latch.

During the change cycle, the tone arm is operated by a lift-rod and a sliding, main-cam assembly, while the next record is dropped by the operation of a push-off slider in the record-shelf assembly.

Record rejection is also started electrically by the control switch, which, in REJ position, shorts across the trip-switch circuit, energizing the solenoid.

Cleaning and Lubrication

After long periods of use, or when a major part or assembly is replaced, the record changer should be cleaned and lubricated. Carbon tetrachloride or other similar cleaning fluid may be used to remove dirt, old oil, or grease. Some parts and assemblies may have to be removed for proper lubrication. The correct procedure for the removal and reinstallation of these parts and assemblies will be found in the REPLACEMENT OF PARTS AND ASSEMBLIES section of this manual. Apply lubricants sparingly, using only enough to do the job. All lubrication points are shown in figure 5.

Parts Not to be Lubricated

The following parts should not be lubricated at any time:

Segment, latch, or gear teeth, of segment gear.
Turntable-hub gear teeth.
Trip pawl.
Solenoid plunger.
Guide arm and tracking pawl (part of main-cam assembly).

Parts to be Greased

Using a light grease of the vaseline type, such as Philco Part No. 60130, lubricate the following parts:

All studs with moving parts attached.
Index disc and lever.
Turntable shaft (apply grease around sleeve, then put turntable on).
Main-cam and slider-cam slide rods (4).
Positioning-cam slots.
All shafts (except tone-arm shaft).
Main-cam gear teeth and cam surfaces.
Push-off-slider eccentric cam and shaft.
Tone-arm pivots.
Lift-arm bushing.

Figure 5—CHANGER, SHOWING ALL LUBRICATION POINTS.

Parts to be Oiled

Using very light oil, Philco Part No. 45-2954, lubricate the following parts:
Motor bearings.
Idler-wheel bearing and idler-wheel lever assembly.
Turntable-shaft ball bearings.
Tone-arm-shaft bearings.

CAUTION

Do not get oil on rubber tire, motor pinion, or inside rim of turntable; if so, remove immediately with carbon tetrachloride.

ADJUSTMENTS AND TESTS

All adjustments to this changer made on the service bench require the use of a radio chassis designed for the changer; all adjustments except those made to the pickup may be made by the use of a suitable auxiliary power supply, to furnish operating voltage for the electric trip mechanism. Details of the auxiliary supply will be found on page 11 of this manual.

Tone-Arm Lift Adjustment

Set the record shelf for 10" operation. With the master control switch OFF, manually trip the changer by lightly pushing the solenoid plunger into the coil. Swing the tone arm in near the spindle. Revolve the turntable one turn by hand. Place a 10" record onto the record shelf and spindle. Position the tone arm so that the needle point is approximately 1½" from the center of the spindle. In this position, the tone arm is at maximum height and should clear the bottom of the record by 1/16" to ⅛", and the needle point should clear the turntable by approximately 1¼". Adjust for correct clearance by turning the adjustment screw through a hole at the top and rear of the tone arm, as shown in figure 6. Turning the screw clockwise raises the arm; counterclockwise lowers it. Then determine whether the tone arm lowers sufficiently to play the first record by revolving the turntable through the complete cycle. The tone arm should lower until the needle point is below the top surface of the turntable.

Figure 6—ADJUSTING TONE-ARM LIFT.

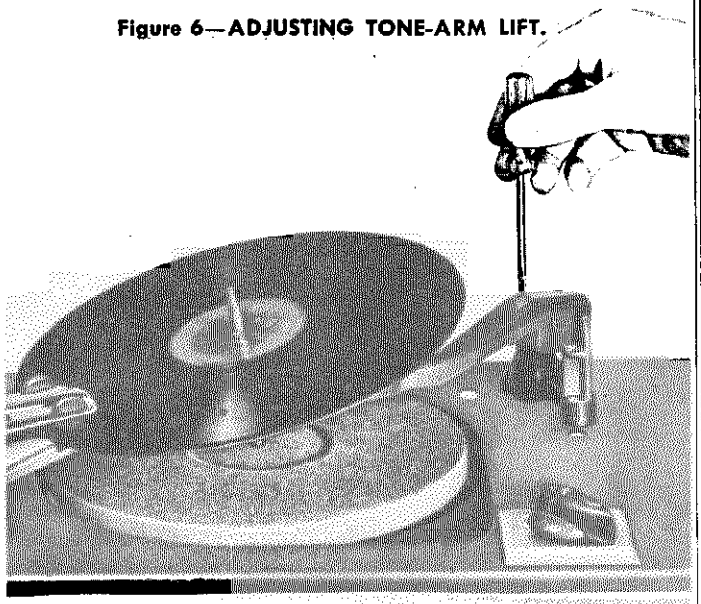


Figure 7—ADJUSTING TONE-ARM SET-DOWN.

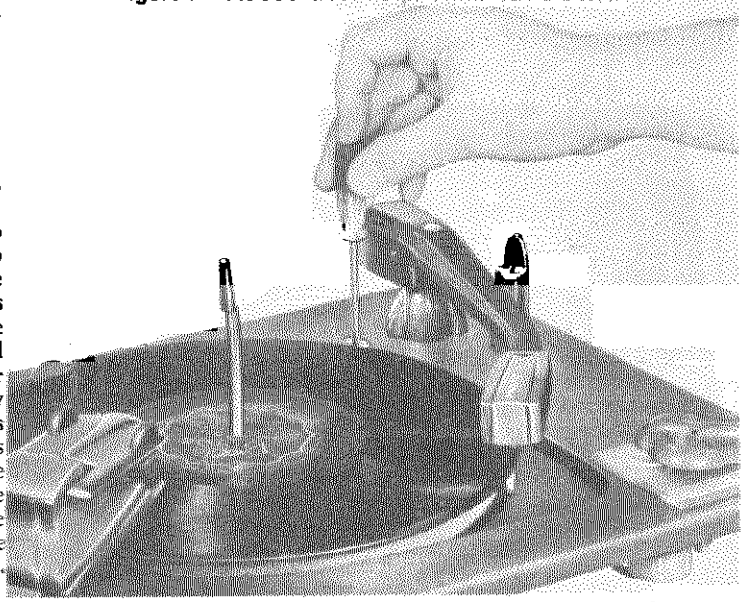


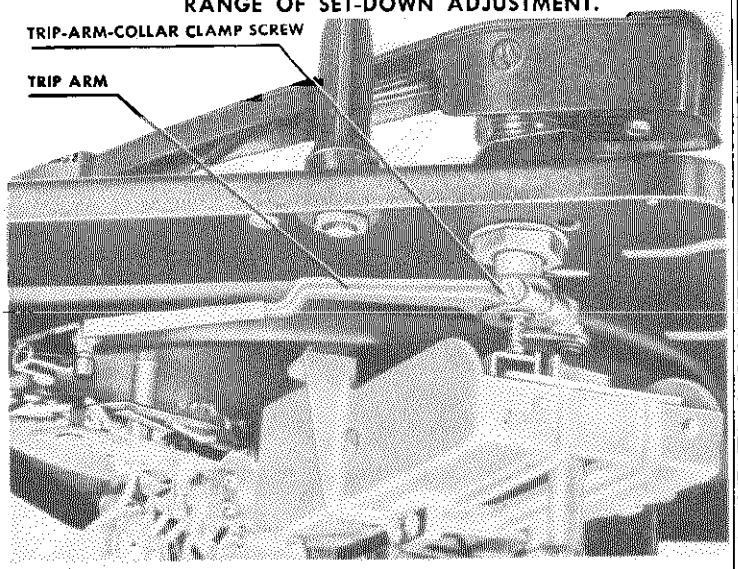
Tone-Arm Set-Down Adjustment

Set the changer for 10" operation. Place a 10" record in position and start a change cycle. Shut off the changer and stop the turntable when the jewel lowers to approximately ¼" above the record. An eccentric screw, reached through a slot in the changer base plate near the tone-arm mounting, provides the adjustment. See figure 7. Adjust so that the jewel will lower onto the record ⅛" in from the edge.

In the event that the range of the eccentric screw does not provide the correct adjustment, proceed as follows:

Turn the eccentric screw to the mid-position of its range. Loosen the clamp screw on the trip-arm collar attached to the tone-arm shaft. See figure 8. Hold the

Figure 8—TRIP-ARM CLAMP, FOR EXTENDING RANGE OF SET-DOWN ADJUSTMENT.



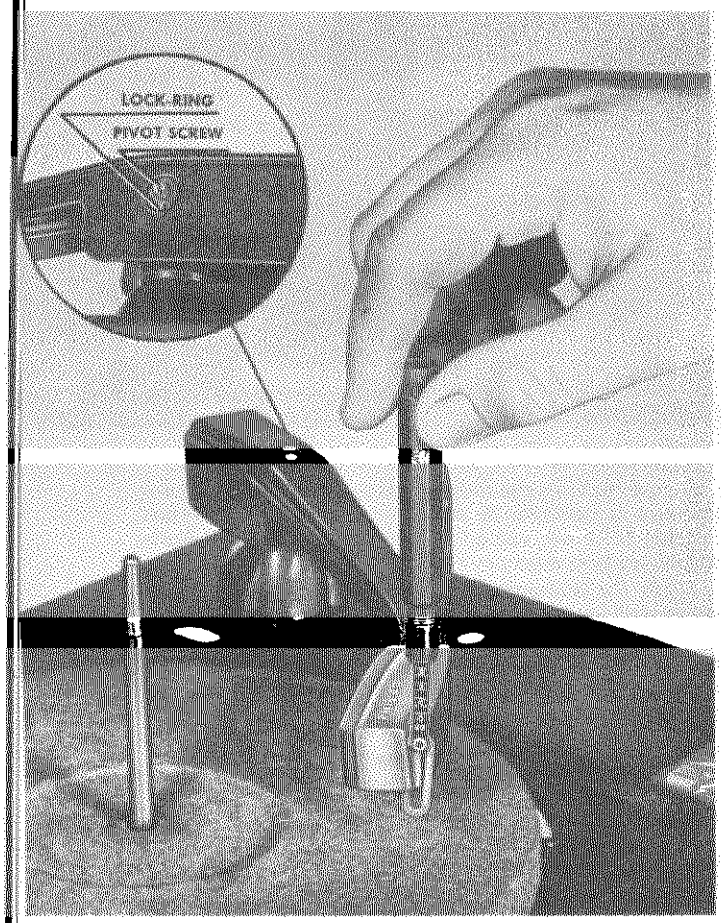


Figure 9—MEASURING TONE-ARM VERTICAL FRICTION.

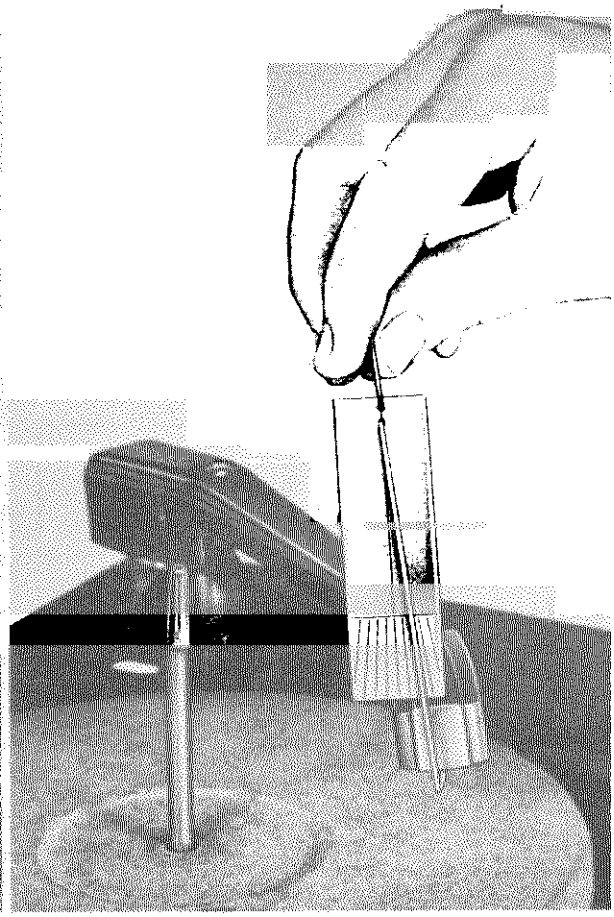

Figure 10—MEASURING TONE-ARM HORIZONTAL FRICTION.

trip arm firmly and move the tone arm to the approximate desired position and tighten the collar.

NOTE

A .003″ to .005″ vertical play in the tone-arm shaft must be maintained when making this adjustment.

If necessary, a vernier set-down adjustment may now be made with the eccentric screw, as previously described.

The 10″ adjustment should be correct for 12″ records. However, the tone-arm rest is adjusted so that the tone arm cannot set down off a 12″ record.

Tone-Arm Needle Pressure and Vertical Friction

With a 2-oz., postal-type scale, similar to Philco Part No. 45-2958, hooked under the front edge of the tone arm, as shown in figure 9, lift up the arm with the scale, noting the reading. Lower the arm, again noting the reading; the difference in these two readings represents vertical friction and should not exceed ⅛ oz.

The reading midway between the two readings taken is the needle pressure. The needle pressure of the dynamic tone arm should be between ¾ and 1 ounce. If the tone arm pivot screw is too tight, excessive friction will result. Loosen the locknut, adjust the pivot screw, and retighten the locknut. If the pivot screw is too loose, erratic set-down of the tone arm and trip failure on some records is likely.

Tone-Arm Horizontal Friction and Trip Sensitivity

With the changer out of cycle and the master control switch OFF, hook a pendulum scale, similar to Philco Part No. 45-2953, under the front edge of the tone arm, as shown in figure 10. Move the tone arm with scale slowly toward the spindle, and back to the outer edge of the record. The pendulum scale is calibrated in 1/16-ounce divisions, with 0 center. The average of both readings should not exceed 1/16 ounce.

With the trip pawl riding at 45° on the top member of the trip switch, the needle should be in the operating range for tripping, i.e., 1½″ to 3″ from the center of the spindle. The trip contact should make with a reading of from ¼ to ⅜ ounce. If these specifications are met, many records which may be considered to have defective trip grooves will play and trip satisfactorily.

Excessive friction may be caused by lack of vertical play in the tone-arm shaft or a defective shaft bearing. Correct assembly of shaft and bearing is given under REPLACEMENT OF PARTS AND ASSEMBLIES.

Tone-Arm Lead-In Test

Using a record which has no lead-in groove, see that the tone arm leads into the first record-playing groove. If it does not lead in properly, check to make

sure that the changer is level in the cabinet. If necessary, level the changer by adjusting the T-nuts and locknuts, as required.

Pickup and Phono Input Transformer Test

To test the pickup and phono input transformer, attach the pickup plug to the phono input transformer, Philco Part No. 32-8256, and attach the lead from the transformer to a radio chassis, designed for use with the dynamic pickup, and known to be in normal operating condition. If such a receiver is not available,

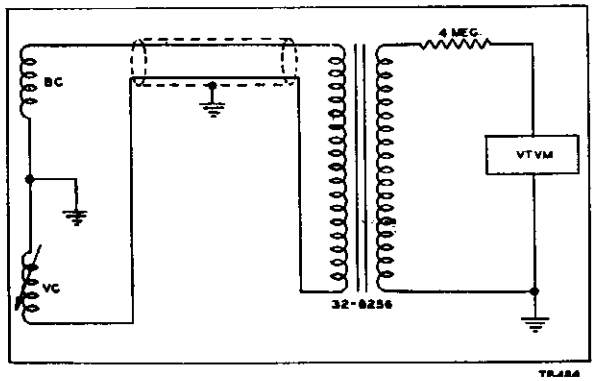

Figure 11—TESTING DYNAMIC PICKUP.

a comparable audio amplifier may be used. Play a record of good quality and listen to the reproduction.

If no reproduction is heard:

Check for a short or open in the shielded-wire pickup lead.

Check the pickup voice coil; this coil should have a resistance of approximately 3 to 4 ohms.

Check the primary and secondary of the transformer; normal resistance of the primary is approximately .1 ohm; secondary, 7000 ohms.

If output is distorted:

Try a new needle.

For a complete check of the dynamic pickup, a standard audio-tone record, or equivalent, and a vacuum-tube voltmeter with a range of 1 or 1½ volts, and with an input impedance of 1 megohm or more, are required. An oscilloscope may be used in the place of the vacuum-tube voltmeter, if desired.

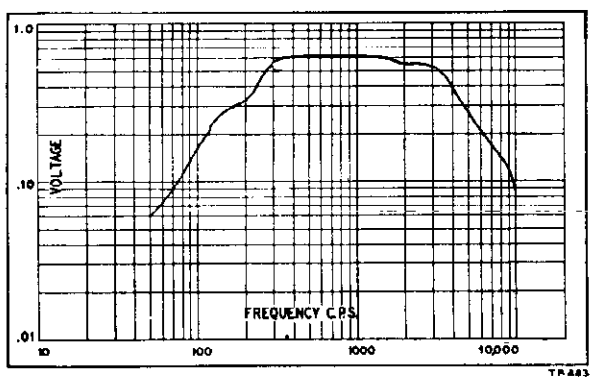

Figure 12—FREQUENCY-RESPONSE CURVE OF DYNAMIC PICKUP.

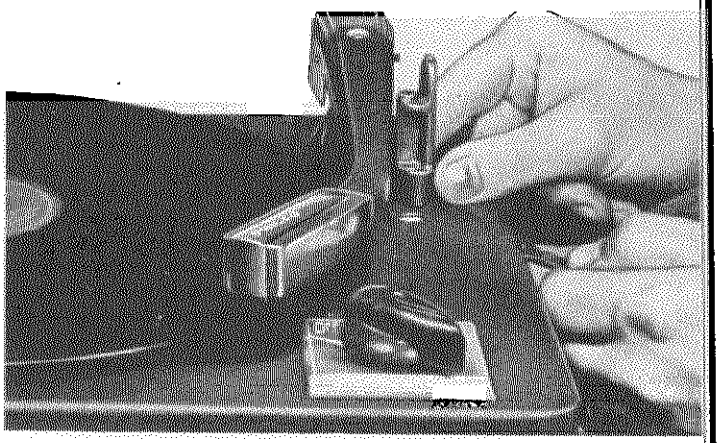

Figure 13—ADJUSTING TONE-ARM REST POST.

Before making the check, make sure that the needle pressure is between ¾ and 1 ounce, that the vertical friction does not exceed ⅛ ounce, and that the horizontal friction does not exceed $\frac{1}{16}$ ounce.

With the vacuum-tube voltmeter (or oscilloscope) connected as shown in figure 11, the output voltage, when playing 1000 cycles on the audio-tone record, should be at least .6 volt. A complete frequency-response curve should closely approximate that of figure 12.

Tone-Arm Rest-Post Placement

The tone-arm rest is adjusted so that the tone arm cannot set down off a 12" record. See figure 13.

Tripping Adjustments

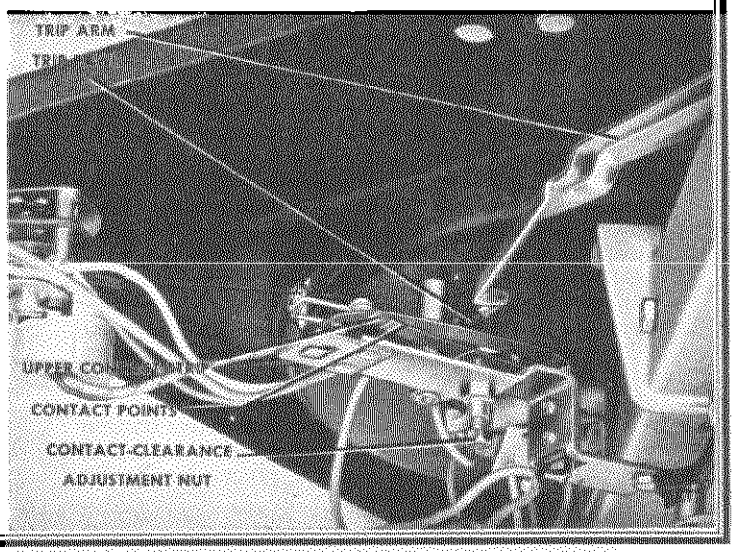
Before making any adjustments to the trip-switch assembly, make the following observations:

Be sure the two trip-switch-assembly mounting screws are tight. One point of mounting is on the changer-mechanism housing and the other screw is under the turntable.

Examine the upper contact strip and make sure it is reasonably flat along the center portion. The strip should have sufficient tension to hold the lip, located on the outer end, against the slotted insulated piece, with a pressure of from ⅛ to ¼ oz.

With the master control switch OFF, swing the tone

Figure 14—TRIP-CONTACT ASSEMBLY, SHOWING CORRECT ANGLE OF TRIP PAWL.



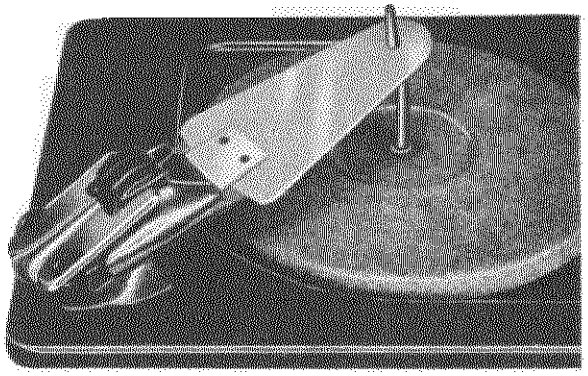


Figure 15—RECORD SHELF, SHOWING SPECIAL RECORD-SHELF GAUGE IN CORRECT POSITION.

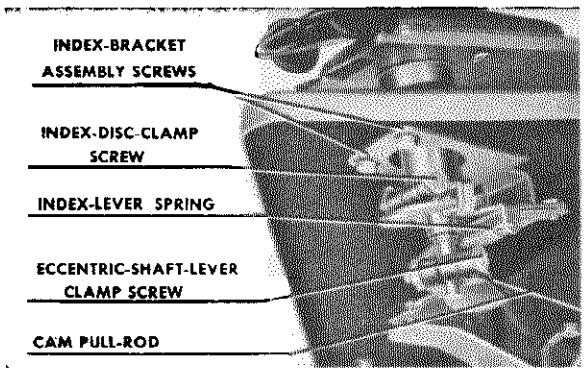

Figure 16—INDEX-BRACKET, INDEX-DISC, AND ECCENTRIC-SHAFT-LEVER ASSEMBLIES.

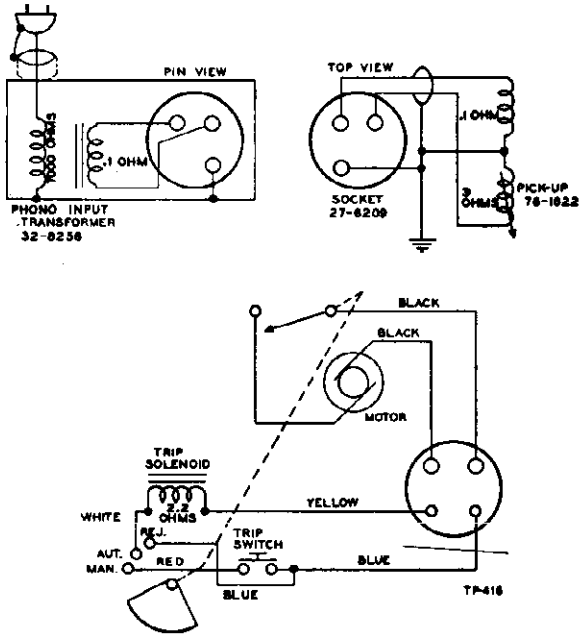

Figure 17—WIRING DIAGRAM OF CHANGER.

arm in so that the rubber-tipped trip pawl is approximately in the center of the flat portion of the upper contact strip. In this position, the trip pawl should be at an angle of approximately 45° with respect to the strip, as shown in figure 14. If necessary, shape the trip arm slightly up or down to give the correct angle.

The clearance between the contact points should be adjusted for a gap of $\frac{1}{32}$", by means of the adjusting nut on the lower strip. See figure 14. The tripping action can be checked by watching the trip pawl and the contacts while the jewel needle is travelling the eccentric finishing groove of a record.

The trip should operate by a slight backward movement of the tone arm (not less than $\frac{1}{16}$") while the arm is between 1½" and 3" from the center of the spindle. Check the action at several points within this range.

NOTE

The top surface of the upper contact strip is coated with a substance for positive action.

Record-Shelf Adjustments

To set the record shelf correctly, place the shelf in its 10" position. Place a special record-shelf gauge, Philco Part No. 45-1470, over the spindle and onto the record shelf, as shown in figure 15.

Loosen the two hex-head screws which hold the index-bracket assembly to the changer base plate. See figure 16. Also loosen the hex-head clamp screw on the index disc. Disconnect one end of the index-lever spring. Move the record-shelf assembly away from the spindle, allowing the center raised portion of the gauge to fit between the record shelf lips, and the wide part of the gauge to drop level with the shelf lips, as shown in figure 15. Push the entire assembly lightly against the edge of the gauge. Before tightening the index-bracket-assembly screws, turn this assembly so that the cam pull-rod is just taut without tensing the spring. Hold the assembly in this position and tighten the two index-bracket screws. Re-connect the index-lever spring; then tighten the clamp screw on the index disc. When the above adjustments have been made, both lips of the record shelf should be touching the edge of the gauge.

Record Push-Off Adjustment

With the changer out of cycle, set the record shelf to the 10" position. Loosen the hex-head clamp screw holding the eccentric-shaft lever to the push-off cam shaft. See figure 16. Rotate the push-off cam shaft *clockwise* until the end of the push-off slider nearest the turntable emerges from the slot in the record shelf and retracts to a point where the center portion of the slider end is just flush with the edges of the slot. Tighten the clamp.

Uneven Turntable Speed (Wows)

Uneven turntable speed (wows) may be caused by the following:

Dirt under and around turntable or idler-wheel assembly. Remove the turntable and clean out the dirt.

Flat or worn spots on rubber tire of idler wheel or defective turntable shaft and bearing assembly. Replace

defective parts as directed under **REPLACEMENT OF PARTS AND ASSEMBLIES.**

Lack of lubrication on turntable-bearing assembly or idler-wheel assembly. Follow directions under the *Cleaning and Lubrication* paragraph in this section of the manual.

Hole in record too large or too small. Try other records.

AUXILIARY POWER SUPPLY

A power adapter for the Model M-4 Philco Automatic Record Changer, providing proper voltages for the motor and solenoid through the connector on the changer, can be quickly assembled.

A small power transformer with one 6.3-volt filament winding, such as Philco Part No. 32-8190, will be satisfactory. The filament winding should have a rating of at least 2 amperes. The voltage for the motor is obtained by a direct connection to the power-transformer primary. The solenoid is energized by the 6.3-volt winding. The use of a socket, Philco Part No. 27-6182, will facilitate the connection of the auxiliary power supply to the changer.

The power supply may be assembled on any suitable chassis; the wiring diagram is shown in figure 18.

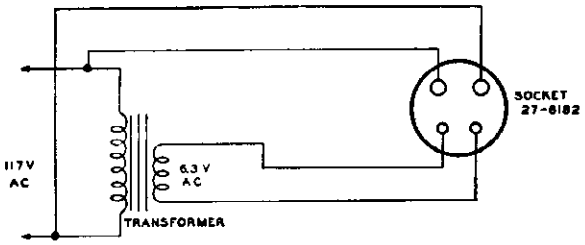

Figure 18—WIRING DIAGRAM OF AUXILIARY POWER SUPPLY.

SPECIAL TOOLS

Most of the adjustments and repairs to the Philco M-4 Changer may be made with the tools usually found in the serviceman's tool kit, and the two scales and special gauge illustrated in figure 19.

The pendulum scale, Philco Part No. 45-2953, may be used to measure the horizontal friction, or drag, of the tone arm.

The 2-oz. scale, Philco Part No. 45-2958, may be used to measure the vertical friction and needle pressure of the tone arm, and all spring tensions not in excess of 2 ounces.

The special record-shelf gauge, Philco Part No. 45-1470, must be used to make the record-shelf adjustments accurately.

A stroboscope disc, Philco Part No. 45-2900, will aid in detecting faulty turntable speed.

After the changer has been removed from the cabinet for repairs, a stand similar to the one shown in figure 20 may be used. This stand is constructed from easily obtainable parts, listed in the figure, and is a convenient addition to any repair shop which expects to service record changers.

If it is not convenient to construct a stand to support the changer, changer support posts, Philco Part No. 45-2894 (4 required), may be purchased.

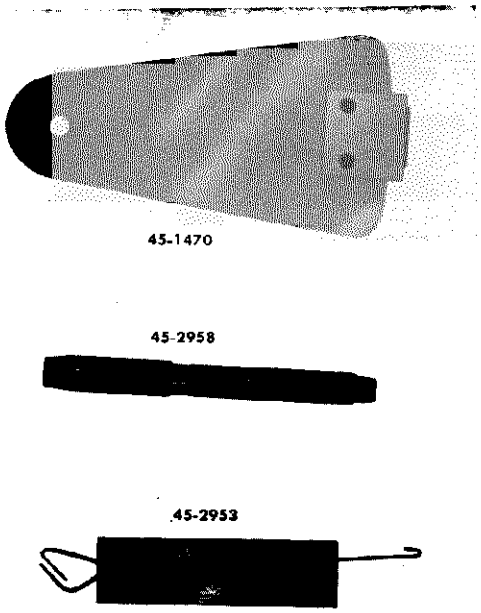

Figure 19—SCALES AND SPECIAL GAUGE.

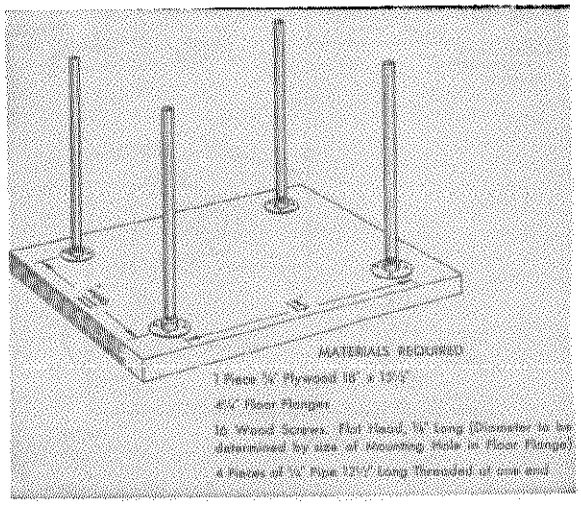

Figure 20—DETAILS OF SUPPORTING STAND FOR CHANGER.

REPLACEMENT OF PARTS AND ASSEMBLIES

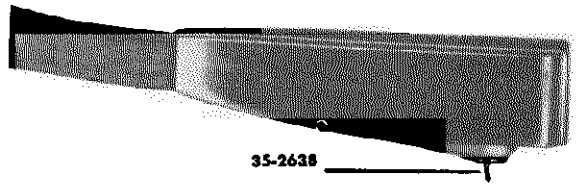

Figure 21—PICKUP HEAD, SHOWING CORRECT PLACEMENT OF NEEDLE.

Whenever a part or assembly is found to be defective, by test or visual inspection, or when it becomes necessary to remove parts for lubrication, the following procedures are recommended.

Parts should be replaced by reversing the order of removal, and adjusted and lubricated according to the directions given in the SERVICING section of this manual. A part should be replaced only when a defect is evident or when all adjustments fail to produce proper operation.

1. Needle (Part No. 35-2638)

The needle should be pulled straight out with the fingers. There are no setscrews or locking devices. When replacing the needle, make sure that it is placed so that its bend is in the direction of record rotation. See figure 21. Push the needle in place, using finger pressure only.

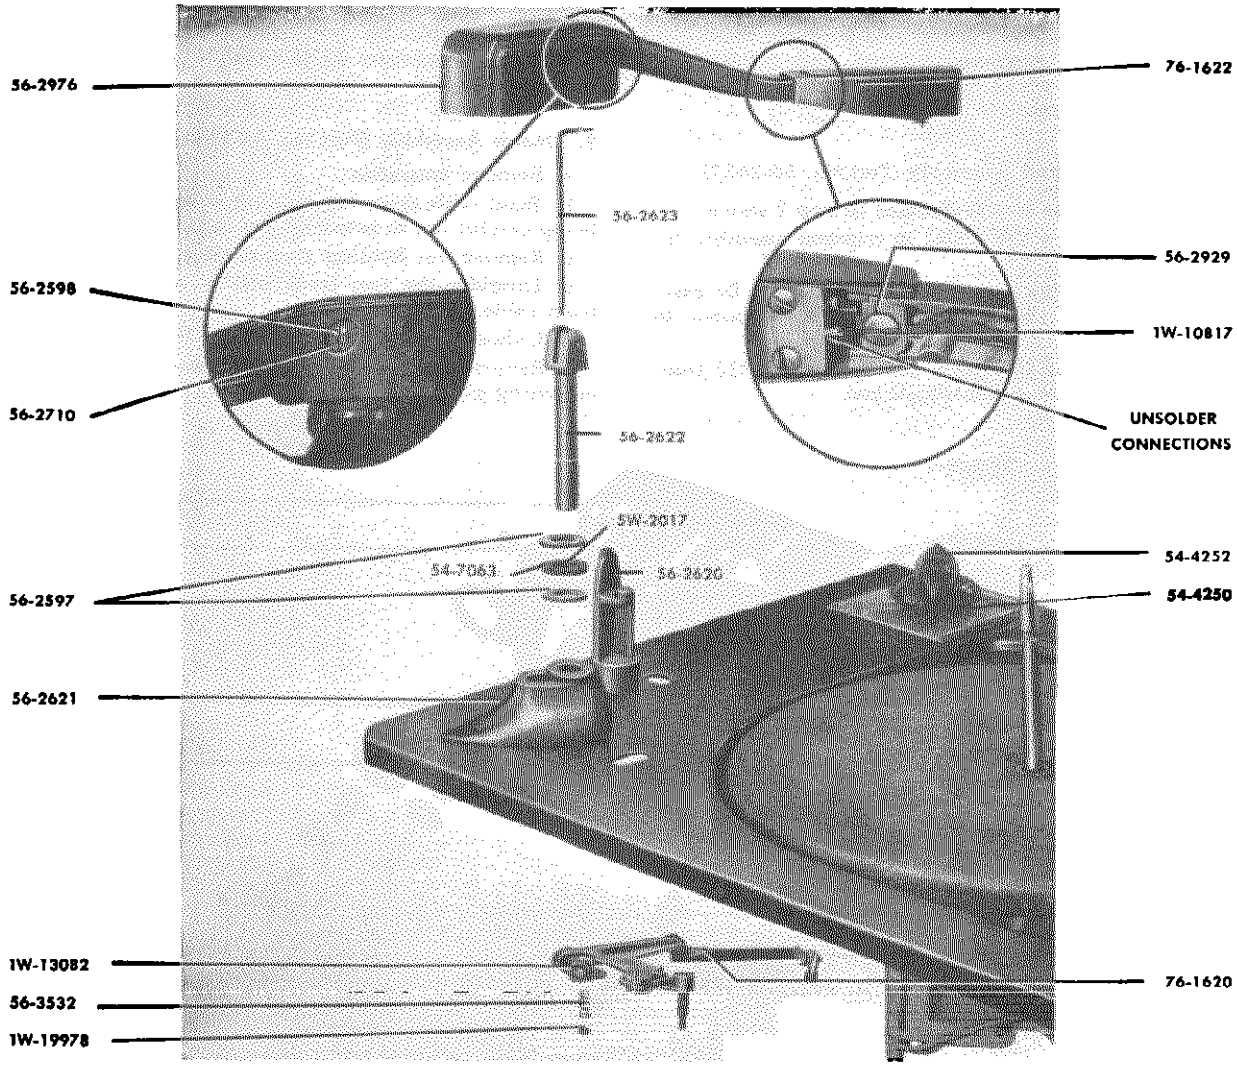

Figure 22—TONE-ARM-SHAFT AND TRIP-ARM ASSEMBLIES, EXPLODED VIEW.

9. Idler Wheel (Part No. 76-2379)

a. Remove spindle and turntable.

b. Remove retaining spring and flat washer from idler-wheel shaft (underside of changer).

c. Lift out idler wheel.

10. Master Control Switch (Part No. 42-1734)

a. Unsolder five leads from switch.

b. Lift off knob 54-4252, figure 22.

c. Remove ⅜" nut under knob.

d. Unhook pull-cord spring 56-2617, figure 24.

11. Record Hold-Down (Part No. 56-2653)

a. Remove record-shelf cap cover 56-2915, by turning counterclockwise about ⅛ turn and lifting out. See figure 25.

b. Lift out retaining spring 56-2656.

c. Unhook hold-down spring 56-2654 and lift off hold-down.

12. Eccentric-Shaft-Lever Assembly (Part No. 76-1618)

a. Remove cross-link spring 56-2627 and cross-link 56-2626, figure 24.

b. Loosen screw 1W-13082 and remove assembly, figure 25.

c. When replacing assembly, make record push-off adjustment as directed under ADJUSTMENTS AND TESTS.

13. Index-Disc Assembly (Part No. 76-1904) and Index-Bracket Assembly (Part No. 76-1615)

a. Remove eccentric-shaft-lever assembly as directed in step 12 above.

b. Unhook one end of pull-rod spring 56-3591, figure 24.

c. Loosen screw 1W-13083 holding index-disc assembly.

d. Remove two screws, 1W-32694, holding index-bracket assembly and remove both assemblies.

e. When replacing these assemblies, make all record-shelf adjustments, including record push-off adjustment, as directed under ADJUSTMENTS AND TESTS.

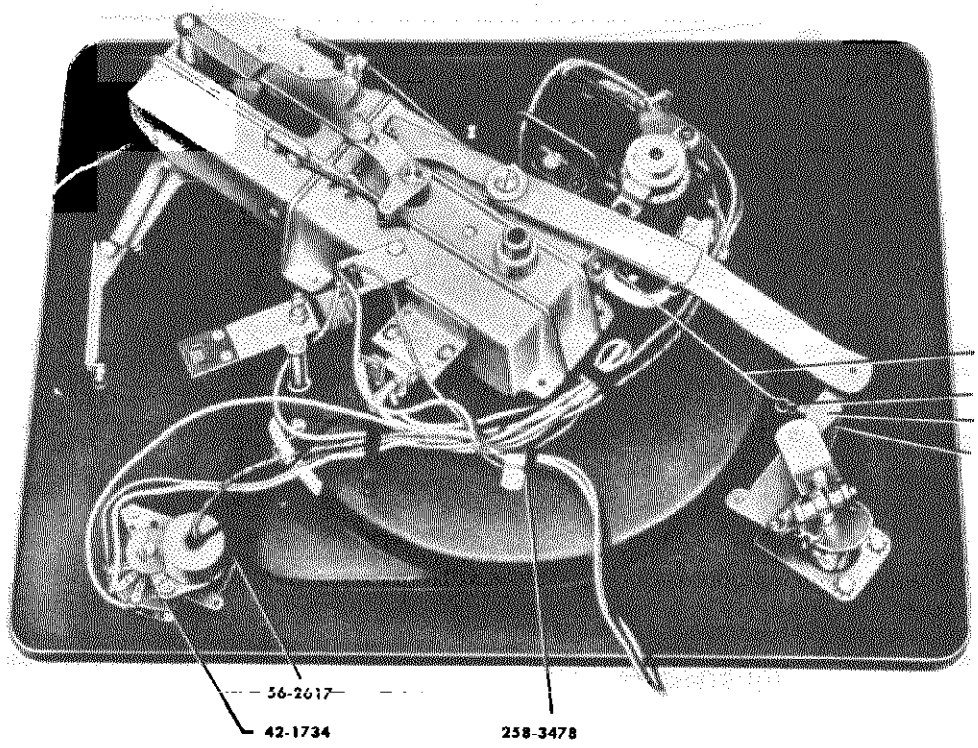

Figure 24—CHANGER, UNDERSIDE VIEW.

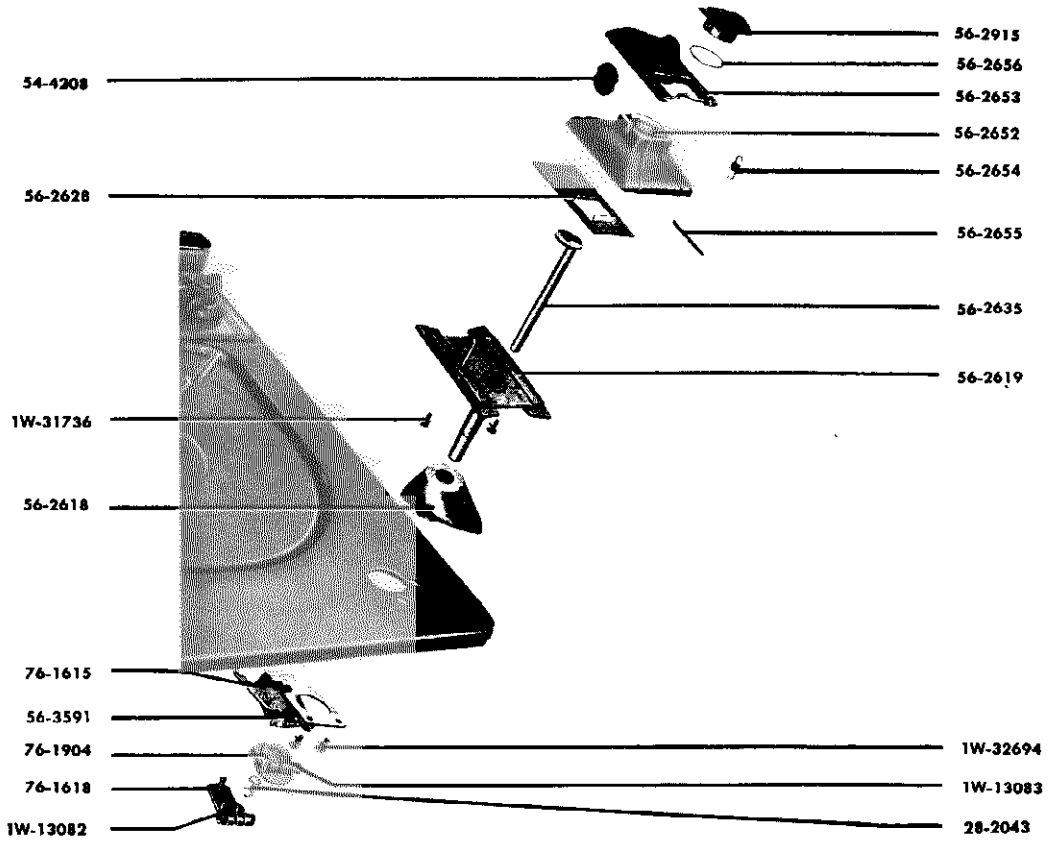

Figure 25—RECORD SHELF AND ASSOCIATED ASSEMBLIES, EXPLODED VIEW.

14. Record-Shelf Stanchion (Part No. 56-2618)

a. Remove index-disc assembly and index-bracket assembly as directed in step 13 above.

b. Lift out record-shelf and cap assembly and lift out stanchion.

c. When replacing this assembly, make all record-shelf adjustments, including record push-off adjustment, as directed under ADJUSTMENTS AND TESTS.

15. Record-Shelf-Cap Assembly (Part No. 56-2652)

a. Remove index-disc assembly and index-bracket assembly as directed in step 13 above.

b. Lift out record-shelf and cap assembly.

c. Remove two screws, 1W-31736, figure 25, from underside of record shelf and lift out record-shelf-cap assembly.

d. When replacing this assembly, make all record-shelf adjustments, including record push-off adjustment, as directed under ADJUSTMENTS AND TESTS.

16. Push-Off Slider (Part No. 56-2628)

a. Remove record-shelf-cap assembly as directed in step 15 above.

b. Lift out push-off slider.

c. When replacing this assembly, make all record-shelf adjustments, including record push-off adjustment, as directed under ADJUSTMENTS AND TESTS.

17. Push-Off-Cam Assembly (Part No. 56-2635)

a. Remove record-shelf-cap assembly as directed in step 15 above.

b. Remove locking ring 28-2043, figure 25.

c. Lift out push-off-cam assembly.

d. When replacing this assembly, make all record-shelf adjustments, including record push-off adjustment, as directed under ADJUSTMENTS AND TESTS.

18. Record Shelf (Part No. 56-2619)

a. Remove push-off-cam assembly as directed in step 17 above.

b. Lift out record shelf.

c. When replacing this assembly, make all record-shelf adjustments, including record push-off adjustment, as directed under ADJUSTMENTS AND TESTS.

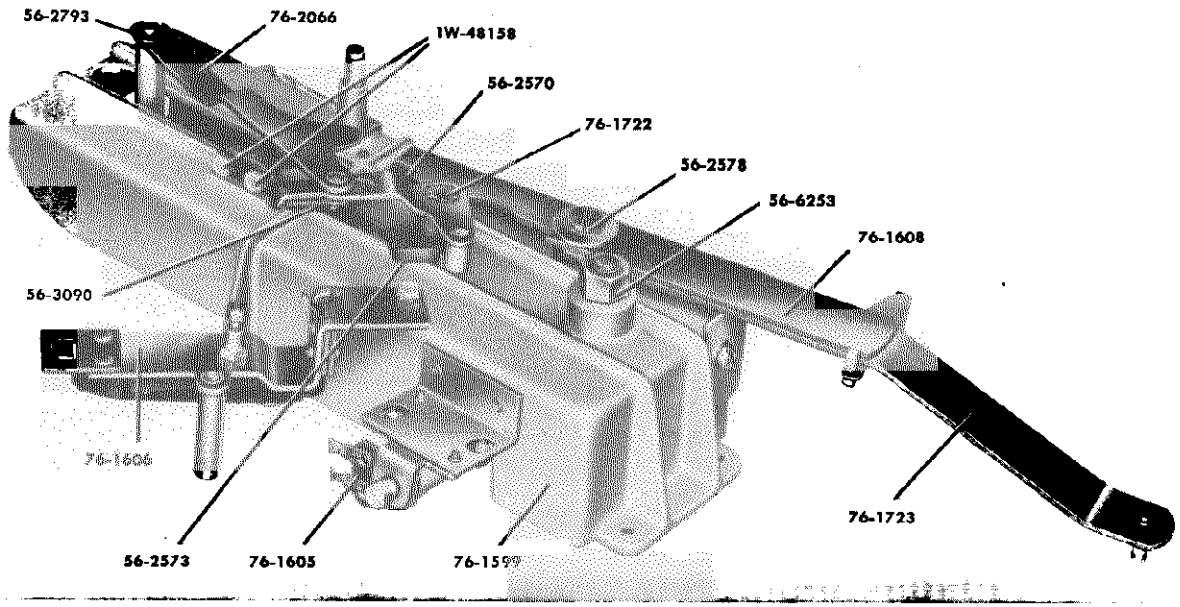

Figure 26—CHANGER MECHANISM ASSEMBLY, UNDERSIDE VIEW.

19. Trip-Contact Assembly (Part No. 76-1606)

a. Remove spindle and turntable.

b. Unsolder the red and blue wires.

c. Remove hex-head screw holding trip-contact assembly to changer-mechanism housing, figure 26.

d. Remove slotted screw holding trip-contact assembly to base plate and lift off assembly.

e. When replacing, adjust contact clearance as directed under ADJUSTMENTS AND TESTS.

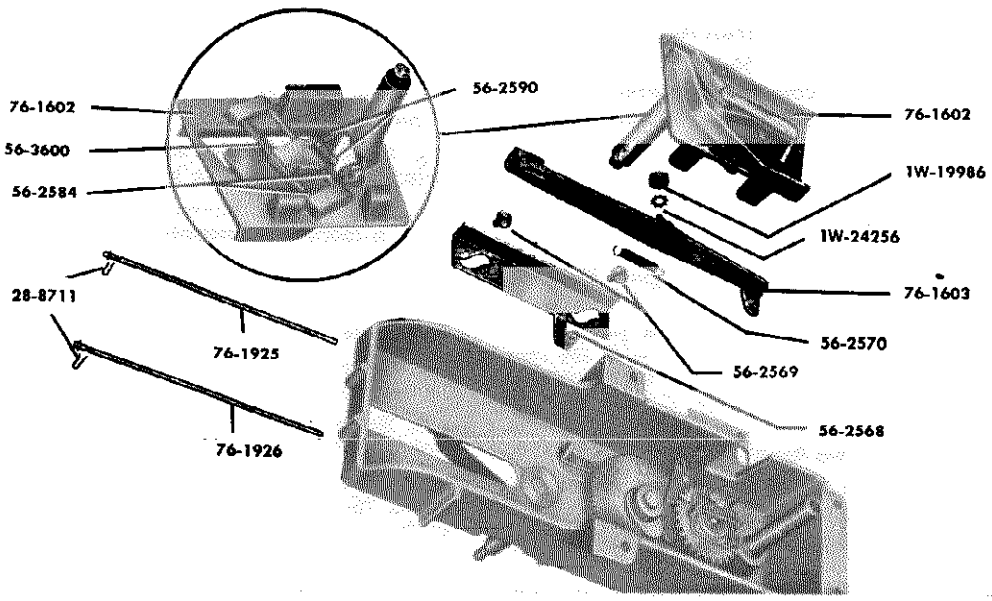
20. Push-Link Assembly (Part No. 76-2066)

a. Remove "C" washers 56-2793 from main-cam and main gear-shaft assemblies, figure 26.

b. Remove spring 56-3090 from main gear-shaft assembly.

c. Lift out link.

Figure 27—CHANGER MECHANISM ASSEMBLY, SHOWING DISASSEMBLY OF MAIN CAM, LIFT ARM, AND POSITIONING CAM.



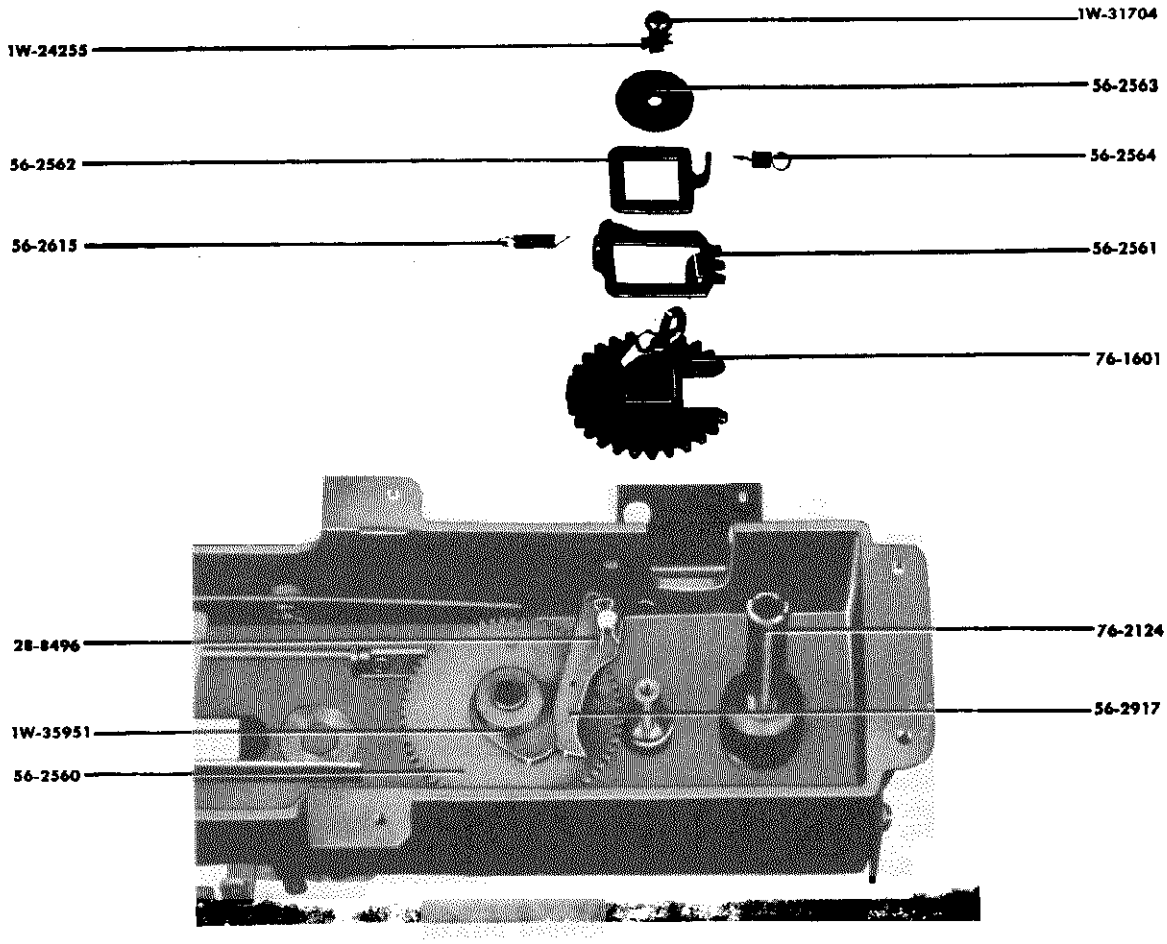


Figure 28—CHANGER MECHANISM, DISASSEMBLY OF INTERMEDIATE GEAR.

21. Push-Off-Lever Assembly (Part No. 76-1608)

a. Remove cross-link spring 56-2627, and cross-link 56-2626, figure 24, from eccentric-shaft lever.

b. Remove spring 56-2570 from mechanism frame, figure 26.

c. Remove bearing screw 56-2578 and lift off assembly.

22. Stop-Spring (Part No. 56-2573)

a. Remove two screws, 1W-48158, figure 26, from mechanism frame and lift off spring.

b. When replacing this spring, adjust position of intermediate gear; the gear should stop with the cut-out section centered, with respect to the turntable shaft.

23. Changer-Mechanism Assembly (Part No. 76-1599)

a. Remove cross-link spring 56-2627, figure 24.

b. Remove cross-link 56-2626.

c. Remove spring 56-3591 and pull-rod 56-2657, figure 24.

d. Remove spindle and turntable.

e. Remove cable clamp 258-3478.

f. Bend dress lugs to remove wires; be careful not to break lugs.

g. Remove one screw (under turntable) holding trip-switch assembly to main base plate.

h. Remove four screws (under turntable) holding changer-mechanism assembly to main base plate.

i. Lift out assembly.

24. Main-Cam Assembly (Part No. 76-1602)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove "C" washer 56-2793 which holds push-link 76-2066 to main-cam stud. See figure 26.

c. Lift out two retaining springs, 28-8711, from slide shafts 76-1925 and 76-1926, figure 27, and pull out shafts.

d. Lift out main-cam assembly.

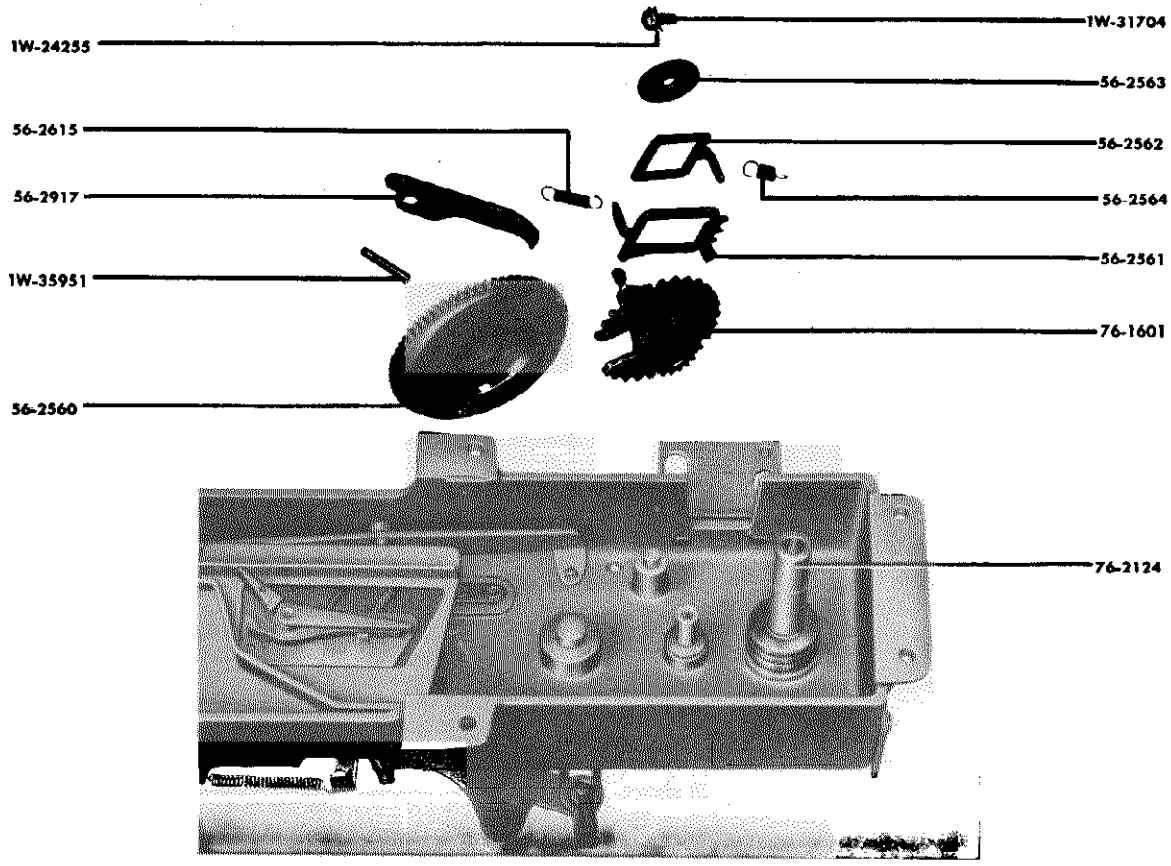

Figure 29—PARTS OF MAIN-GEAR AND INTERMEDIATE-GEAR ASSEMBLIES, UNDERSIDE VIEW.

25. Positioning Cam (Part No. 56-2568)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove main-cam assembly as directed in step 24 above.

c. Remove pull-rod 56-2657, figure 24, and spring 56-2570, figure 26.

d. Remove two shouldered screws, 56-2569, figure 27, and lift out cam.

26. Lift-Arm Assembly (Part No. 76-1603)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove nut 1W-19986 and lockwasher 1W-24256. See figure 27.

c. Lift out assembly.

d. When replacing this assembly, be sure to place ball-end on cam surface under main gear.

27. Intermediate-Gear Assembly (Part No. 76-1601)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove two springs, 56-2564 and 56-2615, from latch and segment gear. See figure 28.

c. Remove screw 1W-31704, lockwasher 1W-24255, and retaining washer 56-2563.

d. Lift out spring lug 56-2562 and gear segment 56-2561.

e. Lift out intermediate-gear assembly. Figure 29 shows the underside of the parts in the assembly.

28. Main Gear (Part No. 56-2560)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove intermediate-gear assembly as directed in step 27 above.

c. Remove main-cam assembly as directed in step 24 above.

d. Remove two screws, 1W-47664, figure 30, holding solenoid assembly 76-1605 to mechanism, and remove solenoid.

e. Remove hex-head screw holding trip-contact assembly 76-1606 to changer-mechanism housing and remove trip-contact assembly.

f. Remove retaining spring 28-8496, figure 28, and remove cam lever 56-2917.

g. Drive out tapered pin 1W-35951 in main gear and lift out main gear. Figure 29 shows the underside of the main gear.

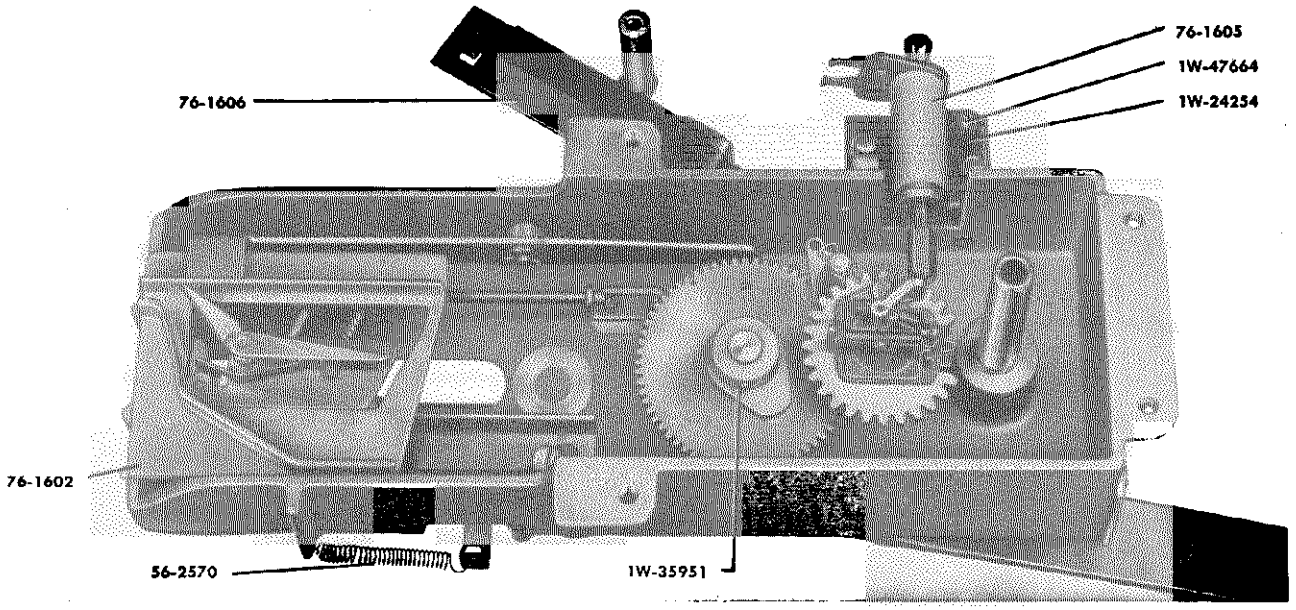

Figure 30—CHANGER MECHANISM ASSEMBLY, TOP VIEW.

29. Main-Gear-Shaft Assembly (Part No. 76-1722)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove push-link assembly as directed in step 20 above.

c. Remove main gear as directed in step 28 above.

d. Lift out main-gear-shaft assembly, figure 26.

30. Turntable-Shaft Assembly (Part No. 76-2124)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Loosen nut 56-6253, figure 26, a few turns and tap with a wooden mallet. Continue this process until shaft is free.

31. Turntable Bearings (Part No. 5W-2017)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Remove turntable-shaft assembly as directed in step 30 above.

c. Remove spring ring 56-2599, steel washer 56-2596, neoprene washer 54-4220, ball race 56-2597, ball retainer 54-7063, ball race 56-2597, neoprene washer 54-4220, and steel washer 56-2596, in order, as shown in figure 31.

32. Solenoid Assembly (Part No. 76-1605)

a. Remove changer-mechanism assembly as directed in step 23 above.

b. Unsolder the two wires from the lugs of the solenoid.

c. Remove the two screws, 1W-47664, and lockwasher, 1W-24254, figure 30.

d. When replacing this assembly, align the solenoid plunger so that its center strikes the latch and trips the segment gear, but does not over-push so as to bind the gear segment. The correct position is shown in figure 30.

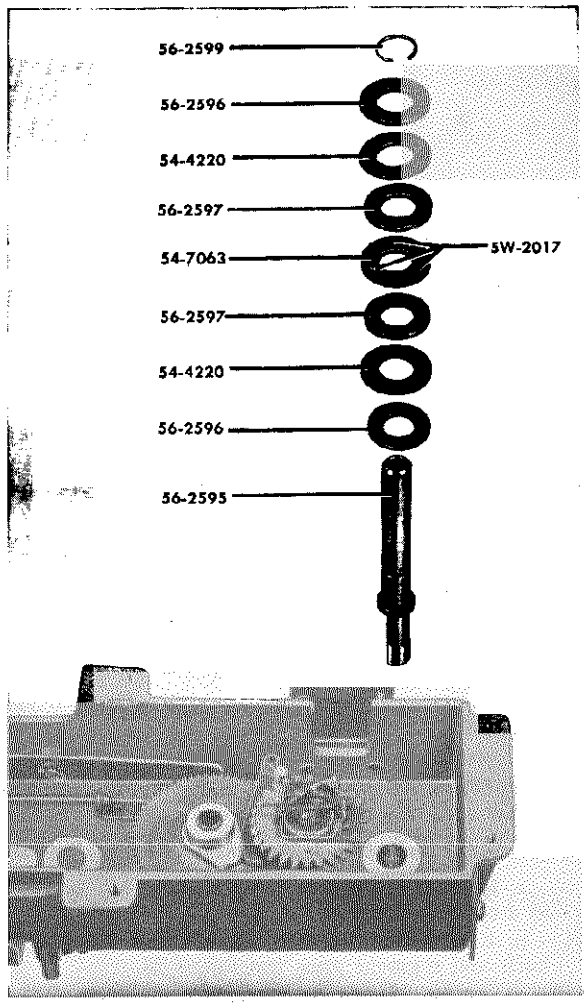

Figure 31—DISASSEMBLY OF TURNTABLE SHAFT AND BEARINGS.

REPLACEMENT PARTS LIST

SERVICE PART NO.	DESCRIPTION
27-6209	Socket (Pickup Cable)
28-2043	Ring, Locking (Push-Off-Cam Shaft)

Open Door *Insert Record* *Close Door*

Figure 1

GENERAL DESCRIPTION

The PHILCO M-7 AUTOMATIC RECORD PLAYER automatically plays single 10-inch or 12-inch records. See Figure 1. The player is loaded by simply opening the door in the front and pushing the record through the slot. As the door is closed, the tone arm is placed on the record, and the drive mechanism is started; after the record is played, the drive mechanism is turned off automatically. The door may be opened at any time a record is being played, without harming any part of the mechanism; the opening of the door shuts off the power and places the tone arm in its starting position.

The tone arm is equipped with a crystal pickup unit using a special, alloy needle having a precious-metal point; this needle plays several thousand records before replacement is necessary.

REMOVAL OF PACKING SUPPORTS

Special packing is used for the tone arm, which is supported by a corrugated cardboard strip, and is lashed to the tone-arm index pin. The turntable is held in place by a cord. Remove the packing carefully.

PRELIMINARY INSPECTION

Connect Set to Power Source

After removing the packing from the tone arm, see that the needle is held tightly by its set screw. Close the door, and see that the tone arm swings freely, without undue friction, over the playing range; also, see that it moves easily upward and downward. Turn the RADIO-OFF-PHONO switch knob of the radio receiver to the PHONO position.

Phono Test—Ten-Inch Record

Open the door of the record player and insert a 10-inch record through the slot, pushing the record in until it stops. While observing the player, close the door; the needle should readily enter the lead-in groove of the record, the *spindle* should rise upward through the hole in the record, and the turntable drive mechanism should start.

Adjust the receiver volume control for moderate volume, and turn the tone control to the treble position. Listen for general quality of reproduction. After the record is played, the turntable should stop automatically. When the door is opened, the tone arm should lift and swing over against the *tone-arm index pin.*

Check the turntable speed while a record is being played; the speed should be approximately 78 r.p.m. Open the door when a record is partially played; the tone arm should lift and swing aside, and the turntable should stop.

Phono Test—Twelve-Inch Record

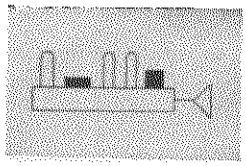
Insert a 12-inch record, pushing inward until the record stops; as the record is pushed home, the tone arm should swing aside (needle remaining over lead-in groove), and the 10-inch hinged section of the *rear index bracket* should lift to clear the edge of the record. When the door is closed, the two rubber-covered *guide rollers* should move away from the edges of the record at least 1/16 inch. When the door is opened, the tone arm should swing aside, and the *guide rollers* should come into contact with the sides of the record; when the record is removed, the hinged section of the *rear index bracket* should fall into its 10-inch position.

SERVICING

TEST PROCEDURES

The following tests are given for quickly localizing trouble in a Philco radio-phonograph. Be sure to make each test, in the order given, *before* removing the record player from the cabinet.

If the trouble is found to be in the audio amplifier, refer to the radio service manual for the particular model under test. If the trouble is in some part of the record player, refer to pages of this manual.

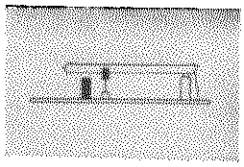


1. AUDIO-AMPLIFIER TEST

The audio amplifier is common to both the radio and phonograph sections of the combination. With a station tuned in, check the audio amplifier by noting the tonal quality and volume of the speaker output.

If the trouble is found to be in the audio amplifier, refer to the radio service manual for the particular model under test.

2. TONE-ARM TESTS



a. Pickup Test

Play a familiar record on the radio-phonograph, and listen to the reproduction. If the audio amplifier was found to be normal in the first test, distortion or low volume indicates trouble in the pickup or in the connecting leads to the radio chassis. Try a new needle if the output is distorted. If the pickup is found to be faulty, replace the unit, following the procedure given on page of this manual.

Note: It is advisable to carry a familiar record with you as a regular part of your test equipment.

b. Indexing and Tripping Test

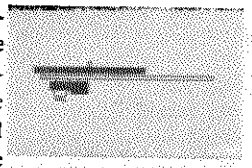
Open the door of the record player. While observing the record player, insert a 10-inch record, and close the door. As the door is closed, the tone arm should set down with the needle in the lead-in groove of the record. After the record has played through, tripping of the mechanism should occur during three to five revolutions with the needle riding in the eccentric groove.

Open the door; the tone arm should lift and swing across to the index pin.

Insert a 12-inch record and repeat the above test.

If the indexing or tripping is incorrect, refer to ADJUSTMENTS in this manual.

3. TURNTABLE-AND-MOTOR TEST



In table-model combinations, it is necessary to raise the top of the cabinet, as directed on page 11. Open the door of the record player, and insert a 12-inch record. Place a stroboscope disc, such as Philco Part No. 45-2900, on the record, and illuminate the disc with a lamp (preferably a neon bulb) operated on 60-cycle a.c. Close the door to start the turntable. The dots in the row calibrated for 78 r.p.m. should appear to remain stationary, or drift slowly but smoothly forward or backward. Erratic motion of the dots indicates trouble in the drive mechanism.

If the speed of the turntable is unstable, refer to POSSIBLE CAUSES OF "WOWS" on page of this manual.

QUALITY OF RECORDS

When diagnosing trouble, or when adjusting or servicing this record player, it should be borne in mind that records, in general, are non-uniform in a number of respects. The characteristics encountered, not only in new records from different manufacturers, but in different records of the same make, include:

Lack of (or incomplete) lead-in groove

Lack of (or incomplete) eccentric groove

Variations in position of eccentric groove

Small hole

Poor recording

In addition to the above, used records may also be found to have cracks, warpage, or high surface noise.

To properly service the PHILCO M-7 AUTOMATIC RECORD PLAYER, the operation of the mechanism should be well understood; therefore, the following explanation is given, preliminary to the actual servicing information.

HOW THE M-7 OPERATES

The operation of the record player is controlled by a *slide-lever assembly,* and an *index-lever assembly.* The *slide-lever assembly,* under the *motor board* (main base plate) is coupled to the door by a *connector-bar,* and is moved forward or backward by the opening or closing of the door.

The indexing (adaptation to 10-inch or 12-inch records) is accomplished by the action of the *index-lever assembly,* which is controlled by the diameter of the record pushed into the slot.

WHEN THE DOOR IS OPENED, as shown in Figure 2, the following operations are performed:

1. The tone arm is moved, by a *pull-cord,* to the starting position; in this position, the pickup and needle are raised, to clear an incoming record.
2. The *record spindle* is retracted.
3. If a record is playing, the motor is turned *off.*

Figure 3 shows the bottom view of the record player (for clarity of reproduction, the wood frame and door are removed). All parts are in their closed-door positions. The *slide-lever assembly* is forward. Note that the tone-arm pull-cord is taut, the record-spindle *connector block* is lowered, and the *mercury switch-case assembly* is tilted to the *off* position.

WHEN A 10-INCH RECORD IS PUSHED INTO THE SLOT, it is guided into place, with the hole approximately centered on the turntable, without altering the positions of the *index-lever assembly* or *rear-inaex bracket.* Figure 4 shows the 10-inch record in position.

WHEN A 12-INCH RECORD IS PUSHED INTO THE SLOT, the *guide rollers* are moved outward, operating the *index-lever assembly* and changing the *rear index bracket* to its 12-inch position. The *tone-arm index pin,* being mounted on the right-hand *index lever,* moves outward, allowing the needle to assume the starting position required by the larger record.

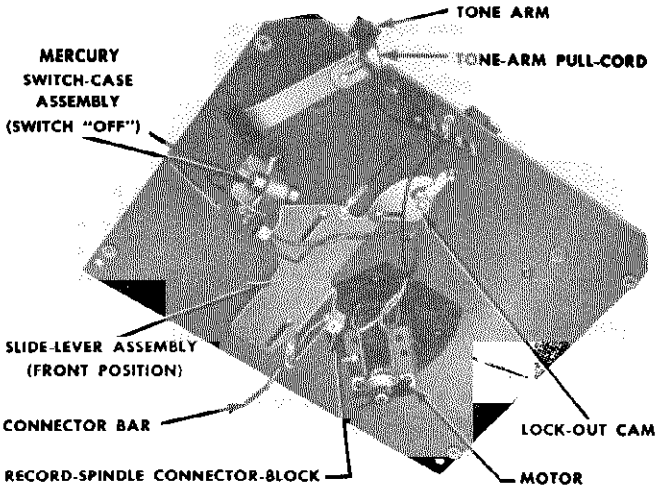


Figure 3—BOTTOM VIEW, COMPONENTS IN OPEN-DOOR POSITIONS, WITHOUT RECORD.

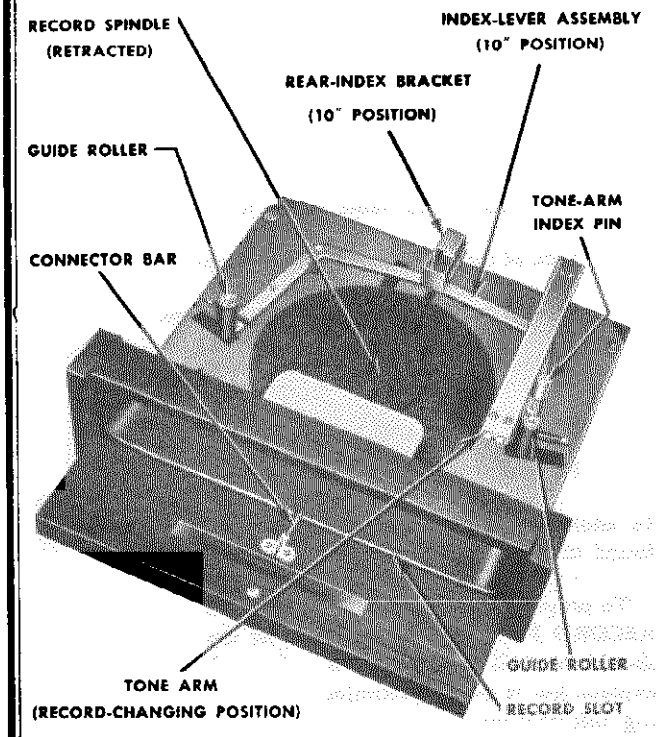

Figure 2—TOP VIEW, DOOR OPEN, WITHOUT RECORD.

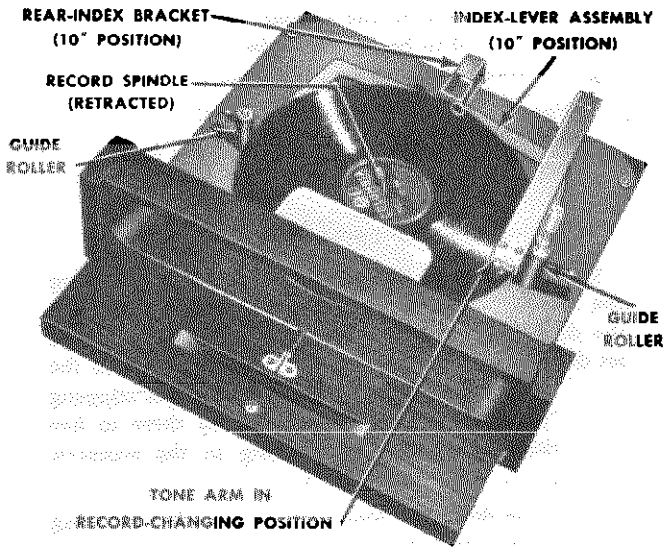

Figure 4—TOP VIEW, DOOR OPEN, WITH 10" RECORD.

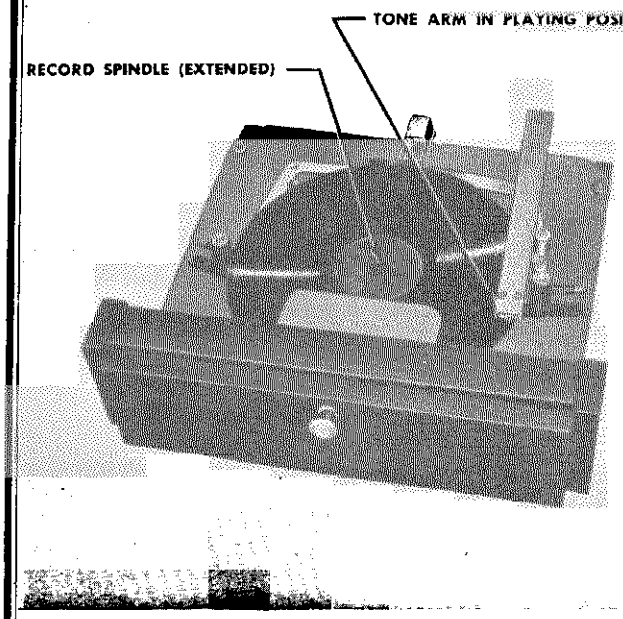

Figure 5—TOP VIEW, DOOR CLOSED, WITH 10″ RECORD.

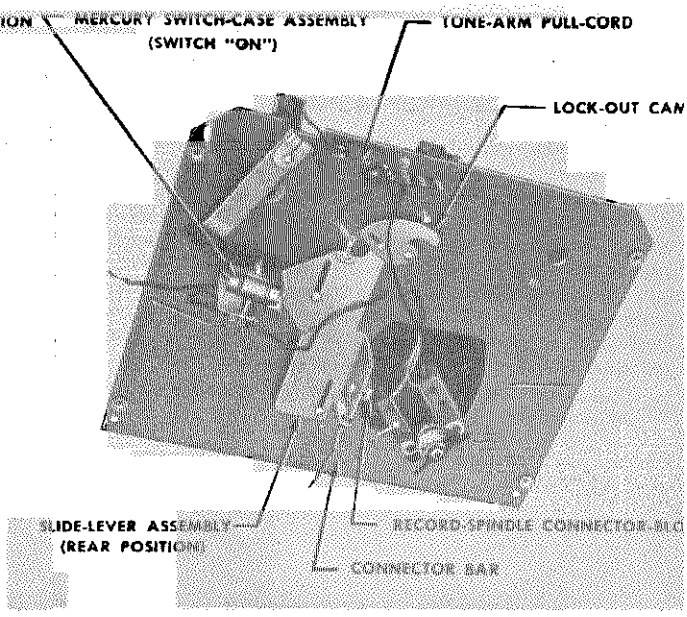

Figure 6—BOTTOM VIEW, COMPONENTS IN CLOSED-DOOR POSITIONS, WITH 10″ RECORD.

WHEN THE DOOR IS CLOSED, WITH A 10-INCH RECORD IN PLACE, the following operations are performed:

1. The *record spindle* is extended through the hole in the record, positioning the record accurately for the tone-arm set down.
2. The needle is lowered to the lead-in groove.
3. The motor is turned *on*.

Figure 5 shows the 10-inch record in place, with the door closed. Note the position of the *record spindle* and the tone arm.

Figure 6 shows the bottom view under the same conditions. Note the positions of the *slide-lever assembly*, the record-spindle *connector-block*, and the *mercury switch-case assembly*. It will be seen that the *tone-arm pull-cord* is slack.

WHEN THE DOOR IS CLOSED, WITH A 12-INCH RECORD IN PLACE, the operations mentioned above are performed, and, in addition, the *stud* of the *index-lever assembly* is engaged by the *lock-out cam;* this causes the two *guide rollers* to be moved away from the edges of the record, permitting the record to turn freely. Figure 7 shows a top view of the record player with a 12-inch record in place. Figure 8 shows the bottom view, with all parts in their closed-door position. Note the positions of the *index-lever stud* and the *lock-out cam*.

When the needle rides into the eccentric portion of the groove, at the finish of the record, the motor is turned *off*. The motor is controlled by the *mercury trip switch;* the power is turned *on* or *off* by closing or opening the door, or turned *off*, at the finish of the record, by the tone-arm trip mechanism.

Figure 7—TOP VIEW, DOOR CLOSED, WITH 12′ RECORD.

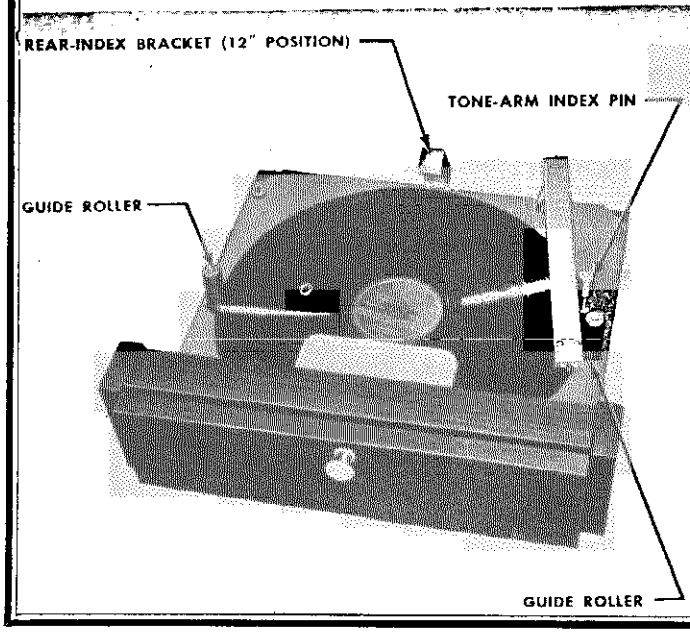

Figure 8—BOTTOM VIEW, COMPONENTS IN CLOSED-DOOR POSITIONS, WITH 12′ RECORD.

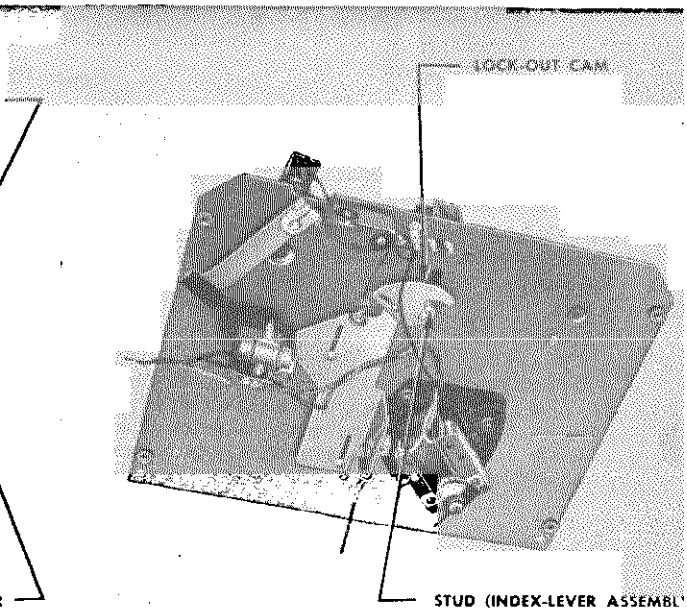

SLIDE-LEVER ASSEMBLY

Most of the operations of the record player are controlled by the *slide-lever assembly* (Figure 9), which is actuated by the opening or closing of the door. The door is coupled to a *connector-bar*, the other end of which is attached to the *slide-lever assembly*, located under the motor board (main base plate). The *slide-lever assembly* moves forward or backward as the door is opened or closed. The operations performed by the *slide-lever assembly*, besides positioning the tone arm, are accomplished by its three elements.

1. The trip-switch reset spring turns the trip switch *off* or *on*.

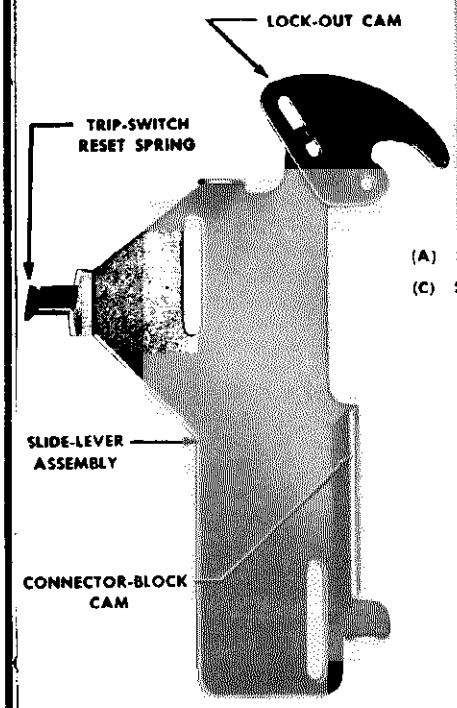

Figure 9—SLIDE-LEVER ASSEMBLY.

2. An ear having a diagonal slot (connector-block cam) retracts or extends the *record spindle*.
3. The *lock-out cam*, at the rear, moves the two *guide rollers* away from the edges of a 12-inch record, allowing the record to turn freely.

TRIP-SWITCH ASSEMBLY

The power to the drive motor is controlled by the *mercury trip switch*, shown in Figure 10A; the *mercury switch-case assembly*, which is mounted in a rocking clamp assembly, is provided with an adjustable *trip lever* at one end of the supporting shaft, and a lever and *trip pawl* at the other end. The switch contacts are closed when the case is tilted so that the mercury settles in the end nearest the *slide lever;* in the *on* position, this end is slightly lower than the opposite end, as shown in Figure 10A. The switch is turned *off* or *on*, when the door is opened or closed, by the *trip-switch reset spring* on the *slide-lever assembly;* this spring engages the tip of the adjustable *trip lever*. The switch is turned *off*, when the needle rides into the eccentric groove of the record, by the *trip pawl;* this pawl is actuated by a reverse motion of the *tone-arm trip lever*.

Figures 10A, 10B, 10C, and 10D show the positions of the *tone-arm trip lever, trip pawl,* and *mercury switch-case assembly* for a sequence of record-playing and tripping actions.

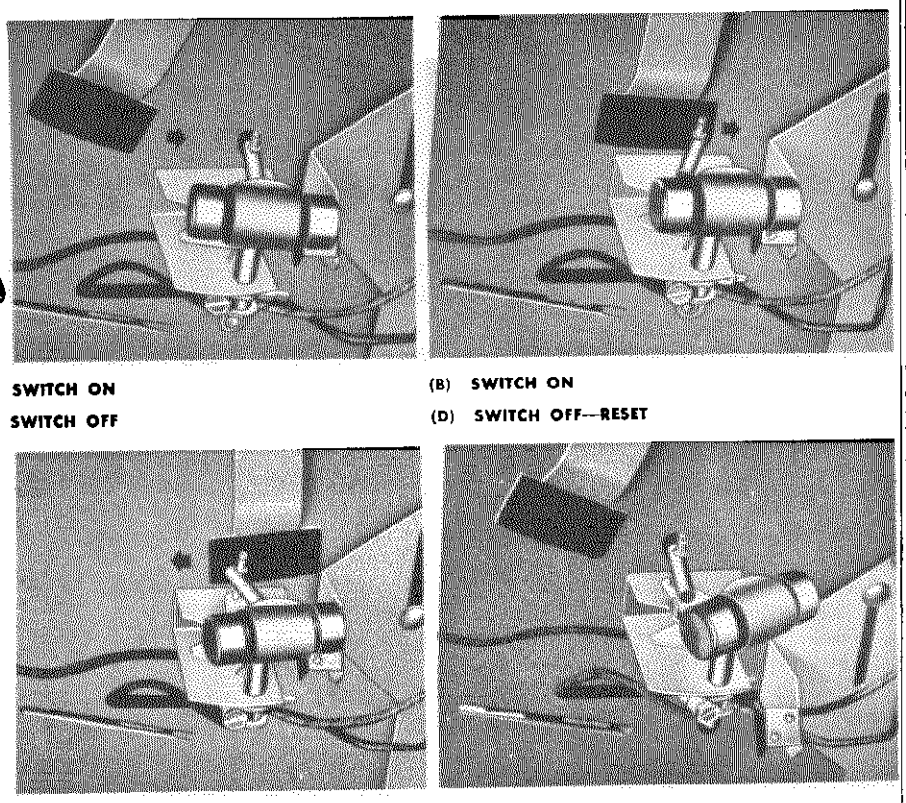

Figure 10—MERCURY TRIP-SWITCH AND TONE-ARM TRIP-MECHANISM OPERATION.

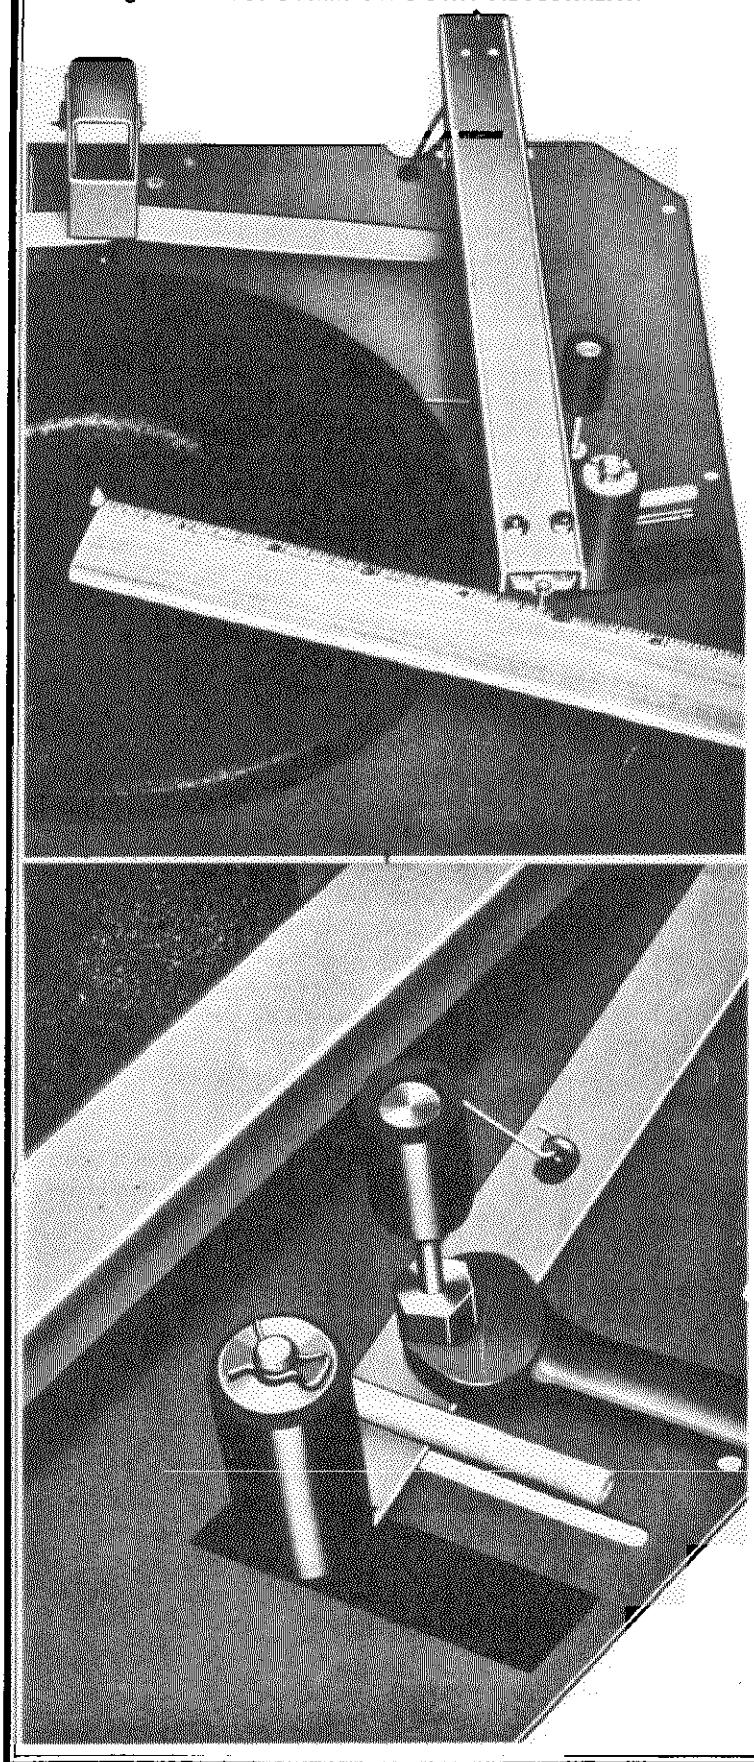
Figure 10A shows the switch in *on* position, and the *tone-arm trip-lever* position soon after the record has started to play.

Figure 10B shows the *trip pawl* starting to ride the *tone-arm trip lever* as the record is partially played.

Figure 10C shows the *trip pawl* after the trip action is completed; the switch is turned *off*.

Figure 10D shows the position of the *mercury switch-case assembly*, after the door is opened; the switch has been *reset*, by the *trip-switch reset spring*, to the position from which it may again be turned *on*, by the same spring, when the door is closed.

Figure 11—TONE-ARM SET-DOWN ADJUSTMENT.



ADJUSTMENTS

Each of the adjustments described below, un otherwise stated, is independent of other adjustme and may be performed separately as required. I advisable, however, to check all adjustments w servicing the record player.

TONE-ARM SET-DOWN

This adjustment should be made without a rec because of the wide variation in individual reco the adjustment is made by measurement, *to insure best average set-down position.*

1. See that the door of the record player is closed.
2. Lift the tone arm until the needle is slightly hig than the turntable.
3. Hold the tone arm lightly against the tone-arm dex pin.
4. Using a 3/8" open-end wrench on the hex shoul of the eccentric-mounted tone-arm index pin, t the pin until the distance between the point of needle and the *side* of the *spindle* nearest the nee is $4\frac{11}{16}$". See Figure 11.

INDEX-LEVER ASSEMBLY

This adjustment establishes the minimum clearа between the guide rollers and the edges of a 10-i record. The position of the index-lever assembly ca ing these rollers is determined by the adjustable inc lever cam shown in Figure 12.

1. Place a 10-inch record on the turntable, and cl the door.
2. Using a socket wrench, loosen the nut (beneath motor board) holding the adjusting cam.
3. Turn the cam until the clearance between the gu rollers and the edges of the record is $\frac{1}{16}$". Hold the cam firmly, tighten the nut.
4. Try a variety of 10-inch records on the turnta If the guide-roller tires contact any of these records with the door closed, repeat the adjustment.
5. After this adjustment is satisfactory, make the tone-arm set-down adjustment, since this is disturbed by changing the index-lever cam.

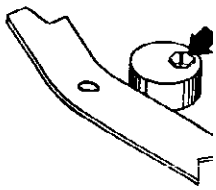


Figure 12 INDEX-LEVER ADJUSTMENT.

Figure 13—TONE-ARM TRIP-LEVER ADJUSTMENT.

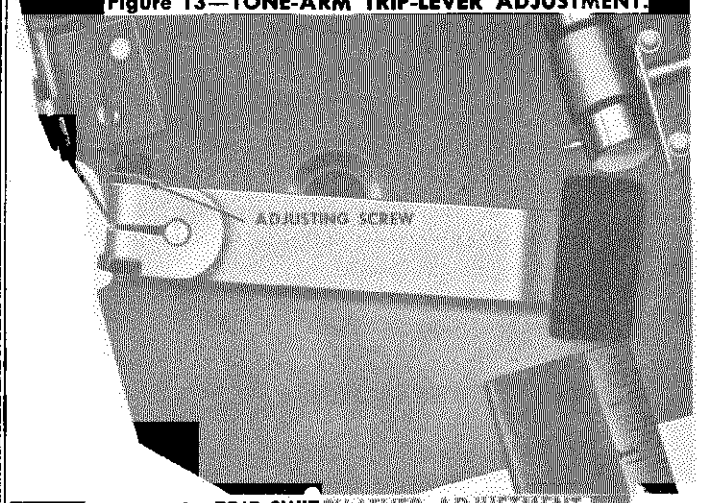

Figure 14—TRIP-SWITCH-LEVER ADJUSTMENT.

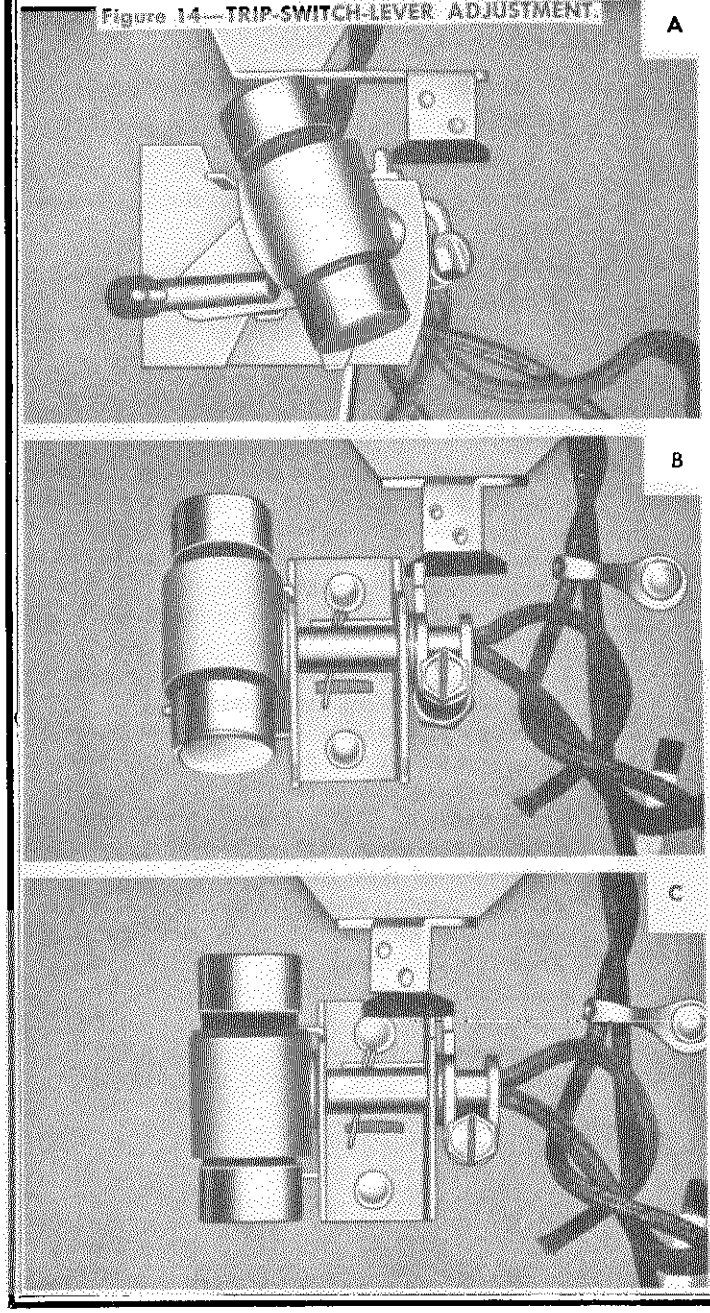

TONE-ARM TRIP LEVER

This adjustment is made to obtain the proper relationship between the trip lever and the tone arm, thus allowing the tone arm, when starting to oscillate in the eccentric groove, to turn off the drive-motor power. There should be an angular difference of approximately 15° between the tone arm and its trip lever. The adjustment, when made according to the following procedure, insures proper operation of the trip mechanism with the wide eccentric-groove variations encountered in different records.

1. See that the door of the record player is closed. No record is required.
2. Loosen the screw in the trip-lever clamp on the lower end of the tone-arm spindle. See Figure 13.
3. Hold the tone arm against the tone-arm index pin.
4. Swing the trip lever until the outside corner of the adhesive-coated portion is ¾" to ⅞" from the edge of the motor board. See Figure 13. Tighten the clamp screw.
5. Check the end play of the tone-arm spindle; there should be just enough play (.003" to .005") to allow the tone arm to swing freely throughout its range. The adhesive-coated end of the trip lever should be close to the motor board, and should swing throughout its range without scraping.
6. When this adjustment is properly made, the trip mechanism should operate through a range between 1½" and 3" from the center of the record spindle.

TRIP-SWITCH LEVER

This adjustment establishes the proper relationship between the trip-switch lever and the trip switch, so that the switch is turned *off* or *on* by opening or closing the door, and is turned *off* by the tone-arm trip mechanism after a record is played.

1. Loosen the screw in the trip-switch-lever clamp. See Figure 14A.
2. Open the door of the record player.
3. Tilt the switch to the position shown in Figure 14A; the lever carrying the trip pawl should be against the stop.
4. Turn the trip-switch lever until its tip is contacted, when the door is closed, by the under surface of the switch-reset spring at a point close to the upper tip of the spring, as shown in Figure 14B. When the door is reopened, the lever tip should be contacted by the upper surface of the switch-reset spring at a point close to the lower tip of the spring, as shown in Figure 14C.
5. Open and close the door several times, observing the upper and lower points where the trip lever contacts the spring; readjust the lever until its tip makes contact at equal distances from the tips of the spring as the spring is moved forward and backward. Tighten the screw.

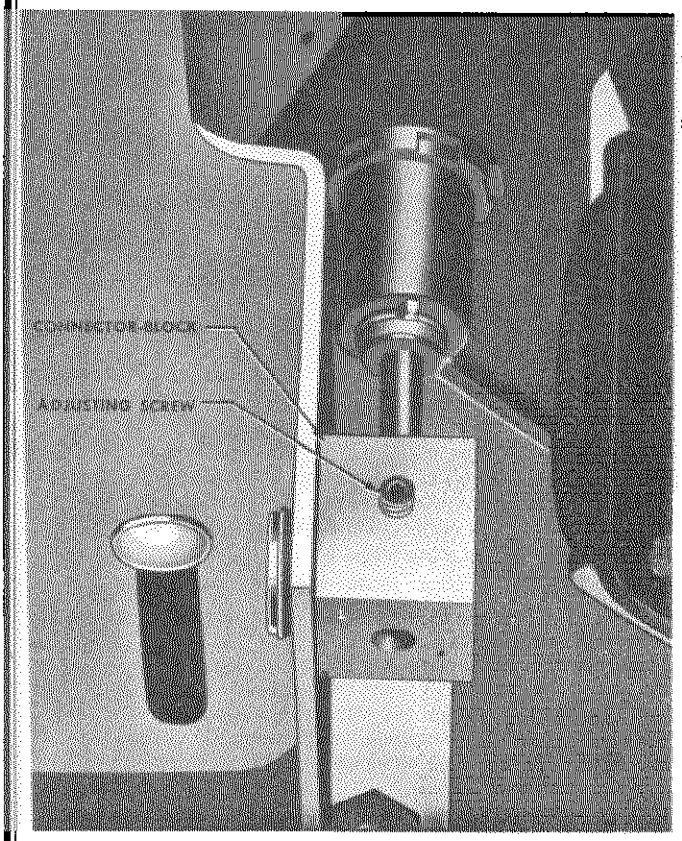

Figure 15—SPINDLE-HEIGHT ADJUSTMENT.

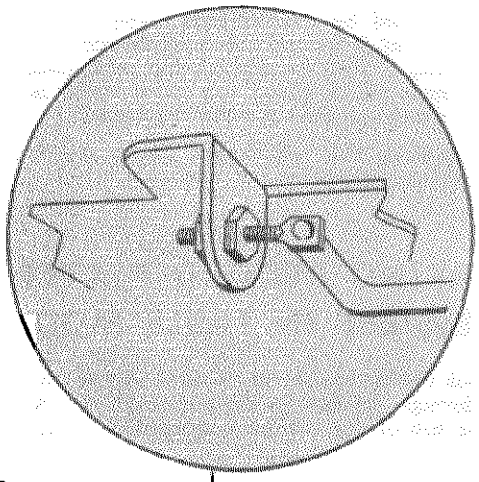
SPINDLE HEIGHT

The height of the record spindle, when extended, should be such that the spindle properly engages the record hole without delay, when the door is closed. The adjustment is made as follows:

1. Open the door of the record player. No record should be used.
2. Using a No. 4 Allen wrench, release the set screw in the spindle connector block. See Figure 15.



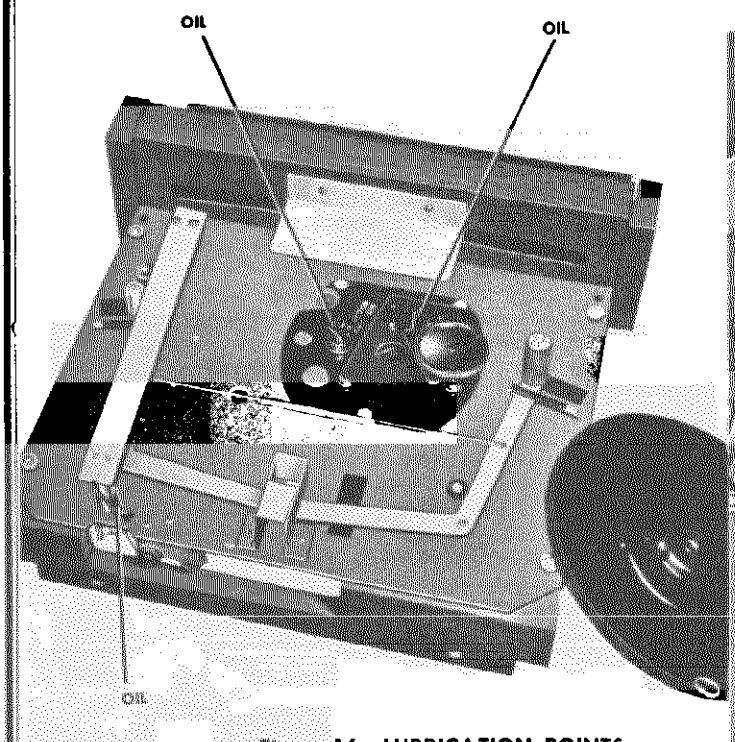


Figure 16—LUBRICATION POINTS UNDER TURNTABLE.

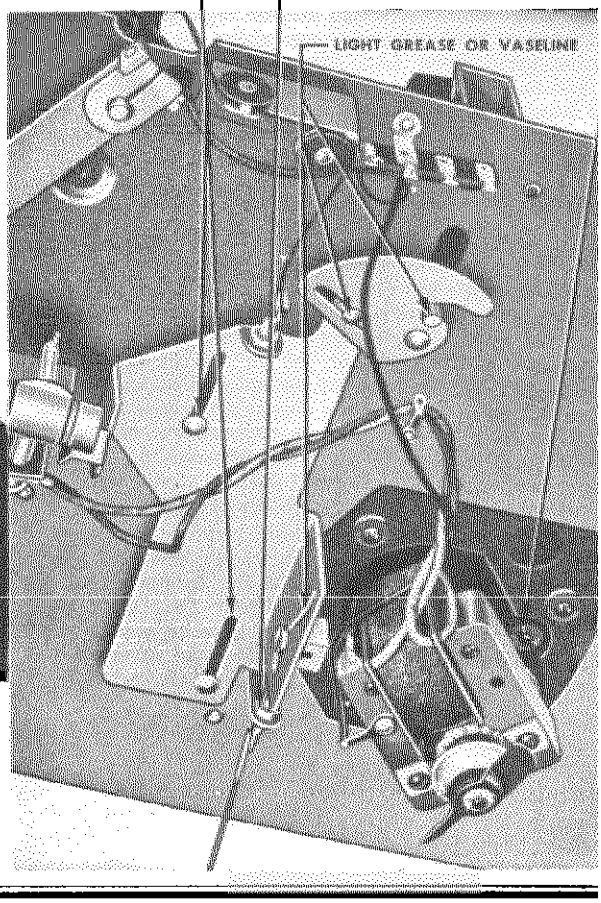

Figure 17—LUBRICATION POINTS UNDER MOTOR BOARD.

3. Adjust the spindle height until the point on the upper end of the spindle is flush with the spindle bushing. Tighten the set screw.

CONNECTOR BAR

This adjustment establishes the correct position of the slide-lever assembly, with respect to the door.

1. Open the door to its limit (do not force).
2. Loosen the two nuts on the threaded stud of the connector bar. See detail, Figure 17.
3. Hold down the door, and separate the two nuts, so that the slide-lever assembly may be pulled forward until stopped by the shoulder rivets in the two straight slots. With the slide-lever assembly held in this forward position, tighten the nuts. Avoid an adjustment which places too much strain on the ear to which the threaded stud is fastened.

After making this adjustment, check the record-spindle height, readjusting if necessary.

MAKING RECORD PLAYER ACCESSIBLE IN TABLE MODELS

Unhook the latch; this can be done by inserting one finger through the hole in the bottom of the cabinet. Push the top of the cabinet backward, then upward.

LUBRICATION

It is recommended that the PHILCO M-7 AUTOMATIC RECORD PLAYER be lubricated about once a year. Remove the turntable, by lifting upward.

CAUTION

Do not get any oil or grease on the idler-wheel tire, drive-motor pinion, or turntable.

The points to be lubricated are indicated in Figures 16 and 17. Apply a few drops of *oil*, such as Philco Part No. 60319, to the following points:

1. Edges of slot under idler-wheel plate (the slot in which the guide pin rides).
2. Record-spindle and bushing.
3. Tone-arm spindle.
4. Idler-wheel bearing, shown in Figure 17.

Clean off old grease with carbon tetrachloride, and apply *light grease* or *vaseline*, such as Philco Part No. 60130, to the following points, also shown in Figure 17.

1. Two straight slots of slide-lever.
2. Diagonal slot carrying record-spindle connector block.
3. Slot of lock-out cam.

After completing the lubrication, close the door of the record player and wipe oil from the extended portion of record spindle. Replace the turntable. Dip a pipe cleaner in carbon tetrachloride, and carefully clean the pin on which the trip pawl swings; do not apply any lubrication to this pin.

REPLACEMENT OF PARTS

Parts or assemblies which may be replaced for worn, damaged, or broken parts or assemblies are listed in the Replacement Parts List. Many of the parts are attached to the motor board by rivets; movable sections are attached by shoulder rivets. When replacing a part or assembly, drill out the ends of the rivets, and knock them out with a nail set or center punch.

NEEDLE

TO REPLACE THE PICKUP NEEDLE IN TABLE MODELS, first remove the top of the cabinet according to the directions given on this page. Then pull the phonograph-compartment door fully open to tilt the tone arm upward. Hold the end of the tone arm and loosen the needle screw on the end of the arm with a small screwdriver. Remove the old needle, and insert the new one *as far into the needle hole as it will go, with the flat side of the shank facing toward the needle screw.* Hold the end of the tone arm with the needle in the proper position, and tighten the needle screw.

TO REPLACE THE PICKUP NEEDLE IN FLOOR MODELS, first pull the phonograph-compartment door about halfway open, and carefully move the tone arm around toward the back of the cabinet until a slight resistance to movement is felt. Then close the door to permit free movement of the tone arm to the end of its backward swing. Hold the end of the tone arm in the left hand, as shown in Figure 18, and loosen the needle screw on the end of the arm with a small screwdriver. Remove the old needle, and insert the new one *as far into the needle hole as it will go, with the flat side of the shank facing toward the needle screw.* Hold the end of the tone arm, with the needle in the proper position, and tighten the needle screw. Again pull the phonograph-compartment door about halfway open, and move the tone arm around toward the front of the cabinet until resistance to movement is felt. Then close the door to permit free movement of the tone arm to its original position.

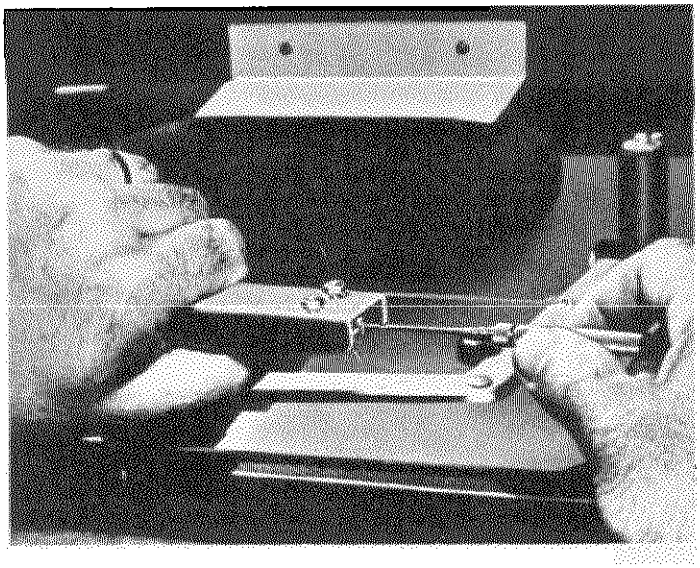

Figure 18—REPLACING NEEDLE.

CRYSTAL-PICKUP UNIT

To replace the pickup unit, first remove the two hex nuts and lockwashers from the tone arm; then withdraw the unit from under the tone arm sufficiently to permit unsoldering the connections.

CAUTION

Excessive heat will damage the crystal in the pickup unit. When unsoldering or soldering connections to this unit, use a well-tinned soldering iron. *Do not apply more heat than is absolutely necessary.*

After removing the connections, the new unit may be connected, and mounted in the tone arm.

MERCURY SWITCH-CASE ASSEMBLY

When replacing the mercury switch-case assembly, this unit must be positioned properly in its clamp, so that, when the switch case is tilted to the *on* position, the mercury covers the contacts. After running the switch leads through the hollow shaft, turn the switch case until the hole through which the leads enter is facing directly upward (toward motor board).

SLIDE-LEVER ASSEMBLY

When any part of the slide-lever assembly becomes worn or damaged, it is recommended that the entire assembly be replaced.

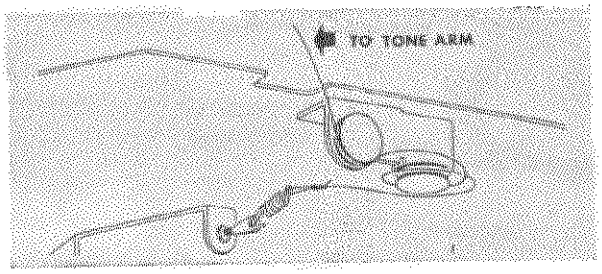

Figure 19—PULL-CORD INSTALLATION DETAILS.

PULL-CORD AND SPRING ASSEMBLY

The pull-cord and spring assembly may be replaced by referring to the sketch, Figure 19.

POSSIBLE CAUSES OF "WOWS"

The presence of "wows" (pitch variations) is usually caused by a change in the speed of the turntable during each revolution. If this condition develops, it may be due to one of the following causes:

1. Defective record.
2. Idler-wheel tire unevenly worn.
3. Oil (or other foreign matter) on idler-wheel tire.
4. Binding of idler-wheel shaft.
5. Binding between record spindle and turntable bushing.
6. Guide roller tire touching edge of record.

RADIO CORP. OF AMERICA

MODELS RP-177, RP-177A
RP-177B

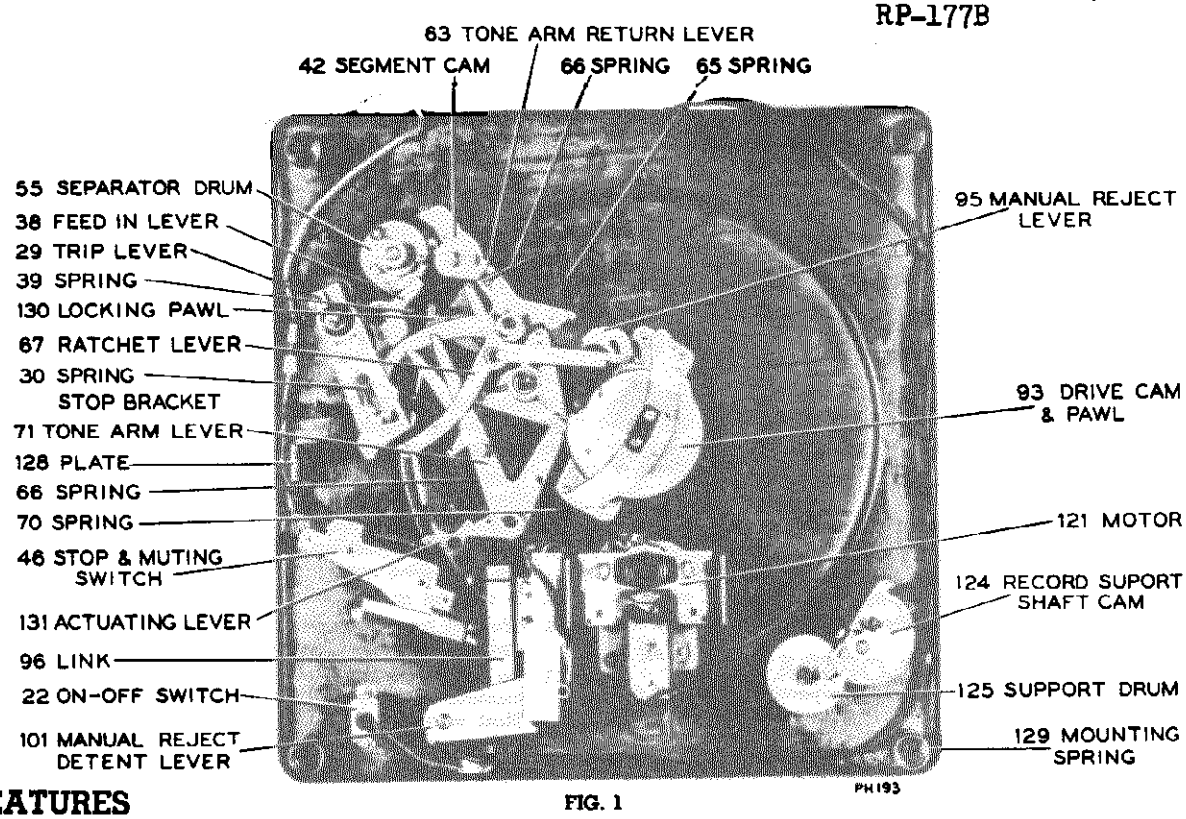

FIG. 1

FEATURES

1. This record changer is a two-support, drop type, non-intermixing mechanism designed to play automatically a series of twelve ten-inch or ten twelve-inch records of the standard 78 RPM type.
2. The mechanism uses a lightweight, low-noise, crystal pickup cartridge, equipped with a long-life sapphire point.
3. The tone arm is automatically returned to rest position and the power removed from the drive motor, after the mechanism has finished playing the last selection of the stack.
4. The changer is equipped with an eccentric tripping device which insures tripping on all standard records.
5. A pickup muting switch is incorporated, which shorts out the pickup while the changer is in cycle. This prevents mechanical noise of moving parts from being amplified.
6. The record support and separator are mechanically linked, requiring only one operation for changing of record size.
7. Moving parts are few in number while playing records. This insures quiet reproduction, free from rumble and wow.
8. The mechanism is provided with a safety clutch which prevents damage to the mechanism in case of a jam due to a defective record.

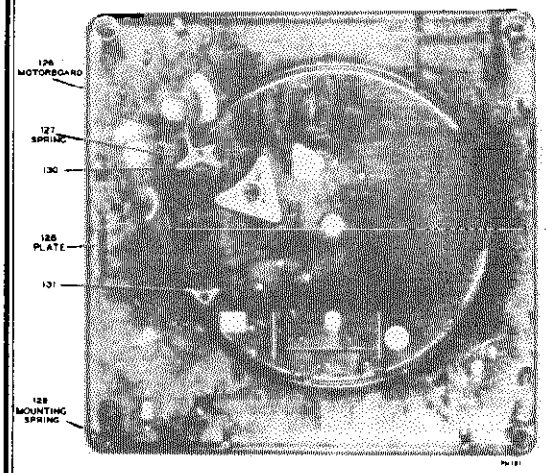

FIG. 3

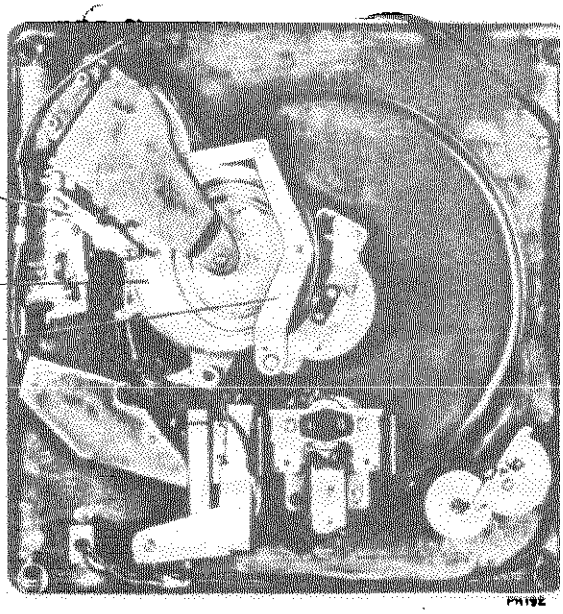

FIG. 2

MODELS RP-177, RP-177A, RP-177B — RADIO CORP. OF AMERICA

MANUAL OPERATION

1. Make certain the mechanism is out of cycle with the pickup on the rest.
2. Push "Start-Reject" knob to manual position.
3. Place record on turntable and push the power switch to the "on" position.
4. Lift and place pickup on record.
5. When the selection has finished playing, the pickup will continue to ride in the eccentric groove until the pickup is lifted from the record or the power is removed from the drive motor.

LUBRICATION

A light machine oil (SAE #10) should be used to oil the bearings of the drive motor.

On all bearing surfaces, excepting the motor bearings, Houghton STA-PUT No. 320, or equivalent, should be used. On all other surfaces, STA-PUT No. 512, or equivalent, is recommended. STA-PUT can be purchased from E. F. Houghton & Co., 303 W. Lehigh Ave., Philadelphia, Pa.

(Do not oil or grease record separator shaft.)

It is important that the drive motor spindle and the rubber tire on the friction disc as well as that on the idler wheel be kept clean and free from oil or grease, dirt, or any foreign material at all times. Carbon tetrachloride or naphtha is satisfactory for cleaning these parts.

AUTOMATIC OPERATION

The pickup "rest" consists of a post incorporating a button and shaft connecting a switch beneath the motor board. This switch, which controls the power to the drive motor, is actuated by the weight of the pickup and tone arm while going in and out of rest position.

1. Turn the record support on the left-hand side of the changer, to position it for 10- or 12-inch records.
2. Load the records on the supports with the desired selections upward, the last record to be played on top. (Make certain the separator shelf is pushed down when stack is placed on the supports.)
3. Push the "On-Off" knob to the "on" position.
4. Push "Manual-Reject" handle to reject position and release. The mechanism will automatically play in sequence, one side of each record stacked on the supports. After completing the selection on the last record the tone arm will return to rest position and the power will be removed from drive motor.
5. To reject a record being played, push the control handle to "Reject" and release.
6. Lift and turn separator shelf to facilitate the removal of records.
   (Note: For automatic operation, each record is required to have the standard eccentric groove.)

Cautions

Before servicing the automatic changer, inspect the assembly to see that all gears, cams, springs, levers, etc., are correctly assembled and in good working order.

1. Never use force to start or stop the motor or any part of the record changing mechanism.
2. Warped or damaged records may cause the mechanism to jam. When jamming occurs, the safety clutch slips, causing a clicking sound.
3. A cracked or chipped record may damage the sapphire.
4. Warped records may slide on one another while playing and result in unsatisfactory reproduction.
5. Do not leave the records on the record posts or on the turntable as they may warp, particularly in warm climates. Most warped records may be flattened by placing them on a flat surface with a heavy flat article placed on top of them for a few days.
6. If, for any reason, the mechanism stalls, turn off the "On-Off" switch and remove the records from the posts. Start the turntable by turning the switch on and allow the tone arm to complete its cycle.
7. Do not tighten copper-plated, cone-pointed screws until final adjustment has been made.

FUNCTION OF PRINCIPAL PARTS

Trip Lever 29
When the pickup is riding in the eccentric groove, the trip pawl located on the trip lever engages the ratchet lever, starting the cycle.

Ratchet Lever 67
Portion of lever acts as a ratchet and the other portion acts as a stop or catch to hold the drive clutch from engaging.

Ratchet Wheel 90 (Fig. 4)
Acts as part of the safety clutch, which is engaged with the cam pawl during cycle.

Drive Cam, Gear and Pawl 93
Transfers motion from turntable through clutch to main gear.

Turntable Spindle Support 82 (Fig. 4)
Forms a bearing for turntable spindle.

Main Cam 80 (Fig. 4)
Has a series of tracks controlling cycling action.

Record Separator Lever, Link, Crank 85 (Fig. 4)
Transfers motion from the main cam through the stud, lever and link to the separator post during change cycle.

Feed-in Lever Locking Pawl or Latch 130
Provides a means of locking feed-in lever until the pickup has landed on the record, then unlatching and allowing feed-in lever to gently push the pickup into starting groove. (Used only on early RP-177)

Manual-Reject Control Knob and Lever Assembly 102-101-96-95
In "manual" position, it contacts the stud on clutch portion of drive cam thereby preventing the clutch from engaging and starting cycle.
In "automatic" position, it permits operation of the ratchet lever safety clutch and stop switch.
In "start reject" position, it momentarily closes control switch which is shunted across stop switch. It also moves the ratchet lever away from drive cam pawl, permitting the clutch to engage and start cycle.

Muting Switch Actuating Lever 131
Opens pickup muting switch during the playing cycle.

Tone Arm Lever 71
Directs horizontal motion of tone arm. It also incorporates an additional retard lever which stabilizes tone arm while the mechanism is in cycle.

Tone Arm Return Lever 63
Moves the tone arm inward and provides positioning for landing.

Feed-in Lever 38
A small lever under spring tension providing a small amount of force inward on tone arm, after the pickup has landed on record. (Used only on early RP-177)

Tone Arm Elevating Lever 77
Directs vertical motion of tone arm.

Tone Arm Elevating Rod 9 (Fig. 4)
Transfers motion from elevating lever to tone arm.

Record Support Shaft, Cam 124
Functions as a lock for record support belt drum.

Record Support and Separator Drums and Belt Assembly 55-56-125
Forms a mechanical linkage between record support and record separator.

Record Support
Provides a support for the record stack and a handle for record size change.

Record Separator Post and Blade
Functions to support the records and, together with the selector blade, to separate the lowest record of the stack and allow it to drop to the turntable during the change cycle.

Shut-off or Segment Cam 42
Forms a stop for tone arm return lever thereby preventing it from pushing the tone arm in for landing.

Retainer Spring and Plate 128
A small piece of phosphor-bronze functioning as a partial lock which stabilizes the tone arm when in the outermost position.

Stop Bracket (part of Motor Board)
A small piece of spring steel used as a stop, which determines the outermost position of tone arm. (Adjustable.)

Cycle of Operation

The changer can be conveniently rotated through the change cycle by pushing the reject handle and revolving the turntable by hand. Eight turntable revolutions are required for one change cycle. Block up the motor, so it is disengaged fro the drive disc, to permit easier manual rotation of the tur table.

	Function	Explanation
Operator	Turn Record Support to 10" or 12" Position as Desired	1. Separator post positions itself by means of belt drive.
	Place Records on Posts	1. Separator shaft is pushed down against its spring and carries segment-cam out of path of inde finger.
	Push Start Knob	1. Switch connected to start knob momentarily applies power to drive motor until tone arm raised from stop button. 2. Manual-reject lever pushes ratchet lever. 3. Ratchet lever is pushed out of step on main gear shaft and releases drive cam pawl. 4. Drive cam pawl engages cam sprocket and it revolves, carrying drive gear with it.
Automatic Cycle	Tone Arm Rises	1. Main cam and gear revolves with drive gear. 2. Stud on tone arm lever rides in top track on main cam and directs movement of the lever. 3. Tone arm elevating lever rides up on ridge on main cam and pushes tone arm up by mean of elevating rod.
	Tone Arm Moves Out	1. Tone arm lever pushes on trip lever stud. (Feed-in on early RP-177 only) 2. Trip lever moves out. 3. Stud on trip lever, on its outermost swing, pushes feed-in lever into locking pawl (130) (fig. 1) 4. Tone arm return lever is carried along by trip lever stud, and by stud on main cam top trac
	Record Knife Separates Bottom Record from Stack After Gauging Thickness of Record	1. Stud on separator lever follows main cam bottom track and directs the motion of the lever. 2. Through the separator link and crank, the separator lever turns the separator shaft. 3. Knife turns with shaft and strikes edge of bottom record. 4. Separator shaft continues to revolve and teeth on inner circumference of knife ride up c shelf teeth until knife is carried high enough against the action of the coil spring to mov in over top of record.
	Record Drops to Turntable	1. Separator shaft continues to turn until knife supports stack of records and shelf moves ou from under bottom record.
	Tone Arm Moves In	1. Separator shaft reverses rotation. 2. Tone arm lever moves away from trip lever stud. 3. While tone arm lever moves away from stud on trip lever, the retard lever, hinged on ton arm lever, stabilizes tone arm for accurate landing. 4. Tone arm return lever pushes on trip lever stud. 5. Trip lever moves in.
	Tone Arm Lowers Sapphire on to Record	1. Index finger on tone arm return lever moves against separator shaft to insure proper landin position. 2. Tone arm elevating lever rides down on main cam ridge thus lowering the elevating rod an the tone arm. 3. Separator shaft returns knife to original position and allows stack of records to rest on shel
	Sapphire Moves In to Record Groove Record Begins to Play	1. Ratchet lever rides into eccentric step on main gear shaft and blocks drive cam pawl. 2. Pawl is disengaged from drive cam sprocket. (Feed-in on early RP-177 only) 3. Drive gear and main gear stop. 4. Tone arm lever moves into cam to maintain disengagement. 5. As tone arm lever moves to its innermost position, it contacts feed-in latch, unlatching feed-i lever. This allows it to gently push pickup into the first groove of the record.
	Last Record Drops and the Last Selection Is Finished Playing	1. As the mechanism goes into cycle the separator shaft raises, allowing segment cam to engag index finger and prevent tone arm return lever from pushing tone arm in for landing. 2. Tone arm is lowered into rest position. 3. Power is removed from drive motor by the weight of the tone arm resting on stop button whic opens the stop switch.

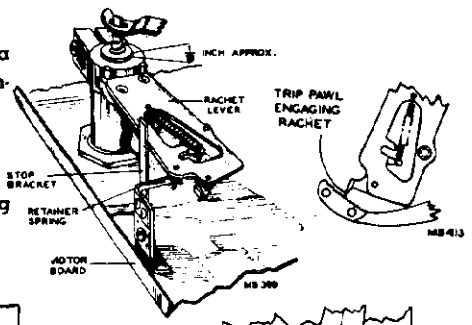
Preliminary Adjustments for Assembling Mechanism

It should be understood that the preliminary adjustments are only approximate and intended to aid in the process of assembling a mechanism in which the major parts have been removed. The final and exact adjustments can be made when the mechanism is completely assembled.

Mounting the Tone Arm:

The assembled tone arm should be mounted with the ratchet lever clamp approximately 1/16" from the end of the pivot arm bushing and against the stop bracket when the tone arm is on the rest as shown in the sketch.

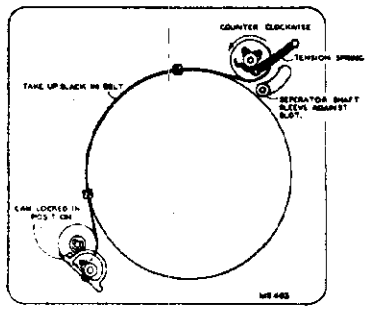
(**Note:** The 1/16" is only a starting point, the important factor is to have the trip pawl engage the ratchet properly.)

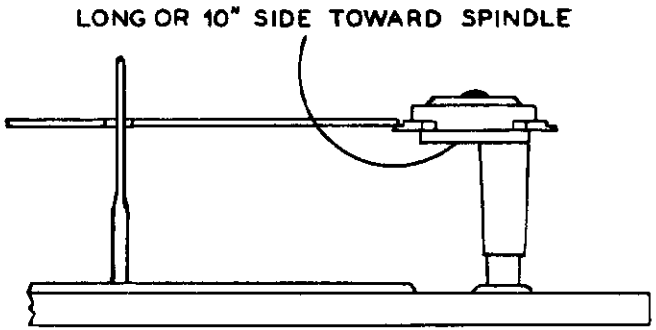


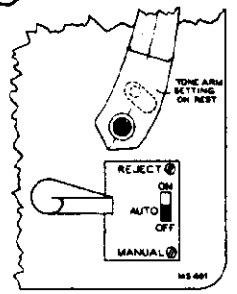
Positioning Record Support Shaft:

Assemble the record support post with the ten inch side (long side) pointing towards the spindle. Adjust the cam so it is locked in position as shown in the sketch.

Take up all the slack in the belt by turning the separation shaft counter clockwise (viewed from underside) aiding the action of the tension spring when the separator shaft sleeve is against the side of the slot in the motor board nearest the turntable as shown in the sketch.



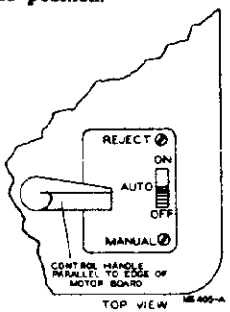


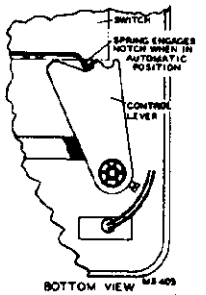


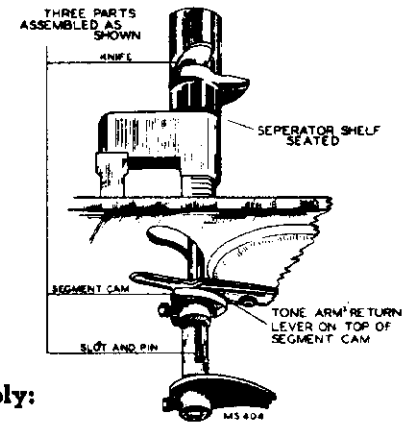
Manual-Reject Lever Mounting:

Place the control handle parallel to the front side of the motor board and pointing towards the "on-off" switch.

Adjust the control lever so the notch engages the spring of the switch as shown in the sketch when the control handle is in the automatic position.







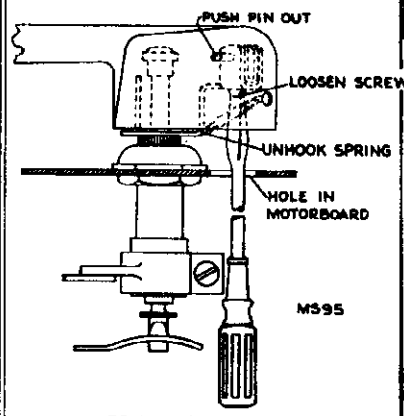
Mounting the Separator Knife and "Shut-off" Cam Assembly:

Turn the record support post to the ten inch position and assemble the separator knife, "Shut-off" cam, and separator shaft pin and bushing assembly approximately in line as shown in sketch. Allow the end of the tone arm return lever to ride on the upper side (towards the motor board) of the "shut-off" cam as shown in sketch.

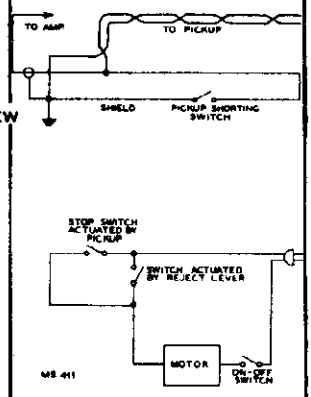
RADIO CORP. OF AMERICA

MODELS RP-177, RP-177
RP-177B

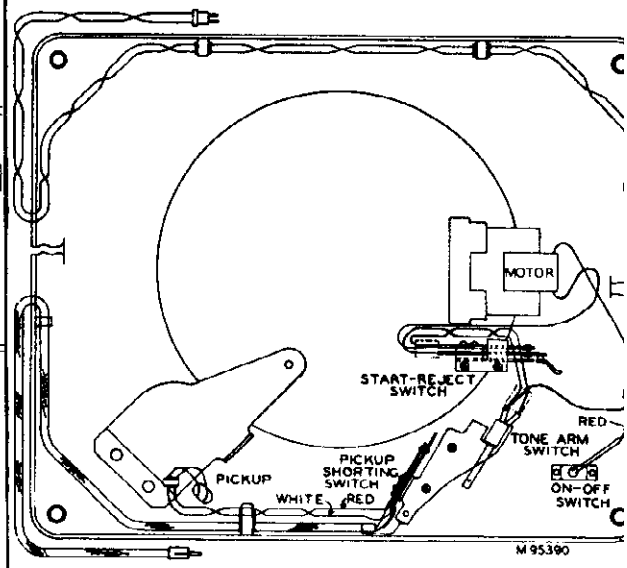
1. Unhook spring
2. Loosen screw
3. Push pin out

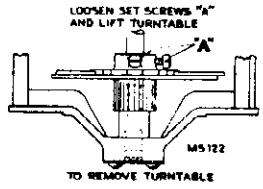


REMOVING TONE ARM

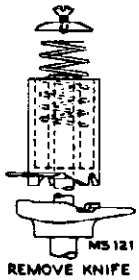


Electrical Connections

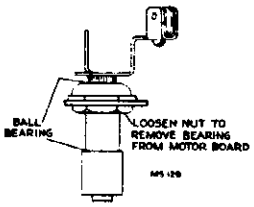




To remove turntable loosen set screws "A" and lift the turntable.



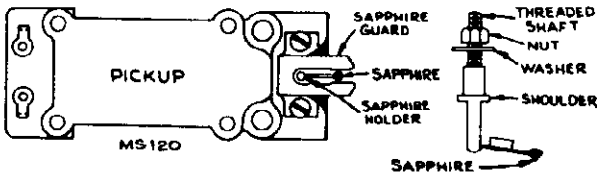
To remove separator knife, loosen top screw and entire assembly can be dismantled as shown.



Do not remove ball bearings from tone arm bearing unless absolutely necessary. If cleaning is necessary immerse entire bearing in cleaning solution such as carbon tetrachloride.

To Remove Tone Arm Bearing:

Replacement of Sapphire:



Caution: Never bend the sapphire support wire.

Extreme care should be used when loosening the sapphire mounting nut so that the twisting motion does not break the crystal.

Remove the two screws holding the sapphire guard in place and remove guard. Remove the small nut and washer on the threaded shaft of the sapphire holder and push the shaft through the hole in the viscoloid until the sapphire holder assembly comes free.

Insert threaded shaft of replacement sapphire holder through viscoloid and replace the washer and nut. Make sure the sapphire is in the correct position. Take hold at the lower end of the shaft with a pair of pliers while tightening the nut, being very careful so as not to strip the threads or break the crystal. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws. Before using, check to see that the sapphire projects far enough (approx. .020) beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little.

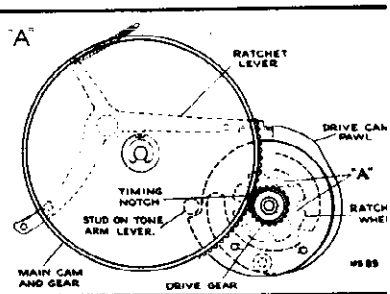
Note: Pickup force should be approximately 1 to 1¼ oz.

Reference Chart for
Automatic Record Changer Adjustments

Mechanism jams. General irregularity of operation.

(Mechanism Timing)

With the ratchet lever and the pawl on the drive shaft cam in playing position as shown, remove the bottom support bracket, link and lever assembly. Remove the "C" washer on the main cam shaft and slip the cam down far enough that it can be rotated with respect to the drive gear. Then rotate it until the timing notch is positioned as shown. Put the main gear back in mesh with the drive gear, replace the "C" washer, place the elevating lever on the cam ridge. Make certain the separator link and lever assembly is in its correct position and replace the bottom support bracket.



MODELS RP-177, RP-177A, RP-177B — RADIO CORP. OF AMERICA

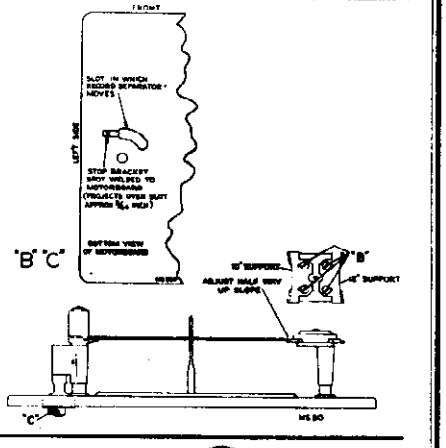
Records strike separator post or fail to stay on record shelf.

(Spacing Between Record Posts)

Turn the record support post to the ten-inch position. Loosen set screws "C," hold the separator post against the end of its slot in the motorboard and turn the belt drum to take up any slack in the belt. Tighten the zinc-plated, blunt-nosed screw and check to see that a ten-inch record fits the posts as shown. Then tighten the copper-plated, cone-pointed screw. Loosen set screws "B" and adjust support shelf so both 10- and 12-inch records set half-way up the slope when support post is turned to their respective positions.

Note:—
A small piece of metal (stop bracket) has been welded to the motor board to improve the separation and dropping of the twelve-inch records.

Bending the metal limits the outward movement of the record separator post, and in so doing makes it possible to equalize the distances between the spindle and the record support and separator posts.

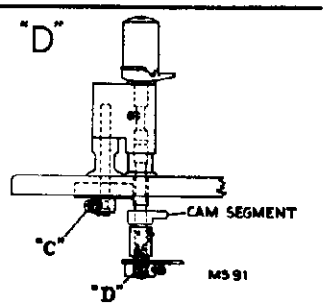


Records do not drop at proper time.

(Record Shelf Timing)

With the record supports turned to ten-inch position, place a ten-inch record on the supports. Loosen the set screws "D" and turn the record separator shaft until the edge of the record-separating knife is 3/32 inch away from the edge of the record. The teeth on the inner circumference of the knife should be resting in the bottom of their slots at the time the adjustment is made. Tighten the zinc-plated blunt-nosed screw first, run through cycle several times as a check, then tighten the cone pointed screw.

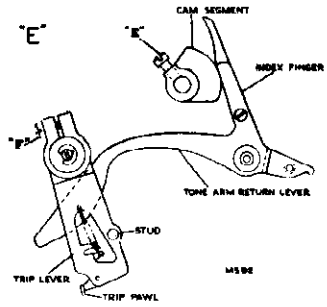
Note: It may be found necessary to deviate slightly from 3/32 inch dimension if twelve-inch records do not drop properly.



Tone arm continues to repeat playing of top record or jams when part way in on record.

(Segment-cam height or radial position)

With record changer in the ten-inch position and the records removed from the posts, loosen the set screw "E." Set the record separator segment-cam so that the index finger of the tone arm return lever rides on the middle of the segment-cam, as shown. Rotate the segment-cam until it is in such a position that the index finger will not ride off either end. Check to see that the index finger rides in over top of the cam when the record shelf is depressed by the weight of one record. Tighten the set screw.



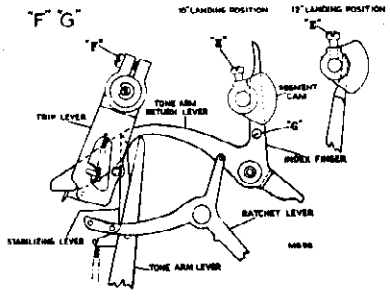
Sapphire does not land at correct point on 10-inch record.

(Tone Arm Position With Respect To Trip Lever)

Correct dimension from outside edge of spindle to sapphire $4\frac{11}{16}$ inches.

With the record changer in the ten-inch position, place a ten-inch record on the turntable and rotate the changer through cycle by hand, until the sapphire is just ready to land. Make certain that the index finger of the pickup arm return lever is against the record separator shaft and that the tone arm trip lever stud is held firmly against the return lever. Loosen the set screw "F" and move the pickup arm to the correct landing position. Maintain correct alignment between ratchet lever and trip pawl, when tightening set screw "F." (Note—Make certain trip lever stud does not come in contact with motorboard while making this adjustment.)

Place a twelve-inch record on the turntable and rotate the changer through cycle until the sapphire is just ready to land. Loosen screw "G" and adjust end of tone arm return lever so it is against separator shaft when pickup is in correct landing position.



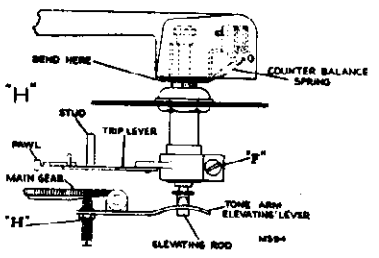
Top of tone arm strikes stack of records or sapphire fails to clear the records on the turntable.

(Tone Arm Height While In Cycle)

Rotate the changer through cycle until the tone arm has risen to its maximum height above the turntable but has not begun to move out. At this point adjust the screw "H" until the distance between the turntable and the sapphire is one and three-sixteenths inches. Tighten the locknut.

(Tone Arm Height While Out of Cycle)

Bend end of tone arm support bracket or pivot arm so the pickup end of tone arm clears the motorboard by 3/32 inch.



RADIO CORP. OF AMERICA

MODELS RP-177, RP-177A
RP-177B

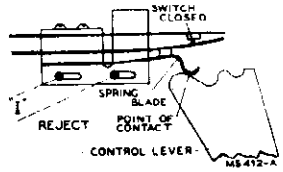
Turntable fails to rotate when the control handle is pushed to "Manual" or "Start-Reject" position.

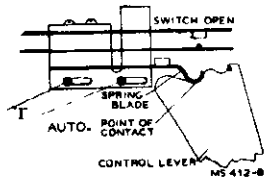
(Control lever and switch position)

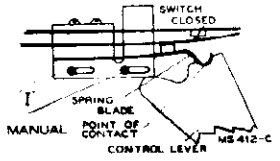
Remove the switch cover.

Loosen the two mounting screws "I" and position the switch so as to conform with the following three conditions.

1. When the control handle is in the "Start-Reject" position, the spring blade should ride up the side of the deep notch in the control lever causing the switch contacts to close. (The control handle should return to "Automatic" position automatically.)
2. When the control handle is in the "Automatic" position the spring blade should engage the deep notch in the control lever and in doing so allow the switch contacts to open.
3. When the control handle is in the "Manual" position, the spring blade should engage the shallow notch in the control lever causing the switch contacts to close and at the same time have "Manual Reject" lever move ratchet lever far enough so as to have free movement of trip lever, thereby preventing engagement between trip pawl and ratchet.





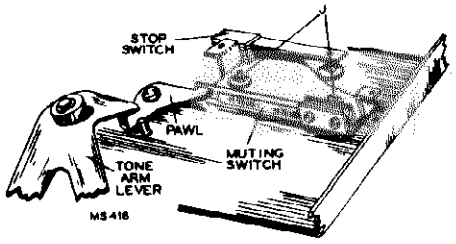


No output.

Noise during cycle.

(Position of pickup shorting switch)

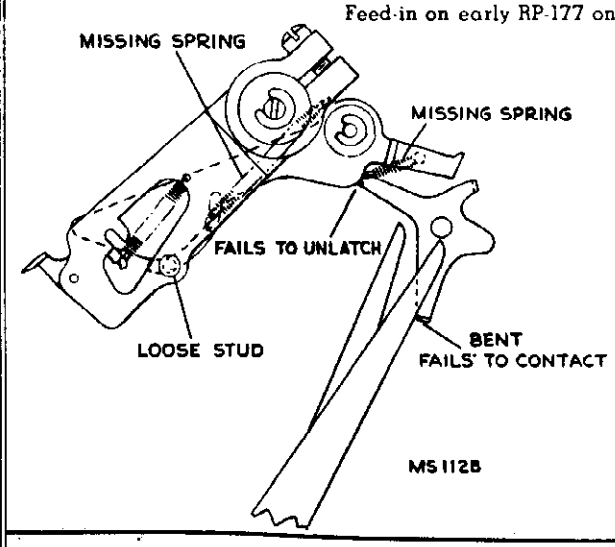
Remove the cover from the switch assembly. Loosen the two mounting screws "J" and position the switch assembly so the shorting switch pawl causes the switch to close during cycle and open while playing records.



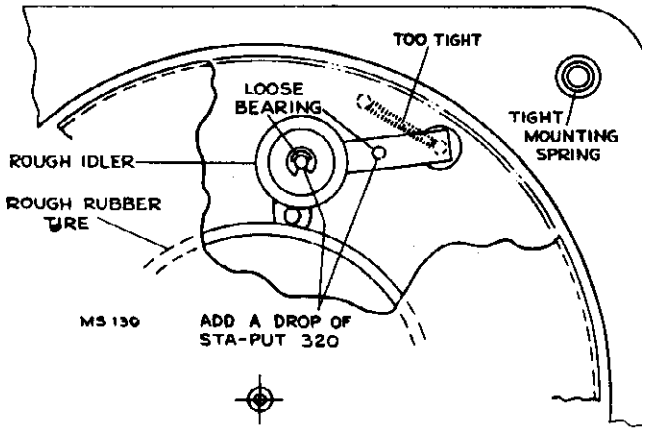
SERVICE HINTS

Incorrect Feed-in:

Feed-in on early RP-177 only.

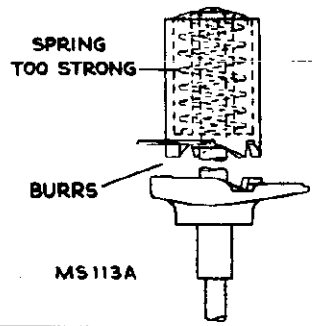


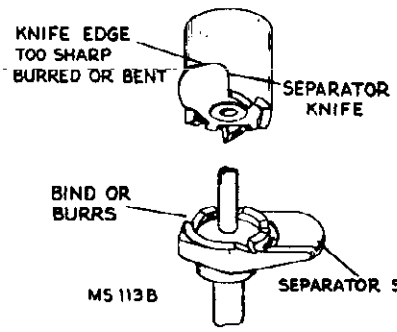
Rumble: **RP-177A and RP-177B use rim drive**

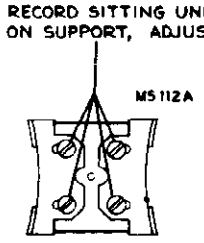


Records Jam or Stack Unsteady:

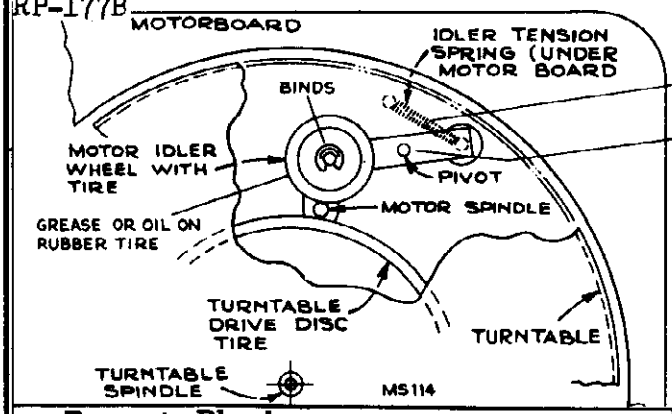
Record too thick, too thin, warped, or has rough edge.





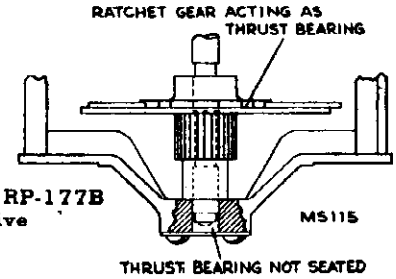


MODELS RP-177, RP-177A, RP-177B — **RADIO CORP. OF AMERICA**



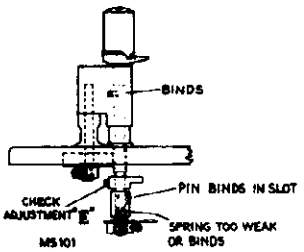
Slow Speed:

Turntable spindle binds on bottom or top bearing.

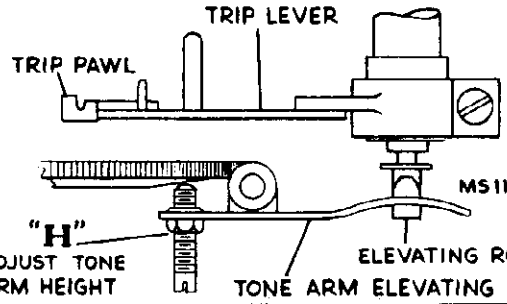


RP-177A and RP-177B use rim drive

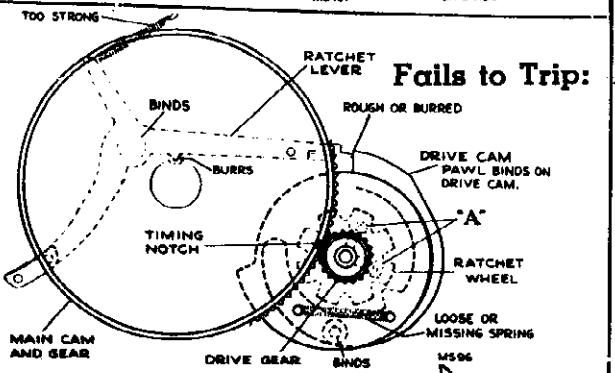
Repeats Playing of Last Record:

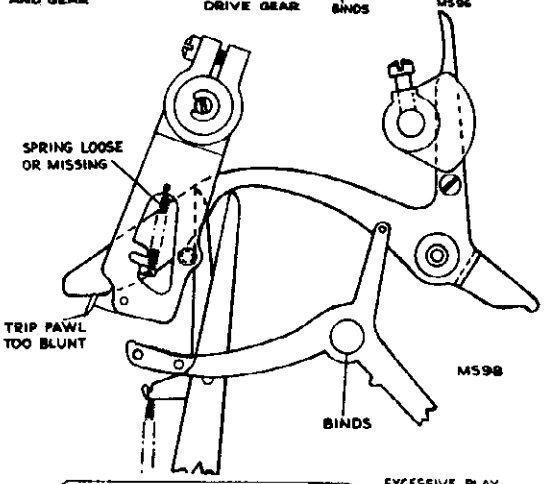


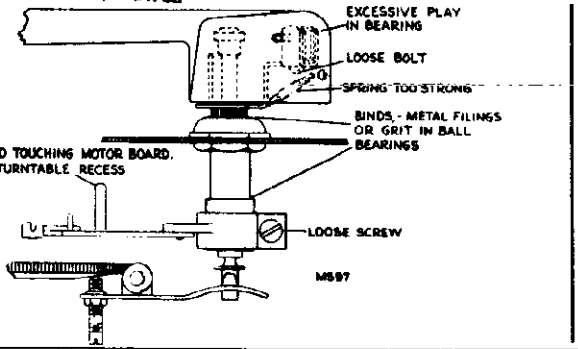
Tone Arm Touches Record on Separator Shelf:



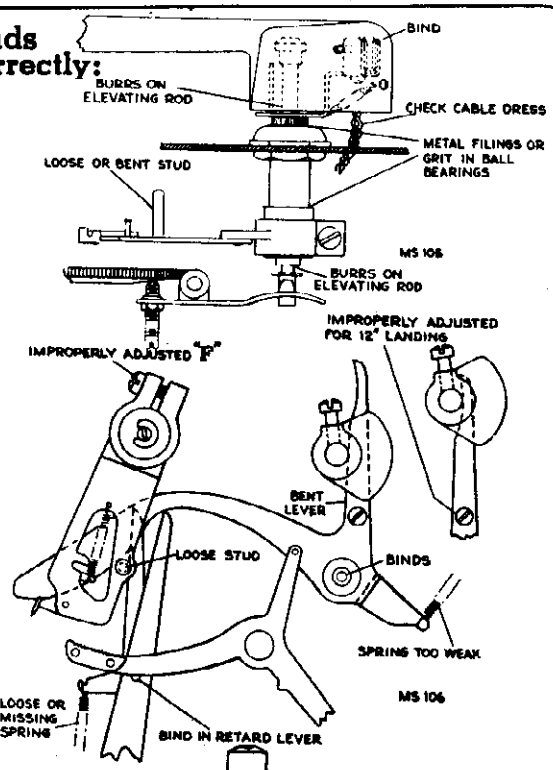
Fails to Trip:

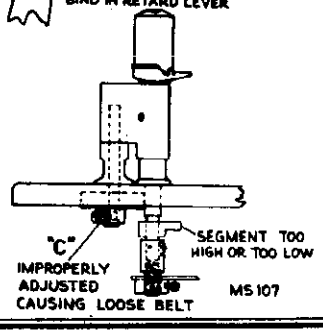






Lands Incorrectly:





RADIO CORP. OF AMERICA

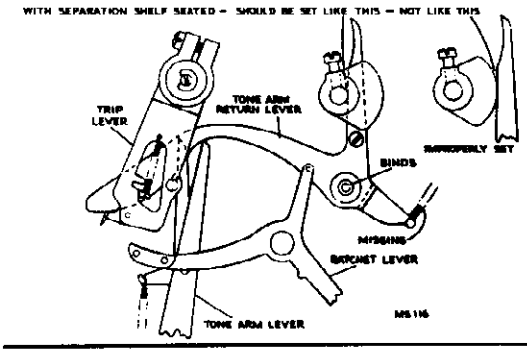
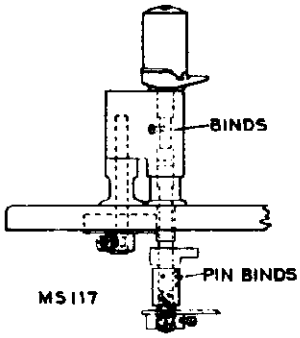
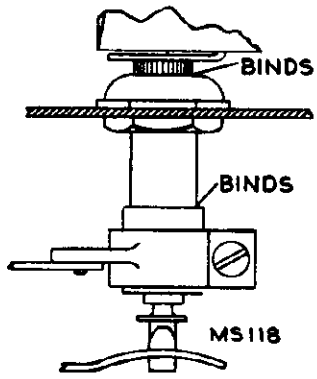
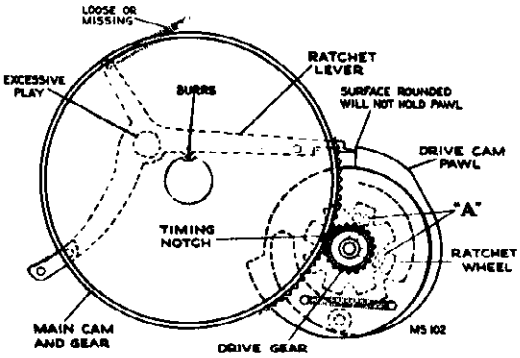
Tone Arm Continues to Come Down in Rest Position:

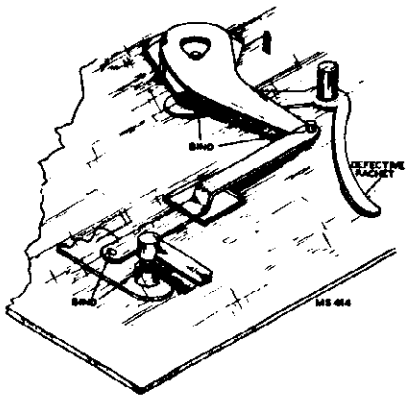


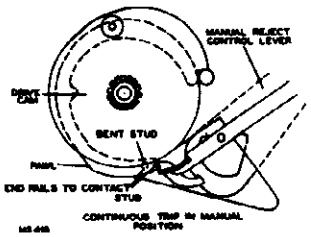




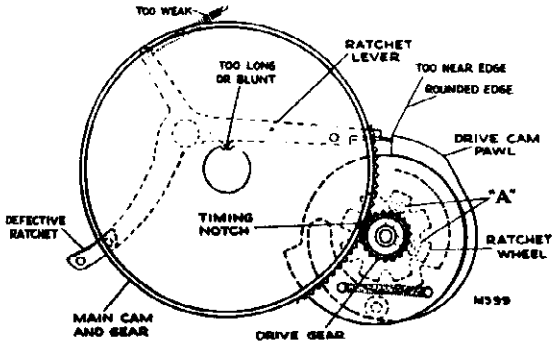
Trips Continuously:

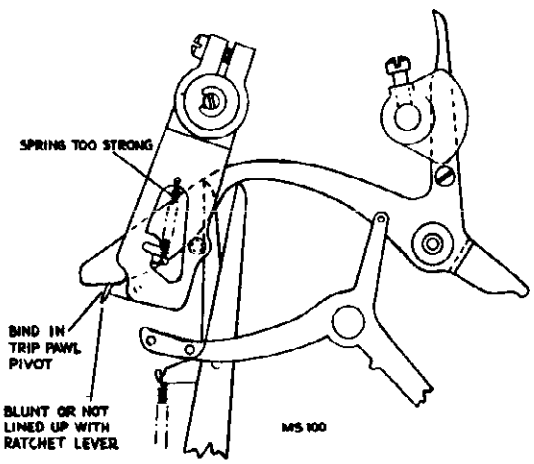




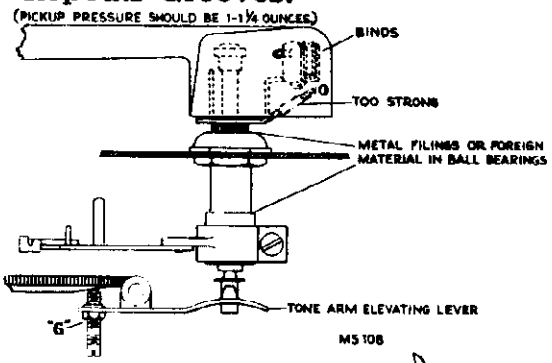


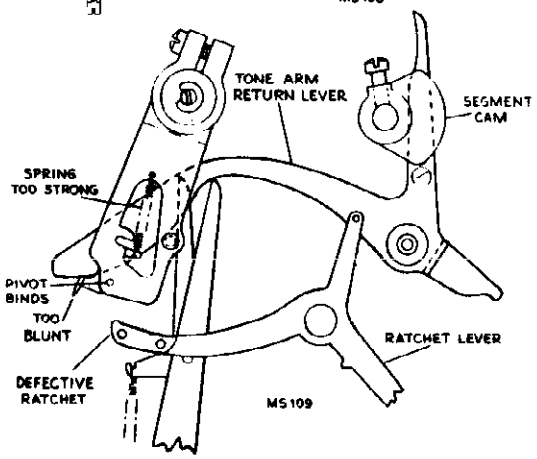
Trips Early:





Repeats Grooves:

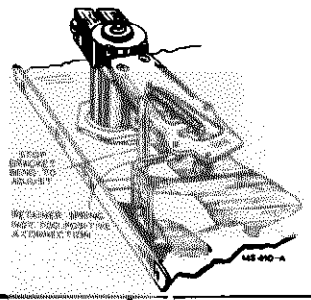




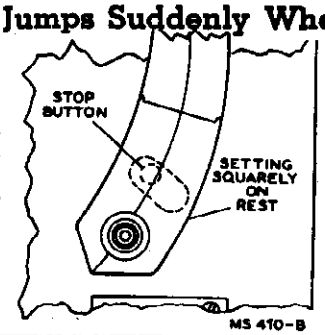
MODELS RP-177, RP-177A, RP-177B

RADIO CORP. OF AMERICA

Tone Arm Lands Incorrectly on Rest, Drifts Off of Rest, or Jumps Suddenly When Moving in for Landing:



1. Bend bracket for tone arm limit stop.
2. Bend retainer spring which contacts stud on trip lever, so tone arm is stabilized while on rest or in the outermost position. Do not make too positive contact or motion of tone arm will start with a sudden jump.



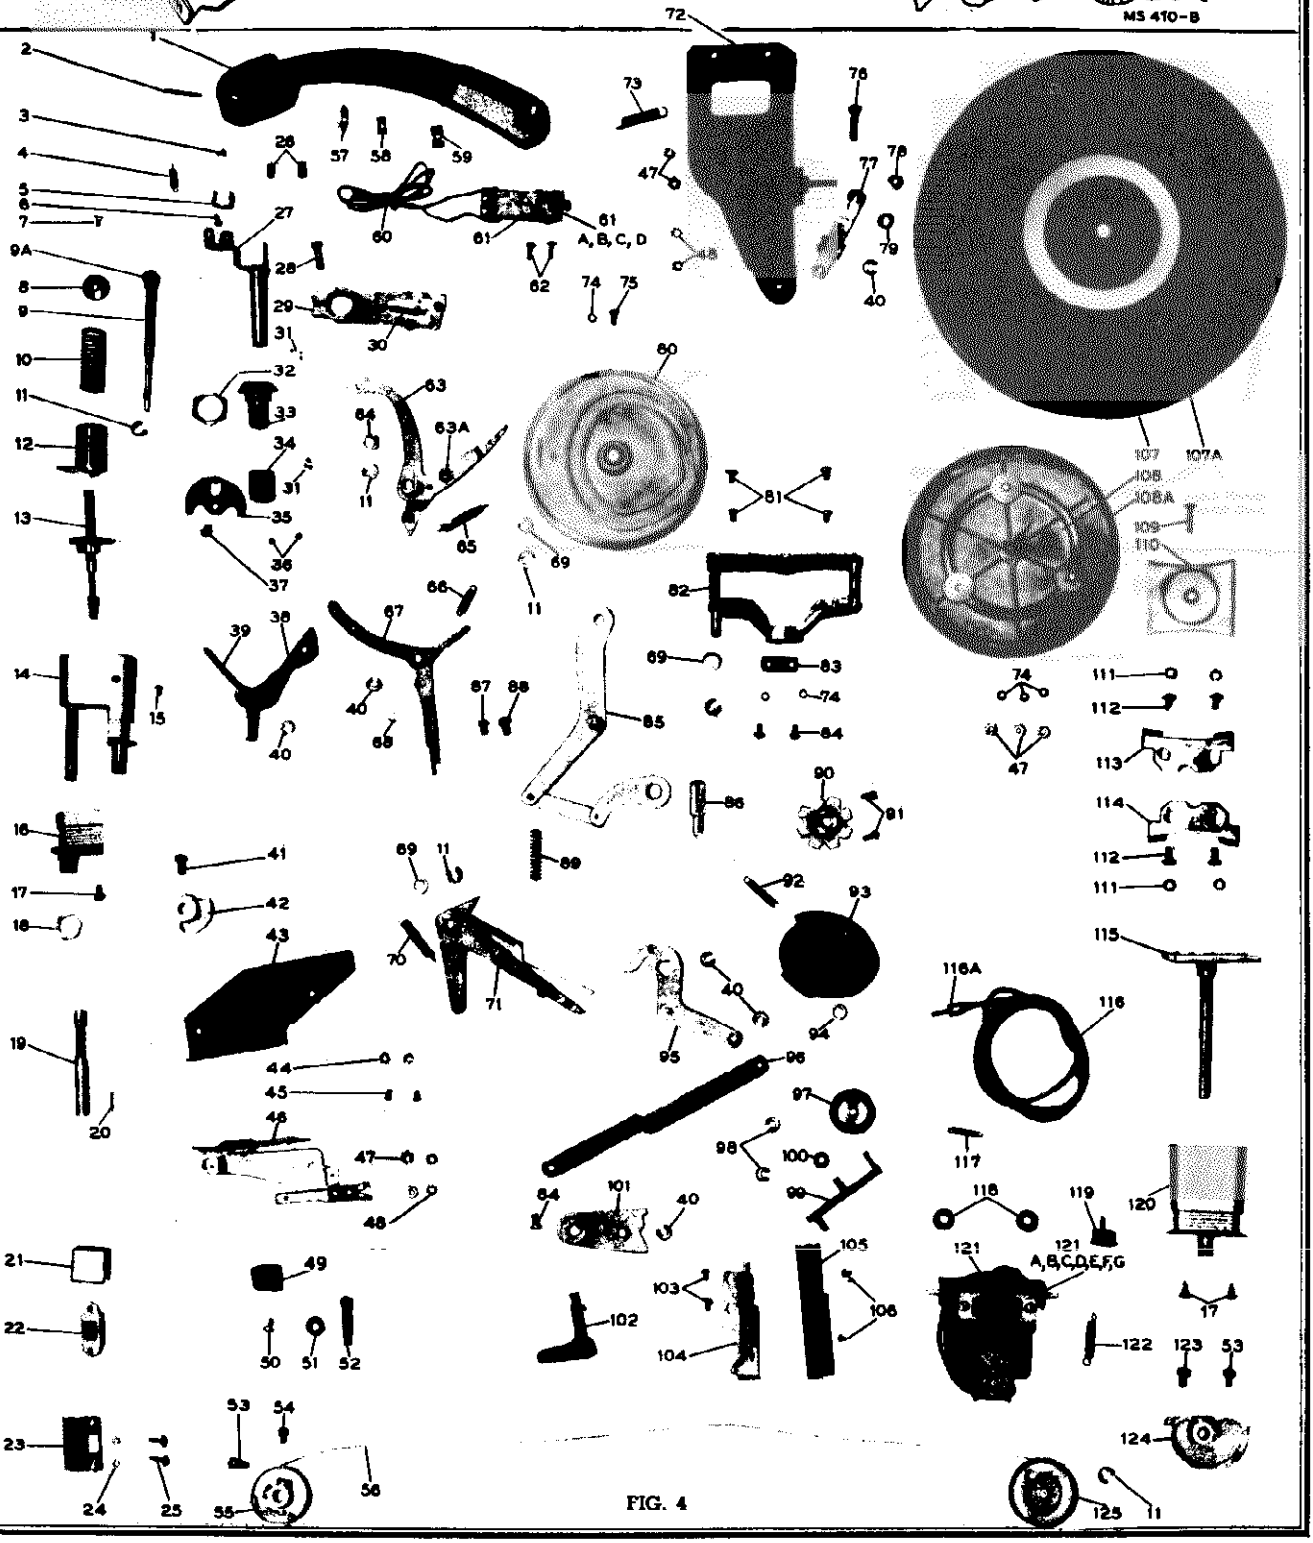


FIG. 4

CHANGES—DIFFERENCES

Pivot Arm Spring:

On early RP-177 the pivot arm spring (Ref. No. 4) was anchored to a stud (Ref. No. 3) in the rear of the tone arm. On RP-177A and late RP-177 a curved spring (Stock No. 73198) clips into the rear of the tone arm to which the pivot arm spring is anchored.

Feed-in Adjustment:

On early RP-177 a feed-in provision was used to cause the sapphire to enter the starting groove of the record after the tone arm had landed. This feature was found to be unnecessary and is not used on RP-177A or late RP-177, however, the feed-in adjusting disc may be found on late RP-177.

Stock No.	Ref. No.		Stock No.	Ref. No.	
72655	35	Disc	71548	127	Spring
70873	38	Lever	—	130	Lever
71550	39	Spring			

Used only on early RP-177, also screws and washers to mount above iten

The major differences between the two models is in the method of drivi the turntable. This requires different turntables, motors, motor boarc motor mountings and idler wheels. In RP-177 the motor drives a rubb tired disc which is attached to the turntable and spindle, in RP-177A t motor drives an idler wheel which engages with the inside rim of the tu table. In RP-177 the record separator swivel (14), record separator supp (16) and record support base (120) are gold finish whereas in RP-17 they are finished the same color as the motor board.

Record supports (113 & 114) are metal in RP-177 and molded plastic RP-177A.

The on-off switch (22) ratchet lever spring (66) and tone arm lever spri (71A) have been changed slightly.

RP-177B is identical to RP-177A except the crystal pickup

RP 177

Motor drives rubber tired disc which is attached to turntable. Record separator swivel and record separator support are gold finish.

Early production has feed-in adjustment.

RP 177A

Motor drives idler wheel which engages with inside rim of turntable.

Record separator swivel and record separator support are finished the same color as the motor board.

Does not have feed-in adjustment.

RP-177B

Same as RP-177A except pickup.

Eccentric groove diameter	3⅜" nominal
Eccentricity	.125" ± .008"
(causes tone arm swing of	.250" ± .016")

The Replacement Parts Listed Below Bear the Same Reference Number as the Corresponding Parts used on RP-177. Refer to RP-1 Parts List for All Other Parts which are Identical. Refer to "CHANGES—DIFFERENCES"

71279	57	Nut—Speed nut to hold cable, rear of pivot arm
71095	58	Nut—Speed nut to hold cable, rear of arm
38458	59	Nut—Speed nut to hold cable, front of arm
72584	60	Cable—Pickup cable, twisted pair
72551	61	Crystal—Crystal cartridge complete
38452	61A	Guard—Needle guard
70341	61B	Nut—Mounting washer and nut for sapphire
72345	61C	Sapphire—Sapphire and holder assembly
37763	61D	Screw—#2-56 x 1/8" screw for needle guard
70912	62	Screw—#4-40 x 3/8" binder head screw to mount crystal (2 required)
70847	63	Lever—Tone arm return lever
72401	63A	Screw—Tone arm return lever screw
70884	64	Washer—Bearing washer for tone arm return lever
71726	65	Spring—Tone arm return lever spring (.218" O.D. x 1 1/2"—48 1/2 turns)
71549	66	Spring— ratchet lever spring (.180" O.D. x 7/8" —54½ turns)
73053	67	Lever—Ratchet lever
†.....	68	Washer—Steel washer O.D. ½" I.D., .193", T .020"
70877	69	Washer—.280" I.D. x 7/16" flat washer for link, tone arm lever and main cam
71547	70	Spring—Tone arm lever tension spring (.218" O.D. x 1½"—48½ turns)
70858	71	Lever—Tone arm lever less spring
71549	71A	Spring—Tone arm lever spring (.180" O.D. x 7/8" —54½ turns)
72420	72	Brace—Bottom support for tone arm lift lever and main cam
71544	73	Spring—Drum and belt tension spring (.255" O.D. x 1¾"—27½ turns)
†.....	74	Washer—#6 lockwasher
†.....	75	Screw—#6-32 x 5/16"
39691	76	Screw—#10-32 x 7/8" fillister head screw for adjusting tone arm lift lever
38631	77	Lever—Tone arm elevating lever
71104	78	Nut—#10-32 hex locknut for tone arm lift lever adjusting screw
†.....	79	Washer—Washer, O.D. 7/16", I.D. 3/16", T 1/32"
70864	80	Cam—Main cam
*72409	81	Screw—#8-32 x 1/4" binder head screw for turntable spindle support
70891	82	Support—Turntable spindle support bearing
70880	83	Plate—Spring thrust plate for turntable
70883	84	Screw—#6-32 x 5/16" round head screw for turntable spring plate
70852	85	Link—Record separator shaft link and lever
70849	86	Bushing—Record separator shaft and bushing
71100	87	Screw—#10-32 x 5/16" round head screw for link
31118	88	Screw—#10-32 x 5/16" fillister head screw for link or for automatic—manual—reject detent lever
70850	89	Spring—Record separator shaft bottom spring (.290" O.D. x 1.35"—14¾ turns)
38624	90	Ratchet—Ratchet wheel (drive cam sprocket) for turntable drive
38626	91	Screw—#8-32 x 1/4" fillister head set screw for ratchet wheel
70854	92	Spring—Drive shaft cam and pawl spring (.195" O.D. x 1-3/16"—42 turns)
70853	93	Cam—Drive shaft cam and pawl
70879	94	Washer—Washer for cam and pawl
72403	95	Lever — Automatic — manual — reject operating lever
72406	96	Link—Link for automatic—reject—manual operating and detent levers
36274	97	Wheel—Idler wheel
33728	98	Washer—"C" washer for idler wheel and arm
70863	99	Arm—Motor idler arm—less wheel
39996	100	Washer—Fibre washer for idler wheel
72404	101	Lever—Automatic—manual—reject detent lever
72586	102	Lever—Reject lever (handle)
†.....	103	Screw—Hex. head 6-32 x 1/4" self-tapping screw
72410	104	Switch—Manual shorting switch
72411	105	Cover—Manual shorting switch cover
†.....	106	Screw—#4-40 x 1/8" round head machine screw
72421	107	Turntable—Turntable including rubber mat less drive disc and tire
70866	107A	Mat—Rubber mat only for turntable
73054	108	Spindle—Turntable spindle drive less tire
37873	108A	Tire—Rubber drive tire
72587	109	Screw—#10-32 x 3/4" oval head screw for record support cap
72423	110	Cap—Record support cap
†.....	111	Washer—Approx. 7/16" O.D., 3/16" I.D., .030 T
70881	112	Screw—#10-32 x 3/8" binder head screw for record supports
72418	113	Support—Record support for 12" records
72417	114	Support—Record support for 10" records
72419	115	Shelf—Record support shelf and shaft
72708	116	Cable—Shielded output cable complete with pin plug
31048	116A	Plug—Pin plug for shielded output cable
71546	117	Spring—Idler arm tension spring (.187" O.D. x 7/8"—31 turns)
34388	118	Grommet—Rubber grommet to mount motor (2 required)
30870	119	Plug—2-prong male plug for power cable
72590	120	Base—Record support base
38612	121	Motor—105-125 volts, 60 cycle
39749	121G	Spring—60 to 50 cycle conversion spring
71545	122	Spring—Motor tension spring (.192" O.D. x 1½" —58 turns)
39772	123	Screw—#10-32 x 5/16" fillister head set screw for record support shaft cam—cone point
70845	124	Cam—Record support shaft cam
70899	125	Drum—Record support drum
72398	126	Motorboard—Motorboard sub-assembly complete with all welded, staked and riveted parts—less operating parts
71548	127	Spring—Feed-in control spring (.160" O.D. x 11/16"—52 turns)
72412	128	Plate—Anti-drift spring and plate for tone arm (retainer spring)
38873	129	Spring—Conical spring to mount record changer (4 required)
†.....	130	Lever—Feed-in lever locking pawl or latch. Part of motorboard
†.....	131	Lever—Muting switch actuating lever. Part of motorboard.

† These parts are not stocked.

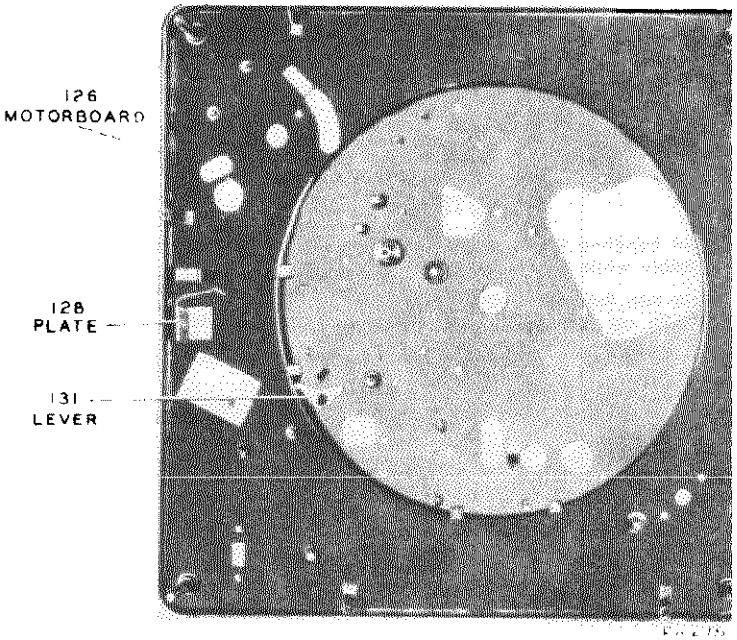

FIG. 6
Bottom view RP-177A, RP-177B (motorboard only)

MODEL RP-178 RADIO CORP. OF AMERICA

FEATURES

1. This mechanism is designed to play automatically a series of twelve 10-inch or ten 12-inch standard records of the 78 r.p.m. type.
2. It will play manually records up to 12 inches in diameter.
3. Tripping system is of "eccentric" type, insuring reliable automatic operation on all records made to RMA proposed standards.
4. It is a simple operation of sliding the record support to change from 10- to 12-inch records or vice versa.
5. Cycling mechanism is disconnected completely while records are being played. This reduces the load on the drive motor, thereby reducing the tendency for "wow" or rumble.
6. Low noise sapphire point pickup cartridge.

AUTOMATIC OPERATION

1. With the power switch in the off position slide the record support shelf as required for 10- or 12-inch records.
2. Place the records to be played in a stack with desired selections upward and in proper sequence with the last record on top. Load them on the changer by placing them over the center post and resting on the record support shelf. Place record stabilizing clamp on top of the record stack.
3. Turn power switch on and press the reject button. The changer will play automatically one side of each record in the stack.
   The tone arm can be moved to the rest position any time the mechanism is not in cycle.
4. Turn the power switch off, lift the stabilizing clamp and remove the stack from the turntable by placing fingers of both hands directly opposite and under the stack. Then lift straight up "don't tilt" or squeeze stack.

MANUAL OPERATION

1. Slide the record support shelf in towards the center post for 10-inch or away from the center post for 12-inch position.
2. Place the record to be played on the turntable and turn the power switch on.
3. Place the pickup on the start of the record.

   Note: The mechanism should be allowed to complete cycle before attempting to move tone arm to the rest position.
4. Turn power switch off manually.
5. Remove the record by raising straight up without tilting.

CAUTIONS

1. Avoid handling the tone arm or sliding the record support assembly while mechanism is in cycle.
2. Never turn the power switch off, leaving the mechanism in cycle for an extended period of time.
3. Do not allow the records to remain on supports when not in use.
4. Do not allow oil or grease to come in contact with any rubber parts.
5. Do not install instrument near source of heat. Excessive heat may damage the pickup cartridge.

LUBRICATION

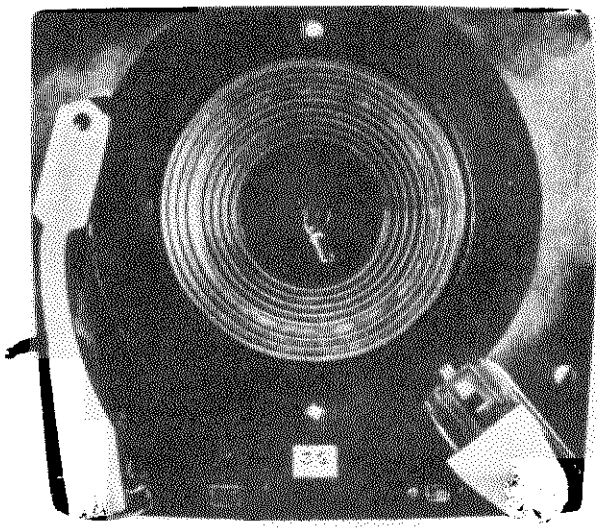
Motor

Motor is lubricated at factory to provide normal operation for a long period of time.

If it becomes necessary to lubricate, use SAE #10 motor oil to saturate the felt wicks on the motor bearings.

Main Bearing

Use STA-PUT #512 or SAE #30 motor oil.



Slides and Levers

Use STA-PUT #512.

STA-PUT can be purchased from E. F. Houghton & Co., 303 W. Lehigh Ave., Phila., Pa.

FUNCTION OF PRINCIPAL PARTS

Trip Lever—67

When the sapphire is riding the eccentric groove, the trip pawl engages the ratchet lever, starting cycle.

Ratchet Lever—63

Portion of the lever acts as a ratchet and the other portion incorporates a catch for the stud on the cycling cam carriage. The engagement of this stud prevents the mechanism from going into cycle.

Center Post—32

The center post performs the function of supporting and aids in the separation of the records.

Tone Arm Return Lever and Latch—53B

The tone-arm return lever, together with the latch, locks and stabilizes the tone arm in its outermost position. It also gives the necessary inward motion to the tone arm.

Cycling Cam Carriage—50A

This carriage provides a movable support for the cycling cam.

Tone Arm Director Lever—71

The roller on one end of this lever follows a channel in the cycling cam and thereby pulls on the cable directing the vertical and outward motion of the tone arm.

Locating Lever—12

The sloped portion of the lever forms a stop for the stud on the tone arm return lever thereby determining the landing position of the pickup.

Record Push Cam Gear Assembly—5, 7

Provides a means of coupling the push cam to the rack lever.

Record Support—1A, B, C, D

Provides a support for the edge of the records and a mounting for the record push cam.

Rack Lever—10

One end of the lever follows the eccentric elevated portion of the cycling cam causing the lever to move in and out from the center of the mechanism. The teeth on the rack lever engage the teeth in the record push cam gear producing a rotary motion necessary to push the record off the step in the center post.

Record Push Cam—4

The oval shaped cam located in the record support, rotates during change cycle. This cam engages and pushes the record from the step in the center post.

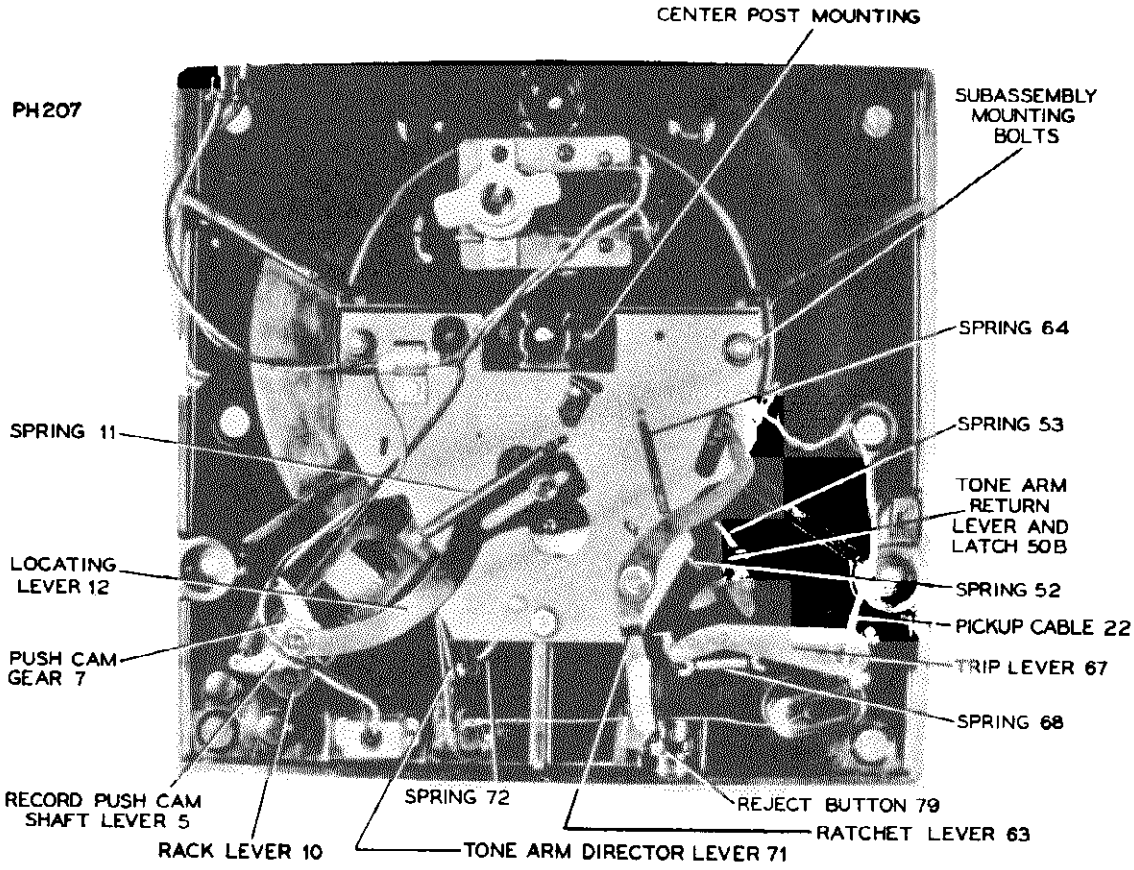


Figure 1

ADJUSTMENTS

Tone arm (out of cycle) height adjustment

1. Rotate the turntable until the change cycle is completed.
2. Move the tone arm to a position off the edge of the record and allow it to rest freely in air.
3. Bend portion of the tone arm bracket so that the sapphire is 3/16 inches above the flat surface of the motorboard. (Figure 3.)

Tone arm height adjustment while in change cycle

1. Press the reject button and rotate the turntable by hand until the pickup has raised, to the maximum height in the change cycle.
2. Turn the adjustment screw "A" until the sapphire is 1⅛ inches above the turntable.
   This adjustment will permit the pickup to land and play one record placed on the turntable. At the same time it prevents the tone arm from touching the record resting on the centerpost while the mechanism is going through cycle.
   (If this height cannot be reached by the adjustment screw, take up on the cotter pin.) (Figures 4 and 5.)

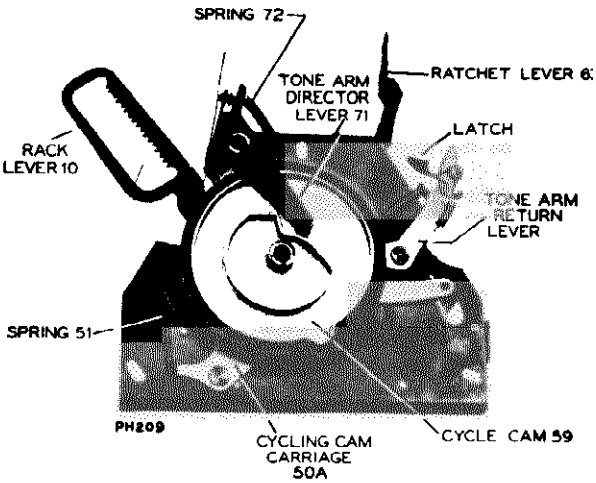

Figure 2

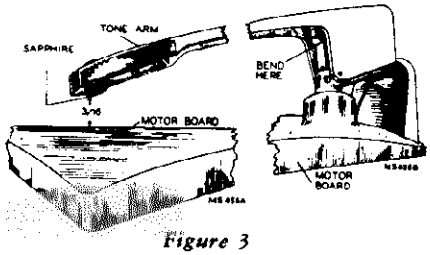

Figure 3

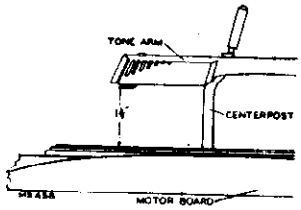

Figure 4

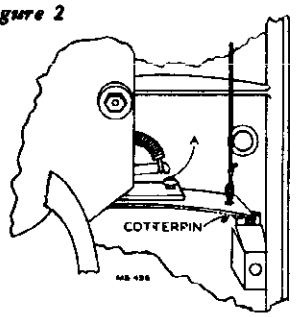

Figure 5

Pickup landing adjustment

1. Slide the record support as required for playing 10-inch records.
2. Place a ten-inch record on the turntable and rotate the turntable by hand until the sapphire is just ready to land.
   Loosen set screws "B" (Figure 6).
3. Hold the trip lever to keep it from moving while the pickup is moved to the start of the record.
4. Tighten the black screw "B" and allow the mechanism to run through cycle automatically. If landing is correct, tighten copper plated screw "B." (Figure 6.)
   (Note) No separate 12-inch landing adjustment is necessary.

Record push cam and gear assembly adjustment

1. Have the mechanism out of cycle.
2. With the push cam in place and the record support in the 10-inch position, assemble and engage the teeth of the push cam gear with the rack lever so the eye in the lever is approximately in line with the centerpost as shown in drawing. (Figure 7.)
3. Set the push cam parallel to the front edge of the record support, make certain the thin edge of the cam is on the left side, viewed from the front or centerpost side of the support. (Figure 8.)

Removing the turntable

1. Loosen the two screws mounting the centerpost. (Figure 10.)
2. The centerpost, turntable and thrust bearing can now be easily lifted out.

Replacing the turntable

1. Slip the turntable over the lower end of the centerpost until it comes against the stop or ears. (Figure 9.)
2. Place the thrust bearing and washers on the bottom end of the centerpost and place the centerpost and turntable in position as shown. (Figure 9.)
3. Turn the spindle so the step in the centerpost is away from the record support. (Figure 11.)
4. Tighten the two mounting screws. (Figure 10.)

Turntable centering

If for any reason the sub-assembly had been removed from the motorboard it is necessary to re-center the turntable.

1. Loosen the three sub-assembly mounting bolts. (Figure 12.)
2. Place the turntable in place with the center post extending down through the mounting as shown. (It is not necessary to have the thrust bearing in place for this operation.) (Figure 9.)
3. Center the turntable in respect to the recess in the motorboard by shifting the position of the sub-assembly slightly. (Figure 11.)
4. Tighten the nut on the end of the square head mounting bolt. (Figure 12.)
5. Remove the turntable and tighten the other two mounting bolts. (Figure 12.)

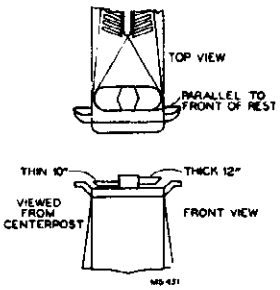

Figure 8

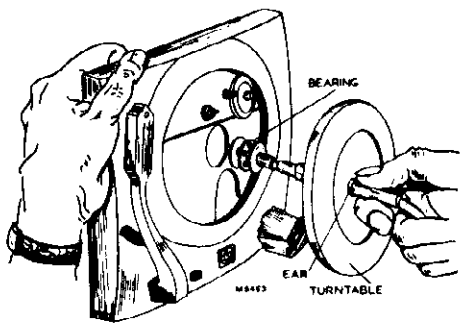

Figure 9

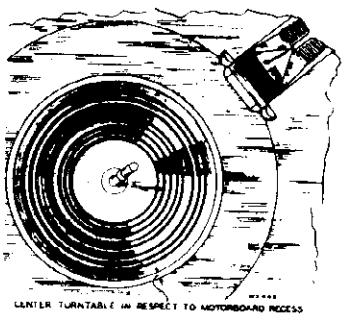

Figure 11

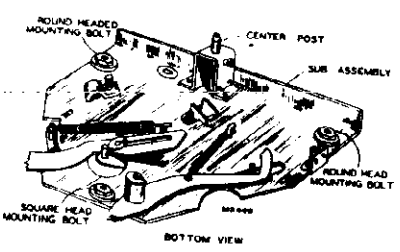

Figure 12

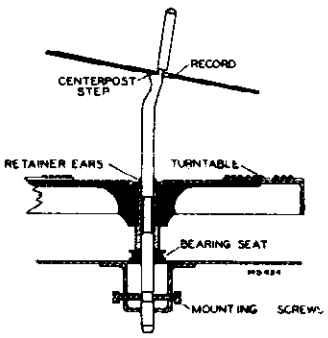

Figure 10

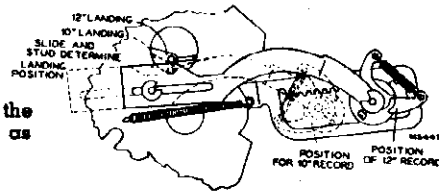
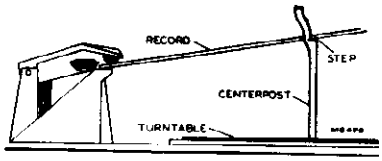
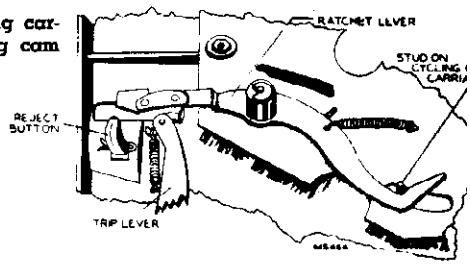
CYCLE OF OPERATION

Operator

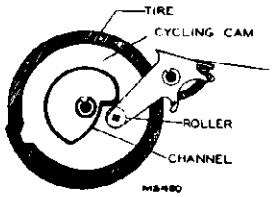
Function	Explanation
Lift and slide the record support to 10 or 12 inch position as desired	1. Record support locks in position and at the same time the record push cam and gear rotates and assumes a position as required for 10- or 12-inch records.
Place the stack of records over the center post	1. The lower record of the stack is sitting on the step in the centerpost, and the edge is resting on the record support.
Push reject button	1. The end of the reject button extending through the motorboard contacts and moves ratchet lever. 2. Ratchet lever unlatches stud which is mounted on cycling carriage. This allows the tension spring to pull the cycling cam against the rotating knurled roller and start cycle.

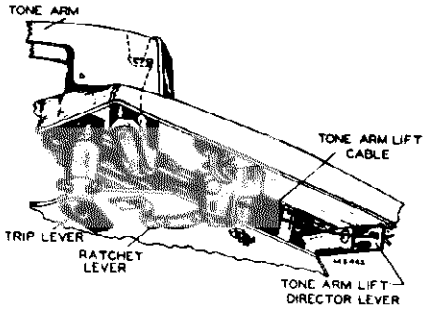




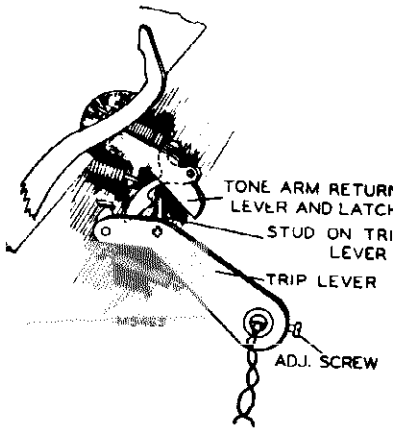


Automatic Cycle





Function	Explanation
Tone arm rises and moves out	1. As the cycling cam rotates the small roller on the tone arm director lever follows the channel in the cam and in so doing pulls on the cable connected to the tone arm. 2. The hole in the motorboard provides a guide for the tone arm cable. It is so placed as to allow the cable to pull at an angle slightly off 90 degrees thus giving the necessary rising and outward motion of the tone arm. 3. The trip lever which is rigidly connected to the tone arm through the tone arm pivot shaft is moved out with the tone arm. 4. The tone arm return lever has moved out slightly ahead of the trip lever. The tone arm return lever together with the small latch assumes such a position so as to engage the stud on the trip lever and stabilize the tone arm in its outermost position.

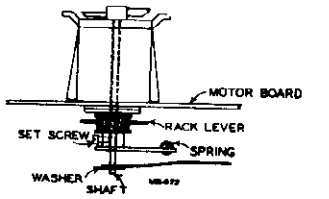


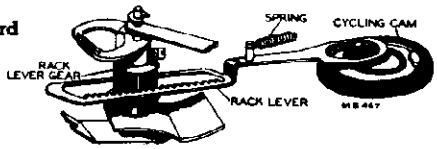
MODEL RP-178

RADIO CORP. OF AMERICA

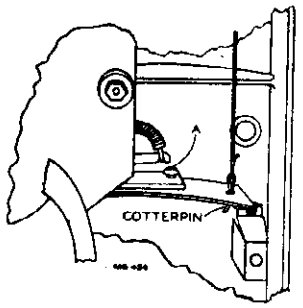
CYCLE OF OPERATION

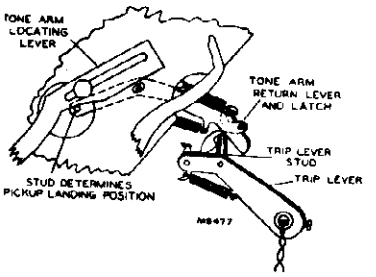
Function	Explanation
The record push cam together with the "step" in the centerpost separates the lower record of the stack allowing it to drop to the turntable	1. While the cycling cam is continuing to rotate, the rack lever is being pushed outward by the small eccentric elevated cam, with which it is engaged. 2. The teeth in the rack lever being engaged with record push cam gear, converts the sliding action of the rack lever into a rotary motion. 3. The rotary motion of the record push cam pushes the record off the step in the centerpost.



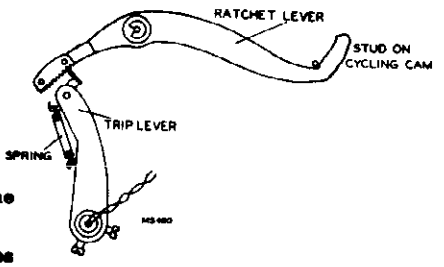


Tone arm moves in and lands on record	1. As the cycling cam is returning to normal position, the tone arm director lever is gradually allowing a slack in the tone arm cable. 2. While the tone arm director lever is gradually allowing slack in cable, the tone arm return lever is tending to retain the tension on the cable by returning the tone arm to the landing position. 3. The distance the tone arm return lever travels, while moving the pickup in for landing, is determined by the contact between the tone arm locating lever and the stud on the tone arm return lever. 4. After the tone arm return lever has moved the tone arm to the landing position the tone arm director lever continues to move and allow enough slack in the cable so the pickup can sit down on the start of the record.





Sapphire moves into record groove. Record begins to play	1. As the sapphire moves into the playing groove, the cycling cam becomes disengaged from the rotating knurled roller as the roller falls into the step in the cam. 2. The change cycle is completed as the stud on the cycling cam carriage becomes engaged with the ratchet lever. This engagement prevents the cycling cam from contacting the knurled roller, starting a new cycle.



The record plays	1. After the playing of the record, the pickup moves into the eccentric groove. 2. The movement of the pickup in the eccentric groove causes the trip pawl to engage the ratchet lever starting a new cycle. (The mechanism plays one side of each record in the stack then repeats the playing of the last record until the pickup is manually placed on the rest or the power removed from the mechanism.)

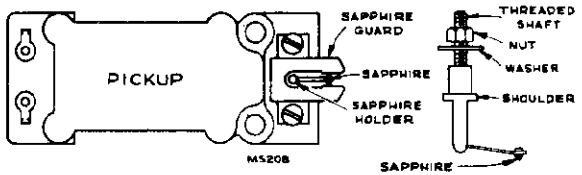
Photograph of Parts

REPLACEMENT OF SAPPHIRE



Caution: Never bend the sapphire support wire.

Extreme care should be used when loosening the sapphire mounting nut so that the twisting motion does not break the crystal.

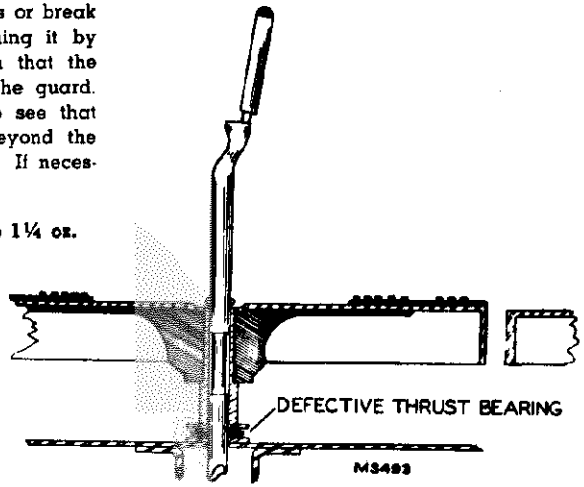
Remove the two screws holding the sapphire guard in place and remove guard. Remove the small nut and washer on the threaded shaft of the sapphire holder and gently push the shaft through the hole in the armature shaft until the sapphire holder assembly comes free.

Do not use force as the crystal may be broken.

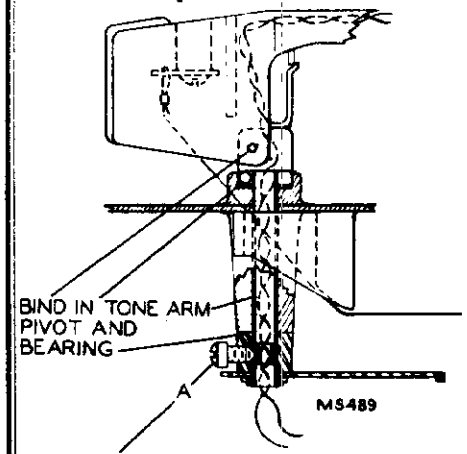
Insert threaded shaft of replacement sapphire holder through armature shaft and replace the washer and nut. Make sure that the sapphire is in the correct position. Take hold at the lower end of the shaft with a pair of pliers while tightening the nut, being very careful so as not to strip the threads or break the crystal.. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws. Before using, check to see that the sapphire projects far enough (approx. .020) beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little.

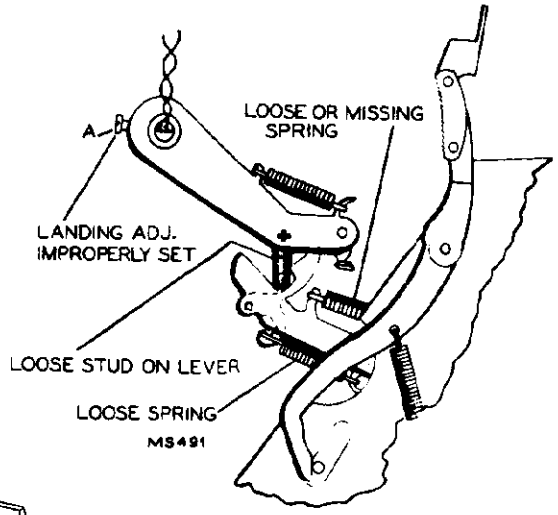
Note: Pickup pressure should be approximately 1 to 1¼ oz.

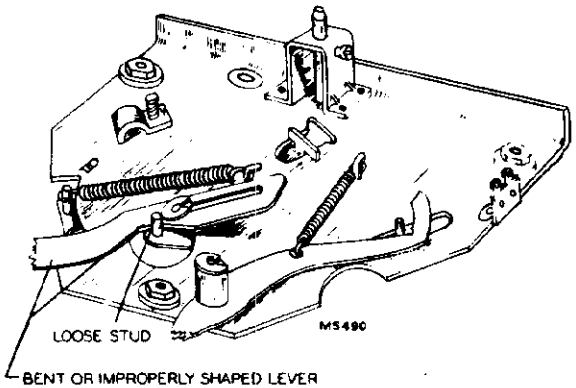
Rumble

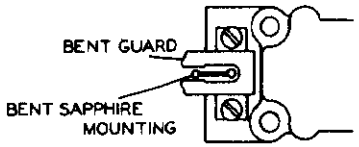


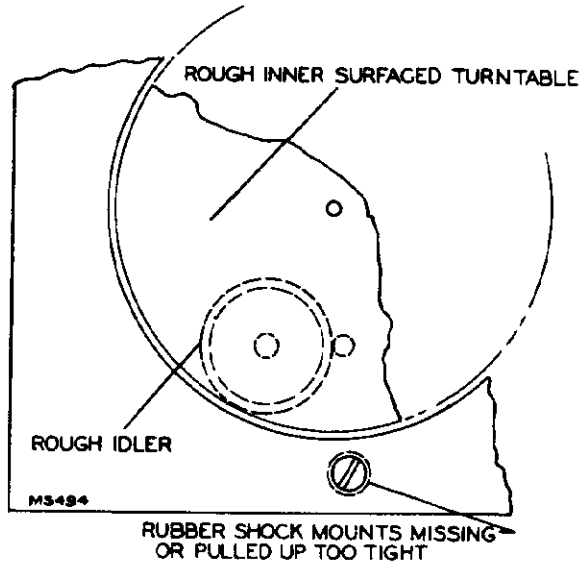
Improper Pickup Landing



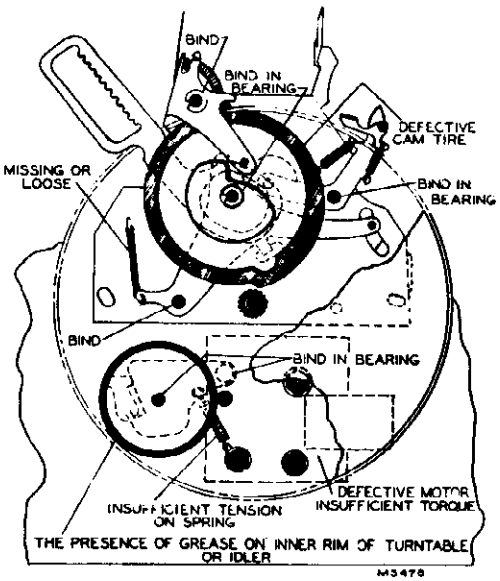


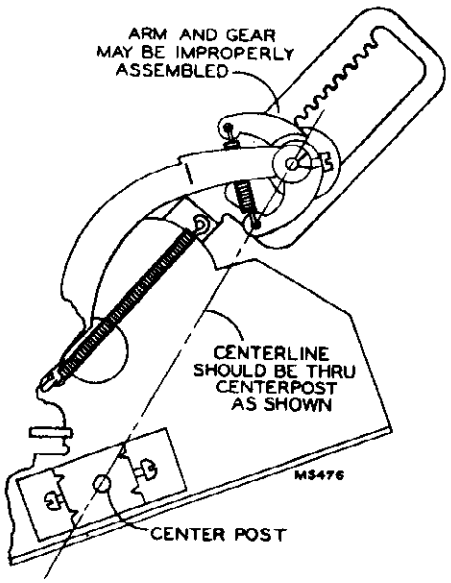




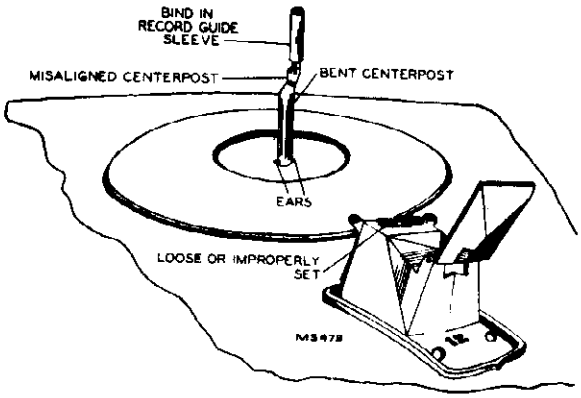


Changer Will Not Complete Cycle

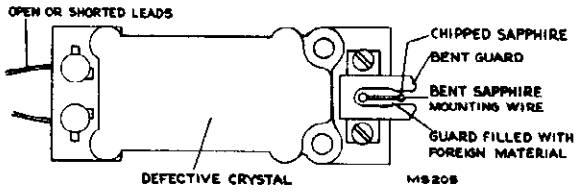




Records Do Not Separate or Drop Properly



Distorted Output



"Wow" or Slow Turntable Speed

REF. No.	STOCK No.	DESCRIPTION
		OPERATING ASSEMBLIES
1A 1B 1C 1D	*72390	Record Support Assembly 1A, complete with rubber cushion 1B, top clamp 1C, and pins 1D
2	*72357	Spring—Record support and clamp spring (.200" O.D. x 1-31/32"—37¼ turns)
3A 3B 3C 3D	*72391	Plate—Clamp 3A, plates 3B (1 set) for record support assembly including lockwashers 3C and screws 3D
4	*72356	Cam—Record separator cam and shaft
5	*72360	Lever—Record push cam shaft lever, upper
6	*72353	Screw—#8-32 x 5/16" filister head screw for Item #5
7	*72361	Lever—Record push cam shaft lever, lower (gear and lever, assembly)
8	*72362	Spring—Record push cam shaft levers connecting spring (.242" O.D. x 1"—19½ turns)
9	*72354	Washer—Flat washer (29/32" O.D. x .22.)" I.D.) between rack lever and record separator cam
10	*72371	Lever—Rack lever
11	*72370	Spring—Rack lever spring (.233" O.D. x 1-11/16"—53 turns)
12	*72352	Lever—Tone arm locating lever
13	70877	Washer—Brass washer (7/16" O.D. x .280" I.D.) to mount locating lever to record separator cam shaft
14	35969	Washer—"C" washer to fasten locating lever to record separator cam shaft
15	*72351	Washer—Brass washer (7/16" O.D. x .195" I.D.) to mount locating lever to sub-base stud
16	33726	Washer—"C" washer to fasten locating lever to sub-base stud
17	*72338	Arm—Pickup arm shell only
18	*72344	Jewel—Pickup arm decorative jewel
19	38458	Nut—Speed nut to hold jewel
20	72551	Crystal—Crystal cartridge complete (including sapphire and guard)
20A	72345	Sapphire—Sapphire and holder assembly
20B	70341	Nut—Mounting washer and nut for sapphire
20C	38452	Guard—Needle guard
20D	37763	Screw—#2-56 x ⅛" screw for needle guard
21	70912	Screw—#4-40 x ⅜" binder head screw to mount crystal in arm (2 required)
22†	.....	Cable—Pickup cable (twisted pair)
23	38458	Nut—Speed nut to hold pickup cable
24†	.....	Sleeving—Sleeving to protect pickup cable
25	*72339	Shaft—Pickup arm shaft
26	*72341	Pivot—Pivot pin 26B, and screw 26A for pickup arm shaft
27	*72342	Screw—#4-40 x 3/16" filister head machine screw for locking pivot screw
28	*72340	Screw—#8-32 x ¼" round head machine screw to hold lift cable tie plate
29	*72343	Cable—Pickup arm lift cable complete (including tie plate and cotter pin)
29A	*72386	Pin—Cotter pin to fasten lift cable
29B	.....	Plate—Tie plate nut stocked separately, lift cable (Part of 29)
30	10941	Ball—Steel ball (⅛" dia.) for pickup arm shaft
31	*72348	Washer—Thrust washer (.580" O.D. x .300" I.D.) for pickup arm shaft
32	*72346	Spindle—Turntable spindle or center post
32A	.....	Guide—Record guide (Part of 32)
33	*72355	Turntable—Turntable complete with knurled bushing and rubber mat
33A	*72564	Mat—Rubber mat only for turntable
33B	.....	Roller—Knurled roller (Part of 33)
34	*72350	Washer—Thrust washer (.750" O.D. x .285" I.D.) for turntable spindle (2 required)
35	*72349	Bearing—Thrust bearing
36	*72395	Arm—Idler wheel arm and mounting lever
37	*72393	Spring—Idler spring (.195" O.D. x 11/16"—17 turns)
38	*72388	Stud—Mounting stud for idler wheel arm
39	38458	Nut—Speed nut to hold idler wheel arm stud
40	*72396	Wheel—Idler wheel including tire
40A	.....	Tire—Rubber tire for idler wheel (not sold separately)
41	39996	Washer—Fibre dampening washer for idler wheel (2 required)
42	33726	Washer—"C" washer to fasten idler wheel

SERVICE AND ADJUSTMENT NOTES

1.	TONE ARM, ACTION NOT FREE	(a) Bent detent lever assembly (18). (b) Pin 20 must follow course of heavy dotted line in view of bottom of gear. (See fig. 4.). Pin must not be on other side of ridge. (c) Tone arm lead too tight.
2.	TONE ARM, FAILURE TO SET DOWN PROPERLY.	(a) After completing cycle adjust lift pin screw (37) for correct height of tone arm. Bottom of tone arm should be even with top of turntable. (b) Bent tone arm lift lever. (This lever holds screw 37).
3.	TONE ARM DROPS TOO FAR IN OR MISSES RECORD.	(a) Minor adjustment—Thru hole (5) in base plate near pickup arm post. Turn screw very slightly to right or left. (b) Major adjustment—Loosen lock screw 38 and slip tone arm bracket to compensate.
4.	CLICKING NOISE.	(a) Missing ball retainer assembly (11).
5.	FAILURE TO TRIP.	(a) Adjust screw on detent lever assembly (18). (b) Bent or loose positive tripping lever (15), or tripping lever assembly (21). (c) Defective or missing springs (22) or (23).
6.	CYCLES TOO SOON OR CONTINUOUSLY.	(a) Weak spring (22).
7.	RECORD JAMS BETWEEN SHELF AND SPINDLE.	(a) Bent spindle (4).
8.	RECORD FAILS TO DROP FROM SHELF.	(a) Check spring (42).
9.	STALLS WHEN REJECTING RECORD.	(a) Adjust idler wheel on changer drive assembly to make better contact with drum.
10.	TURNTABLE SPEED SLOW OR IRREGULAR.	(a) Same as No. 9 above.
11.	JERKY ACTION DURING CYCLE.	(a) Same as No. 9.
12.	NO AUTOMATIC SHUT-OFF, OR FAILS TO PLAY LAST RECORD.	Broken spring No. 36. Bent rod No. 39 sticking automatic shut-off pin or hinge (41).
13.	ADJUSTMENT (For C-10 Only)	If changer jams after last record is played, bend lever No. (33) about 10/1000 of an inch in direction of switch.

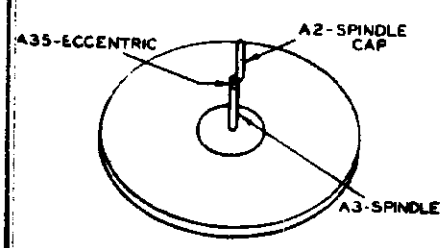

FIG. 1

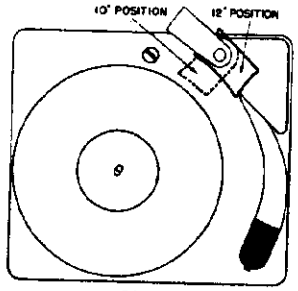

FIG. 2

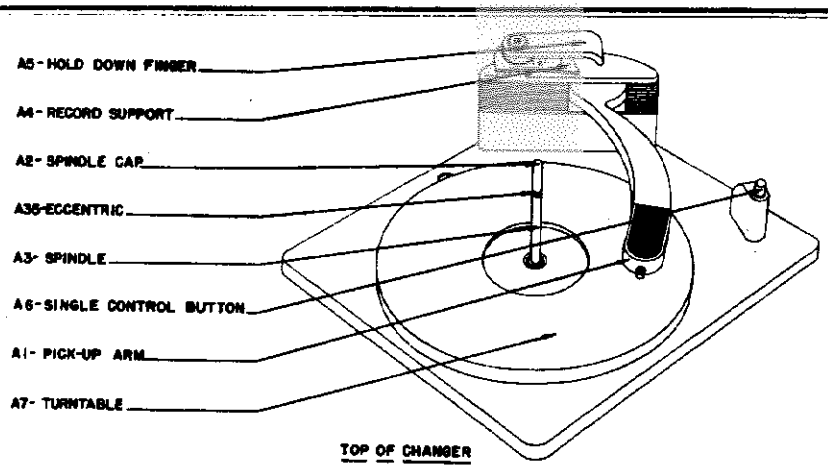
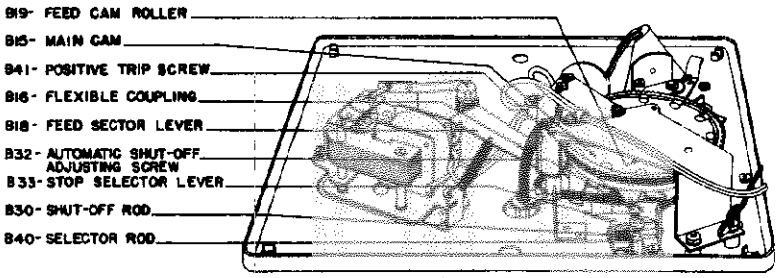
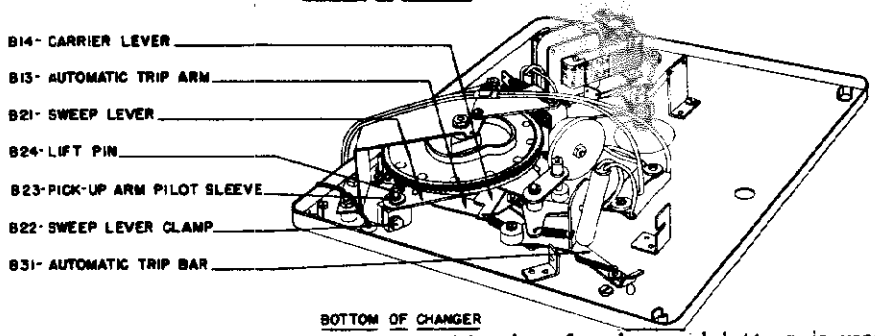


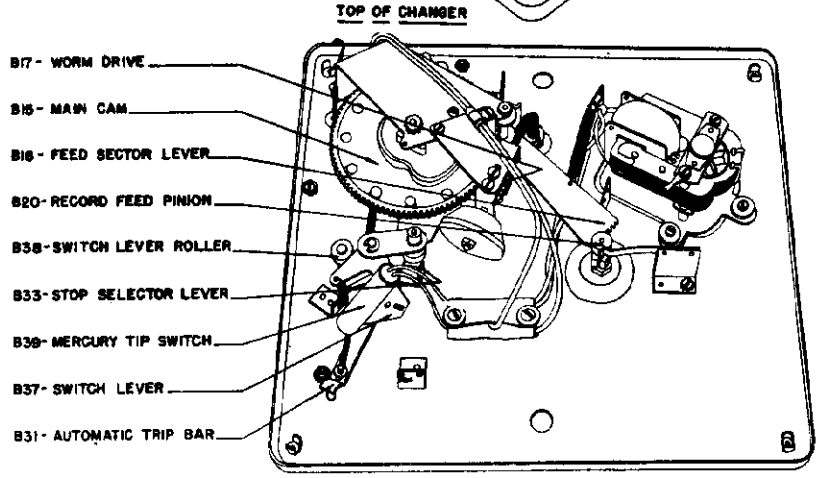


BOTTOM OF CHANGER



BOTTOM OF CHANGER

TOP OF CHANGER



BOTTOM OF CHANGER

A combination of numbers and letters is used in the illustrations and in the descriptions to facilitate locating parts in the illustrations. Parts with the prefix letter 'A' will be found in the illustration of the top of the record changer. Parts with the prefix letter 'B' will be found in the illustration of the bottom of the changer.

DESCRIPTION OF OPERATION

The Model 204 Record Changer is designed to automatically change a series of records of standard commercial dimensions, with a minimum of record wear, and to manually play any standard record up to twelve inches in diameter. The unit features Automatic Shut-off and Single Button Control.

AUTOMATIC OPERATION

Loading:

(1) Turn the Spindle Cap (A-2) until it is as completely out of line with the Spindle (A-3) as possible. (See Figure 1.)

(2) If ten-inch records are to be played, rotate Record Support (A-4) to extreme left, and for twelve-inch record operation, rotate Record Support (A-4) to extreme right, as indicated

(3) Place stack of records over Spindle Cap (A-2) and on Record Support (A-4).
NOTE: Maximum load is 12 ten-inch records or 10 twelve-inch records.
(4) Swing Hold-down Finger (A-5) so that it rests on top record.

Starting:

To start operation, press Pick-up Arm (A-1) down, thus depressing Single Control Button (A-6).

Automatic Shut-off:

After playing the last record, the Pick-up Arm (A-1) will return to rest position on the Control Button and the motor power will be automatically shut off.

Reject Records:

In order to reject a record, depress the Single Control Button (A-6)

Manual Stopping:

To discontinue operation before the Automatic Shut-off goes into effect, remove any records remaining on Record Support (A-4) and depress Single Control Button (A-6).

Unloading:

(1) Rotate Spindle Cap (A-2) until it is aligned with Spindle (A-3).
(2) Turn Hold-down Finger (A-5) aside.
(3) Lift records, tilting slightly to clear Record Support (A-4).

MANUAL OPERATION

Starting:

(1) Make sure Spindle Cap (A-2) is aligned with Spindle (A-3).
(2) Place record over Spindle (A-3) and on to turntable (A-7).
(3) Place Pick-up Arm (A-1) on outer edge of record. This will start motor.

CAUTION

(1) DO NOT bend or strain the Spindle Cap (A-2) when loading or unloading records.
(2) DO NOT force the Pick-up Arm (A-1) while in cycle.
(3) DO NOT overload the changer. The maximum load is either 12 ten-inch records or 10 twelve-inch records.
(4) DO NOT leave records on Record Support (A-4) when turning off set, or warpage of the records will result.

DESCRIPTION OF CHANGE CYCLE

The Model 204 Record Changer is an automatic cam type changer, featuring Single Button Control Automatic Shut-off and Eccentric Spindle Record Selection.

Operation

(1) Single Button Control:

Initial depression of the Single Button Control (A-6) causes a lateral motion of the Automatic Trip Bar (B-31) which in turn tilts the Mercury Tip Switch (B-39) to the CONTACT or ON position thus supplying power to the motor. The motion of the Automatic Trip Bar (B-31) causes the Carrier Lever (B-14) and its attached Drive Wheel (A-10) to come in contact with the rim of the Turntable. The consequent revolving motion of the Drive Wheel (A-10) is transmitted to the Main Cam (B-15) through a Flexible Coupling (B-16) and Worm Drive (B-17) assembly.

(2) Cycling:

A single revolution of the Main Cam (B-15) results in complete automatic cycling of the changer. This includes selection of record from stack, lifting Pick-up Arm (A-1) from rest position and setting needle on edge of record. Upon completion of the revolution, the Automatic Trip Cam (B-13) engages with the block on the Trip Lever and pulls the Carrier Lever (B-14) back to its original position so that the Drive Wheel (A-10) is no longer engaged with turntable rim.

(3) Record Feed:

The lower side of the Main Cam (B-15) controls record selection. Motion of the Feed Cam Roller (B-19) about the cam results in a backward and forward movement of the Feed Sector Lever (B-18) thus engaging the Record Feed Pinion (B-20). This in turn causes the Eccentric (A-35) to first rotate to proper position for record selection and to then return, allowing record to drop over Spindle (A-3).

(4) Pick-up Arm Movement:

The upper side of the Main Cam (B-15) controls Pick-up Arm (A-1) movement. Lift is effected by motion of the Lift Pin (B-24) along the upper horizontal face of the cam as it rotates. Direction is controlled by engagement of the Main Cam (B-15) with the Sweep Lever Pinion (B-29). The Sweep Lever (B-21) is attached to the Pick-up Arm (A-1) by means of a Clamp (B-22) around Pick-up Arm Pivot Sleeve (B-23). A boss projecting from the upper side of the Main Cam (B-15) displaces the Stop Lever (B-25) at the end of the change cycle, thus permitting the Pick-up Arm to proceed across the record.

(5) Positive Trip Action:

As the Pick-up Arm approaches the Spindle (A-3), the Sweep Lever (B-21) hits the Positive Trip Screw mounted on the Carrier-Trip Lever Assembly (B-14). This action reengages the drive wheel with the turntable rim and starts a new cycle.

(6) Pawl Trip Action:

Any reversal of the direction of the Sweep Lever (B-21) travel before positive trip action takes place causes the Sweep Lever (B-21) to push forward a Pawl mounted on the opposite side of the Trip Lever from the Positive Screw. This movement also has the effect of reengaging the Drive Wheel (A-10) to start a new cycle.

(7) Ten or Twelve-Inch Operation:

Adjusting the Record Support (A-4) to the ten-inch or twelve-inch position lowers the Selector Rod (B-40) a definite degree. The length of the extension of this rod determines the position of the Stop Selector Lever (B-33) which in turn controls the Stop Lever (B-25). The latter is the means of regulating the distance the Sweep Lever (B-21) and its attached Pick-up Arm (A-1) travel before the Pick-up Arm (A-1) is lowered to the edge of the record.

(8) Automatic Shut-off:

Release of the Record Hold-down Finger (A-5) lowers the Shut-off Rod (B-30) and forces the Stop Selector Lever (B-33) completely clear of the Stop Lever (B-25). The latter is then able to move into a position which completely blocks any forward motion of the Sweep Lever (B-21). Consequently, the Sweep Lever (B-21) cannot perform its usual function of actuating the Switch Lever (B-37). Thus, the Switch Lever Roller (B-38) remains in the path of the Stop Lever (B-25). On completion of the cycle, the Stop Lever (B-25), in returning to rest position, hits the Switch Lever Roller (B-38) and tilts the Mercury Tip Switch (B-39) to the OPEN or OFF position.

Lubrication:

No lubrication should be necessary. However, in case of squeaks or stiffness of operation, a drop of any good light machine oil on the bearings, motor, and at other pivot points should be applied. A light application of grease to the worm also might help.

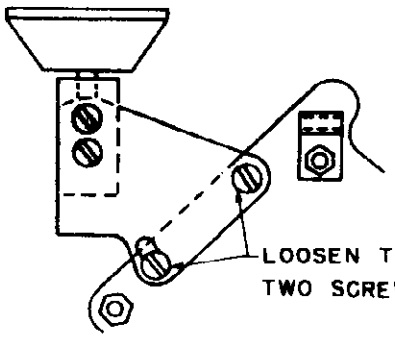


FIG. 1

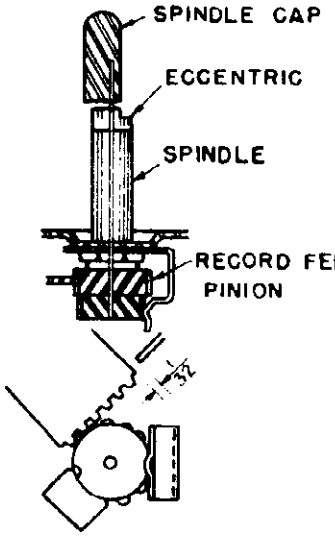

FIG. 2

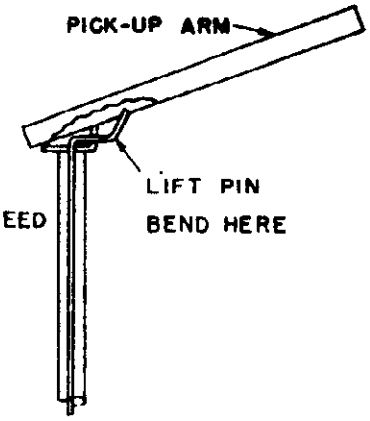

FIG. 3

SERVICE ADJUSTMENT TIPS

IF CHANGER TRIPS BEFORE COMPLETION OF THE RECORD:

Turn the Positive Trip Screw (B41) clockwise.

IF CHANGER FAILS TO TRIP AFTER COMPLETION OF THE RECORD:

Turn the Positive Trip Screw (B41) counter-clockwise.

IF THE DROP POINT OF THE PICK-UP ARM IS NOT AT PROPER POINT ON THE RECORD:

Loosen the screw on the Sweep Lever Clamp (B22) slightly and reposition the Pick-Up Arm (A1) with respect to Sweep Lever.

IF THE TURNTABLE SPEED IS LOW:

Make sure the Drive Wheel does not strike the rim of the turntable. If necessary, readjust eccentric bushing on the Drive Wheel. (NOTE: This adjustment should be exceedingly slight as a large movement may cause continous trip.)

Check for grease or oil on the Idler Wheel of the Motor and inside of turntable. Wipe with carbon techrachloride.

Check for sticky Idler Wheel plate on the Motor. Free with a screw-driver.

IF THE CHANGER STALLS IN CYCLE:

Remove any grease on the Drive Wheel or inside of turntable with carbon tetrachloride.

Check the mesh of the Worm Drive (B17) and Main Cam (B15) for proper clearance. Loosen screws on main bracket and tighten. (See Figure 1).

Check for binding in the Spindle Assembly (See Figure 2). Disassemble Index Collar and record Feed Pinion (B20), remove Spindle Cap (A2), Eccentric (A35) and Eccentric Rod.

Check for freeness and remove binds.

The following cautions should be observed in reassembling the Spindle Assembly:

(a) Reassemble with a maximum end play of .005" between Eccentric (A35) and Spindle Cap (A2).

(b) The Eccentric (A35) should be in line with the Spindle (A3) when the changer has completed its cycle.

(c) The Feed Sector Lever (B18) should mesh with the Record Feed Pinion (B20) as shown in Figure 2.

(d) Align Spindle Cap (A2) with Spindle (A3) in detent position.

IF THE RECORDS FAIL TO DROP:

Check the meshing of the Feed Sector Lever (B18) with the Record Feed Pinion (B20). Reset as shown in Figure 2.

IF THE FIRST RECORD DOES NOT PLAY:

Readjust the end of the Lift Pin (B24) so that the needle will play the first record (See Figure 3).

(NOTE: Do not bend Lift Pin (B24) too much as this will prevent playing of top record on full stack.)

Make certain that the pick-up lead does not hit the top of the Lift Pin (B24) or hinge.

IF THE AUTOMATIC SHUT-OFF FAILS TO OPERATE:

Make certain that the Automatic Shut-Off Adjusting Screw (B32) mounted on the Stop Selector Lever (B33) makes contact with the Shut-Off Adjusting Rod (B30) when the Stabilizer Finger (A5) is released. Adjust as required. Check leads on Mercury Switch (B39) for interference with the Switch Lever motion. Check Mercury Switch (B39) continuity.

IF A GRINDING NOISE OCCURS DURING THE CYCLING OPERATION:

The Worm and Main Cam Assemble are misaligned. Loosen the two small screws indicated on Figure 1; adjust the worm for closer approximation with the cam; tighten screws; lubricate worm and cam teeth.

CAUTION: It is essential to leave some play between the two parts or a definite bind will develop.

Always check through 360° movement of the cam by hand operation of the turntable before turning on the motor after an adjustment.)

IF A HIGH FREQUENCY BUZZ OCCURS DURING RECORD PLAY:

A slight burr or dust particular may be impeding the motion of the motor armature. With the motor turned on, move the armature up and down several times by hand. This will usually wear off any obstruction.

IF AUDIBLE NOISE INCREASES DURING RECORD PLAY:

The shipping bolt is secured too tightly to permit the necessary compliance between the mounting board and the record changer. Loosen the bolt slightly.

IF A METALLIC CLICKING IS HEARD DURING CYCLING:

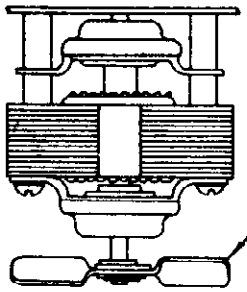
There is excess horizontal end play in the Drive Spring Assembly. Loosen the two screws indicated in Figure 1, adjust the drive assembly for approximately .010 " horizontal end play, tighten the screws and lubricate worm and cam teeth.

CAUTION: It is essential to leave at least .010 "end play or a bind will result. Always check through 360° rotation of the cam by hand operation of the turntable before turning on the motor after an adjustment.

IF A CONTINOUS BUZZING OCCURS: (EXTERNAL FAN-TYPE MOTOR ONLY)

The motor fan may be slightly bent and the pitch disturbed. Bend the fan slightly in either direction until the noise disappears.

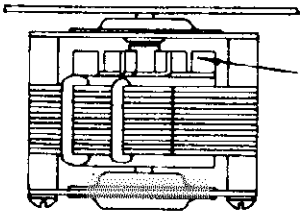
HOW TO IDENTIFY THE RECORD CHANGER MOTORS FOR CONVERSION TO 50 CYCLE OPERATION:



ALLIANCE

FAN-TWO BLADE TYPE-
ON BOTTOM OF ROTOR

USE PKG. #57311



GENERAL INDUSTRIES

FAN-BLACK OXIDIZED-
ON TOP OF ROTOR

USE PKG. #57312

ALSO MADE WITH FAN AT TOP AND BOTTOM OF ROTOR.

1. Remove the radio from the carton.

2. The record changer drawer CANNOT be opened until the shipping screws holding the record changer drawer are removed at the rear of the radio.

3. Pull the record changer drawer out as far as it will go.

4. Go to the left side of the radio and examine the motor from the underside of the record changer drawer. It may be necessary to remove a cardboard cover before the motor can be seen.

5. Compare the motor with the two illustrations above and determine the motor used. The main distinguishing points of each motor are given at the right of each illustration.

6. When the correct motor has been determined, the correct conversion spring will be found in the package identified by the part number given at the right of the motor illustration.

7. Instructions for installing the spring will be found in the envelope containing the spring.

8. Before repacking the radio, secure the record changer by replacing the shipping screws at the rear of the record changer drawer.

A combination of numbers and letters is used in the illustration and in the description to facilitate locating parts in the illustrations. Parts with the prefix letter 'A' will be found in the illustration of the top of the record changer. Parts with the prefix letter 'B' will be found in the illustration of the bottom of the changer.

DESCRIPTION OF OPERATION

The Model 206 Record Changer is designed to automatically change a series of records of standard commercial dimenions, with a minimum of record wear, and to manually play any standard record up to twelve inches in diameter.

AUTOMATIC OPERATION

Loading:

(1) On the Pick-up Arm Hub (A-7) are two detents marked A and H. Hold the Hub, move the Pick-up Arm (A-8) sidewise and engage the groove marked A for Automatic Operation.
(2) Adjust the Record Support (A-1) for 10 inch or 12 inch records by rotating it one-half revolution in either direction. The wide shelf is for 10 inch records, the narrower for 12 inch records.
(3) Flip the Toggle Plate (A-4), which hinges between the 10 inch and 12 inch positions on the Record Support (A-1) toward the back.
(4) Place the stack of records on the Spindle (A-13) allowing them to rest on the Record Support.
(5) Flip the Record Hold-Down Finger over on to the top of the records. This must be done to provide the necessary tension to allow the records to drop correctly.

Starting:

Push the Record Changer Control Button (A-12) to the 'ON' position. If the changing action does not start at once, push the Control Button to the 'Reject' position and release.

Reject Records:

Merely press the Control Button to the 'Reject' position and release.

Shut Off:

(1) With the Pick-up Arm (A-8) resting on a record, move the Control Button (A-12) to the 'OFF' position.
(2) Lift the Pick-up Arm and place it on its rest.

Unloading:

Flip the Toggle Plate (A-4) toward the back, away from the Spindle (A-13). The records can then be lifted from the turntable.

MANUAL OPERATION

Starting:

(1) Move the Pick-up Arm (A-8) sidewise into the detent marked H.
(2) Rotate the Record Support (A-1) to the 12 inch position.
(3) Flip the Toggle Plate (A-4) toward the back.
(4) Place the selected record over the Spindle (A-13) and down on the turntable.
(5) Move the Control Button (A-12) to the 'ON' position.
(6) Let the Pick-up Arm raise and lower. The Pick-up Arm can then be placed by hand on the starting edge of any size record.

CAUTION

(1) DO NOT force the Pick-up Arm while in cycle.
(2) DO NOT overload changer. The maximum load is either 12 ten-inch records or 10 twelve inch records.
(3) DO NOT leave records on Record Support (A-1) when turning set off, or warpage of the records will result.

DESCRIPTION OF CHANGE CYCLE

The Model 206 Record Changer is an automatic ejection lever type changer, featuring a Single On-Off Rejection Control Lever.

Operation:

(1) Single Control Lever:

Initial movement of the Control Button (A-12) to the 'ON' position turns on the Motor Power Switch (B-20) and simultaneously flips the Ratchet Release (B-4). This allows the Pick-up Arm Cam Dog (B-8) to engage the Drive Drum (B-5) bosses causing the Pick-up Arm (B-8) to rotate.

(2) Cycling:

A single revolution of the Pick-up Arm Cam (B-8) results in complete automatic cycling of the changer. This includes selection of record from stack, lifting Pick-up Arm (A-8) home position and setting stylus on lead-in groove of record. Upon completion of one revolution, the Cam Dog hits against the Ratchet Release (B-4) and is lifted to its original position, free of the Drive Drum (B-5).

(3) Record Feed:

The outer edge of the Pick-up Arm Cam (B-8) moves the Record Ejector Lever (B-10) in a horizontal direction causing the Record Ejector Plate (A-2) to move towards the spindle and return, pushing the next record off the shelf and on to the turntable.

(4) Pick-up Arm Movement:

The upper side of the Pick-up Arm Cam (B-8) controls Pick-up Arm (A-8) movement. Lift is effected by motion of the Lift Rod (B-7) along the upper edge of the cam as the latter rotates. Direction is controlled by engagement of the Pick-up Arm Cam (B-8) with the Pick-up Arm Cam Follower Stud, which guides the Pick-up Arm Trip Lever (B-6). The Pick-up Arm Trip Lever (B-6) is staked to the Hub (A-7) which controls horizontal movement of the Pick-up Arm (A-8).

At completion of cycling the Pick-up Arm Cam (B-8) comes to rest in such a position that the Pick-up Arm Cam Follower Stud has a large area for free movement permitting the Pick-up Arm (A-8) to proceed across the record.

(5) Trip Action:

As the Pick-up Arm (A-8) approaches the spindle, the eccentric groove of the record causes an oscillating action of the Pick-up Arm Trip Lever (B-6) against the Ratchet Release (B-4). This in turn releases the Pick-up Arm Cam Dog (B-8) and cycling begins.

(6) Reversal Trip Action:

Any reverse of direction of the Pick-up Arm (A-8) travel before the eccentric groove of the record is reached causes the Pick-up Arm Trip Lever (B-6) to operate the Ratchet Release (B-4) and cycling commences.

(7) Ten or Twelve Inch Operation:

Adjusting the Record Support Plate (A-1) to the ten inch or twelve inch position rotates the Record Adjustment Cam (B-9) which in turn re-sets the Pick-up Arm Cam Follower Stud, and consequently the dropping point of the Pick-up Arm (A-8).

(8) Reject Lever:

Movement of the Reject Button (A-12) during play flips the Ratchet Release (B-4) and cycling commences immediately. Thus, a record can be rejected during play.

Adjustments:

(1) A-H; Automatic and Home Recordings:

On the Pick-up Arm Hub (A-7) are two Detents (A-6). By holding Hub (A-7) and moving Pick-up Arm (A-8) sidewise, either position can be selected. Position 'A' gives us completely automatic operation with the cycling commencing as the stylus approaches within 1-7/8" of the spindle (A-13). Position 'H' moves the Pick-up Arm (A-8) inward in reference to the Pick-up Arm Trip Lever (B-6) thereby permitting the stylus to traverse nearer the spindle without tripping the cycling mechanism. This permits playing of smaller than standard recordings.

(2) Pick-up Arm Height:

If the stylus does not ride on the record or if it is not raised high enough to clear the top record of a stack this adjustment must be made. Raise Pick-up Arm (A-8) and after releasing the lock nut on the Height Adjustment Screw (A-5), rotate the screw clockwise to lower the Pick-up Arm (A-8), and counterclockwise to raise it. Be certain that locknut is then locked securely.

Lubrication:

No lubrication should be necessary. However, in case of squeaks or stiffness of operation, a drop of any good light machine oil on the bearings, motor, and at other pivot points should be applied. A light application of grease to the cam also might help.

HOW TO IDENTIFY THE RECORD CHANGER MOTORS FOR CONVERSION TO 50 CYCLE OPERATION.

1. Remove the radio from the carton.
2. The record changer drawer CANNOT be opened until the shipping screws holding the record changer drawer are removed at the rear of the radio.
3. Pull the record changer drawer out as far as it will go.
4. Go to the left side of the radio and examine the motor from the underside of the record changer drawer.
5. Looking at the motor from this direction will give you the same view as shown in the illustration in at the left.
6. Compare the motor with the four illustrations above and determine the motor used. The main distinguishing points of each motor are given at the right of each illustration.
7. When the correct motor has been determined, the correct conversion spring will be found in the package identified by the part number given at the right of the motor illustration.
8. Instructions for installing the spring will be found in the envelope containing the spring.
9. Before repacking the radio, secure the record changer by replacing the shipping screws at the rear of the record changer drawer.

OPERATING INSTRUCTIONS

SETTING FOR SIZE OF RECORDS: Setting of Record Support Arm (see Fig. 1) determines size of record that may be placed on the changer and may be accomplished in the following manner.

To set for 10" records grasp the Record Support Arm as shown in Fig. 1. Lift the edge closest to the Center Post and slide the entire top of the arm forward toward the center of the changer as far as it will go, (a slight pressure may be required to move it all the way). Lower Record Support Arm and it should **lock** into a level position.

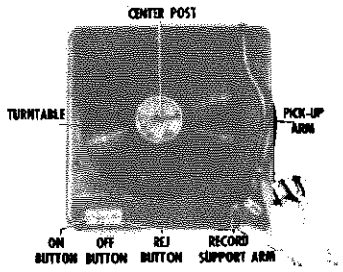

Fig. 1

To set for 12" records grasp the Record Support Arm as shown in Fig. 1. Lift the edge closest to the Center Post and slide the entire top of the arm away from the center of the changer as far as it will go. Lower Record Support Arm and it should **lock** into a level position.

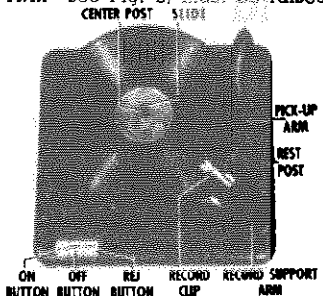
NOTE: Always be sure Record Support Arm is properly **locked** in, otherwise improper operation will result.

PICK-UP ARM AND NEEDLE: The new Stewart-Warner "Strobo-Sonic" Pick-up Arm has been designed to faithfully reproduce your records with a minimum of "surface scratch" and "needle talk." It incorporates a special "retractable" type needle which protects the needle, cartridge and record if arm is accidentally dropped or undue pressure is applied to Pick-up Arm.

Check to see that pick-up cartridge has a "floating" action. If it is ever found in a "retracted" position merely slide the cartridge until it is centrally located and it should regain its "floating" action.

A special long-life needle (good for many thousands of playings) is included with this changer. Care should be exercised to see that the point is always protruding slightly beyond the metal guard at bottom of the cartridge. Should the needle become damaged or worn, it may be removed by releasing the small set screw visible and accessible at the front of the cartridge. These needles can be purchased from your dealer by requesting Stewart-Warner Part 505717. Always insert needle in the cartridge so that flattened surface on the shaft faces the set screw. Single play steel needles or cactus needles must not be used when records are changed automatically.

PLACING RECORDS ON THE CHANGER: The Record Clip (located on the head of the Record Support Arm—see Fig. 2) must be raised until it is straight up before attempting to load records on the changer. Also check to be sure the Slide Center Post is all the way down.



Place records on the Center Post so that center of record rests on the off-set in the Center Post and outer rim of record rests on step of properly positioned Record Support Arm. Then lower the Record Clip so that it rests on the top record.

The changer is capable of handling fourteen 10 inch records or twelve 12 inch records of the 78 revolutions-per-minute type. **Do not attempt to mix 10 and 12 inch records;** the records must be all one size for each loading and may consist of fewer than listed above.

STARTING THE CHANGER: Turn on the radio before attempting to start the changer and be sure that controls on radio panel are properly set for phonograph operation.

To start the changer, press down on the "ON" button. This will turn motor on and Turntable will start rotating. Then, depress the **"REJ"** button momentarily to start the changing mechanism. All records which are loaded on the changer will then be played in sequence.

CONTROLLING THE VOLUME: Use the volume control on the radio control panel to adjust the volume of the phonograph.

In event a radio station is heard when listening to the phonograph, you can eliminate this interference by turning the Tuning Control knob to a different position (select a position which is between stations).

CONTROLLING THE TONE: The tone control on radio control panel is used to select most pleasing tone.

REJECTING A RECORD: If you wish to stop playing a record and start playing the next one, merely depress the **"REJ"** button momentarily and the changer will drop the next record.

STOPPING AND UNLOADING: It is not advisable to stop the changer when it is in the process of changing a record. Wait until the Pick-up Arm lands on the record and then press down on the **"OFF"** button. The motor will then be automatically turned off and the Turntable will stop rotating. Lift the Pick-up Arm and place it on the Rest Post.

Record Clip must be raised to straight up position before removing the entire stack of records from the Turntable. Then place the fingers of both hands under opposite edges of the bottom record. Do not apply pressure to the top record with your thumbs. Lift the stack of records straight up following the contours of the Center Post.

PLAYING RECORDS MANUALLY: Standard records or home recorded records may be played individually if desired. Set the Record Support Arm in the 12" position as described in a previous section. This arrangement provides the space necessary to lower the record over the Center Post and down onto the Turntable.

After the record has been placed on the Turntable, depress the **"ON"** Button. This starts the Turntable rotating and the Pick-up Arm may then be placed on the record. When the record is finished, the mechanism will automatically start playing it over again unless the "OFF" button is depressed so as to stop the changer.

PLAYING REVERSE RECORDINGS: This record changer may be used to play records which are recorded from the center outward toward the rim. Merely proceed as described in preceding section entitled "Playing Records Manually" with the exception that the Pick-up Arm

CAUTIONS: Observe the following precautions in order to insure proper operation.

1. Never use force to stop or start the changer.
2. Never change position of Record Support Arm while changer is in cycle.
3. Always grasp Pick-up Arm at sides, never under the cartridge, as that may force cartridge to remain in the "retracted" position. Should this happen, merely slide cartridge until it is centrally located and it should regain its floating action.
4. Never leave the Pick-up Arm and needle resting on a record when radio is turned off.
5. Be sure Record Support Arm is properly locked in a level position otherwise improper operation results.
6. Be sure that Slide in Center Post is all the way down.
7. Do not leave records on the supports for an extended period of time as they may warp.
8. Exercise care not to bend the Center Post.

DESCRIPTION OF CYCLE

In order to observe the operation of the changer mechanism, it will be necessary to remove the Turntable. This may be accomplished by taking out the three small Screws located on top of the Turntable near the Center Post. Changer may now be put thru its cycle by first depressing the "REJ" Button and then manually rotating the bushing to which the Turntable was formerly attached.

FUNCTION	EXPLANATION
STARTING (Fig. 3) Depressing "ON" Button (1).	1. Turns Power Switch (5) on. 2. Motor (6) operates Idler Wheel (7) to rotate Turntable. 3. Turntable rotates Clutch and Turntable Shaft (8).
CYCLING Depressing "REJ" Button (3).	1. Actuates Reject Link (10). 2. Moves Reject Arm (11). 3. Disengages Reject Lever (13) from Clutch Arm (15), allowing arm to contact rotating Clutch and Turntable Shaft (8) which starts the entire mechanism thru its change cycle.
Function of Pinion Gear (17).	1. Rotates Main Drive Gear (18). 2. Top Drive Roller (19) actuates Main Slide (20).
DISPLACEMENT OF A RECORD (Fig. 4) Record Selection.	1. Main Slide (20) moves toward right rear corner of changer. 2. Ejector Roller (22) engages a notch in Ejector Arm (23) and moves this arm plus Ejector Link (24) as well as attached Ejector Lever (26). 3. Ejector Lever (26) engages with a slotted hole in Channel (27) and moves attached Record Support Arm (29) away from Center Post (32). This movement allows bottom record of a stack to drop from the second step on Record Support Arm (29) to the first step.
Record Ejection.	1. Main Slide (20) now reverses its direction and proceeds toward left front corner. 2. Attached Ejector Roller (22) moves Ejector Arm (23) plus Ejector Link (24) and Ejector Lever (26). 3. Ejector Lever (26), which engages a slotted hole in Record Support Channel (27), moves attached Record Support Arm (29) toward the Center Post (32). This movement pushes bottom record until it clears the off-set in the Center Post (32) and drops down to the Turntable.
MOVEMENT OF PICK UP ARM (Fig. 5) Raising Pick-up Arm (43).	1. When Main Slide (20) moves toward right rear corner, Lift Roller (39) engages and pushes Lift Lever (40) down. 2. Lift Lever (40) actuates Lift Rod (41) which in turn causes Pick-up Arm (43) to rise. 3. Height of Pick-up Arm may be changed by shifting the Height Adjustment Screw (44).
Lateral motion of Pick-up Arm (43) toward Center Post (32).	1. When Main Slide (20) reverses its dircetion and moves toward left front corner of changer, Return Slide (48) pulls on Stud (49) which is a part of the Link Assembly (50). Since the Link Assembly is attached to Follower Arm and Pick-up Shaft (51), it controls the approach of the Pick-up Arm (43) to the record. 2. Set down point of Pick-up Arm may be changed by shifting the Horizontal Adjustment Screw (54).

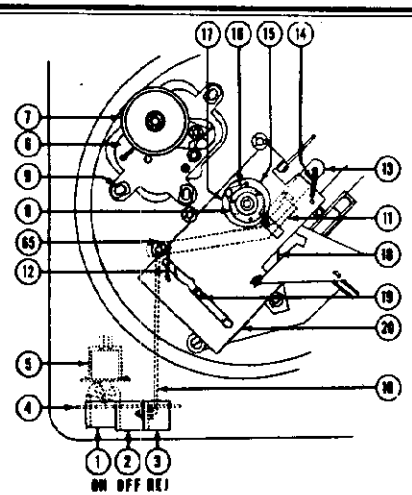


Fig. 3

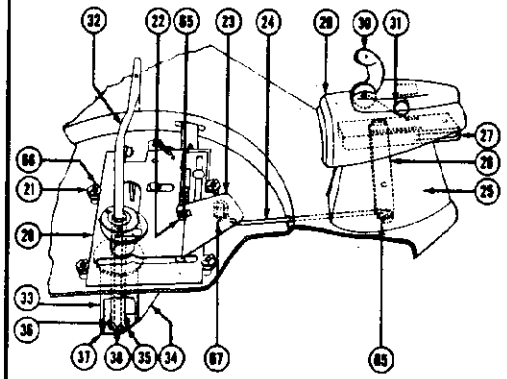

Fig. 4

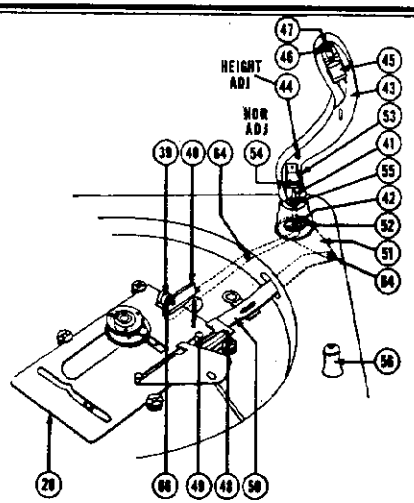

Fig. 5

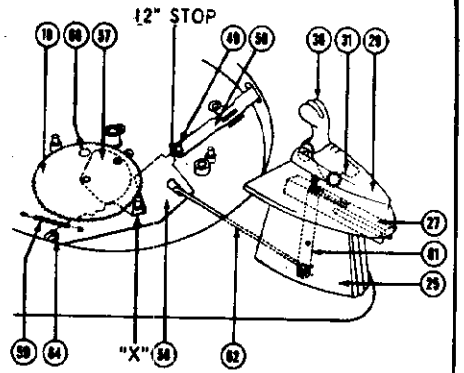

Fig. 6

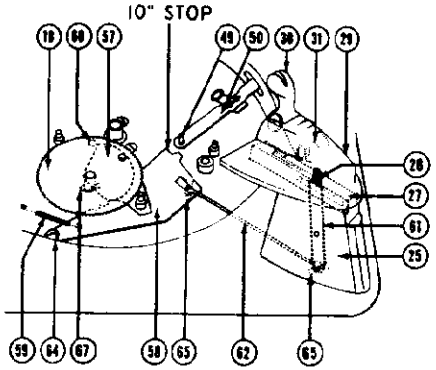

Fig. 7

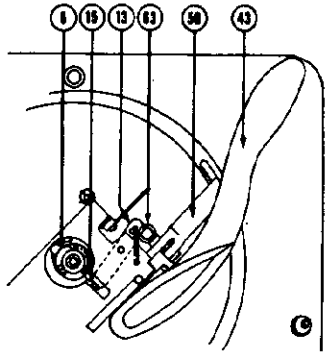

Fig. 8

Lowering Pick-up Arm (43) to the record.

1. When Main Slide (20) has almost reached its front left position, Lift Roller (39) disengages Lift Lever (40).
2. This releases the upward pressure on Lift Rod (41) and allows Pick-up Arm (43) to set down on the record.

SETTING FOR DESIRED RECORD SIZE
Record Support Arm (29) set to 12" position.
(Fig. 6)

1. When changer starts to cycle, Cam (57) under Main Drive Gear (18) actuates the Index Plate (58).
2. Index Plate (58) moves toward center of changer until it contacts lower right roller stud (see point "X" in Fig. 6).
3. Projection on end of Index Plate (58), designated as the "12 STOP," is now directly in the path of Stud (49) on Link Assembly (50).
4. As Pick-up Arm approaches record it moves Link Assembly (50) and attached Stud (49) until the stud comes in contact with the "12" STOP" (see Fig. 6)—this determines the correct set-down point of Pick-up Arm for 12" records.
5. After Pick-up Arm is lowered to the record, then Bottom Drive Roller (60) under Main Drive Gear (18) displaces the Index Plate (58) so that "12" STOP" projection disengages Stud (49) and permits Pick-up

Record Support Arm (29) set to 10" position. (Fig. 7)	1. When Record Support Arm (29) is shifted to this position it moves Channel (27) which actuates Index Lever (61). That allows Index Link (62) to control the 10" setting of Index Plate (58). 2. When the changer starts to cycle, Index Plate (58) moves toward center of changer until it is stopped by Index Link (62). 3. Notch at end of Index Plate (58), designated as the "10" STOP," is now in the path of Stud (49) on Link Assembly (50). 4. As Pick-up Arm approaches record it moves Link Assembly (50) and attached Stud (49) until the stud comes in Contact with the "10" STOP" (see Fig. 7)—this determines the correct set-down point of Pick-up Arm for 10" records. 5. After Pick-up Arm is lowered to the record, then Bottom Drive Roller (60) under Main Drive Gear (18) displaces the Index Plate (58) so that the "10" STOP" disengages Stud (49) and permits Pick-up Arm to proceed across the record.
CHANGING A RECORD (Fig. 8) Pick-up Arm (43) approaches end of record.	1. Trip Roller (63) on Link Assembly (50) approaches and moves Reject Lever (13) so that this lever releases Clutch Arm (15). 2. As Clutch Arm (15) is released, it engages the rotating Clutch and Turntable Shaft (8) which starts the entire mechanism thru its change cycle.
REJECTING A RECORD Depressing "REJ" Button (3).	1. This starts the change cycle as described above under "CYCLING" and permits the next record to be played.
STOPPING Depressing "OFF" Button (2).	1. Turns Switch (5) to off position and Motor (6) stops.

	505999	Spring for Mtg. Record Changer

TROUBLE SHOOTING CHART

SYMPTOM	CAUSE	REMEDY
Turntable fails to start after depressing "ON" Button (1).	1. No Power.	Check to determine if there is power at the wall outlet by disconnecting radio power cord and connecting a lamp to same outlet.
	2. Idler Wheel (7) not engaging Turntable.	Check to see that pivot lever under Idler Wheel (7) is free. Also be sure that spring which pulls Idler Wheel (7) toward Turntable is hooked to motor frame and has sufficient tension.
	3. Defective Switch (5).	Check continuity across switch contacts. Replace switch if necessary.
	4. Defective Motor.	Check and replace if necessary.
	5. Binding in changer mechanism.	For analysis of fault see symptom entitled "Changer Stops While Changing a Record."
Changer refuses to cycle after depressing "REJ" Button (3).	1. Reject Link (10) unhooked.	Reconnect as shown in Fig. 3.
	2. Bent Reject Arm (11).	Reject Arm (11) must be flush with record changer base plate. Bent-up end of Reject Arm (11) should contact a projection on Reject Lever (13) when the Reject Button is depressed. Straighten Reject Arm so that it operates freely and properly engages Reject Lever.
	3. Clutch Arm (15) not engaging Clutch and Turntable Shaft (8) when released by Reject Lever (13).	Check for broken, loose or missing Clutch Arm Spring (16). Replace or rehook this spring as shown in Fig. 3. Also note whether Clutch and Turntable Shaft (8) is seated so that Clutch Arm (15) engages clutch teeth. Hold Clutch Arm (15) away from Center Post and allow Clutch and Turntable Shaft (8) to drop all the way down. Then tighten Center Post Screw (38) located at bottom of changer. Center Post (32) should have at least .050" end play when this screw is tight.
Changer stops while changing a record.	1. Grease on Idler Wheel (7) or Turntable rim.	Clean with carbon tetrachloride.
	2. Idler Wheel (7) not engaging Turntable properly.	Check to see that pivot lever under Idler Wheel (7) moves freely. Also be sure that spring which pulls Idler Wheel (7) toward Turntable is properly engaged and has sufficient tension.
	3. Binding in changer mechansim.	Remove the three screws located on top of the Turntable near the Center Post (32) so that Turntable may be lifted off. Then depress "REJ" Button (3) and rotate Clutch and Turntable Shaft (8) **clockwise** by hand. Check all parts for binding action. Be sure Main Slide Rollers (21) are free.
	4. Binding between shoulder on Center Post (32) and top surface of Turntable Shaft (8).	There should be at least .005" end play in Center Post (32). Pinion Gear (17) and Clutch and Turntable Shaft (8) should be pushed down as far as possible and be sure that they are not binding against surrounding parts.
	5. Low line voltage.	Line voltage should not be less than 100 volts.
	6. Operating temperature too low.	If the changer has been stored in a cold room, the Turntable speed may be slower than normal.
	7. Weak Motor (6).	If, after checking the above six items, the changer continues to stall, it may be assumed that the Motor (6) has low torque and should be replaced.
Changer cycles continuously.	1. Reject Lever Spring (14) unhooked, broken or miss-	Rehook or replace Reject Lever Spring (14) in correct position as shown in Fig. 3.

	2. Binding of reject mechanism so that Reject Lever (13) fails to engage and hold Clutch Arm (15).	Remove any binding between the following parts: "REJ" Button (3), Reject Link (10), Reject Arm (11) and Reject Lever (13). Check for burrs on contacting surfaces at bent-up portion of Reject Arm (11) and bent-down projection of Reject Lever (13).
	3. Pinion Gear (17) improperly set in respect to Main Drive Gear (18).	To obtain correct setting of these gears, refer to section entitled "Timing Adjustment of Pinion Gear" on Page 8.
Record fails to drop off of Support Arm at correct time during the change cycle.	1. Record Support Arm (29) improperly "locked" in 10" or 12" position.	Be sure Record Support Arm (29) is properly set as outlined in the section entitled "Setting For Size of Records" on Page 1. Care should be exercised that Record Support Arm (29) **"locks" in a level position.**
	2. Record size not standard.	A standard 10" record has a diameter of 9-7/8" ± 1/32" and a standard 12" record has a diameter of 11-7/8" ± 1/32".
	3. Ejector mechanism bent or loose.	Check for bent, loose or unhooked Ejector Link (24). Ejector Arm (23) should, at all times, contact Ejector Roller (22) on Main Slide (20); see Fig. 4 for location of these parts.
	4. The distance from Center Post (32) to Record Support Arm (29) is incorrect.	Using a **new** and **standard** record as a gauge, place it so that it rests on the off-set of the Center Post (32) and edge is at the **top step** of Record Support Arm (29). There should be a clearance of 1/32" between edge of record and back of this step. If that clearance is insufficient, loosen the three screws holding the Record Post Assembly (25) at base of changer and move the entire Record Post Assembly away from the Center Post. Be sure that Record Support Arm (29) is so placed that the curvature of the step matches the curve of the record—both corners of the Arm must be equidistant from the edge of the record. Recheck to see that clearance has been maintained after screws are retightened.
Multiple dropping of records OR Records drop at wrong time and land on Pick-up Arm.	1. Hole in record too large.	Records with badly worn center hole should be discarded.
	2. Slide in top of Center Post (32) has failed to return to its lowest position.	Clean out any foreign matter that might prevent free movement of slide at top of Center Post.
	3. The distance from Center Post (32) to Record Support Arm (29) is incorrect.	Using a **new** and **standard** record as a gauge place it so that record rests on off-set in the Center Post and edge rests on **top step** of Record Support Arm. There should be a clearance of 1/32" between edge of record and back of top step. If this clearance is insufficient loosen the three screws holding the Record Post Assembly (25) at base of the changer and move the entire Record Post Assembly toward the Center Post. Be sure that Record Support Arm is so placed that the curvature of the step matches the curve of the record—both corners of the arm must be equidistant from the edge of the record. Recheck to see that clearance has been maintained after screws are retightened.
Pick-up Arm (43) fails to move during change cycle.	1. Lift Lever (40) bent so that it fails to engage Lift Rod (41).	Straighten tip of Lift Lever (40) so that it contacts and actuates the Lift Rod (41) during the change cycle. (See Fig. 9).
	2. Binding between Pick-up Arm Hinge Assembly (53) and hub.	There should be from .005" to .010" end play between Pick-up Arm Hinge Assembly (53) and the hub on base plate. Loosen Set Screw (55) and adjust for proper clearance. If necessary, readjust set-down point by means of Horizontal Adjustment Screw (54).
	3. Return Slide (48) is too loose.	Return Slide (48) must have enough tension to pull Link Assembly (50) to the proper stop position. If it is too loose it will be necessary to replace the entire Main Slide (20). For a description of the function of these parts see section entitled "Lateral Motion of Pick-up Arm toward Center Post" on Page 2.
	4. Stud (49) binding against Ejector Arm (23).	There should be about 1/32" clearance between top of Stud (49) and bottom of Ejector Arm (23) when the Stud passes under the arm. Bend Ejector Arm (23) to provide this clearance.

Pick-up Arm and Needle fail to contact first record.	1. Height of Pick-up Arm (43) is incorrectly set.	With changer mechanism in normal playing position, turn Height Adjustment Screw (44) **counter-clockwise** (see Fig. 5) until Pick-up Arm lands properly on first record.
	2. Leads to Crystal Cartridge are tightly drawn causing binding of Pick-up Arm.	Be sure electrical leads to Crystal Cartridge (45) have sufficient slack to allow Pick-up Arm (43) to move freely.
Top of Pick-up Arm (43) striking Record Support Arm (29) or stack of records while changer is cycling.	1. Height of Pick-up Arm (43) is incorrectly set.	When Pick-up Arm is elevated to the highest point during the change cycle, turn Height Adjustment Screw (44) **counter-clockwise** (see Fig. 5) until Pick-up Arm clears Record Support Arm (29).
Needle strikes edge of record as Pick-up Arm approaches set-down point OR Arm strikes Rest Post during change cycle.	1. Height of Pick-up Arm is incorrectly set.	With Pick-up Arm in the position where it is approaching a full stack of 12 ten inch records, turn Height Adjustment Screw (44) **clockwise** (see Fig. 5) until Needle clears edge of top record.
Pick-up Arm (43) sets down at wrong starting point on record.	1. Crystal Cartridge (45) off center in its mounting bracket.	Slide Cartridge (45) until it is centrally located in the supporting bracket at front of Pick-up Arm (43).
	2. Incorrect adjustment of set-down point.	With the changer turned off, depress the "REJ" Button (3) and rotate Turntable by hand until needle approaches its set-down point. Then, insert a screwdriver in the hole at rear of Pick-up Arm (43) and turn Horizontal Adjustment Screw (54) clockwise to move arm away from Center Post or counter-clockwise to move arm towards Center Post (see Fig. 5 for location of this adjusting screw). Should it be found that Pick-up Arm (43) cannot be moved sufficiently by the foregoing adjustment, it will be necessary to loosen Set Screw (55) and reposition the Pick-up Arm Hinge Assembly (53) on Pick-up Shaft (51). Fine adjustment can then be made by turning Horizontal Adjustment Screw (54) until Pick-up Arm has reached the desired point. CAUTION: When tightening Set Screw (55) be sure that there is from .005" to .010" end play between Pick-up Arm Hinge Assembly (53) and hub on base plate.
	3. Index Plate Spring (59) broken, loose or missing.	Rehook or replace Index Plate Spring (59).
Pick-up Arm (43) sets down in the 10" position when playing 12" records.	1. Record Support Arm (29) improperly "locked" in the 12" position.	Be sure Record Support Arm (29) is properly set for 12" operation as outlined in the section entitled "Setting for Size of Records" on Page 1. Care should be exercised that Record Support Arm (29) **"locks" into a level position.**
	2. Bent Index Link (62).	Straighten Index Link (62) so that Index Plate (58) is in the position shown in Fig. 6 with notch in plate **at point "X"** resting against stud of slide roller.
Pick-up Arm (43) sets down in 12" position when playing 10" records.	1. Record Support Arm (29) improperly "locked" in 10" position.	Be sure Record Support Arm (29) is properly set for 10" operation as outlined in the section entitled "Setting for Size of Records" on Page 1. Care should be exercised that Record Support Arm (29) is pushed towards the Center Post as far as it will go and **"locks" into a level position.**
	2. Index Link (62) is too long.	Bend Index Link (62) so that Index Plate (58) is in the position indicated by the title "10" Stop" in Fig. 7. CAUTION: Care should be exercised not to bend Index Link too much as it might cause Pick-up Arm to set

Pick-up Arm does not set down at same position consistently.	1. Plates at base of Pick-up Shaft (51) fail to return to position where notches coincide.	Remove any burrs on edge of plates at bottom of Pick-up Shaft (51) so that Index Spring (52) will return these plates to the position where the notches in each coincide as shown in Fig. 9.
	2. Index Spring (52) broken, improperly hooked or missing.	Rehook or replace as shown in Fig. 9.
	3. Binding between Pick-up Arm Hinge Assembly (53) and hub.	There should be from .005" to .010" end play between Pick-up Arm Hinge Assembly (53) and the hub on the base plate. Loosen Set Screw (55) and adjust for proper clearance. If necessary, readjust set-down point by means of Horizontal Adjusting Screw (54).
	4. Excess play in Pick-up Arm Link Assembly (50).	There should be no appreciable play between Link Assembly (50) and Follower Arm (51) at point of attachment If necessary, replace Shoulder Bushing (64).
Improper "tracking" of needle with record—needle slips out of grooves and skips portions of record.	1. Foreign matter in record grooves.	Clean record with record brush or soft camel hair brush.
	2. Badly worn record.	Examine record for scratches that may have destroyed continuity of grooves.
	3. Needle (46) may not be properly protruding from metal guard at bottom of Crystal Cartridge (45).	Bend Needle (46) downward until the tip protrudes 1/32" beyond metal guard at base of cartridge.
	4. Badly worn needle (46).	Examine needle for worn tip and replace if necessary. To remove the old Needle (46) release the small set screw visible and accessible at front of the cartridge. When installing a new needle, always insert it in the cartridge so that flattened surface on its shaft faces the set screw.
	5. Crystal Cartridge (45) locked in a retracted position.	Shift position of Crystal Cartrige (45) until it is centrally located in its mounting bracket. This will allow the cartridge to regain its "floating" action.
	6. Stud (49) binding against Ejector Arm (23).	There should be about 1/32" clearance between top of Stud (49) and bottom of Ejector Arm (23) when the stud passes under the arm. Bend Ejector Arm (23) to provide this clearance.
	7. Binding between Pick-up Arm Hinge Assembly (53) and hub.	There should be from .005" to .010" end play between Pick-up Arm Hinge Assembly (53) and the hub on base plate. Loosen Set Screw .005" end play when this screw is tight.
Changer cycles before record is finished playing.	1. Trip (63) engages Reject Lever (13) too early.	When the Needle is 1 3/4" away from the edge of Center Post (32), Trip (63) should start to engage Reject Lever (13) thus releasing Clutch Arm (15) which permits changer to cycle. See Fig. 8 for relative position of parts. If trip point occurs too early, loosen the two screws holding trip (63) and move it in a direction away from the Center Post. Then, retighten screws.

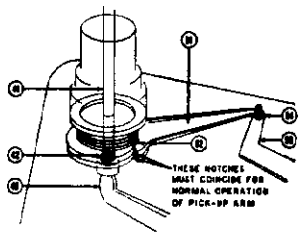

Fig. 9

STEWART-WARNER CORP. MODEL A-5056

Changer fails to cycle after playing a record.	1. Trip (63) does not properly engage Reject Lever (13) when Pick-up Arm reaches end of record.	When the Needle is 1 3/4" away from the edge of Center Post (Trip (63) should start to engage Reject Lever (13) thus releasing Clu Arm (15) which permits changer to cycle. See Fig. 8 for relative posit of parts. If trip fails to engage Reject Lever, loosen the two screws ho ing Trip (63) and move it toward the Center Post. Then, retighten scre
	2. Clutch Arm (15) not engaging Clutch and Turntable Shaft (8) when released by Reject Lever (13).	Check for broken, loose or missing Clutch Arm Spring (16). Replace rehook as shown in Fig. 3. Also note whether Clutch and Turntc Shaft (8) is seated so that Clutch Arm (15) engages clutch teeth. H Clutch Arm (15) away from Center Post and allow Clutch and Turntc Shaft (8) to drop all the way down. Then tighten Center Post Screw located at the bottom of changer. Center Post should have at le .005" end play when this screw is tight.
Slow Turntable speed.	1. Grease on Idler Wheel (7) or Turntable rim causing slipping.	Clean surfaces with carbon tetrachloride.
	2. Idler Wheel (7) not properly engaging Turntable.	Check to see that pivot lever under Idler Wheel (7) is free. Also be s that spring which pulls Idler Wheel (7) toward Turntable is hooked motor frame and has sufficient tension.
	3. Binding at Clutch and Turntable Shaft (8).	Remove Turntable and check for binding of shaft. Also check cleara between shaft and shoulder of Center Post. There should be at le .005" end play between Center Post Shoulder and Turntable Shaft. sure that Pinion Gear (17) and Clutch and Turntable Shaft (8) are pus down as far as possible.
	4. Line voltage is too low.	Line Voltage should not be less than 100 volts.
	5. Operating temperature too low.	If the changer has been stored in a cold room, the Turntable sp may be slower than normal.
	6. Faulty Motor.	If, after checking the above five items, Turntable speed is still too sl then it may be assumed that the Motor is at fault and should be repla
Rumble or "wow".	1. Changer not floating freely on its mounting springs.	Be sure the three hold-down screws used for mounting the chan have been loosened sufficiently to allow the entire unit to float fre
	2. Improper motor mounting.	Be sure that Motor (6) is mounted on rubber bushings.
	3. Worn tire on Idler Wheel (7).	Examine Idler Wheel for flat spots on tire and replace entire whee required.
Noisy Operation.	1. Clicking noise resulting from incorrect timing of Pinion Gear (17).	To obtain correct setting of Pinion Gear, refer to section entitled "Tim Adjustment of Pinion Gear" on Page 8.
	2. Lack of lubricant.	See "Lubrication" on Page 8.
	3. Binding at some point in changer mechanism.	Remove Turntable and depress "REJ" Button (3). Then, rotate Clutch Turntable Shaft (8) **clockwise.** Observe action of mechanism to loc components that are causing binding and attendant noise.

PROCEDURES FOR REMOVAL AND REPLACEMENT OF MAJOR PART

NAME OF ITEM	METHOD OF REMOVING OR REPLACING
Crystal Cartridge (45).	To remove this part, hold Pick-up Arm in a vertical position and grasp Crystal Cartridge (45) near the fr Then push the cartridge down toward rear of Pick-up Arm (43) and, at the same time, pull it away f the arm. Do not attempt to unsolder lead connections—merely slip the "quick disconnect" electrical nectors off of prongs at rear. To replace a cartridge, insert it in the arm so that flat spring hooks over lip of mounting bracket. T pull it outward slightly and at the same time pull forward until the two ears on the bracket fit into "V" groove in the body of cartridge. Be sure cartridge is centrally located and has a "floating acti Also be sure that needle protrudes 1/32" beyond metal guard.
Needle (46).	To remove the Needle, loosen small Set Screw (47) visible and accessible at front of cartridge. A Needle may be installed by inserting it so that flattened side of shaft faces the set screw.
Pick-up Arm (43).	To remove the Pick-up Arm, disconnect leads from crystal cartridge as described above. Then use a scr driver to disengage flexible ends of hinge at the pivot point. Replacement of the Arm is accomplished re-engaging the hinge at the same point.
Follower Arm and Pick-up Shaft (51).	To remove this part, take out screw that holds Lift Lever (51) to bracket at base of changer. Lift Rod will then drop out—be careful not to lose Lift Rod Spring (42). Remove screw that holds Link Assembly to Follower Arm and loosen Set Screw (55). Entire Follower Arm assembly may then be withdrawn bottom of changer. To replace the arm, apply the reverse procedure.
Record Support Arm (29	This part is held in place by two screws located in Record Support Channel (27) which is located immedic below the Record Support Arm (29). To reach these screws, move arm forward or backward as requ
Drive Mechanism.	To disassemble mechanism, proceed as follows: 1. Remove Turntable by taking out three screws located near the Center Post (32). 2. Take-out Screw (38) located at base of changer and Center Post may then be withdrawn. 3. Lift out Clutch and Turntable Shaft (8); also remove Pinion Gear (17). 4. Disconnect Ejector Link (24) from Ejector Lever (26) by taking off Spring Clip (65). Then, swing Ej Lever (26) to one side. 5. Remove hairpin type Spring Clip (66) on each stud of the Main Slide Rollers (21). Main Slide can now be taken out of the mechanism. 6. All remaining parts are easily accessible.

MODEL A-505650 STEWART-WARNER CORP.

NAME OF ITEM	METHOD OF REMOVING OR REPLACING
Drive Mechanism.	The Drive mechanism may be reassembled by reversing the above procedure and exercising the following precautions: 1. Before replacing Main Slide (20), be sure that Top Drive Roller (19) and Bottom Drive Roller (60) are in position. Also see that Stud (49) is in front of upward projection on base plate and fits into slot in Main Slide (20). 2. Be sure Return Slide (48) is in the position shown in Fig. 5 so that "L" shaped section does not contact Stud (49). 3. When replacing Pinion Gear (17), hold end of Reject Lever (13) away from Center so that gear can drop all the way down. Correct placement of Pinion Gear (17) is very important and is described in Steps 1 and 2 of the next section entitled "Timing Adjustment of Pinion Gear". When replacing Clutch and Turntable Shaft, hold Clutch Arm (15) away from center until shaft is properly seated. 4. After Center Post has been installed and Screw (38) at base is tightened, check for .005" clearance between shoulder on Center Post and top of Clutch and Turntable Shaft (8).
Timing Adjustment of Pinion Gear.	Proper operation of the changer mechanism requires the establishment of a definite timing relation between Pinion Gear (17), Main Drive Gear (18), Clutch Arm (15) and Reject Lever (13). To position these parts for correct timing, proceed as follows: 1. Rotate Main Drive Gear (18) until Top Drive Roller (19) is **centrally** located in cross slot of Main Slide (20); see position in Fig. 3. In this position the roller is equidistant from either end of the slot. 2. Mesh Pinion Gear (17) with Main Drive Gear (18) so that "Brass Rivet" on Clutch Arm (15) is directly opposite Reject Lever (13) as shown in Fig. 10. 3. After installing Clutch and Turntable Shaft (8) rotate it **counter-clockwise.** Clutch Arm (15) will be partially displaced. At the point of maximum displacement, tip of Clutch Arm (15) should be in line with **front edge** of Reject Lever (13) as shown in Fig. 11. a. If Reject Lever (13) engages Clutch Arm (15), as shown in Fig. 10, when Clutch Arm is at point of maximum displacement then Pinion Gear (17) must be re-meshed one tooth clockwise. b. If Reject Lever (13) is in the position shown in Fig. 12, when Clutch Arm is at point of maximum displacement, then Pinion Gear (17) must be re-meshed one tooth counter-clockwise. c. If necessary, fine adjustment of Reject Lever and Clutch Arm position may be accomplished by making a slight bend in tip of lever until it is flush with tip surface of Clutch Arm as shown in Fig. 11. 4. After Pinion Gear (17) is correctly meshed, rotate Clutch and Turntable Shaft **clockwise** so that the mechanism goes thru its change cycle. As cycle is completed, Reject Lever (13) should engage Clutch Arm (15) as shown in Fig. 10. Clutch and Turntable Shaft (8) will then be fully disengaged and rotates independent of the changer mechanism.
Turntable Main Bearing (33)	Turntable Main Bearing (33) is held in position by three screws which are located on top surface of base plate and will be accessible only upon removal of the entire changer mechanism. After taking out these screws then remove Center Post Support Plate (37) and exercise care to avoid loss of the six Ball Bearings (36). When replacing the Turntable Main Bearing (33) be sure to check for correct spacing between Center Post (32) and Record Support Arm (29).

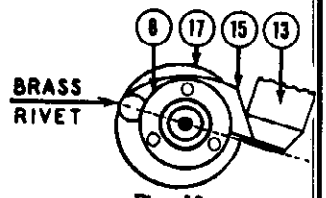

Fig. 10

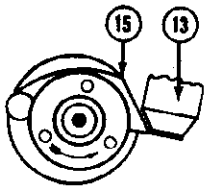

Clutch Arm (15) and Reject Lever (13) shown in correct timing position.
Fig. 11

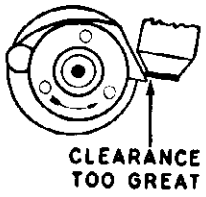

Fig. 12

LUBRICATION

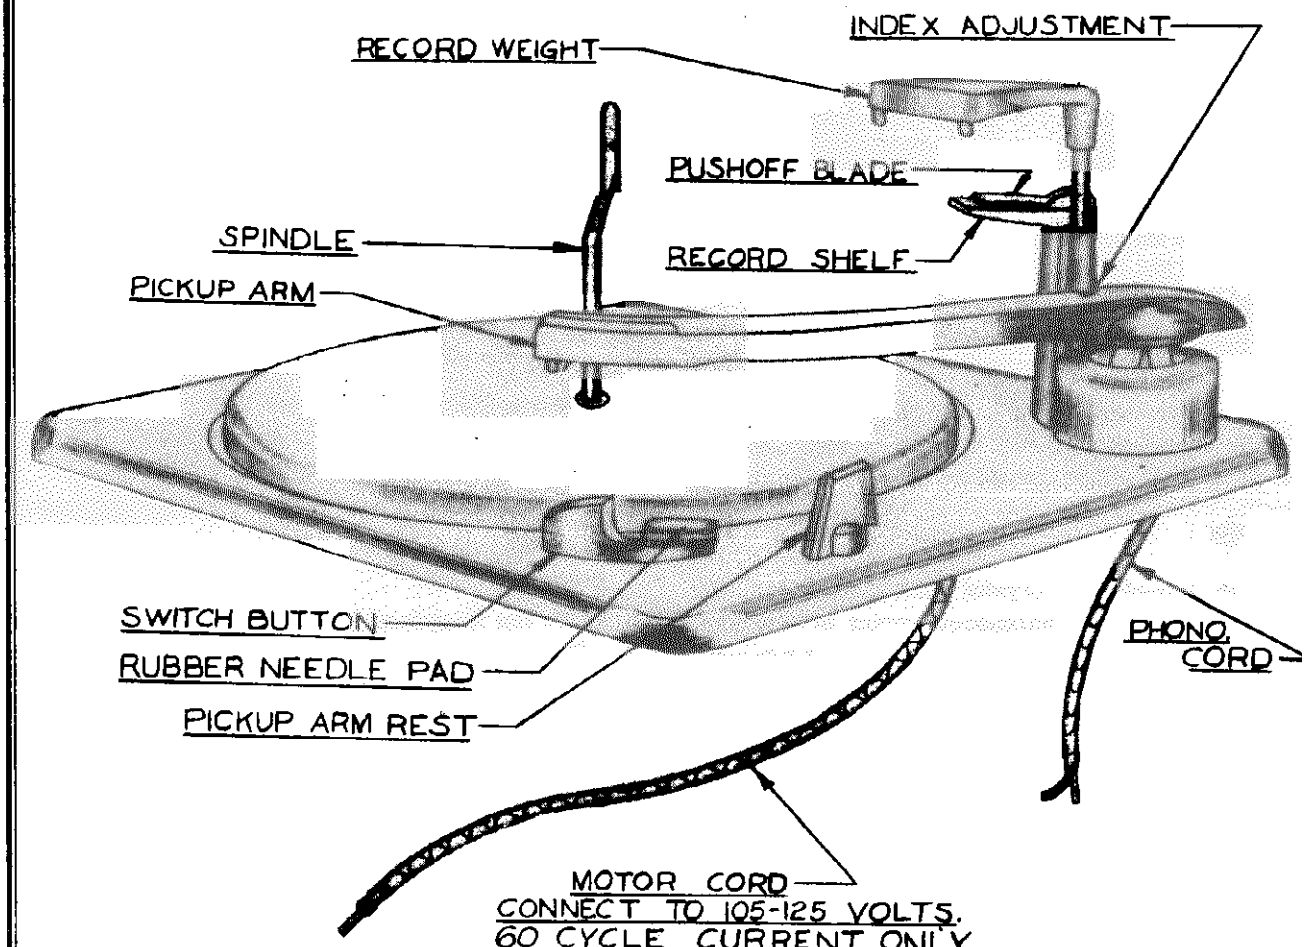
The record changer leaves the factory completely oiled and lubricated. Under normal conditions this should be adequate for the life of the product. When operated under extreme conditions of dust or heat, lubrication should be performed as required and in accordance with the following recommendations.

Use fine oil on Main Slide Rollers and other bearing surfaces with the exception of the bearing for Clutch and Turntable Shaft (8) and upper part of Turntable Main Bearing (33) which have "Oilite" bearings and require no lubricant.

Use light cup grease to lubricate Ball Bearings (36) and Ball Bearing Retainer (35) at base of Turntable Main Bearing (33).

DO NOT ATTEMPT TO OIL THE MOTOR UNDER ANY CIRCUMSTANCES.

WEBSTER CHICAGO CORP. MODEL 1



The Webster-Chicago Model 148 is a single post, spring-cushioned spindle, automatic record changer.

Model 148 features the exclusive Webster-Chicago Velocity Trip mechanism. The pickup arm is not actuated by "lead-in" springs and there is a minimum of lateral pressure. The arm travels freely in either direction. This lack of lateral pressure or inertia add immeasurably to the life of records and is considered to be as important as extra light vertical pressure, which in some instances would result in poor tracking at extremely low or high frequencies.

When set for automatic operation, Model 148 will continue to repeat a single record placed on the turntable (or the last record of a stack) until the Control Knob is returned to the STOP position.

OPERATION

MOTOR

Connect the motor cord to a source of 105-115 volt 60 cycle current only. If it is desired to operate the changer on 50 cycle current, a special motor pulley (Part No. 17X412-11) must be used in place of the one supplied with the changer in order to drive the turntable at the required speed of 78 R.P.M.

Do not under any circumstances connect the motor to a source of direct current or alternating current of any other frequencies.

PICKUP

The high impedance crystal cartridge supplied may be of the fixed permanent point or removable needle type. If it is the latter, use a needle which is not more than $^{11}/_{16}$ inches long for most satisfactory results.

Some desirable qualities of a good needle are faithful reproduction, low surface scratch or hiss, long wearing qualities, minimum record wear and rugged construction.

The Webster-Chicago Nylon Needles are particularly adaptable for use with your Webster-Chicago "148". Do not use single play or cactus needles for automatic operation. Such needles require frequent replacement or sharpening and are not designed to play a full stack of records.

OPERATION — AUTOMATIC

1. Turn the Record Shelf forward or back for ten or twelve inch records.
2. With the record ballast weight lifted and turned forward out of position, place up to ten 12" records or twelve 10" records on the spindle so that the bottom record rests on the step of the spindle and on the Record Shelf.
3. Turn the record ballast weight and lower it until it rests on the top record.
4. Move the control knob from the STOP position (nearest the pickup arm rest) to the START-REJECT position (farthest from the pickup arm rest) and release. The control will then drop back into the automatic playing position and mechanism will continue to operate automatically until the control is moved to the STOP position.
5. To reject any record while playing in the automatic position, move the control knob momentarily to the START-REJECT position and release.

NOTE: The mechanism may be turned off at any time or during any portion of the change cycle by moving the control knob to the STOP position.

The pickup arm may be moved horizontally at any time without damage to the mechanism. However, the pickup arm cannot be returned to the pickup arm rest until the change cycle has been completed.

After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:

a. Place the pickup arm on the pickup arm rest.
b. Lift and turn the record ballast weight out of position.
c. Place the fingers of both hands under opposite edges of the bottom record.
d. Do not apply pressure to the top record. (Keep your thumbs free.)
e. Lift the stack of records straight up following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

OPERATION — MANUAL

1. Turn the Record Shelf to the TWELVE inch position (this is not essential but permits more clearance in loading and unloading records.)
2. Place a record on the turntable.
3. Move the control knob from the STOP position to the AUTOMATIC position, then toward the spindle to the MANUAL position, as indicated by the arrow on the control knob.

   No harm will result if the knob is accidentally moved to the START-REJECT position. If a twelve inch record is on the turntable, the arm will automatically index to the edge of the record. If a ten inch record is on the turntable, the needle will be set down gently on the rubber pad and the arm may be moved to the edge of the record.
4. Place the needle gently on the edge of the record. Particular care should be exercised if your pickup has a sapphire point needle. Although the sapphire is very hard and long wearing, it is extremely brittle and may be fractured or chipped if dropped on the record.
5. To stop the mechanism at any time, move the control knob to the STOP position.

SERVICE INFORMATION

All units are accurately adjusted, lubricated and tested at the factory. However, service repairs and adjustments sometimes become necessary. This bulleti... should be studied carefully before making any adjustments or replacing parts.

Service parts are available from your Webster-Chicago distributor. All parts must be ordered by piece part number and also record changer model and production number, stamped on the under side of the main plate.

The functions and most probable misadjustments of the main assemblies are as follows (reference numbers refer to the exploded views on pages 14 and 16):

THE AUTOMATIC TRIP FAILS TO FUNCTION

The Main Cam Assembly (32) and Actuating Gear (31) are the heart of the record changer. The Main Cam Assembly drives the mechanism associated with the action of the Pickup Arm (7) and the Record Selector assemblies. It, in turn, is driven by the gear train (28, 29, 30) and the Turntable which is rim driven by the phonograph motor.

The Main Cam Assembly and Actuating Gear is put in motion or "tripped" by means of the "automatic" trip or by the manually operated "reject" trip. When the movement of the Pickup Arm toward the spindle is greater than ⅛" in ½ revolution of the turntable, the Automatic Trip Arm (35) trips the Velocity Trip and Roller Assembly (33). This releases the Actuating Pawl on the Main Cam Assembly (32), allowing it to engage th Main Cam Actuating Gear (31) and driving through the change cycle. The pressure from th Automatic Trip Arm required to actuate the tri mechanism is negligible.

The Automatic Trip Arm follows the movement c the Pickup Arm through a weighted friction clutc (34). This clutch must be kept free of oil an grease. If the clutch does not cause the Automati Trip Arm to trip the mechanism, clean the clutc parts with carbon tetrachloride. This clutch shoul operate the trip mechanism without placing un due drag on the movement of the pickup arm.

Also check for:

1. Velocity Trip and Roller Assembly (32) bind ing.
2. Slight burr on end of the Actuating Pawl o on the underside of the hook end of the Veloc ity Trip and Roller Assembly.
3. Actuating Pawl stuck (part of Main Cam As sembly (32) engaged by the hook end of th Velocity Trip and Roller Assembly (33).
4. Automatic Trip Arm (35) bent and not hittin the Velocity Trip and Roller Assembly (33).
5. Automatic Trip Arm (35) fails to touch th Velocity Trip and Roller Assembly.
6. Velocity Trip and Roller Assembly (33) rub bing on the underside of the Main Cam Actu ating Gear (31).
7. No velocity lead-in groove or eccentric groov in the center of record.

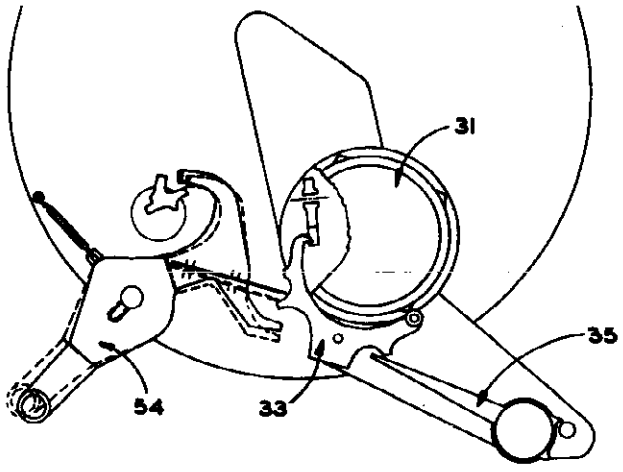


Fig. 1

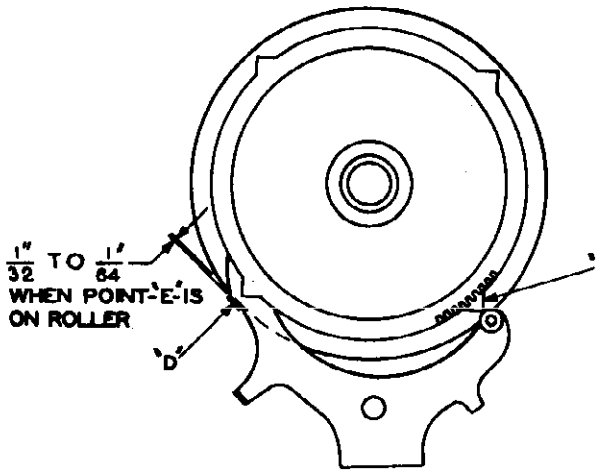

ADJUST IF NECESSARY BY BENDING AT POINT "D".

Fig. 2

8. Foreign matter in record groove.
9. Badly worn record.
10. Badly bent or worn needle.

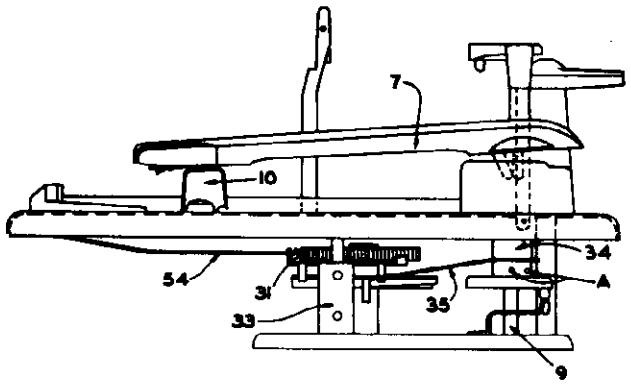

Fig. 3

IF THE "REJECT" TRIP FAILS TO FUNCTION

When the control knob is moved to the extreme START-REJECT position, the hair spring of the Reject Trip Lever Arm (54) actuates the Velocity Trip and Arm Assembly, putting the change mechanism in cycle. See Fig. 1.

Check for:

1. "Reject" trip hair spring of Lever 54 bent or broken.
2. Velocity Trip and Roller Assembly (33) binding.
3. Actuating Pawl stuck (part of Main Cam Assembly 32).

IF THE MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle, the Actuating Pawl is disengaged from the Main Cam Assembly Actuating Gear by the hook end of the Velocity Trip and Roller Assembly, which has been returned to its normal position by the reset points on the Main Cam Drive Gear, Fig. 2.

If the clearance between the lip on the Velocity Trip Lever and the edge of the Main Cam is too small, it will prevent the hooked end of the Velocity Trip Lever from engaging the trigger. Adjust the clearance between the lip ("D" of Fig. 2) on the Velocity Trip Lever and the Main Cam to be within $\frac{1}{32}$" and $\frac{1}{64}$" when the roller is contacting the point of one of the reset points on the Actuating Gear.

Also check for:

1. Velocity Trip and Roller Assembly (33) rubbing on Main Cam Actuating Gear (31).
2. Manual Trip Lever (54) binding.
3. "Disengage Roller" broken on Velocity Trip and Roller Assembly (33).

PICKUP ARM LIFT TOO HIGH OR TOO LOW

The vertical movement of the pickup arm is controlled by the angle of the pickup arm raising lever (37 and Fig. 4). The needle should approach the top record of a full stack of 10" records on the turntable with approximately $\frac{1}{16}$" clearance.

To adjust:

1. Put a full stack of 10" records ON THE TURNTABLE.
2. Trip the "Start-Reject" control and rotate the turntable clockwise until the needle clears the top record of the stack by about $\frac{1}{16}$"
3. Be sure the notch in the pickup arm raising disc engages the pickup arm raising lever.
4. If the needle does not clear the top record or if it raises too high, adjust by bending the pickup arm raising lever (37) at points X and Y as indicated in Fig. 4.

CAUTION: All adjusting bends should be made slowly, using slight but firm, easy pressure.

Be sure the set screws in the Pickup Arm Raising Disc (36) are not loose and are properly positioned in the alignment holes as explained in the paragraph on Needle Setdown Indexing.

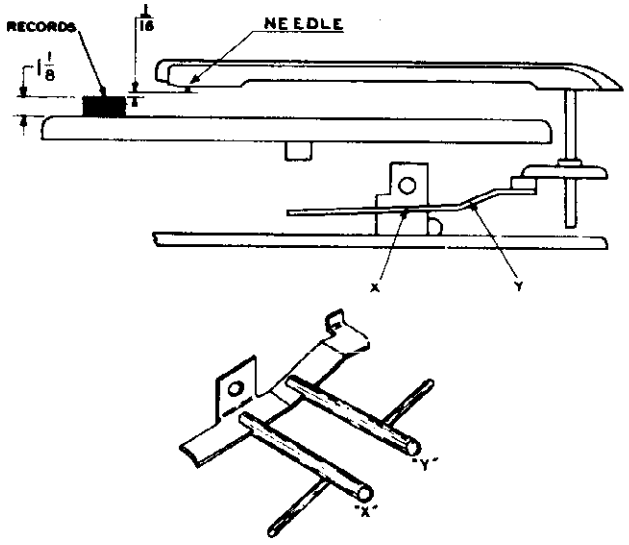

Fig. 4

NEEDLE SET DOWN INDEXING INCORRECT

The horizontal movement of the pickup arm (7) is controlled by the eccentric excursion of the Pickup Arm Raising Lever (37) moving the Pickup Arm Raising Disc (36) when actuated by the Main Cam Assembly (32). The eccentric screw (part of 8). accessible through the top of the pickup arm (7), should take care of any normal position adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary, proceed as follows:

1. Set the eccentric screw, just mentioned, to a middle position.
2. Set the Record Shelf (4) to the 10" position.
3. Operate the mechanism by revolving the turntable manually until the needle drops to within 1/8" of a ten inch record on the turntable.
4. Be sure the notch in the Pickup Arm Raising Disc (36) engages the Pickup Arm Raising Lever (37).
5. The No. 8 Bristol set screws "A" of the Pickup Arm Raising Disc (36, Fig. 3) have pointed ends which fit into off center holes in the Pickup Arm Pivot (9). Alternately loosen one screw and tighten the other until the needle rests above the record lead-in groove at the desired point. Be sure that both set screws are tight when this adjustment is completed.
6. Complete the change cycle of the mechanism and place the pickup arm on the Pickup Arm Rest (10). The tongue of the Pickup Arm Raising Disc (36) should now rest against the post which supports the sub plate assembly. If the pickup arm does not rest in the proper position on the pickup arm rest, bend the tongue closer to or away from this post until the pickup arm is correctly positioned.

   REMEMBER: Always slight but firm, easy bends!
7. Turn the Record Shelf to 12" and check the needle drop on a twelve inch record. Make any additional adjustments with the eccentric screw mentioned previously.

PICKUP ARM DROPS OFF REST

The upturned end of the Pickup Arm Pivot Shaft Bracket (Fig. 3) prevents the Pickup Arm from falling off the Pickup Arm Rest. There should be 1/64" clearance between the tongue of the Pickup Arm Raising Disc (36) and the bottom of the groove formed by the Bracket and the Base Plate Post. Bend the Bracket end up or down to secure proper positioning of the Disc tongue and the Pivot bracket. Be careful to bend the end only or the Bracket will bind on the Pickup Arm Pivot Shaft. The Bracket should not be too high or the Disc tongue will rub on it when the needle approaches the edge of a 12" record, causing "glide in" on the first few grooves of the record.

ERRATIC INDEXING

Indexing in either the 10" or the 12" position is controlled through the presence or absence of pressure from the Compression Spring (45), on the Pickup Arm Raising Lever bracket, forcing the stud to travel the inside edge or the outside edge of the groove in the bottom of the Main Cam. The compression on this spring is changed as the Record Shelf is changed from the 10" to the 12" position. Improper adjustment of the spring tension will result in erratic indexing.

In the 12" position, the spring should be just free. In the 10" position the compression of the spring holds the stud of the Pickup Arm Raising Lever against the outside edge of the groove. If the compression tension needs adjustment:

1. Turn the Record Shelf (4) to the 12" position.
2. Trip the Reject control and rotate the Turntable clockwise until the push off Blade reaches its farthest forward position. At this point the cam follower will be at the highest point on the Main Cam ("A" of Fig. 5).
3. Loosen the lock bolts of (41) and (42).
4. Be sure that the Record Shelf is held in the extreme 12" position while adjusting the Record Shelf and Push-off Blade fingers.
5. At the same time, push the Push-off Blade forward as far as possible and push the Push-off Blade and Record Shelf Assembly downward tight against the Housing (6).
6. Position the Record Shelf finger and the Toggle Assembly (41) so the 12" finger of the Push-off

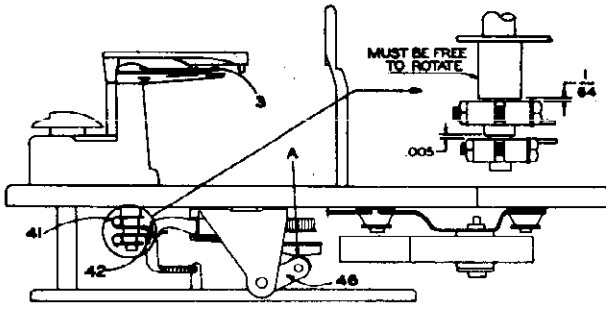

Fig. 5

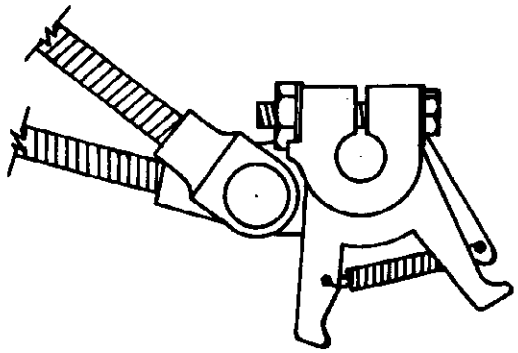

Fig. 6

Blade finger (42) looks like Fig. 6. A visual spacing of approximately 1/64 between the rounded edge of the toggle assembly and the Push-off Blade finger when viewed directly from the bottom of the record changer is required. See Fig. 6. Since these two parts lie on different planes, this adjustment must be made by observation only.

7. While holding the Push-off Blade and Record Shelf Assembly tight against the Housing (6), push the Index Toggle Assembly (41) against the spacer (40) and tighten the lock bolt.
8. Tighten the Push-off Blade bracket lock bolt, leaving approximately 1/64" clearance between the shoulder of the Record Shelf shaft and the Push-off Blade finger bracket (42).

RECORD FAILS TO DROP

The record must leave the spindle step just prior to or at least by the time it leaves the record shelf. If the spindle is too far from the record shelf, the record will hang up on the spindle step and fail to drop.

To adjust:

Press down on the edge of the turntable nearest the Record Shelf to secure proper spacing. DO NOT bend the spindle itself. Also be sure a standard record is used when making this adjustment. A standard 10" record has a diameter of 9 7/8" ± 1/32". A standard 12" record measures 11 7/8" ± 1/32" in diameter.

If the changer still fails to drop records, put the mechanism in cycle and watch the movement of the Push-off Blade. If it fails to protrude beyond the edge of the Record Shelf when at its greatest forward position, adjust the Push-off Blade finger position:

1. Turn the Record Shelf (4) to the 12" position.
2. Trip the Reject control and rotate the Turntable until the Push-off Cam Follower reaches the highest point on the Main Cam ("A" of Fig. 6).
3. Loosen the Push-off Blade finger (42) clamp bolt.
4. Push the Push-off Blade forward as far as possible and hold the Push-off Blade and Record Shelf assembly downward tight against the housing (6).
5. Tighten the Push-off Blade finger clamp bolt (42), leaving 1/64" vertical clearance between the shoulder of the Record Shelf shaft and the Push-off Blade finger (42).

CHANGE CYCLE STARTS BEFORE END OF RECORD

If the Trip Assembly chatters while the changer is running or if the changer cycles before the entire record is played, there is probably insufficient clearance between the hook end of the Velocity Trip and Roller Assembly and the actuating gear. This clearance should be adjusted to be within 1/32" to 1/64" by bending the lever at point "C" as shown in Fig. 7.

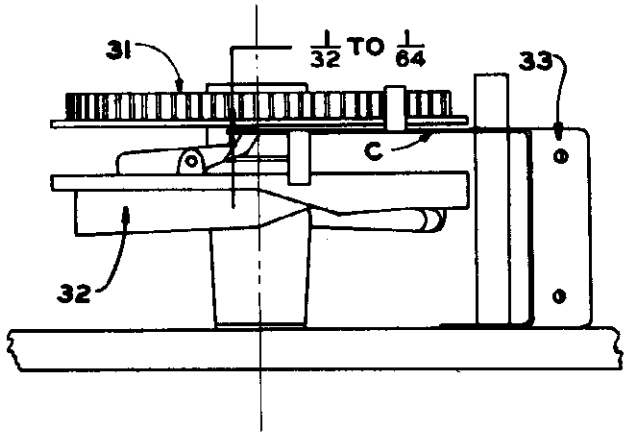

Fig. 7

REPLACEMENT OF PARTS

TO REPLACE PICKUP CARTRIDGE

A Pickup cartridge can be most easily replaced by first removing the Pickup Arm.

1. Hold the Pickup Arm firmly with left hand.
2. Remove the spring from between the pins of the hinge bracket.

3. Using a tool such as a screwdriver, press in on one of the blue steel Pickup Arm hinge brackets while lifting up on the arm. This will release the Pickup Arm Hinge pin.
4. Repeat on the other pickup arm bracket.
5. The Pickup Arm, when released from the hinge brackets, may then be turned over and laid on the turntable for easy access to the cartridge.

TO REPLACE THE PICKUP ARM

The Pickup Arm may be replaced in its bracket as follows:

1. Hook the roller on the rear of the hinge assembly under the Pickup Arm lift stop, inside the Housing (6).
2. Using a pair of long nose pliers, place the pickup arm hinge brackets, one at a time, over the pins in the Pickup Arm Pivot Shaft (9) bracket.

The retaining spring need not be replaced unless the unit is to be re-shipped.

In performing this operation, be sure that the pickup cord lies outside of the hinge and does not become wedged in the bracket.

TO REMOVE THE SUB-PLATE ASSEMBLY

In the event that it becomes necessary to replace any of the major parts in the sub-plate assembly, the entire assembly should first be removed from the Main Plate.

1. Remove the spindle which is held in by a cotter pin under the sub plate.
2. Remove the Turntable.
3. Remove the Pickup Arm.
4. Remove the three No. 8 32 x ½" screws holding the sub-plate posts to the Main Plate.
5. Carefully detach the Sub-Plate assembly from the Main Plate.

TO REPLACE THE SUB-PLATE ASSEMBLY

Reverse the above procedure making certain that all parts fall into their proper positions.

Particularly note the Selector Lever and Selector Lever Compression Spring to see that they are in position with the lever through the slot in the Pickup Arm Raising Lever Bracket.

LUBRICATION

Model 148 Record Changers leave the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

NOTE: AVOID EXCESSIVE LUBRICATION.

Do not permit any oil or grease to get on the rubber Idler Drive Wheel or the Motor Sleeve, on Turntable Drive rim or on the Automatic Trip Arm clutch. Any oil or grease on these points should be removed using Carbon Tetrachloride.

The Recommended lubricants and points of lubrication are as follows:

A — No. 10 OIL (Apply With Small Oil Can Or Medicine Dropper)

1. Motor Bearings. Saturate top and bottom felts.
2. Pickup Arm Shaft. Drop one drop each to bottom bearing point, bracket hole through Main Base Plate.
3. Ball Bearing Assembly.
4. Idler Wheel Felt.

B — LUBRIPLATE (Apply With Small Brush)

1. Idler Wheel Link.
2. Turntable Shaft Stud.
3. Pickup Arm Hinge Pins.
4. Knife edge of Pickup Arm Raising Lever.
5. Main Cam Bearing. (It is necessary to remove the sub-plate assembly to Lubriplate this bearing.)

C — STA-PUT (Apply With Small Brush)

1. Teeth of Main Cam Actuating Gear.
2. Track of Main Cam Gear.
3. Teeth of Large and Small idler gears.
4. Raising lever Bracket bearing surfaces.

MODELS S-14004
S-14007

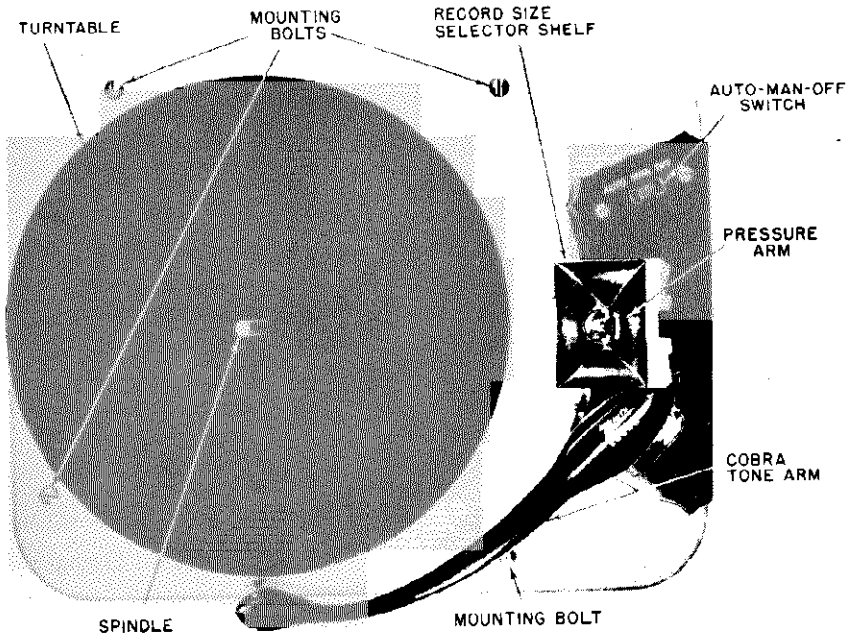

Fig. 1. S14004 and S14007 Record Changers.

GENERAL

The Models S14004 and S14007 record changers are used in Zenith Models 7R887 and 6R880 respectively. These changers are designed to play 12 ten inch or 10 twelve inch records automatically. Odd size and warped records must be played manually. Mechanically the changers are alike. There are slight electrical differences. Model S14004 receives the solenoid energizing voltage from the receiver proper while the S14007 supplies its own energizing voltage from a separate winding on the motor. When servicing these changers, check the schematic diagrams as to the electrical differences. The mechanical operation and adjustments of both changers are identical. To load for automatic operation, set the record size selector shelf to either ten or twelve, depending on th size of the records to be played. Lift the pressure arm ar place a stack of records over the spindle. Lower the pre sure arm until it rests on the record stack. Set the AUT MAN-OFF switch to AUTO and press the record chan button on the receiver panel. The record changer will pl the complete selection of records, and will repeat the la record until turned off. For manual operation set th AUTO-MAN-OFF switch to MAN, place a record on th turntable and set the needle on the starting groove of th record. To turn the changer off, set the AUTO-MAN-O switch to OFF, and place the tone arm in the rest positio

DESCRIPTION OF CYCLING

The motor driven idler wheel rim drives the turntable. Closing the contacts of the trip switch or the record change switch allows current to flow through the solenoid. The magnetic field of the energized solenoid attracts the trip pawl lever which releases the gear pawl tooth and allows it to engage the rotating turntable gear. This action starts the clutch gear to turn. A stud on the clutch gear engages the tone arm lift lever which engages the tone arm stud and raises the tone arm. The tone arm lift lever also applies the tone arm brake which prevents coasting and erratic landing of the needle. The clutch gear moves the tone arm actuating lever and laterally swings the tone arm off the turntable. During the lateral swing of the tone arm, the record ejector link and arm assembly operates the record push plate and when the tone arm moves to its maximum outward position, the record push plate ejects the record and allows it to drop on the turntable. The clutch gear then moves the tone arm actuating lever which swings the tone arm over the starting groove of the record. The tone arm swings 1 inch nearer the spindle with 10 inch records than it does with 12 inch. This difference in inward swing is controlled by the discriminator lever assembly. When the record size selector shelf is turned to the 10 or 12 inch position, its shaft moves the discriminator cam and sets the discriminator lever assembly for the correct inward swing of the tone arm. After the tone arm swings over the starti groove of the record, the tone arm lift lever lowers it a releases the brake. As the clutch gear completes the rev lution, the gear pawl tooth bracket hits the trip pawl a the action removes the gear pawl tooth from the path the turntable gear, causing the clutch gear to stop a complete the cycle.

The velocity trip depends on the ratio of oscillations the trip switch contact to the rate of movement of the to arm. As the record is played, the tone arm lever mov slowly inward. The oscillating lever comes in contact wi the ratchet on the tone arm lever and then moves out befo the ratchet can drag the oscillating lever and close the t switch contacts. When the record is completed and t needle enters the oscillating groove, the inward speed the tone arm increases. This makes it impossible for t oscillating lever to move out of the ratchet in time and as result is dragged inward, closing the trip switch contacts an starting the next cycle.

The S14004 and S14007 record changers use th famous Cobra pickup. Previously published service manua Z800 and Z801 explain in detail the theory and operatio of the Cobra pickup. If these manuals are not availabl they may be obtained from your Zenith distributor.

MODELS S-14004, S-14007

ZENITH RADIO CORP.

RECORD CHANGER MOUNTING CLIPS

Clamp on pivot clips are used to mount the record changer in the cabinet. The changer is released by applying an upward pressure to the slotted ends of the clips (see Fig. 3) until the clips pivot to a vertical position. When the changer is installed, the clips are pivoted back to the horizontal or holding position.

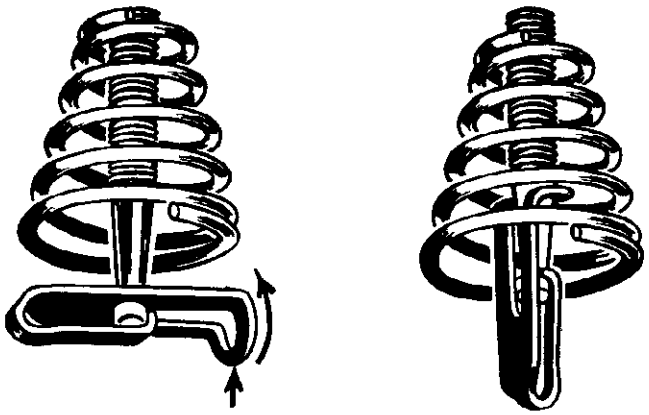

Fig. 3. Record Changer Mounting Clip.

LUBRICATION

Sta-Put grease No. 512 (light grease of the vaseline type) is used for lubrication throughout. Fig. 5 indicates the various lubrication points. Do not apply grease to the top surface or teeth of the clutch gear.

ADJUSTMENTS

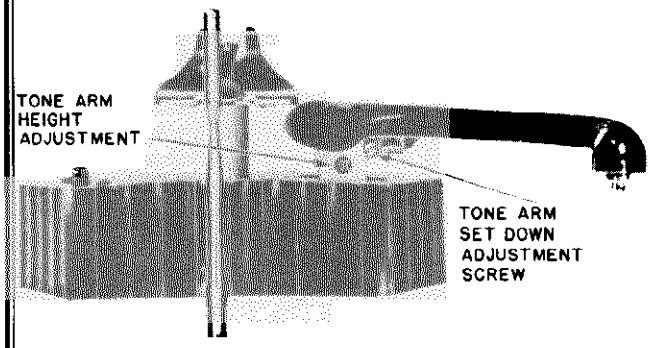

Fig. 2. Tone Arm Set Down and Height Adjustment.

TONE ARM SET DOWN ADJUSTMENT

The landing position of the needle on the record is determined by the setting of the tone arm set down adjustment screw (see Fig. 2). Clockwise rotation of the screw moves the tone arm in, while counter-clockwise rotation moves it out.

TONE ARM HEIGHT ADJUSTMENT

The tone arm height adjustment determines the vertical rise of the tone arm. If the tone arm does not rise sufficiently, the record changer will not play a full load of 12 ten inch records. If, on the other hand, the tone arm is raised too high, it may hit the records on the record shelf. Set the adjustment screw so that the needle clears 12 unwarped ten inch records on the turntable. The tone arm housing must not hit the underside of the records on the record shelf when the changer is cycled after adjustment.

TRIP SWITCH ADJUSTMENT

The tone arm lever must be moved so that its ratchet does not engage the oscillating switch lever. With a pair of long nose pliers simultaneously bend the stationary contact and guide spring until the spacing between the trip switch contacts is 1/16 inch to 3/32 inch. The contact spring must always rest against the heavier guide spring after adjustment.

ZENITH RADIO CORP. MODELS S-14004 S-14007

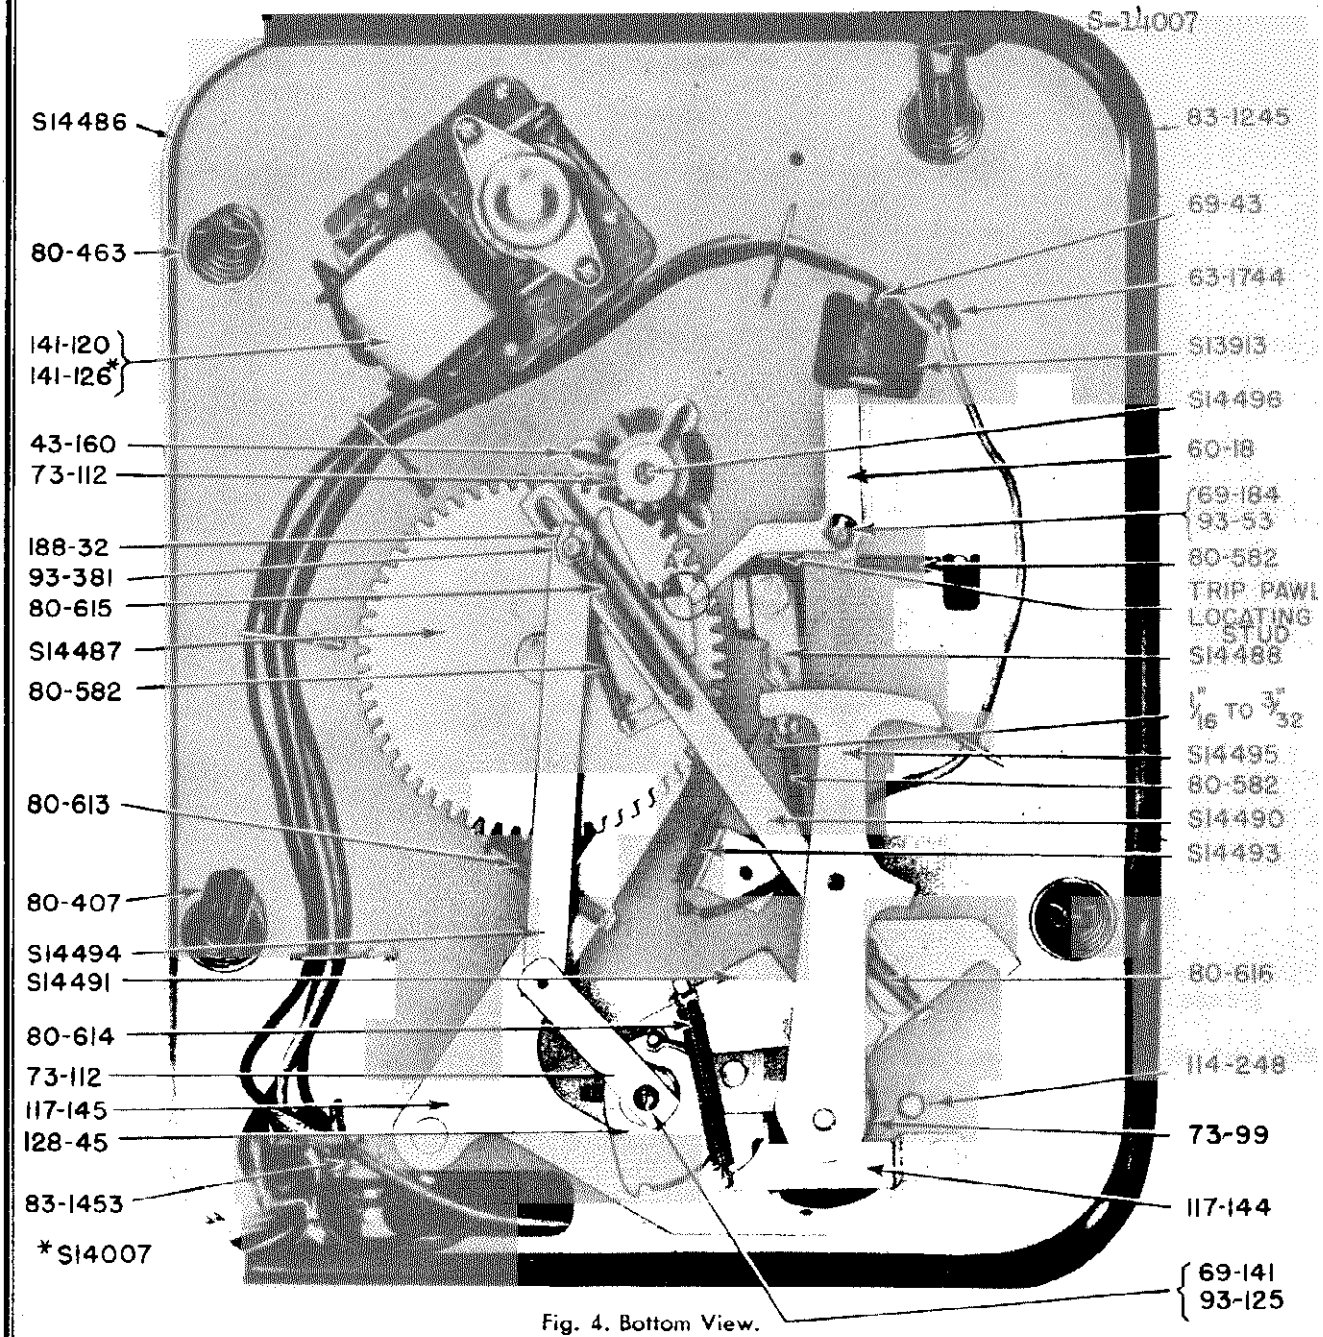

Fig. 4. Bottom View.

SLAB HEAD SET SCREWS

For maximum rigidity, the spindle, discriminator cam and tone arm lever are locked in position with slab head screws. A slab head set screw wrench is available as Zenith part No. 68-8.

REMOVING THE TONE ARM ASSEMBLY

The complete tone arm assembly can be removed by loosening the two slab head holding screws and pulling the unit out. When the tone arm assembly is installed, the cone points of the slab head screws must enter the indentations previously made. A new assembly does not have these indentations, and must be assembled as follows:

1. See that the changer mechanism is out of cycle.
2. Turn the tone arm set down adjustment screw (see Fig. 2) as far as it will go in the clockwise direction.
3. Insert the tone arm support shaft through its mountin hole.
4. Place a 12 inch record on the turntable and hold th Cobra tone arm housing against the edge of th record. Move the tone arm lever (Part No. S14495) t its maximum outward position. These two positior must be maintained during the next operation.
5. See that the tone arm lever bushing has approximatel .005 inch play and tighten the slab head screws.
6. Adjust the tone arm set down adjustment screw (se Fig. 2) for proper landing of the needle.

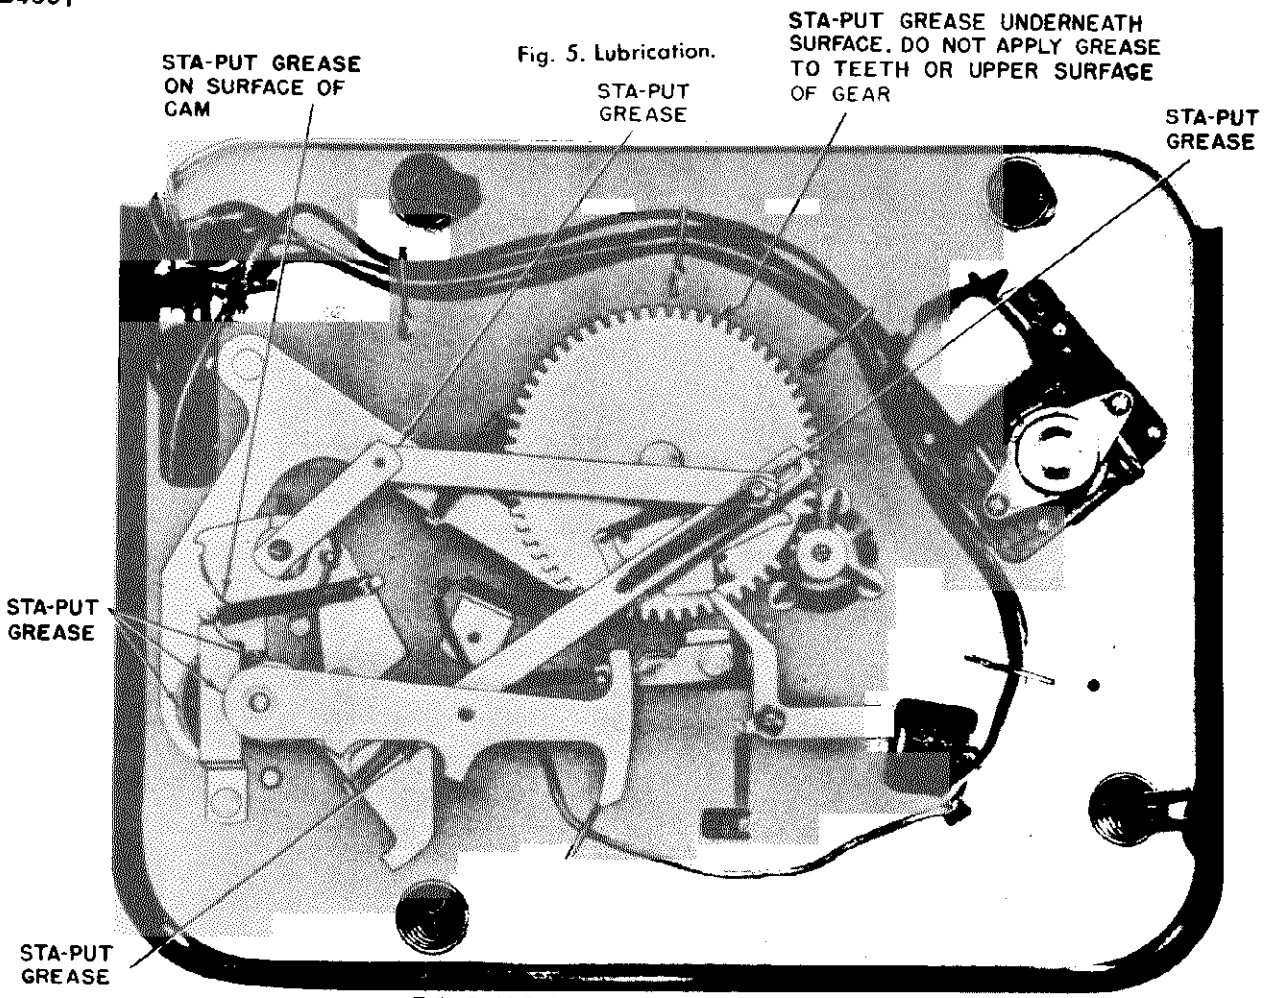
REMOVING THE RECORD SHELF

The record shelf is removed by unscrewing the slab hea screw at the bottom of its shaft and the machine screw whic holds the record ejector link. When the unit is assemblec see that the changer is out of cycle and turn the slotte shaft until the record push off plate is retracted into i housing before attaching the record ejector link.

MODELS S-14004, S-14007

ZENITH RADIO CORP.

Fig. 5. Lubrication.



TROUBLE SHOOTING

SQUEAKS OR NOISES DURING PLAYING OF RECORDS.

a. Friction between the records on the turntable and the spindle will occasionally cause squeaks. A thin coat of wax applied to the spindle will remedy this condition.

b. Check lubrication.

RECORD IS NOT HEARD ALTHOUGH CHANGER OPERATES.

a. See that the Phono Radio switch is on Phono.
b. Check receiver audio by listening to radio.
c. Check the phono oscillator tube.
d. Check Needle Cartridge.
e. Check Tone Arm Housing for broken leads.

PRESSING RECORD CHANGE BUTTON ON RECEIVER PANEL DOES NOT START RECORD CHANGE CYCLE.

a. See that the AUTO-MAN-OFF switch is set to AUTO.
b. Check Record Change Switch.
c. Check electrical continuity of solenoid circuit.
d. Check the solenoid energizing voltage.

RUMBLE AND MICROPHONICS DURING REPRODUCTION.

a. Changer not "floated" properly. Remove packing strip. Loosen mounting bolts.

b. Motor retaining rings rubbing on the idler wheel.

c. Motor leads pulled too tight preventing motor from "floating" freely.

d. Noisy phono oscillator tube.

e. Impression on Idler Wheel.

NEEDLE FAILS TO CLEAR MAXIMUM LOAD OF RECORDS ON THE TURNTABLE.

a. Check Tone Arm height adjustment.

TONE ARM SETS DOWN TOO FAR IN OR OUT ON RECORD.

a. Check Tone Arm set down adjustment.

TONE ARM SET-DOWN POSITION VARIES.

a. Check Tone Arm Brake and Spring.
b. Tone Arm pivots loosely.

CHANGER CONTINUES TO CYCLE.

a. Check the trip switch adjustment.
b. Check Record Change switch.
c. Trip Pawl sticks.

CHANGER WILL NOT CYCLE UPON COMPLETION OF RECORD.

a. See that the AUTO-MAN-OFF switch is set to AUTO.

b. Be certain that the record has an eccentric center groove.

c. Check the Trip Switch.
d. Check the solenoid energizing voltage.

SOLENOID FAILS TO TRIP MECHANISM

a. Check the pawl lever positioning stud. The tip of the pawl must be in approximately the same position in relation to the gear pawl tooth lever as indicated at "A" in Fig. 4. If the position is not the same as indicated, the positioning stud can be bent slightly.

b. Tension on the trip pawl actuating spring too high.

MECHANISM JAMS

a. Burr or sharp point on the gear pawl tooth. Smooth out with a small file.
